New York Safety Code Conference

Although the conference on the proposed national electrical safety code was not held last week in Washington as scheduled, a very important two-weeks conference under the auspices of the Bureau of Standards is just concluding its work in New York. This represents by far the most important step yet taken in the direction of adapting the code to the requirements of the electrical industry. The representation of the several branches of the industry was complete enough to insure an adequate presentation of the difficulties to be met with in applying a code of this kind.

Of the more than fifty attendants at the meetings several represented electric railway interests directly or indirectly. W. J. Harvie, Syracuse, N. Y., and C. L. Cadle, Rochester, N. Y., officially represented the American Association. There were also present H. A. Barre, Los Angeles, Cal., for the Los Angeles and Pacific Electric Railways; E. R. Hill, New York; E. B. Katté, New York; G. E. Quinnan, Seattle, Wash., representing the Puget Sound Traction, Light & Power Company; Paul Spencer, Philadelphia, Pa., and many others. The Bureau of Standards was represented by Dr. E. B. Rosa, who presided, and W. J. Canada, who has had much to do with the preparation of the rules.

The results of the conference will appear in the form of a revision of the proposed code which will be submitted within a few weeks to the members of the industry taking part in it and to a limited number of others, after which the Bureau of Standards will take up the matter with the public service commissions and municipalities. It is doubtful whether the Bureau of Standards will be able to hold a public conference on the code in Washington until after Jan. 1.

Washington Railway & Electric Company Section Received Twenty-six Applications for Membership and Elected New Officers—A Paper on "The Power Plant Department's Part" Was Read by B. H. Blaisdell at the Manila Company Section Meeting on Sept. 7

WASHINGTON SECTION

A meeting of Washington Railway & Electric Company section, No. 4, was held on Nov. 2 with President George G. Whitney in the chair. Twenty-six applications for membership were received, bringing the total membership to 123. The new members included eight conductors and ten motormen.

The result of the election was as follows: President, Charles S. Kimball, engineer maintenance of way; vice-president, J. T. Moffett, superintendent of transportation; secretary-treasurer, R. A. Vetter, legal department; and director for a two-year term, L. B. Schloss, publicity agent. William L. Clarke, assistant secretary, holds over for another year as director, and C. P. King and W. F. Ham, president and vice-president of the company respectively, are ex-officio members of the board.

Robert G. Wall of the Sheldon School of Chicago, then gave a blackboard talk on the science of man building as applied to the science of business building. After the meeting, which was held in the instruction room of the company, tastefully decorated with cornstalks and husks, a buffet luncheon was served under the direction of Mr. Kimball.

MANILA SECTION

At the ninth monthly meeting of joint company section No. 5, Manila Electric Railroad & Light Company, held on Sept. 7, B. H. Blaisdell, chief engineer of power plant, read a paper on "The Power Plant Department's Part." He defined as the functions of the power plant the following: To produce electrical energy at such times and in such amounts as is demanded; to give uninterrupted service; to preserve satisfactory voltage regulation, and to reduce to a minimum the cost of production. He said that to fulfill its first function the power plant department must impress on the management the necessity of having sufficient generating equipment not only to carry the peak load but to relieve generating units for repair. Accurate records of output are necessary to this end. Continuity of service requires first-class engineering ability, careful and regular inspection, and prompt correction of small defects.

The reduction of energy cost to the minimum is the most important function of the power plant from the investor's standpoint, and is the real test of good engineering. As the cost of fuel is the greatest factor to contend with, every effort should be made to select a grade of coal best suited to the conditions and to the character of equipment, considering the cost of coal on a heat-value basis. Mr. Blaisdell stated that during the past three months the cost of fuel per kilowatt-hour had been reduced in the local plant more than 10 per cent without adding expense for equipment. This was done by showing the employees that savings were possible, by offering a bonus for fuel saving, and by fostering a good-natured rivalry. He gave as the conditions favorable to economy the following: cleanliness of boilers, tightness of boiler settings and baffle walls, good maintenance of grates, correct adjustment of air supply, thorough lagging to prevent heat radiation, dryness of coal, and proper firing. The responsibility for the economical use of fuel rests upon the men higher up than

the firemen. The former must determine the proper conditions relative to the supply and distribution of air to the furnaces, the thickness of fire to be carried, the number of boilers to be fired and banked, the proper times for the cutting out of generating units, etc.

Mr. Blaisdell concluded by explaining the sources of loss in a power plant, and outlining the characteristics of employees if the best results are to be secured. The paper was discussed by W. R. McGeachin, manager railway department; J. N. Weaver, superintendent power installations; E. I. Jeffery, assistant chief engineer power plant; J. C. Rockwell, manager electric department; L. L. Vincent, superintendent electrical testing, and C. N. Duffy, vice-president and general manager. Mr. McGeachin explained some of the advantages and disadvantages of the oil engine, the mercury engine and other inventions to reduce fuel consumption. Other speakers elaborated on points touched upon in the paper, all discussions bearing directly upon the subject in hand. In closing the discussion Mr. Duffy paid a tribute to the power plant department of the local company for its work during the night of the great flood in Manila, Sept. 2, 1914. By heroic efforts of the department steam was kept up and current supplied to the lines on that memorable night. After the meeting it was announced that the safety-first films which had been ordered from the United States had been received and would probably be shown at the October meeting.

Accident to Jitney in Spokane

The accompanying illustration shows a jitney after falling over a steep embankment on Sprague Avenue, Spokane, on Oct. 12. The occupants, both women, were reported to be seriously injured. One was the only

JITNEY ACCIDENT IN SPOKANE

woman jitney driver in Spokane, Mrs. W. L. Swain. The other was her sister-in-law. The accident was said to have resulted from a defect in the steering gear.

The risks attendant upon the use of the upper deck in double-deck cars was brought out in a recent inquiry held at Hastings, England, where a woman passenger on the local street railway had died following a fall from the stairway of a moving car. It was stated that the victim rang the signal bell on the upper deck to stop the car but descended the stairs while the car was still in motion and fell to the road. Neither the conductor nor the motorman heard the bell ring.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

One-Piece Splicer vs. Wrapped Joint in Feeder Cable Splicing Practice

BY S. L. FOSTER, CHIEF ELECTRICIAN UNITED RAILROADS
OF SAN FRANCISCO

In 1895 the illustrated one-piece brass splicer for feeder cables was devised in San Francisco and has been found entirely satisfactory in all subsequent use. The idea came after observation of the mason's device for raising his huge blocks of stone by the insertion of a modest little wedge, called a "lewis," in a tapered hole. It has been stated to be a very old cable-splicing device, having been seen many years before 1895 in the coal mines of Pennsylvania.

This device seems to combine better than any other cable-splicing device the features of full tensile strength, full conductivity, small price, light weight, least requirements as to time, tools, labor and material, entire absence of shortening of conductor involved in completing the splice, freedom from patent claims, freedom from danger of internal corrosion from uncombined soldering chemicals, freedom from catching when pulled over cross-arms, and suitability for repeated use without repairs or waste except that of old tape removed.

The splicer is a rough, short, tapered, one-piece brass casting. The only finish is given by running a drill through it and tinning the interior. The only preparation required for the cable ends is removing the insulation for a distance equal to half the length of the short splicer, tinning the copper conductor, inserting it in the splicer and splitting the cable end with a screw-driver or chisel to fill half the central pocket in the splicer. The wedge of solder that fills the space in the split-open cable end of the pocket will insure the joint having a greater tensile strength than the conductor. As malicious or careless workmen have on a few occasions omitted to split open the cable ends and provide this

splice strength no results could be obtained, as the copper conductor broke repeatedly in the clamps of the machine. Tests for resistance showed that 12 in. of cable containing the sleeve had but 82 per cent as much resistance as 12 in. of uncut cable.

As the minimum length of any given insulated conductor that it pays to splice up equals the cost of the

Straight 500,000 - circ. mil splicer.

Reducer for 1,000,000 to 500,000-circ. mil cable.

Split from one 1,000,000-circ. mil to two 500,000-circ. mil cables.

Dead-end for 1,000,000-circ. mil cable.

Turn-down for 1,000,000-circ. mil cable at connection to rails from overhead negative feeder.

Take-down for house-movings through feeder lines, partially opened to show key and key way.

CABLE SPLICERS READY FOR SOLDERING AND INSULATION

splice divided by the difference between the cost of a foot of new wire and the net selling price of the scrap copper in a foot of old wire, and as this difference is practically constant, the lower the cost of the splice the shorter the piece of cable that can be economically spliced up and the more desirable becomes the type of splicer described.

Some Eastern linemen who were accustomed to make splices in feeders by the usual interlacing and wrapping method were asked to make a 1,000,000-circ. mil splice in their way while the Western man made a joint with the brass sleeve. The Eastern men unlaid their cable ends back 18 in., wasting 3 ft. of cable at once, while the Western man wasted no cable at all, butting the cable ends together in the sleeve. Then they used 6 lb. of solder to the Western man's 3 lb., and took seventy minutes to complete their job as against seventeen minutes for the other. The resulting splices cost \$1.89 and \$4.52 for the splicer joint and the wrapped joint respectively. The making of the latter delayed the whole cable-stringing crew while the former was done while the men were preparing to pull up the feeder, and the stringing was uninterrupted.

A similar competition on a 500,000-circ. mil cable cost 74½ cents for the sleeve and \$2.23 for the wrapped joint. The former took eleven minutes and the latter sixty-eight minutes to complete, while the former added 3.4 lb. to the cable as against 6.2 lb. for the latter.

When a feeder is to be taken down it is cut off in convenient lengths, usually 1000 ft. for a 500,000-circ.

mil cable, pulled off the cross-arms and rapidly reeled up on a motor-driven reeling machine. It is then ready for use at once elsewhere. If a sleeve joint is to be cut out, the conductor is cut off at each end of the sleeve and the short pieces in the sleeve melted out. The sleeve is then ready for use again as good as new. The waste with the sleeve has been 5 in. or 6 in. of cable in the case of 500,000-circ. mil cable, as against about 4 ft. cut out of the cable when a wrapped splice is removed (including the lengths of cable required to make the splice originally).

In the great San Francisco fire of 1906 when copper cables lost their weatherproof covering and in some cases were burned off altogether these sleeve joints lost their solder but the wedges maintained the tensile strength of the joints and the cables remained in place. The linemen came along, put on ropes for safety, resoldered the joints and they were as good as new.

A comparison in 1908 between this sleeve joint and a much advertised unsoldered one on the market showed that in the 500,000-circ. mil size the patented sleeve cost \$1.73 and the one-piece sleeve illustrated on page 955 cost 49 cents. The former cost 2.26 times as much in place and had 2.30 times as much resistance as the one illustrated.

This one-piece splicer is conveniently made in all sizes for cables from No. 0000 to 2,000,000 circ. mils, also in many other forms as a neat reducer from 1,000,000 to 500,000, for example, or for changing from one to two conductors, as from one 1,000,000 to two 500,000-circ. mil conductors, for instance, or for a dead-end or dead-end and turn combined, as shown in the illustration.

Columbus Uses New Joint and Track Foundation

BY E. O. ACKERMAN, ENGINEER OF WAY COLUMBUS RAILWAY, POWER & LIGHT COMPANY

Quite an extensive track construction and extension program is being executed by the way department of the Columbus Railway, Power & Light Company, Columbus, Ohio. The work contemplated for this year includes approximately 9.7 miles of track. This is being laid with A. E. R. A. standard 7-in. grooved girder rail for all straight line construction, and A. E. R. A. standard 7-in. guard girder rail for all special track construction. In a few instances where the old rail is found in good condition, it will be relaid in track where light traffic obtains. On straight line work the rail is being laid on Carnegie ties and supported on a concrete foundation. Special track work is laid on white oak ties and is supported on a concrete slab foundation.

Incorporated in the new work on lines where heavy traffic obtains is a new type of construction. This pro-

COLUMBUS TRACK—ELECTRICALLY OPERATED CONCRETE MIXER

vides for an 8-in. concrete slab sub-foundation, the top of which is 2 in. below the bottom of the steel ties, which are spaced at 2½-ft. centers. The track structure is assembled on top of this slab and blocked to permanent line and surface. In this position concrete is tamped under the steel ties and carried up to the required height to form the pavement foundation. The details of this type of foundation construction are shown in the track cross-section in one of the accompanying illustrations. This form of steel tie, solid concrete construction, provides rigidity and permanency, and at the same time there is a line of cleavage or a parting between the sub-foundation slab and the concrete incasing the track. In case renewals or repairs are necessary in this type of construction, it is contemplated that the sub-foundation slab may be left intact.

For all special track work there is provided an 8-in. concrete slab sub-foundation. When this has set permanently, the track is laid with white oak ties and tamped to line and surface with ¾-in. screened crushed stone. Over this, concrete is deposited to form the pavement foundation. This type of work provides a more flexible construction, both as to riding qualities and for making repairs and renewals than that used in straight track. Two kinds of unit pavement are being

COLUMBUS TRACK—STANDARD CROSS-SECTION

COLUMBUS TRACK—CROSS-SECTION AND SIDE ELEVATION OF JOINT

COLUMBUS TRACK—ELECTRICALLY OPERATED TRACK CRANE

used in the construction work this year, granite block for the heavy traffic lines and brick for the light traffic lines.

Probably the most unusual feature in connection with this new track construction is the Columbus rail joint, which has been adopted as standard for straight-line track. This joint is the outgrowth of a series of developments in joint construction through which the track and roadway department of this railway has passed. The fundamental feature of the joint was used in Columbus six years ago, and included the combination of the joint reinforcement and the anchor. Added stability is obtained in the joint used this year by resorting to the electric weld. An elevation and cross-section of this joint are shown in one of the accompanying illustrations. In the cross-section it will be noted that there are four lines of welds, one at the base of each joint plate and one at each side of the rail base, and all extend the full length of the joint.

Several years' experience with joints of this type has produced no failures, a record which has not been equaled by any other type of joint used by this company. This result was obtained despite the fact that the cost of the complete joint is relatively low when compared with other good joints. The essential features of the joint are the reinforcement support and anchor, the heavy splice bars with large bearing surfaces and the drive fit bolts. The holes, drilled at the mill, are afterward reamed in the field with power drills so that the bolts may have a drive fit. The bolts are also special, being made of chromium steel and manufactured very closely to a specified diameter. The cost of the joint complete is \$4.43, which includes material and labor and 50 cents for power consumed.

The track construction plant employed in connection with this year's work includes a self-contained concrete mixer, having a wheeling platform and concrete chute, all of which are under the control of a single operator. The mixer is motor driven and is mounted on a low steel truck which is self-propelled, energy being supplied through a trolley pole. The compactness of this mixer makes it a particularly valuable machine for track concrete work. The mixer was built by the L. T. Smith Company of Milwaukee, Wis. Another feature of the track-laying equipment is a Whiting electric crane which is used to install special track work. Views of the concrete mixer and the electric crane are shown in two of the accompanying illustrations.

Where Classifying Scrap Paid

BY A. W. REDDERSON, SUPERINTENDENT OF MOTIVE POWER
FORT WAYNE & NORTHERN INDIANA TRACTION
COMPANY, FORT WAYNE, IND.

From time to time articles appear concerning the advantage of classifying railway repair-shop scrap. Only recently the Fort Wayne & Northern Indiana Traction Company had occasion to test this. A number of obsolete Lorain No. 34 motors were retired from service and the mechanical department desired to dispose of them to the best advantage. Accordingly a circular letter describing this equipment and listing it, together with a number of new repair parts which were on hand in the store-room, was sent to all dealers in second-hand equipment, and in response a number of inquiries were received and several offers to purchase were made. In no case, however, did the company receive an offer of more than \$70 per motor, and the majority of the bids were about \$50 per motor. The mechanical department believed that these prices were entirely too low, and in order to verify this conclusion decided to dismantle one of the motors and classify the scrap. After this had been done the different materials were weighed separately and the following data were obtained:

Mixed Scrap	
Motor case	933 lb.
Gear case	120 lb.
Gear	220 lb.
Pinion	67 lb.
Armature core	380 lb.
Pole pieces	140 lb.

Total weight 1,860 lb

Scrap Copper	
Armature coils	81 lb.
Field coils	260 lb.
Commutator	46 lb.

Total weight 387 lb.

To obtain the net weight of the scrap copper the insulation on the armature and field coils was burnt off.

Scrap Brass	
Field frames	56 lb.
Brush-holders	8 lb.
Axle bearings	48 ft.

Total weight 112 lb.

With this metal classified as indicated the 1860 lb. of mixed scrap was sold for \$7.50 per ton, a rather low

price for scrap of this kind which obtained in the Fort Wayne territory. At this time, however, the market price for scrap copper and brass was very high, the former selling for $17\frac{1}{4}$ cents per pound and brass for $16\frac{3}{4}$ cents per pound. From the foregoing market prices it will be noted that the mechanical department realized the following for one motor:

1,860 lb. scrap iron at \$7.50 per net ton.....	\$6.98
387 lb. scrap copper at $17\frac{1}{4}$ cents per pound.....	69.76
112 lb. scrap brass at $16\frac{3}{4}$ cents per pound.....	18.96
Total amount received	\$95.70

As a result of the sale of scrap of this one motor, the mechanical department immediately scrapped all the motors removed from service and realized almost twice as much money as was offered by any of the second-hand equipment dealers. From this amount, of course, the labor of scrapping must be deducted, but it was a relatively small item when compared with the total money received from the sale of these old equipments as scrap.

New Manual and Pneumatic Door and Step Control

The widening use of the fully-inclosed car has given increased importance to the mechanisms for controlling the operation of the doors and steps. Since this operation is in the hands of the motorman and conductor respectively, the liability of the railway in cases of accident is greater than when the passenger himself assumes the risk of boarding or leaving a moving car. Aside from this legal consideration modern door and step control must embody such features as these:

Quick operation, so that the stopping time of a car will be the minimum;

Safe operation, so that a passenger cannot possibly be caught by a closing door;

Reliable operation, so that the car will not lose shop-time because of maintenance defects in the mechanism;

Laborless operation, so that the motorman and conductor can manipulate doors and steps without so tiring themselves that their other work suffers.

So far as the last point is concerned, pneumatic control offers the best solution for heavy service; but for conditions of less congestion, a manual control will answer if it is properly designed.

The features outlined plainly call for highly specialized skill and equipment. This fact will be made clear by the following details relating to the manufacture of new types of door and step control by the National

Pneumatic Company, Chicago, for the Interborough Rapid Transit Company, the Boston Elevated Railway Company, the Detroit United Railway, the Cleveland Electric Railway, the New York State Railways—Rochester Lines, the Northwestern Elevated Railways, Chicago, Market Street Elevated Railway, Philadelphia, and others.

MATERIAL

All control parts on which there are heavy strains or excessive wear are made of crucible cast steel instead of ordinary steel. On receipt at the works they are examined for defects, fins or other rough portions being ground off before going into stock. It is customary

CLEVELAND ENGINE PLACED UNDER CONDUCTOR'S STAND

always to order enough extra castings to permit immediate replacement of any lost or spoilt parts. This surplus is not only large enough to avoid delays in manufacture, but also to ship replacements to the customer at once. Users of standard mechanisms are assured immediate shipment in any event. Another example of attention to detail is that most patterns stay permanently at the foundries to eliminate damage in shipment between founder and manufacturer.

METHODS OF MANUFACTURE

Every detail in National pneumatic mechanisms has been planned to make maintenance by the user inappreciable. Thus the malleable-iron control transmission pipe could be cheaply attached to the levers on each end by means of a pin or set screw. Instead, the costlier but better practice of autogenous welding is applied because sooner or later the pin would shear or the set screw would slip in service. Next, the distance between these end levers is gaged by means of a jig, whereupon the transmission equipment is ready for painting. As with all other castings, the equipment is immersed in a tank of "125 Rubber" paint, then allowed to drip and finally baked for three and one-half hours in a gas furnace kept heated at 340 deg. Fahr.

The bearing wear which the transmission equipment

GRINDING OFF THE BEARING PARTS OF THE ENGINE FRAME

BROACHING THE CYLINDER BARREL TO GET PERFECT ALIGNMENT

receives is taken up by ball bearings. These bearings cost more than bushings, but they permit easier operation and allow no wear on the ball retainer or on the shaft over which the ball race works.

The faces of the main engine casting are ground off by pressing them against a sheeting of carborundum which is mounted on a horizontal grinder. This method is found more satisfactory than milling. The ends, however, are milled in a jig which can be swiveled around to allow each end to be milled exactly alike. The hole in the end of each foot of the engine casting is also in precisely the same relative position.

TYPE OF PNEUMATIC ENGINE USED IN CLEVELAND

The next step is to broach the interior of the engine with a specially-designed tool to get a finish of gun-barrel accuracy. Upon this the engine casting is drilled with the aid of rigid jigs, after which it is bathed in gasoline to remove all chips and foreign substances.

The last step before assembly is the individual inspection of each casting. Following the assembly, a second inspection is made by another inspector before the equipment is taken from the assembly bench for the final test hereinafter described.

The gears are drop-forgings and therefore are free from blowholes and other defects possible in steel castings. First a square hole is broached and then the gear is turned and cut. The teeth are cut in gangs of eight under conditions which assure absolute alignment of the teeth and a position concentric with the broached hole. The gear shaft is made of crucible steel and is accurately turned and broached to fit tightly the squared hole in the gear. The rack in which the gear works is made of solid rolled steel with cut teeth to insure absolute straightness.

The leather cups against which the compressed air pushes are attached to the ends of the rack. Inside each cup is a phosphor-bronze expansion piece to insure that the cup will always lie so closely against the cylinder wall that leakage of air will be impossible. The leather is the only air-proof material found out of several score tested.

Splash lubrication, so efficient in automobile work, has been adopted for this engine mechanism. All the working parts are subjected to continuous lubrication forced by the exhaust of the engine itself. The course of the oil is such that it returns for reuse after lubricating the valve and other working parts.

Special attention has been given to the design of a valve that would insure against air leakage so that existing airbrake compressors could be used to supply air for pneumatic door and step control. Even where storage air is employed, as at Detroit, this company's engine will be applied without interfering with the air-charging routine.

The valve face is of semi-steel, but the valve itself is made of phosphor bronze cut with a die to insure registration. This combination of semi-steel and phosphor bronze has been found to give the longest possible life.

The valve stem is so milled that it cannot be wrongly installed. Where the stem passes through the semi-steel, it is made of brass to avoid corrosion. As in the rest of the engine, no stuffing boxes are required. The lever for operating the stem is secured by a lock washer and nut instead of pins or set screws which would shear or work loose respectively. The gaskets throughout are of Tennax, a tough, fibrous material which can be used repeatedly instead of requiring replacement, like rubber or paper, at each removal.

The valves are ground in a specially-designed machine which has an oscillatory motion akin to that used in hand grinding. This machine assures a degree of accuracy and uniformity impossible in hand work. Upon completion, each valve is tested under water for assurance against leakage.

In all parts where several holes are to be drilled, even in different planes and angles, multiple-drill jigs are used so that all holes are made accurately at one setting.

The mechanical connections to the door engines depend, of course, upon the distance between the door engines and the operator. These connections are made through malleable iron rods with drop-forged jaws and $\frac{1}{4}$ -in. pipe. The jaws are pulled up tight without the use of lock-nuts, which frequently work loose. After this, the jaws are dipped and baked like other parts.

The control handles are sometimes made with counterweights to hold them positively at "open" or "closed" position. The connection between the valve and the handle is spaced by jig drilling. This spacing between the pins and the center of the gear is varied to take care of predetermined torsion in the transmission pipe and lost motion.

The handle base is made of steel. The pins which go into the base and hold the handles and their counterweights are fitted with a steel sleeve instead of being turned to a step. This sleeve prevents the crystallization from vibration that would otherwise destroy the pin.

The hole for the gear shaft of the engine base casting is made with a concentric reamer so that the two different-sized holes on opposite sides of the engine are in alignment.

All castings are painted before machining them. Consequently no trouble can arise from fouled threads.

ASSEMBLY AND TEST

After the mechanisms have been assembled, they are subjected to a leakage test by means of soap water. They are then attached to test doors which may be weighted to approximate any particular service condition.

The most important feature of the door operation is its positive checking or cushioning. This checking is non-adjustable, being calculated in advance for each specific condition. As the door closes it moves rapidly until within 2 in. or 3 in. of the jamb, whereupon it is automatically checked to complete its motion at a greatly reduced speed. It is often found desirable to supplement this checking device by the use of a collapsible edging or buffer which extends the full height of the door. When this buffer comes into contact with any obstruction during the closing of the door, the compression of the buffer actuates an auxiliary valve which reverses the air in the engine so that the door moves backward until the obstruction is cleared. Thus the tardy passenger cannot possibly be injured.

Another special feature is a ratchet mechanism which allows a station platform man to close the door from outside the car. To prevent him from closing the door violently, a pneumatic stop is provided to check the door momentarily when it is within 3 in. or 4 in. of the jamb. This delay is just enough to avoid the slamming which

might injure a passenger, and it prevents unnecessary shocks to the mechanism. It should be added that the last 3 in. or 4 in. of door movement is not manual, but is effected by the admission of air to the engine in the direction of closing. Thereby the door is locked mechanically just as if it had been closed pneumatically throughout the entire operation.

Electric Heater for Shrink Fits

An exceptionally interesting device for heating electrically the steel tires, gears and other features of car equipment that are applied by shrinkage has recently been commercialized by the Maschinenfabrik Oerlikon, Switzerland, and it is said that this not only insures absolutely even heating in a short space of time but also effects the operation at a very low cost for the current consumed. The process is based upon the well-known transformer induction principle that forms the basis of the melting and refining processes used in metallurgy. In effect, the tire or other ring of metal that is to be heated is made to form the short-circuited secondary winding of a transformer, and in this current is induced to an intensity proportional to the number of ampere turns of the primary coil, the induced current generating heat in the ring sufficient for the requisite expansion.

The practical design of the apparatus and its applications are shown in the accompanying illustrations. The device, which consists of a two-core transformer mounted on a suitable channel-iron frame for convenient transport on rollers, has one of its cores wound with tapped coils. The taps are provided to vary the current produced in the transformer secondary and thus to suit the size of the ring that is to be heated, the amount of heat being proportional to the current generated in the ring.

The windings are protected by a mechanically strong insulating cylinder. The secondary core has no windings but may also be protected with an insulating cylinder if desired. The top yoke of the transformer is, as shown in one of the illustrations, so arranged that it can be turned horizontally around one of the two screw spindles which are used for tightening up the members that form the magnetic circuit, thus making good contacts between the yokes and the cores. Both of the spindles must, of course, be loosened and one removed when the tire is being placed in position, the top yoke being swung to one side, so that the ring that is to be heated can be put over one of the vertical transformer cores.

To facilitate this operation and also to prevent damage to the joint between the transformer cores and the yoke, the weight of the yoke is counterbalanced by means of a weight arranged between two flat iron bars.

HEATING BRONZE GEAR WITH ELECTRIC HEATER

This balance weight can be swung over in a vertical plane around its bearings at the center of the top yoke, so that the apparatus can be used to heat a ring that has an inner diameter smaller than the outside diameter of the primary coil. In this case the ring that is to be heated is put around the free transformer leg, which has no windings, and not around the leg that is fitted with the primary coil, the thermal efficiency being thereby slightly reduced but not to any great extent.

Normally, the device is built for single-phase current at 200 volts or 220 volts and 50 cycles, but it can also be built for any other current condition. Thus far the apparatus has been standardized in two sizes, one of which possesses a coil with a small number of windings which are adjustable to several current steps suitable to the ordinary materials and sizes of rings. The other size is fitted with a primary coil having a larger number of windings and a correspondingly larger number of tappings so as to permit a more elaborate adjustment of the heat that is generated, such as is necessary, for instance, in connection with copper, bronze, or soft-metal rings with relatively low melting points. The increased number of taps permits also a finer adjustment for currents of different frequency.

As a rule the most favorable shrinkage proportion for iron and steel is 1:1000 or 1:1500 in a given length of metal. In practice it has been shown that for a tire having a diameter of, say, 28 in., an expansion in diameter of $\frac{1}{8}$ in. is quite sufficient. This corresponds to a maximum temperature of approximately 300 deg. Fahr. at which the metal does not alter either structurally or in the color or in the condition of the surface. In the case illustrated by the accompanying halftone, where car-wheel tires weighing 265 lb. were heated prior to shrinking on the wheel centers, the inner diameter was increased from $26\frac{1}{4}$ in. to $26\frac{3}{8}$ in. with a temperature

ELECTRIC HEATER WITH TIRE IN POSITION

TOP YOKE TURNED ASIDE TO PERMIT PLACING OF TIRE

of 300 deg. Fahr., and the following observations were recorded:

Time	Power Consumption	Initial Temperature	Final Temperature
9 minutes	17.2 kw.	59 deg. Fahr.	295 deg. Fahr.
35 minutes	6.2 kw.	59 deg. Fahr.	232 deg. Fahr.
180 minutes	2.2 kw.	59 deg. Fahr.	260 deg. Fahr.

The total weight of the complete electric heating device varies between 885 lb. and 975 lb. The apparatus is solidly built, perfectly safe in working and is easily transportable. It can be used for all kinds of ring and tire sections of various diameters. It works very economically and turns out a cheaper and cleaner job than the customary gasoline tire heater, and, of course, the heating of the rings is perfectly even throughout the metal. The time within which the rings are to be heated up to the requisite temperature can be conveniently and quickly adjusted by means of the taps provided on the primary transformer coil.

It is of interest to note that the apparatus can also be arranged for loosening rings and tires that are shrunk on to wheel centers or other members, this being accomplished by the provision of special equipment. However, in order to determine the necessary windings and tappings for such operations it is necessary for the manufacturer to know the exact particulars of the cross-section and diameters of the pieces to be heated.

Oxy-Acetylene Welder and Cutter

The oxy-acetylene welding and cutting apparatus that is manufactured by the Modern Engineering Company, St. Louis, Mo., is given exceptional guarantees by its makers. It is the product of exhaustive tests extending through a period of ten years, and the result has been that all parts of the apparatus are correctly proportioned and no weak links exist. Every equipment that leaves the factory is thoroughly tested, and it is warranted absolutely to give satisfactory service.

One of the first considerations in the design is safety, this being considered essential because in many cases in the past operators have been burned by back ignition of the gas in the hose. This has been overcome by the introduction of a special check-valve system in both of the gas conduits, which absolutely prevents either of the gases from flowing into the pipe that contains the other gas. All of the tips that are furnished with the torch are equipped with a special protective seal between the tip and the head, this insuring a perfect union and preventing leakage or breakage if the torch is dropped or handled roughly.

The mixing chamber is especially designed for high efficiency in mixing, and it produces an absolutely

OXY-ACETYLENE TORCH WITH CUTTING ATTACHMENT IN PLACE

neutral flame having a temperature of more than 6300 deg. Fahr. The mixing of the gases is so carried out that it is impossible for combustion to take place in the mixing chamber even when the largest tips are used. A notable feature is the simplicity with which the cutter is attached to the torch, the necessity for removing the hose connection being eliminated. Two operations are involved, the first one being to remove the nut on the oxygen valve and the union nut on the gas conduit. When the cutter has been inserted and the nuts tightened again, the welding torch has been changed to a highly efficient cutting apparatus. The simplicity of this change-over as well as the non-back-

firing feature makes the tool especially satisfactory for use by inexperienced workmen.

Flexible Running Track Scraper

A new flexibly operating track scraper, to be known as the Simplex type, has been placed on the market by the Electric Service Supplies Company, Philadelphia, Pa. This scraper consists essentially of two scraping blades attached to a horizontal shaft, the latter being equipped with necessary hangers, control springs and brackets.

The primary feature of the new scraper is found in the flexibility of the blades, which allows them to swing back and over any obstructions that might be met, with

FLEXIBLE TRACK SCRAPER IN RAISED POSITION

the car running either forward or backward. They need not be raised for switches, crossings or other obstructions in paving, and may be used with any type of rail. When in working position they require no attention.

In the accompanying illustrations it will be noted that this equipment is attached directly to the truck proper instead of to the car body, as in the older scheme of attachment. This improved method results in a very strong, simple and rigid mounting, and on account of the scraper being so attached the blades automatically

VIEW SHOWING SCRAPER BLADES LOWERED INTO OPERATING POSITION ON RAILS

swing with the trucks, thus insuring efficient scraping when the trucks swing in rounding curves.

Raising and lowering of the blades is controlled by means of a hand lever and a strong helical spring. Hangers for attachment to trucks are adjustable along the main supporting shaft, hence one size of scraper may be fitted to any type of car, whether single or double truck; one type may be used interchangeably on any number of cars. Blades are adjustable to accommodate any standard track gage.

This scraper has been in use for two years on the lines of the Montreal (Que.) Tramways, operating with splendid results through two very severe winters.

LONDON LETTER

Women Conductors for London—Report of Municipal Tramway Conference—New Power Plant for Glasgow

(From Our Regular Correspondent)

London is now to be permitted to use women as conductors. A formal announcement has been issued by the war press bureau to the following effect: "With a view to removing obstacles to the voluntary enlistment of men of military age and suitable physique employed as conductors of stage carriages, the licensing authority for the metropolitan police area is prepared to issue licenses to suitable women to act as conductors of stage carriages. The term 'stage carriage' includes both omnibuses and tramway cars. Delay will be obviated by candidates forwarding their applications in the first instance through the manager of the company with which they seek employment." The use of women conductors in Glasgow, Edinburgh, Leeds, Birmingham, Newcastle and other cities is already an established success, and the experiment might readily have been attempted in London months ago but for the attitude of the London police, and also, it might be added, the attitude of the management of the London County Council Tramways, which was inclined to believe that women were not capable of handling the larger cars in London and the larger volume of traffic at the busy hours. The recruiting possibilities, as far as the Council tramways service is concerned, have to a large extent been discounted, as it will be recalled that, as the result of the recent strike, the services of men of military age were dispensed with, save in some very exceptional cases.

The fourteenth annual conference of the Municipal Tramways Association was held during the past month in London, under the presidency of Alderman H. Linsley of Salford, who has filled the presidential office for two years in succession. The conference was not held last year, owing to the war, and this year, instead of holding the meeting at Salford as would have been the case in ordinary circumstances, it was decided to meet in London and to restrict the business to discussion of various points arising from the war in connection with the conduct of tramways. In his presidential address, Alderman Linsley stated that more than 16,000, or 30 per cent, of the municipal tramway employees had responded to the country's call to join the colors, and he also made the interesting statement that £23,500 had been subscribed by tramcar passengers to numerous charitable funds connected with the war by contributions placed in the various collecting boxes on tramcars on practically all the systems. James Dalrymple, Glasgow, introduced the first subject for discussion, "Tramway Labor Problems as Affected by the War." He stated that owing to the varying conditions in the different tramway undertakings no general experience could be given. Glasgow had not suffered much so far as the general staff of tradesmen and laborers was concerned in the various carhouses, etc. Government work was being done by the Glasgow tramways department, and new tramway work had been stopped, as it was impossible to get more tradesmen. A very warm tribute was paid to the 818 women who are now acting as conductors in Glasgow. It was stated that 12,000 women had applied for situations, and those selected were from twenty-five to thirty-five years of age. About 300 were married women and fifty-five were widows. The women had the same conditions of service as the men, but were not asked to work seven days a week. They were employed on all routes. The only complaint against the women was their inability at first to place a proper value on the question of punctuality, but this was being rapidly overcome. The subject was discussed by Mr. Mallins of Liverpool, who doubted whether women conductors could be used on the Liverpool hilly routes. He said that there was plenty of male labor above military age in that city. He thought a much more important question was the utilization of the resources of the tramways for munition work. Mr. Fell, London, stated that the Metropolitan Commissioner of Police had met them in their efforts to maintain the tramway services by allowing overloading of the cars. He thought it would be inadvisable to employ women on the crowded cars, but that they should be allowed on out-

lying routes and in special cases. (The action of the London police, as noted herein, had not at that time been taken.) Mr. Fearnley, Sheffield, spoke in favor of the women, and said they were employed on the hilly routes in that city. In the afternoon, Alfred Baker, Birmingham, discussed "Financial Problems as Affecting Tramways During the War." He called attention to the cost of stores and material, which had gone up at least 27 per cent as compared with 1912-1913, while the traffic and permanent-way staff wages showed an increase of 10 per cent. In Birmingham, the net result had been a decrease in the surplus, and the sum of £30,000 had gone to the relief of the rates, which is less than one-half of the amount two years ago. As a remedy it was decided that a new schedule of increased fares should be adopted, and this so far had been quite successful, and they expected to be from £70,000 to £80,000 better off on the year as a result. The following morning, Mr. Fisher, general manager of the Dundee tramways, was elected president of the association and Mr. Mozley, Burnley, vice-president.

A new generating plant is in course of erection at Dalmarnock for the Glasgow Corporation. The first work consists of a water intake from the River Clyde, a screening house, two water culverts—one for the inlet condensing water and the other for the outlet water—a switch house, a turbine room, two boiler houses, workshop and store, and a complete coal-handling plant capable of dealing with 100 tons of coal an hour. The work now proceeding was contracted for prior to the war. The cost includes £50,000 for excavations, etc., and £25,000 for coal-handling plant. It is not proposed to place the contract for the buildings or issue specifications for the first instalment of the machinery until after the war. The first instalment of the machinery will consist of three 15,000 kw. turbines, which will be coupled direct to a.c. generators; also three 1000 kw. turbo sets for driving auxiliary machinery. It is proposed to add plant units of 15,000 kw. as the demand increases, while turbines of 30,000 kw. can be installed if found to be necessary. The ultimate capacity of the Dalmarnock works will be about 150,000 kw. It is intended to transmit electricity at 20,000 volts, three-phase alternating twenty-five periods per second, to distributing centers at Port Dundas, Springburn, Partick, Cathedral Street, Osborne Street, Waterloo Street, Pollokshaws Road, Govan, Linthouse and Dalmarnock.

The Devonport & District Tramway has passed into the possession of the Corporation of Plymouth. The ceremony was quite simple. The tramways manager for the corporation, and the valuer under the arbitration arrangement, met the manager of the Devonport tramways, and two representatives of the company at midnight, and completed the transfer. Between that hour and the time at which the first workman's car left the Devonport sheds, the change was announced on the dash-plates at either end of the thirty-two cars by the lettering "Plymouth Corporation Tramways" and the additional inscription "C. R. Everson, manager," as required by the legal enactments.

The London & South Western Railway announced that on Nov. 1 the first section of the electrified line which serves the district between Waterloo, Putney and Wimbledon would be opened. There is to be a train in each direction every twenty minutes throughout the day, and the journey is to be completed in twenty-four minutes, as compared with thirty minutes by the steam trains. Other important sections of the electrified line, including Richmond, Kingston, Shepperton, Hounslow, Surbiton, Hampton Court, etc., are expected to be ready shortly.

Despite the opposition of the Chief Commissioner of Police, the House of Lord select committee has passed the London County Council tramways and improvements bill. The hostility of the police was manifested against those portions of the bill which provide for new tramways in Hackney and the reconstruction and electrification of the old horse tramways in Bermondsey. At first, the police hostility was against details of the tramways, but later the police took up an attitude of general hostility, going so far as to say that unless their objections were met the tramways should be vetoed by Parliament. The police demands would involve the Council in an expenditure of more than £150,000 for road widening and other improvements. A. C. S.

News of Electric Railways

TUESDAY'S ELECTION RESULTS

Municipal Ownership Defeated in Detroit and Cleveland— Toledo Franchise Rejected—Other Cleveland Issues Successful—Results in Pennsylvania and New York

By a vote of 35,494 to 32,672 the electors of Detroit rejected at the special election on Nov. 2 the proposition to purchase the lines of the Detroit United Railway within the one-fare zone and have the price fixed by the Wayne County Circuit Court. The proposed contract required a three-fifths affirmative vote, but failed to register a majority. The vote was the heaviest of any special election ever held in Detroit and almost approached the vote of the last Presidential election.

The election followed probably the most bitter newspaper battle ever staged in the city, both opponents and proponents using every resource to secure victory. Mayor Marx, the city administration, the Street Railway Commission and the majority of the political leaders of the community favored the purchase plan. Against them were arraigned the Municipal Ownership League, the Federation of Labor and the local street car employees' union, and, of course, the voters who oppose municipal ownership.

Characterization of the proposal as a "blank check plan" and a "pig in the poke" was probably responsible for the action of the electorate. The idea of buying without knowing the price, perhaps more than anything else connected with the proposition, did not appeal to the majority. It was upon this angle that the chief efforts of the opponents of the plan centered.

Following the election the Detroit United Railway issued this statement:

"The people have expressed themselves and we bow to their will. We feel relieved just as we would have felt had the people voted the other way. It is our earnest desire to do as nearly as possible just what the informed public would like us to do. There are those who think we have been waiting for and that we very much desire a term franchise. This is not the case, as we certainly want nothing of the kind. The Detroit United Railway, like any individual or corporation, is subject to the sovereignty of the State. We ask nothing more than that the State shall exercise a benign guardianship over us; and by the State we mean that government which the people erect over themselves and us. Let us have fair play—we would have nothing more.

"In addition to motor cars and trailers ordered some months ago, such as are now being installed on some of the lines, we are to-day placing orders for more cars to be delivered and put into service as soon as possible. We will do everything in our power to provide any facility we may be permitted to provide for the further improvement and extension of the company's plant."

The Municipal Ownership League fought the proposed contract on the ground that the price would be too high for successful operation of the lines by the municipality. The Federation of Labor backed up the street car employees in their opposition because of the contention that the purchase would destroy their union. However, the great bulk of the quiet opposition came from the wards where either the fear of higher fares or increased taxes or the unknown price operated to kill off the rather rosy promises which the supporters of the plan presented.

Just what the effect of the vote will be upon the municipal ownership question cannot be stated at this time. One of the newspapers which has been a steady fighter for municipal ownership but opposed this plan declared an adverse vote would set back municipal ownership for years if not kill it outright. On the other hand there is a feeling that because the street car issue has been such a meaty one for the newspapers and politicians for years it will pop up again in some new form before very long.

The Dotson franchise, under which the Toledo Railways & Light Company was to have the right to operate in the streets of Toledo, Ohio, for twenty-five years, was defeated at the election on Nov. 2 by a plurality estimated the fol-

lowing day at 6273. The campaign indicated that the business men of the city were strongly in favor of the franchise. They were anxious to have the question settled and improvements made in the transportation facilities.

In commenting on the results the Toledo Times said:

"Toledo has gone on record on the Dotson ordinance. Inspired opposition to the stand taken by the business interests of the city preyed upon the prejudices of the voter. But this one fact stands out prominent: Before Toledo can go ahead and reach its natural growth the street railway situation must be settled. The Dotson ordinance offered a plan. It is now up to the sources of opposition to this settlement to proffer a plan. Will the interests which have fought the proposition come forward with a solution of the question? It is due to the business interests of the city."

The municipal ownership ordinance in Cleveland was defeated by a large vote. None of the candidates for Mayor espoused its cause, and there was no campaign made for it, except by the Socialists, by whom it was initiated. The ordinance provided for the issue of bonds for the purchase of the property of the Cleveland Railway, the bonds to be a lien against the railway property only.

The Cleveland & Youngstown Railroad, which already had a franchise for an electric line through Kingsbury Run and back on the hill to the southeast of the city, was voted a further franchise for the establishment of a large, high-level freight yard in the Cuyahoga Valley, near the retail business district of the city. This right carries with it the authority to operate steam trains over its right-of-way along Kingsbury Run and erect both freight and passenger depots for steam and electric railways. The company has constructed a portion of its electric track on the hill and expects to complete it to East Ninth Street within another year. This will admit interurban roads from the south and east. The company will serve all roads, both electric and steam, which desire the facilities it offers. The freight yards will be operated with steam until such time as electricity can be practically applied.

The franchise granted the Cleveland, Akron & Canton Terminal Railroad for a four-track, electrically operated subway under East Fifty-fifth Street, was also approved by a heavy vote. This subway will give the railroads from the south and southeast direct admittance to the lake front and paves the way for great docks for the lake boats. Ohio C. Barber, the match king of Barberton, Ohio, is the president of the company and the originator of the idea. It is understood that the contracts for constructing the subway were all made, subject to approval of the franchise at the polls.

Harry L. Davis defeated Peter Witt, Street Railway Commissioner, for Mayor of Cleveland. The construction of the two improvements mentioned and the new union station for the steam roads, also approved by the voters, will come under his administration. Mr. Witt, in all probability, will be succeeded in the office of Street Railway Commissioner by a man from Mr. Davis' own party. William S. Fitzgerald, member of the City Council, has been mentioned for the place. The Council is strongly Democratic, while Mr. Davis is a Republican.

The franchise adopted by the Council of Lakewood, suburb of Cleveland, was approved by a large majority. It provides for a rate of 3 cents within the city of Lakewood and straight 5 cents between Lakewood and points within the city. It also provides for the extension of the Madison Avenue car line to Rocky River. Clayton R. Tyler, an advocate of the franchise, was re-elected Mayor.

The new constitution, voted upon at the election in New York State, was defeated by more than 460,000 votes. The constitutional amendments, among them woman suffrage, were also lost. The outstanding feature of the proposed constitution was its further centralization of power in the executives. It would have made the present Public Service Commissions constitutional bodies, the members to be appointed by the Governor subject to confirmation by the Senate. Likewise the tax commission, the industrial commission and the civil service commission would have become constitutional bodies. Under the defeated constitution the State budget would in the

future have been submitted to the Legislature by the Governor instead of being initiated by the Legislature and subject only to a limited veto power by the chief executive. The proposed constitution would have vested with a commission of nine men appointed by the Governor the power of the Legislature to initiate conservation and other legislation. One of the points on which the measure was attacked was that it did not confer on the cities of the State the power to operate or own public utilities. The question of whether there shall be another constitutional convention will be submitted to the people in 1916.

Four amendments to the Pennsylvania constitution, three of importance throughout the State and one affecting Philadelphia only, were voted on in Pennsylvania at the election on Nov. 2, in addition to the numerous local issues. One of the amendments was to give the vote to women. The others were to make workmen's compensation compulsory as of Jan. 1, 1916, to authorize the Legislature to make laws for a new system of registering land titles, and to permit Philadelphia to increase its borrowing capacity 3 per cent in excess of the present limit, 7 per cent of the assessed valuation, the increase to be applied only to public improvements of a self-supporting nature.

The Mayorality campaign in Philadelphia, however, held the center of the stage in Pennsylvania politics, as the carrying out of certain important improvements begun under Mayor Blankenburg was regarded as dependent for success on the election of George D. Porter. The plans for improvements under Mayor Blankenburg included those for new rapid transit facilities. These had their inception in the appointment of A. Merritt Taylor as City Transit Director by Mayor Blankenburg on May 27, 1912. Mr. Taylor was asked to report on ways and means to secure rapid transit commensurate with present and future needs. On March 8, 1915, Councils approved the holding of a special election to obtain the consent of the electors to an increase in the city's indebtedness of \$6,000,000 for starting actual subway construction. The proposition carried at the special election on April 29. Two ordinances subsequently were passed by Councils. One appropriated \$3,000,000 for the construction work on the Broad Street subway and one appropriated an equal amount for the Frankford elevated. Both ordinances were approved on July 2, 1915, and some of the contracts have been let. The future of the plans for rapid transit was regarded as hinging largely on the passing of the constitutional amendment, thus releasing the necessary funds. The vote on the amendment was favorable. Many of the adherents of Thomas B. Smith, elected Mayor, are known to be opposed to the rapid transit program of the present administration, at least so far as the proposed down-town delivery loop is concerned. The amendment in regard to workmen's compensation also was passed.

PAVING DISPUTE IN EAST CLEVELAND

Through City Solicitor E. A. Binyon the city of East Cleveland filed suits in the Cuyahoga County Common Pleas Court on Oct. 19 to compel the Cleveland Railway to repave between its tracks in Euclid Avenue, that city. Arrangements have been made to pave the entire length of that thoroughfare in East Cleveland. Aside from the strip between the railroad tracks, the cost is to be divided among the city, county and the citizens. The city claims that the franchise granted to the company in 1896 provides that the company shall pave the strip between its tracks and that it has refused to do so unless its franchise, which expires in 1921, is renewed on a 5-cent basis. City officials claim that the Nickel Plate Railroad will be operating suburban cars or trains before 1921 and that the city will not agree to an increase of fare above that paid by passengers in Cleveland.

The Chamber of Industry, an organization of West Side business men, has announced that plans are on foot for building a rapid transit line along Bulkley Boulevard and through Edgewater Park, primarily for the development of the section of territory west of Rocky River. It will be similar in its plans and purposes to the Cleveland & Youngstown Railroad's line, which is expected to result in the rapid development of the Shaker Heights district in Cleveland.

ELECTRIC RAILWAY SHARE IN STREET MAINTENANCE TO BE INVESTIGATED

The Massachusetts Public Service Commission was to hold a hearing at Boston on Nov. 4 relative to the share taken by electric railways in street maintenance, snow removal and local franchise taxes. At the last session of the Legislature a resolution was passed directing the board to investigate the subjects above mentioned and to report in January, 1916, with a bill revising existing statutes so far as deemed essential. Question blanks have been sent to all the companies in the State asking for data on existing and recent track mileage, amounts expended in highway maintenance, for snow removal, franchise and commutation taxes. The investigation is the outcome of several bills presented at the last session, one of which, brought by petition of the Massachusetts Street Railway Association, sought to reduce the burdens now laid upon operating companies in connection with the maintenance of public ways over and above the natural obligation to restore excavated sections in track construction or repairs to their previous condition.

ELECTRIFICATION AT CHICAGO

Forecasts of Report on Smoke Abatement and Railway Terminal Electrification

It is announced that the report of the Chicago Commission on Smoke Abatement & Railway Terminal Electrification will be made public within the next few weeks. This is the report on which a commission has been engaged since April, 1911, the commission consisting of four men to represent the city, four the railroads and four the Association of Commerce. The railroads terminating in Chicago volunteered to pay the entire expense of the investigation, which is said to have amounted to more than \$500,000.

In an article which appeared in the *Chicago Daily Tribune* for Nov. 3, Henry M. Hyde gives what purports to be some advance information in regard to the contents of the report. He says, in part:

"Early in its career the committee divided its work into three classes. It decided to reach a determination as to:

"1. The necessity of changing the motive power of steam railroads to electric or other power.

"2. The mechanical or technical feasibility of such a change.

"3. The financial practicability of such a change.

"As the final result of the investigation made under its direction, the committee finds, as to the first point:

"That the complete elimination of steam locomotives from the railroad terminals of Chicago, as a means of smoke abatement, is not, under present-day conditions, necessary."

"As to the technical feasibility of complete electrification of Chicago's railroad terminals, the committee reports:

"1. The launching of such an undertaking, to be participated in by all the railroads at practically the same time, would involve a large amount of experimentation.

"2. The problem of contact design when considered in relation to normal railroad operation, presents many difficulties. A limited amount of trackage in the Chicago terminals is so located that it has been found impracticable to equip it with any form of contact system. Operation over such trackage, subsequent to electrification, will need to be conducted by some form of self-propelled unit or there must be some rearrangement of tracks. The difficulties imposed at numerous points by insufficient clearance of overhead structures will, under the plans of the committee, be met by the installation of warning devices or the enforcement of regulations governing the presence of trainmen on tops of cars.

"3. The technical difficulties to be met and overcome in bringing about the complete electrification of Chicago's terminals will, through the general development of the art, diminish year by year. Therefore, the longer the undertaking can be delayed the more certain will become the procedure by which the electrical establishment can be secured."

"On the final point the report says:

"The complete electrification of the railroad terminals of Chicago as a betterment to be brought about by the railroads through the investment of free capital is, under present-day conditions, impracticable."

"As to the cost of electrification, the report shows that the direct cost, including the extension of electric service to points as far outside the city limits as Waukegan, Des-plaines, Elmhurst, Morton Grove, Mannheim, Blue Island, Hawthorne and Hammond would be \$188,000,000. To this the sum of \$102,000,000 is added to cover the cost of changes and betterments in the existing railroad establishments, which might otherwise be postponed for a long time. It is understood that the sum of \$102,000,000 was arrived at as the result of estimates made by the railroads interested."

SERVICE RESTORED IN WILKES-BARRE

As a result of the proposition made by T. A. Wright, general manager of the Wilkes-Barre (Pa.) Railway, to submit to the Luzerne County Courts the question as to the right of the arbitrators to repudiate their own wage award, the employees have made a counter proposition in which the suggestion is advanced that the company name another arbitrator to take the place of S. D. Warriner, Philadelphia, the new man to act with T. D. Shea, the employees' representative, and Dr. John Price Jackson, the umpire of the original arbitration board, and that the three agree upon a flat wage rate.

James A. Steese, a representative of the Pennsylvania State Department of Labor, met the executive committee representing the striking carmen and submitted two propositions for their consideration, the acceptance of either of which might bring about an early resumption of work by the strikers. These propositions follow:

First, it was urged upon the men that inasmuch as the company had agreed to submit the point of the legal right of the arbitrators to repudiate their award to the courts of Luzerne County the question should be referred to the local judges, particularly as Dr. Jackson, the umpire of the board of arbitrators, has made a similar recommendation.

Second, It was urged that the men return to work on the sliding scale basis and that the company and its employees, without any outside interference, get together to fix a flat rate wage rate for all trainmen. This would mean negotiations for a wage scale without national officers of the union taking part.

Rioting occurred in Wilkes-Barre, Pa., on the morning of Nov. 3 when cars of the Wilkes-Barre Railway were run for the first time since the beginning of the strike, three weeks ago. The first car was met by a mob near Ashley, on the outskirts of the city, and bricks were thrown through the windows. About 250 men engaged to take the places of the strikers are quartered in the Wood Street carhouse.

REPORT PRESENTED ON PROPOSED TORONTO-GUELPH RADIAL RAILWAYS

Having heard the report of Sir Adam Beck, chairman of the Ontario Hydro-Electric Power Commission, upon the proposal to construct a hydro-electric radial railway between Toronto and Guelph, the representatives of fifteen municipalities interested passed a resolution indorsing the scheme, and declaring that the electors in each place should be allowed to pronounce upon it by voting upon a by-law in January next.

The Hydro-Electric Power Commission submitted plans for a system of radial railways to connect Toronto, Port Credit, Milton, Guelph, Berlin, New Hamburg, Stratford, St. Mary's, London, Strathroy, Arkona and Sarnia. Sir Adam Beck, chairman of the commission, told the members of the conference that in the opinion of the Provincial Commission the proposed railway between Toronto and London would be a paying one and could be built and equipped for \$10,000,000 or \$11,000,000. He was not prepared at the moment to divulge the details of the arrangements made with the Toronto Harbor Commission for an entrance to the city of Toronto, but stated that the road would come into Toronto by the water front and would run to the market center. He also intimated that a lake shore line to Hamilton and thence to Niagara Falls was under consideration. He also told a Milton delegate that the commission had had an opportunity to purchase the railway now under construction from Toronto to Guelph via Georgetown, but had done nothing with regard to the offer. He said that the commission had prepared plans for a line by the most

feasible and most profitable route and that it would do nothing detrimental to its own interests and the interests of the province. He promised to notify the municipalities of its intention with regard to the road now being built before the time came to vote on the by-laws.

A resolution was adopted approving the route suggested, but authorizing the commission to make any diversion from the general plan which might be considered of benefit to the project and the province as a whole. Another resolution advocated the commencement of a campaign in favor of the construction of the road immediately, and asked the commission to supply each municipality with the data necessary to inform the electors of the details of the project. Representatives of municipalities on the route for the second link of the proposed line conferred with the commission on Oct. 28 and approved plans for the section between Guelph and London. Delegates from places between London and Sarnia, which will be the third link, were to confer with the commission on Nov. 2 and others from points between Toronto and Collingwood on Nov. 3.

Sir Adam pointed out that while the supply of power under present contracts was about exhausted the commission had before the government for approval plans that would allow an ultimate development of 600,000 hp. and an immediate development of 200,000 or twice the amount now used.

ANNUAL REPORT OF BOSTON TRANSIT COMMISSION

The twenty-first annual report of the Boston (Mass.) Transit Commission covers 102 pages, including descriptions of work under way during the year, statistical data regarding the rentals paid by the Boston Elevated Railway for the use of subways and tunnels in Boston proper, construction expenses and legislative matters. The commission, of which Prof. George F. Swain is chairman, states that it hopes to open the Summer Street section of the Dorchester tunnel to traffic by Jan. 1, 1916. The contract for that portion of the tunnel under Fort Point Channel has been let, as has the section in South Boston between Broadway Station and Andrew Square. Important enlargements of the Park Street subway station under Tremont Street took place within the year. Toll receipts from the East Boston tunnel for the year ended June 30, 1915, were \$138,314. During the year the Boston Elevated Railway paid as rentals the following: Tremont Street subway, \$211,782; Washington Street tunnel, \$355,488; Cambridge subway connection in Boston, \$70,858; Boylston Street subway, \$150,381. Since its organization the commission has expended \$29,002,756 on Boston rapid transit subway, tunnel and related work.

In his annual report, Chief Engineer Edmund S. Davis describes the main features of the Dorchester tunnel now building, construction methods, and contract details, and discusses the improvements effected at Park Street subway station, the alterations in the Public Garden section of Boylston Street and the construction methods in the East Boston tunnel extension into the West End. The Dorchester tunnel will be about 12,000 ft. long, of which about 8300 ft. is completed or under contract. An important station in this tunnel will be located at Dewey Square, adjoining the South Terminal Station. This will be a two-story structure, with lobby for ticket offices and general distribution of traffic above, and two side platforms, each 350 ft. long, with tracks below. The lobby will connect with the street by four stairways, and in addition two single-file, cleat-type escalators will connect the lobby with the sidewalk. Two stairways will connect the lobby with each of the train platforms, and two escalators will connect the two train platforms with the sidewalks above.

At the Park Street station, one of the most important points on the Boston Elevated System, the commission executed noteworthy improvements by reducing track curvature and increasing platform areas. The westerly platform was increased in area from 8212 sq. ft. to 14,047 sq. ft., and the easterly platform from 7046 sq. ft. to 9625 sq. ft. The former was lengthened about 118 ft., and its width now averages about 27 ft. It provides berths for eight cars on each southbound track. Eight berths were also provided on each side of the easterly platform, so that thirty-two cars can occupy the station at one time.

Pardon for Columbus Dynamiter Denied.—Governor Frank B. Willis of Ohio has refused to give Alfred Strader, the man who was convicted of dynamiting cars during the Columbus strike in 1910, his liberty, although the board of pardons had recommended such action. Strader was given two sentences of five years each. He has served his first sentence and one year on the second.

Chicago Elevated Employees Accept Offer.—In a referendum the employees of the elevated railroads of Chicago accepted the wage offer of the company by vote of 1836 to 319. The new agreement included no important changes in the working conditions, but did provide substantial increases in the rates of pay as outlined in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30, page 923. It is estimated that the total increase in wages will amount to about \$200,000 a year.

Union Jurisdiction Settled.—The board of arbitration appointed to decide questions between the Amalgamated Association of Street & Electric Railway Employees of America and the Empire United Railways, Syracuse, N. Y., has decided against the Amalgamated's claim to exclusive jurisdiction over employees of the Auburn and Port Byron line of the Empire United Lines. The Amalgamated's claim was disputed by the Brotherhood of Locomotive Engineers and the Order of Railway Trainmen. Arbitration was agreed upon after a strike last summer. All cars on the Auburn-Port Byron division of the Empire United Railways will be operated from Newark hereafter instead of from Auburn.

Boston Elevated Carhouse Burned.—The Eagle Street carhouse of the Boston Elevated Railway in East Boston, Mass., was destroyed by fire in the early evening of Nov. 1, causing an estimated damage of about \$250,000. Twenty-two semi-convertible cars were burned. The carhouse was built about eighteen years ago and was a wooden structure, 100 ft. wide and 100 ft. deep. It contained eight tracks. The service in East Boston was maintained without interruption and an adjacent power plant of the company was uninjured. Two snow plows were also destroyed by the flames. The company will probably rebuild with a smaller carhouse of concrete, using open-air storage on the premises as far as possible.

Preparing for the Des Moines Election.—The special election on the granting of a new franchise to the Des Moines (Iowa) City Railway will be held on Nov. 22 as ordered by the City Council. Election notices are now being published. Emil G. Schmidt, president of the company, says no campaign will be made. Mayor Hanna, chief opponent of the franchise grant for years, voted for it upon final adoption by the City Council and there is now no opposition whatever among leaders in public opinion. Mr. Schmidt is busily preparing for improvements to cost \$1,500,000 which will be made as soon as the grant is adopted. He is now in the East to make final preparations for ordering new cars.

PROGRAMS OF ASSOCIATION MEETINGS

Central Electric Railway Accountants' Association

The Central Electric Railway Accountants' Association will meet at Detroit, Mich., on Dec. 7 and 8.

Central Electric Traffic Association

The Central Electric Traffic Association will meet in the office of the chairman of the association in Indianapolis, Ind., on Nov. 17.

Central Electric Railway Association

The Central Electric Railway Association will meet at the Claypool Hotel, Indianapolis, Ind., on Thursday and Friday, Nov. 18 and 19.

American Society of Mechanical Engineers

The annual meeting of the A. S. M. E. will be held in New York on Dec. 7-10. The opening session will be on the evening of Dec. 7. Professional sessions will be held on Dec. 8 and Dec. 9 and one industrial safety meeting on Dec. 10. The annual dinner will be held on the evening of Dec. 9.

Financial and Corporate

ANNUAL REPORTS

Albany Southern Railroad

The comparative statement of income, profit and loss of the Albany (N. Y.) Southern Railroad for the years ended June 30, 1914 and 1915, shows that for the latest fiscal year the gross revenue of all departments (railway, electric and gas) was \$502,775, a decrease of 0.84 per cent as compared to the preceding year, and the operating expenses including taxes were \$366,083, a decrease of 4.16 per cent, leaving net revenue of \$136,692, an increase of 9.2 per cent. Deductions of interest on bonds, rentals and reserves amounted to \$91,719, a decrease of 6.5 per cent, leaving a net corporate income of \$44,972, an increase of 66 per cent.

The following table shows some comparative railway statistics for the last two years:

	1915.	1914.
Revenue passengers carried.....	1,452,739	1,563,064
Revenue passenger car mileage.....	706,771	737,877
Gross operating revenue per passenger car mile	\$0.461	\$0.460
Operating expenses per passenger car mile	\$0.314	\$0.341
Tons of freight carried.....	61,211	67,661
Freight train mileage.....	74,759	75,074

In the railway department the diminishing traffic experienced the previous year continued in even more marked degree, owing to the general business depression. Several of the important mills along the line were shut down, others were worked on short time, and the freight and passenger traffic normally derived from these sources contributed largely to the decrease of \$13,849, or 4.1 per cent, in the gross revenue of this department. The company met the situation as much as possible by a rearrangement of its train schedule with due consideration for public welfare. Owing to the unusually large expenditures for maintenance in the preceding two years the cost of maintenance of way and structures showed a decrease of \$7,001, or 21.6 per cent, for this year. The expenditures for maintenance of equipment decreased \$4,039, or 17.2 per cent. jitney buses are running in competition with the company between Albany and Nassau, but the traffic has been light and the effect little felt. During the last year the company expended \$17,482 on construction and new property.

For the last two years a vigorous effort has been made to obtain more equitable taxes for the company with very good results. While the tax rate each year has increased, the assessed valuations of the company's property in the various towns have been reduced, and the amount of taxes paid in 1913 was \$43,535 and in 1914, \$42,010. These are the first two years that have shown any decrease in the charges for taxation.

Fonda, Johnstown & Gloversville Railroad

The comparative statement of income, profit and loss of the Fonda, Johnstown & Gloversville Railroad for the years ended June 30, 1914 and 1915, follows:

	1915	1914
Operating revenues	\$874,761	\$986,877
Operating expenses	467,236	494,771
Net revenue from railway operations.....	\$407,525	\$492,106
Railway tax accruals.....	39,500	45,367
Railway operating income.....	\$368,025	\$446,739
Miscellaneous operations (Sacandaga, N. Y., summer resort)—deficit	6,017	7,279
Operating income	\$362,008	\$439,460
Non-operating income	31,804	33,580
Gross income	\$393,812	\$473,040
Deductions from gross income.....	380,549	380,333
Net income (available for dividends).....	\$13,263	\$92,707
Dividends on preferred stock.....	30,000	30,000
Balance to profit and loss.....	*\$16,737	\$62,707

*Deficit.

Business conditions were so unfavorable throughout the year that the result of operations was more unsatisfactory than in any other year in the history of the company. The output of all manufacturing plants in the section served by the company was greatly reduced, and many were shut down or run on short time. A glove cutter's strike, de-

clared in August, continued for five months, during which period the glove industry of Johnstown and Gloversville was practically at a standstill and all other business seriously affected. In the spring months jitney competition with the electric lines in Johnstown and Gloversville cut heavily into earnings, before legislative action for proper regulation and a publicity campaign eliminated this competition in the latter part of June.

Through the combination of such unfavorable conditions in one year, the company suffered a loss in net income of \$79,228 as compared with the previous year, and in gross revenues of \$112,115, which brought the total gross earnings to a point lower than in any year since 1909. Freight revenue declined only \$24,623, however, while passenger earnings decreased \$74,342 and express revenue \$2,663. The total operating expenditures of \$467,236, which included a charge of \$4,984 for depreciation of equipment as required by the Interstate Commerce Commission, showed a reduction of only \$27,535. The operating payroll, included in the above figures, amounted to \$323,083 or about 37 per cent of gross revenues—a decrease of \$28,429.

The sum of \$76,558 was expended during the year for the improvement and development of existing property. The 2.03 miles of new track in Amsterdam cost \$38,868 and 0.72 mile in Johnstown involved an amount of \$9,956. Among the other items was the only expenditure for road equipment during the year, amounting to \$2,283 for a new track grinder for the electric division and a caboose for the steam division. No securities have been sold since 1911, and all additions to property since then, amounting to \$205,961, have been financed from surplus earnings and temporary loans. This amount is subject to addition to the capital accounts.

This company operates 83.91 miles of electric road and 40.60 miles of steam road, a total of 124.51 miles. The following table shows the separate electric and steam revenues and expenses for the year ended June 30, 1915, with the increases or decreases as compared with the preceding year:

	ELECTRIC.		STEAM.	
	1915	Change	1915	Change
Revenue from transportation	\$541,779†	— \$62,655	\$311,134*	— \$39,572
Revenue from other railway operations.	18,618	— 10,206	3,230	+ 318
Total operating revenues	\$560,397	— \$72,861	\$314,364	— \$39,254
Way and structures..	\$50,309	— \$8,332	\$24,839	— \$2,512
Equipment	31,751	+ 1,777	20,803	+ 4,373
Power	46,578	— 9,325
Conducting transportation	134,466	— 4,494	86,179	— 4,935
Traffic	3,163	— 213	4,992	+ 38
General and miscellaneous	48,017	— 959	16,138	— 2,953
Total operating expenses	\$314,284	— \$21,546	\$152,951	— \$5,989
Net revenues	\$246,113	— \$51,315	\$161,413	— \$33,265
Operating ratio.....	56.08	+ 3.05	48.65	+ 3.70
Passengers carried..	5,994,376	— 701,402	211,913	— 46,089

*Freight revenue, \$239,574 (\$24,623 decrease); passenger revenue, \$54,137 (\$11,975 decrease).

†Passenger revenue, \$536,479 (\$62,366 decrease).

Dick, Kerr & Company, Ltd.

Judging from the profit, the year ended June 30, 1915, was a moderately good one for Dick, Kerr & Company, Ltd., London, England. The net revenue was £46,960, an improvement of £2,000 over the previous year and £22,500 over the average of the five years before 1913-1915. From the net revenue the debenture interest and the preference dividend were paid, and a sum of £25,000 was set aside as a reserve against contingencies. To make this appropriation the balance in profit and loss was reduced by more than £7,000 to £18,346.

On June 30 the amount due to the company on contracts was £460,365, more than double the sum due twelve months before. Stocks and work-in-progress, apart from contracts, stood at a figure £34,000 lower than a year ago, but cash and investments were higher. The outlay incurred on contracts was financed by a heavier indebtedness to creditors of £93,000, and by a loan from bankers of £100,000, this loan being secured on a second debenture.

Part of the company's business was doubtless disorganized by the outbreak of war, and though German competition in the manufacture of electrical machinery and apparatus has been eliminated, great difficulties stand in the way of that branch being extended. It is believed that these difficulties will probably continue for some time, but at the close of the war, or in its final stages, it should be possible to make substantial progress.

EXTENSION GRANTED IN KANSAS CITY

City Council Upon Request of Judge Hook Grants Ninety-Day Extension to Complete Details of Reorganization— Judge Hook Takes Full Charge of Railway Matters

The City Council of Kansas City, Mo., on Nov. 1 granted an extension of ninety days to the Kansas City Railways for complying with the conditions of the new franchise granted in July, 1914. This action was taken in response to a request from Judge Hook, who stated that the essentials of the reorganization had been effected and only details remained, which required more time.

Judge Hook on Nov. 1 issued a ruling instructing the receivers and managers of the company to take all necessary steps to secure from the Missouri Public Utilities Commission the orders and approvals that the legal situation demands. This has particular reference to the separation of the railway and light companies. The order included a statement that Judge Hook had taken full charge of the street railway matters, and that no other proceeding would be allowed to interfere with the consummation of the plans now under way and the assumption of control by the new company. It was understood to be the purpose of the court to gather all litigation under one jurisdiction at this time and to prevent any outside interference with reorganization.

Frank Hagerman, attorney for the receivers of the Metropolitan Street Railway, is quoted as follows with reference to the court's order:

"No court, notary public or anybody else, except Judge Hook in the receivership cases, has any right, directly or indirectly, to question in any way the validity of the franchise, or attempt to harass anybody connected therewith, or to use any pretended contest for political or capital purposes."

The particular local application of the order is to the Wilson suit now pending, in which the validity of the franchise is attacked on the ground of conspiracy in its enactment. The taking of testimony in the suit had been temporarily suspended because of a court order quashing a notice to take depositions before a notary. The Kansas City Court of Appeals decided on Nov. 1 that testimony must be taken before a commissioner, who can rule out matters apparently relevant to the election and the franchise, but not bearing directly on the suit.

TAXABLE VALUATIONS IN IOWA

The 1915 taxable valuation of interurban electric railways in Iowa, as fixed by the executive council of the State last July and now published in that body's forty-fourth annual report, amounts to \$1,810,491 for 477.80 miles of road. The taxable valuation of the steam railroads in the State is \$78,880,376 for 10,016.71 miles of road. Other valuations are as follows: Transmission lines, \$117,352; equipment companies, \$257,800; sleeping cars, \$427,067, and express property, \$312,243.

The detailed lengths for the interurban electric railways as on Jan. 1, 1915, and the taxable values thereof are shown in the following table:

	Miles of Road	Taxable Value Per Mile	Total Taxable Value
Cedar Rapids & Marion City Railway....	20.97	\$8,500	\$178,245
Centerville Light & Traction Company....	7.84	3,000	23,520
Charles City Western Railway.....	16.33	2,000	32,660
Davenport & Muscatine Railway.....	25.27	3,000	75,810
Fort Dodge, Des Moines & Southern Railroad	117.97	3,000	353,910
Inter-Urban Railway	64.18	3,500	224,630
Iowa & Illinois Railway.....	33.05	3,700	122,285
Iowa Railway & Light Company.....	54.48	3,700	201,576
Mason City & Clear Lake Railroad.....	14.62	4,500	65,790
Oskaloosa & Buxton Electric Railway....	2.30	3,700	8,510
Southern Iowa Railway & Light Company	10.00	2,500	25,000
Waterloo, Cedar Falls & Northern Railway	110.79	4,500	498,555
Total	477.80	\$1,810,491

BIG MERGER ARRANGED

American Railways Amalgamates with National Properties Company—Stock of Wilmington & Philadelphia Traction Company to Go to Former for New Stock

The American Railways, Philadelphia, is to be merged with the National Properties Company, New York, according to Newburger, Henderson & Loeb, Philadelphia, the bankers who have directed negotiations to this end. The conditions of the merger have been approved by the managements of both corporations and a majority of the American Railways stockholders. The plan is to become effective on Jan. 1, 1916.

According to the agreement, the entire capital stock of the Wilmington & Philadelphia Traction Company, Wilmington, Del., amounting to \$4,060,000, formerly owned by the National Properties Company, is to become the property of the American Railways. In addition, \$500,000 cash will be paid into the treasury of the American Railways for purchase at par of a like amount of its preferred stock to be issued and bought by the National Properties Company. By these changes it is said that the equities behind the funded debt of the American Railways will be increased.

The American Railways is to issue additional 7 per cent preferred stock to the amount of \$1,500,000 and \$2,560,000 of new common stock for the \$4,060,000 of Wilmington & Philadelphia Traction Company stock turned over by the National Properties Company. The outstanding common stock of the American Railways will be bought at par, or \$50 per share, by the National Properties Company, payment being made in guaranteed collateral trust bonds to be secured by such stock and also by the \$2,560,000 of new common stock to be turned over to the National Properties Company.

These collateral trust bonds are not to exceed \$7,000,000 and will run for thirty years. Interest on them will be at rates increasing from 4 per cent per annum, the present dividend rate on the American Railways common stock. After two years the rate will become 4½ per cent for two years, and thereafter 5 per cent. To secure further the equity of holders of American Railways common stock, it is stipulated that if at any time the National Properties Company shall pay dividends on its common stock in excess of 5 per cent per annum, an additional amount will be paid as interest on the collateral trust bonds up to a maximum of 6 per cent.

The board of directors of the American Railways will soon issue a notice to stockholders requesting them to deposit their shares with a trust company, which will issue negotiable receipts exchangeable for definite bonds. The plan to be effective requires the deposit of not less than 75 per cent of the stock.

Atlantic Shore Railway, Kennebunk, Me.—The Atlantic Shore Railway has defaulted the initial payment on \$641,750 of refunding mortgage thirty-year gold bonds. These bonds, dated 1910, bear interest at 4 per cent, payable for the first five years only if earned. No interest was earned during this period, but the coupon falling due on Oct. 1 was the first of the obligatory ones. It is reported that the company during its year to April 1 secured \$361,577 in gross revenues, but had left only \$77,329 for taxes and interest. After these payments there was a \$25,087 loss to be added to previous losses of \$67,155, making a deficit of \$92,242 for the five-year period.

Brooklyn (N. Y.) Rapid Transit Company.—The South Brooklyn Railway, one of the subsidiaries of the Brooklyn Rapid Transit Company, has been authorized by the Public Service Commission for the First District of New York to purchase all the outstanding capital stock of the Prospect Park & Coney Island Railroad, namely, 2500 shares, with a par value of \$100 each. Of the total amount 1768½ shares are to be acquired immediately, and the remainder from time to time. The commission requires as a condition of the purchase that the offer of the company to pay \$200 per share for the stock shall be kept open to Dec. 31, 1915. Within twenty days from date it must notify all stockholders of the Prospect Park company, excepting those whose stock

has already been acquired, of its acquisition of a majority of the stock, of the price paid, and of its willingness to acquire the remainder on the same terms on or before Dec. 31, 1915. As noted in the ELECTRIC RAILWAY JOURNAL of Oct. 23, the minority holders opposed the purchase of the 1768½-share block from the Long Island Railroad, which has been leasing the line to the Brooklyn Rapid Transit Company, unless the latter company would make a uniform offer to all stockholders. The rental for the line was said to be its only income.

Cleburne (Tex.) Street Railway.—An offer of \$17,000 for the rails and wire of the Cleburne Street Railway has been refused by John W. Floore, Sr., the owner of the line. Mr. Floore said that \$16,000 would pay him for the line, which is not being operated at present, but he will sell the property only to some one who will agree to operate it. The sale of this line at foreclosure to Mr. Floore, the mortgagee, was noted in the ELECTRIC RAILWAY JOURNAL of May 15.

Empire United Railways, Inc., Syracuse, N. Y.—The Public Service Commission for the Second District of New York has approved the merger of the Monroe County Electric Belt Line with the Empire United Railways, Inc. Some time ago the commission approved the purchase of all of the outstanding capital stock of the belt line by the latter company, as noted in the ELECTRIC RAILWAY JOURNAL of Sept. 11. The stock has now been all purchased, and the present order approves the merger, the Empire United Railways, Inc., taking over all the assets and assuming all the liabilities of the belt line company.

Groton & Stonington Street Railroad, Mystic, Conn.—The stockholders of the Groton & Stonington Street Railroad voted at the recent annual meeting to reduce the number of directors from nine to seven. The following were then elected to the board: Morton F. Plant, Robert W. Perkins, F. De C. Sullivan, A. E. Locke, H. M. Verrill, C. L. S. Robinson and C. L. Avery.

International Traction Company, Buffalo, N. Y.—The directors of the International Traction Company have declared a dividend of 1½ per cent on the company's 4 per cent cumulative preferred stock, payable on Nov. 15 to stockholders of record on Nov. 5. This payment compares with 2 per cent paid last February and 2 per cent in July, 1914. On Oct. 16 the company filed at Trenton, N. J., an amendment to its charter providing for the retirement of \$5,000,000 of 4 per cent cumulative preferred stock, with accumulated dividends thereon, by the issuance of new 7 per cent cumulative first preferred stock, share for share. This plan was described in the ELECTRIC RAILWAY JOURNAL of Aug. 21.

Iowa Railway & Light Company, Cedar Rapids, Iowa.—Miller & George, Providence, R. I., are offering at \$100 and dividends a block of the 7 per cent cumulative preferred stock of the Iowa Railway & Light Company.

Lehigh Valley Transit Company, Allentown, Pa.—The directors of the Lehigh Valley Transit Company have declared a semi-annual dividend of 2½ per cent on the company's 5 per cent cumulative preferred stock, payable on Nov. 10 to stockholders of record on Oct. 31. Dividends at the rate of 2 per cent per annum were paid semi-annually from November, 1911, to May, 1915, the accumulation after the present payment amounting to 14½ per cent.

Mississippi Valley Electric Company, Iowa City, Iowa.—It is announced that the Mississippi Valley Electric Company has taken over and is operating the Fort Madison Street Railway. This act followed the approval of a new franchise for the local company by the voters of Fort Madison, this being the condition of purchase, as noted in the ELECTRIC RAILWAY JOURNAL of June 26. The new owner expects to put on four new cars and otherwise improve the line.

Monongahela Valley Traction Company, Fairmont, W. Va.—The shareholders of the Fairmont Gas Company are to vote on Nov. 24 on selling the entire property to the Monongahela Valley Traction Company. It is proposed by the directors that the proceeds of the sale shall be distributed as follows: (a) To the holders of the preferred stock one share (\$100 par value) of preferred and one-fourth share (\$25 par value) of common stock of the Monongahela Valley Traction Company and \$17 in cash for

each two shares (\$100 par value) of preferred stock of the Fairmont Gas Company. (b) To the holders of the common stock one share (\$100) of the common stock of the traction company and \$18.75 in cash for each 2½ shares (\$125 par value) of common stock of the Fairmont Gas Company. On the completion of the deal the Monongahela Valley Traction Company will have outstanding \$5,000,000 of bonds, \$2,787,150 of preferred stock and \$6,782,037 of common stock. The authorized common stock, it is said, will be increased from \$5,000,000 to \$9,500,000 and the authorized preferred from \$2,500,000 to \$3,000,000. The Monongahela Valley Traction Company agrees to begin dividends on its common stock in January at the rate of 4 per cent a year. The payment of this dividend, as well as that of 5 per cent on its preferred stock, will be made in quarterly disbursements from that date. The capitalization of the Fairmont Gas Company is \$2,000,000 of common stock and \$728,150 of preferred. The last-named stock was recently reduced from \$750,000 with earnings.

Muscatine & Iowa City Railway, Muscatine, Iowa.—The Muscatine & Iowa City Railway, organized to provide electric service on a 104-mile leased section of the Rock Island Railroad, as noted in the ELECTRIC RAILWAY JOURNAL of Oct. 30, has been granted a charter by W. S. Allen, Secretary of State of Iowa. The authorized capital stock is \$400,000, of which \$100,000 is common and \$300,000 preferred. Headquarters of the company will be at Muscatine. The lease with the Rock Island Railway has been drawn up and will be approved by the new company as soon as the charter is issued. It is for a period of fifty years. The directors of the company are G. M. Titus, E. L. McColm, H. F. Giessler, W. F. Bishop, F. O. Block and A. D. Bowen of Muscatine; William Musser, S. W. Mercer, Ralph Otto, C. W. Schmitt and W. P. Hohenschuh of Iowa City; H. G. Moore of Wellman, and E. D. Rayburn of Montezuma.

North Branch Transit Company, Bloomsburg, Pa.—A. W. Duy, receiver North Branch Transit Company, has applied to the court for permission to issue \$62,000 of receiver's certificates to provide for needed improvements to the company's track and equipment. The appointment of the receiver for this company was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 16.

Philadelphia Company, Pittsburgh, Pa.—The stockholders of the Philadelphia Company are to vote on Dec. 28 on the following propositions: (1) An increase in the authorized capital stock from the present \$69,433,400 to \$71,933,400, such authorized increase to be in the common shares; (2) the sale of \$2,500,000 of new common stock to Ladenburg, Thalmann & Company, and Hayden, Stone & Company. The purpose of the increase is to provide funds for paying off all the outstanding floating indebtedness of the company. This sale, together with cash on hand, will clean up the entire floating indebtedness incurred last winter for improvements and betterments when business was slack. The wisdom of the improvements made during the period of inactivity in the Pittsburgh district is said to be now reflected in the company's earnings. It is estimated that earnings this fall will be at least 20 per cent in excess of any previous months in the history of the company. It is reported that none of the new stock, when taken by the bankers mentioned above, will be offered in the market.

Winnipeg, Selkirk & Lake Winnipeg Railway, Winnipeg, Man.—The Dominion Securities Corporation, Ltd., Toronto, Ont., is offering \$1,000,000 of 5 per cent ten-year general mortgage and refunding gold bonds of the Winnipeg, Selkirk & Lake Winnipeg Railway. The bonds are dated July 1, 1915, and are due on July 1, 1925, but are callable, as a whole or in part, at 103 and interest. These bonds are part of a closed mortgage issue of \$1,400,000, of which \$400,000 is reserved to retire an underlying 5 per cent issue of like amount, due in 1933 but now being rapidly exchanged. The principal and interest are unconditionally guaranteed by the indorsement of the Winnipeg Electric Railway.

Youngstown & Ohio River Railroad, Leetonia, Ohio.—Application has been made by the Youngstown & Ohio River Railroad to the Ohio Public Utilities Commission for permission to issue \$200,000 of one-year bonds. These would be used in taking up an equal amount of outstanding securities.

DIVIDENDS DECLARED

Boston (Mass.) Elevated Railway, quarterly, 1½ per cent.

Connecticut Railway & Lighting Company, New Haven, Conn., quarterly, 1 per cent, preferred and common.

International Traction Company, Buffalo, N. Y., 1½ per cent, preferred.

Lehigh Valley Transit Company, Allentown, Pa., 2½ per cent, preferred.

Monongahela Valley Traction Company, Fairmont, W. Va., quarterly, 1¼ per cent, preferred.

Ohio Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred.

Union Street Railway, New Bedford, Mass., quarterly, 2 per cent.

Washington Railway & Electric Company, Washington, D. C., quarterly, 1¼ per cent, preferred; quarterly, 1¼ per cent, common.

Washington-Virginia Railway, Washington, D. C., 2½ per cent, preferred.

Traffic and Transportation

JITNEY JOTTINGS

Tennessee Bonding Law Upheld—Jitneys a Menace in Atlantic City—Company in Springfield, Ill., Applies for Relief

The Supreme Court of Tennessee has upheld the law that provided for bonding jitney buses. Thirty days are allowed by the decision of the court for the operators of jitneys to obtain permits or franchises to use the streets and to take out bonds. In Memphis, however, the proscription was put into effect immediately by the city authorities, at least pending issuance of temporary permits in the matter. The court considered two cases, one that of the Memphis Street Railway against the Rapid Transit Company and others, and the second that in which the city of Memphis was appellant. The first asked an injunction. The street railway contended that it holds franchise rights from the sovereign power and that to use the streets in a manner not common to the general public the person so using them must first obtain a franchise or permit. The street railway, having a special interest and special property rights under its franchise, was being specially damaged in a manner not common to the public, by the unlawful operation of the jitneys, doing business similar to that of the street railway. The court held that under the act of 1915 it was unlawful to operate jitneys in any city of Tennessee until such city had passed an ordinance authorizing their presence and fixing their routes, and until the jitney owners had procured licenses and executed bonds to cover damages, etc. In Memphis no such ordinance had been passed and no jitney bus operator had given any bond. On the other hand, the street railway company, having complied with the law, was entitled to protection from illegal competition, it was ruled. The other case was that of a jitney operator who had been arrested by the police for operating without bond, the lower court in its finding having held the State law unconstitutional. This finding was reversed.

The Atlantic City & Shore Railway, Atlantic City, N. J., has appealed to city officials, hotel owners and business men for relief from ruinous jitney competition. As a result of a preliminary conference between I. H. Silverman, president of the company, executives of civic organizations and bankers, the Chamber of Commerce, Hotel Men's Association and the Rotary Club appointed committees to meet with officials of the company to discuss the situation and decide what the business community can do to help the company in its emergency. In the absence of any other requirement than a municipal license fee of \$25, the competing conveyances grew to more than 400 during the summer rush. William F. Hanstein, president of the Hotel Men's Association, has proposed that the jitneys be excluded altogether from Atlantic Avenue, the principal business thoroughfare of the city, where the Shore Line, before the jitney's advent, derived most of its profitable income. Representatives of the company are said to have declined to consider informal proposals from the joint committees of merchants, hotelmen and bankers that the company establish a 3-cent fare zone for the business district.

A. D. Mackie, vice-president and general manager of the Springfield (Ill.) Consolidated Railway, has filed a petition before the Illinois Public Utilities Commission asking that the jitney men in Springfield be restrained from operating their cars until they have obtained a certificate of necessity and convenience from the commission. The petition contends that the "service" cars operated in Springfield are carrying passengers for hire the same as the street railway and that they are common carriers. In the Jacksonville jitney case, decided by the commission some time ago, the commission held that jitneys are common carriers and subject to the same regulations as other common carriers, and that to obtain the right to operate in a city they must follow specified routes, file adequate bonds and not operate where satisfactory service is being given by street railway. When the City Commissioners of Springfield recently passed an ordinance regulating the jitney buses these features were eliminated by efforts of the jitney men. This ordinance

went into effect on Nov. 2. Plans which were being made by Mr. Mackie to start jitney buses in Springfield on Nov. 1 have been abandoned. Mr. Mackie was unable to rent large buses and did not want to buy them.

The People's Motor Club was characterized by Assistant City Solicitor Lowengrund of Philadelphia as a "sham and a fraud," at a hearing on a bill for a preliminary injunction to restrain Director of Public Dripps from interfering with the operation of the automobiles hired by the club to carry its members. The club was organized, according to Paul Randolph, its president, at a meeting of eighteen business men. Its stated purpose is to provide means of transportation to members of the club. To become a member it is only necessary to apply at the club's headquarters or to one of the ten or twelve branch offices in drug stores and cigar stores along Broad Street. There the applicant's name is taken and upon the payment of 25 cents, a membership card and five tickets are handed to him which represent five 3-mile rides in one of the thirty-seven automobiles the club has hired. No money is accepted by the driver. The chauffeurs, every evening, receive 4½ cents in exchange for every ticket received from members during the day. The club retains the other half cent. The active members of the club began suit against Director Dripps following the arrest of several chauffeurs employed to drive the club's automobiles. They aver that the purpose of the club is not to evade the jitney ordinance, but to accommodate members.

The North Corning, Corning and Painted Post jitney bus lines have been required by the Public Service Commission of the Second District of New York to cease operating until they have complied with the law and secured permits from the Corning Common Council and certificates of necessity from the commission itself. The Painted Post line has been operating all summer in competition with the Corning & Painted Post Street Railway.

At the request of Burt C. Hurtgam, who has been operating a motor-bus line between Lockport and Olcott, Public Service Commissioner Hodson has adjourned until Nov. 20, the hearing on his petition to continue to operate the line in competition with the Lockport and Olcott branch of the International Railway. The commission recently forced Hurtgam to discontinue his service. Hurtgam now claims he will operate the line only between Olcott and the Lockport city line and asks if this will be in violation of the commission's order.

A hearing in the matter of the application of about sixty local jitney drivers at Rochester, N. Y., for permission to ask for a certificate of conveniences and necessity from the Public Service Commission will be held on Nov. 9. At a meeting of the Common Council of Rochester on Oct. 26, the finance committee reported a hearing would be necessary and the date was fixed.

The jitney ordinance of Houston, Tex., has been upheld on every count by Judge Charles E. Ashe of the Eleventh District Court in the case of a number of jitney operators who sought to enjoin the city from enforcing the ordinance. The decision was rendered after Judge Ashe had had the case under advisement for three weeks. The ordinance was attacked on the ground that the city had no right to establish classifications in automobiles; that to do so was discrimination; that the license fee of \$72 a year was excessive; that the provisions of the ordinance establishing routes and schedules for jitneys were unreasonable; that the jitneys, having paid the old license fee of \$1 a year, could not be required to pay the new and higher fee until after the expiration of the old license, and that the license fee of \$72 was more than sufficient to reimburse the police department for the additional expense growing out of the police regulation of the jitneys.

The Washington Auto Bus Company, organized in the interest of the Puget Sound Traction, Light & Power Company, Seattle, Wash., has applied to the city comptroller of Bellingham for four jitney bus licenses. According to C. W. Howard, attorney for Stone & Webster in Whatcom County, the company will begin operations shortly after Nov. 1. The buses will operate in conjunction with the Bellingham lines of Stone & Webster. Each car will be bonded under the State law, in the sum of \$2,500, and in addition, each car will carry insurance.

CHICAGO QUESTIONS AUTHORITY OF STATE COMMISSION

Suit has been filed in the Circuit Court of Cook County by Corporation Counsel Richard S. Folsom of Chicago for a temporary injunction to restrain the Public Utilities Commission of Illinois from putting into effect its recent service order, as mentioned in the *ELECTRIC RAILWAY JOURNAL* of Oct. 20, page 931. Up to Nov. 3, the court had taken no action on the prayer of the city, and pending definite action, the Chicago Surface Lines has not complied with the order of the commission requiring it to file certain schedules, plans and specifications on or before Nov. 1. The suit was filed at the direction of the City Council, which is seeking to protect its right to regulate public utilities. Chief among the allegations in the city's bill is one that the State constitution gives the regulation and control of the construction and operation of street railroads to the cities and villages in which they are located. This has been the continuous policy of the general assembly in the enactment of new legislation both before and after the passage of the public utilities act in 1913. The bill further alleges that the public utilities law was not constitutionally passed, as the Senate did not finally act upon the law passed by the lower house, and the final vote was taken after the time set for adjournment. The bill also states that the commission's order is an interference with the contract rights of the city with the surface railways and the property rights of the city looking to future municipal ownership. The suit was directed at both the Public Utilities Commission and the several companies forming the Chicago Surface Lines.

WASHINGTON RELIEF ASSOCIATION REPORT

Association Has 1339 Members, \$7,312 Cash, \$120,000 Invested, and \$4,075 Loaned to Members

The Washington Railway Relief Association, organized in 1900 and composed exclusively of employees of the Washington Railway & Electric Company, Washington, D. C., and subsidiaries, including the Potomac Electric Power Company, now has 1339 members. The report of Sept. 30, 1915, shows \$141,772 paid out for health, accident and death benefits since organization.

The object of the association is to provide for members disabled by reason of sickness or injuries received, and at their death for their families. Sick benefits are allowed at the rate of \$1 a day, not exceeding, however, the sum of \$200 in any one year. In addition to an accumulated share of the surplus \$250 is paid in case of death of a member. In the event of the death of the wife of a member the husband is paid \$50, and upon the death of the mother of a single man a like amount is paid the member. Free medical and surgical attendance is provided for all members. Independently, the Washington Railway & Electric Company and allied companies maintain a pension system for employees, whether or not they are members of the association.

A board of managers composed of thirty-three, selected from each division and department of the companies, administer the affairs of the association. These men serve without pay and are elected annually by the members. The present officers are Clarence P. King, president; C. E. Brown, treasurer; P. T. Haller, secretary, and Clarence A. Weaver, medical officer. The affairs of the association have been so conservatively and ably managed that with dues of \$1 monthly, it has been possible to credit each member's surplus amount \$11.26 at the end of the fiscal year, making an actual cost of all benefits derived only 74 cents for the current year, or about 6 cents a month.

The Washington Railway & Electric Company guarantees the accounts of the association, bears a considerable part of the yearly operating expense, pays the rent of and maintains the club rooms and furnishings, in addition to all expense for the several entertainments given in the name of the relief association. The club rooms are centrally located, and contain bowling alleys, pool tables, musical instruments, games and reading rooms. A branch of the Public Library with a circulation of more than 1000 books is also maintained, and nearly 400 members take advantage of the convenience.

The association has a savings department paying 5 per

cent per annum, compounded semi-annually. At present \$35,000 is on deposit. During the year 1910 a loan department was established. Members pay 6 per cent interest on loans and pledge as security for loans their share of the association surplus fund. The annual excursion for 1915 netted \$1,700. This was credited to the individual accounts of members, giving each a credit of \$1.37.

After deducting sick and death benefits and miscellaneous expenses of the association, the balance of the dues paid in by members, together with interest on investments and other miscellaneous income constitute a surplus fund, and is periodically credited to the individual accounts of members. In the case of charter members the present value is nearly \$100; ten-year men \$87; five-year men \$51 and two-year men \$21. All amounts credited to members are payable upon leaving the service of the company or to the beneficiary upon the death of the member.

The assets of the association total \$131,615. They consist of cash on hand and in bank amounting to \$7,312, \$120,000 in stocks and bonds at present market values, \$227 in accounts receivable, and \$4075 loans to members.

FRESH-AIR CARS FOR CHICAGO ELEVATED

At the request of Dr. John Dill Robertson, commissioner of health, the elevated railroads of Chicago put in operation on six of its trains what have been popularly termed "fresh-air" cars. Complaints to the health department ranging from too much to too little ventilation had begun to arrive, and in response to these, Dr. Robertson asked the elevated railroads to co-operate with him to the extent of putting on several cars with the windows and doors removed. Trains carrying these "fresh-air" cars were announced in the press as leaving the north and south side terminals at a certain time so that those desiring plenty of ventilation could test the new service. The first cars of this type were put in service on Nov. 1. All windows and doors were fastened in the open position and the "fresh-air" car was coupled in the middle of the train so that in case passengers did not like the innovation they could proceed to the fully-inclosed coaches.

At each end of the "fresh-air" cars white cards furnished by the Chicago health department were posted. Among other statements these cards contain the following concerning fresh air and health: "Dirty air is death," "Good air means good work," "Too much fresh air is just enough," "Fresh air is the best life assurance agency," "Get the fresh-air habit; dress warm enough to enjoy it," "Colds are 'catching,'" "Coddle yourself and you flirt with pneumonia," "Breathe freely and fully; the more you expand your chest the less you will contract cold." These were printed over the signatures of Mayor Thompson and Dr. Robertson. According to the city health department, the service is proving popular and its educational value is deemed immeasurable. "Fresh-air" car service will continue to be furnished until it ceases to be popular.

Car Capacity Order in Effect Again.—The order of the Board of Health of New York limiting the number of passengers on the cars of certain lines of the Brooklyn (N. Y.) Rapid Transit Company has been made effective again after having been suspended during the summer.

Court Decision on Car Tax and Fender Ordinances.—Judge H. M. Waggoner in the Circuit Court of Fulton County, Ill., has declared valid an ordinance of Canton which required a tax of \$10 a year on each car operated over the streets of the city. The same jurist declared invalid an ordinance of the city of Canton requiring the use of basket fenders. The Illinois Central Electric Railway operates in Canton.

Successful Train Operation in Buffalo.—Success in the operation of two-car trains during the rush hours in the morning and evening has prompted the International Railway, Buffalo, N. Y., to extend the operation of these trains to almost all lines during the rush hours. The first car of each train is a remodeled rear-entrance car with an exit at the front end, while the second car is a pay-as-you-enter near-side front-entrance trail car with fare box on the front platform.

Relief from Vehicular Obstruction Asked in Chicago.—Leonard A. Busby, president of the Chicago Surface Lines,

requested the local transportation committee of the Chicago City Council to recommend an ordinance prohibiting the parking of vehicles in the loop thoroughfares and barring heavy teaming in the loop district during the morning and evening rush-hour periods. Vehicular obstruction has been the subject of much comment by various regulative bodies. Its elimination has been suggested by the Illinois Public Utilities Commission and attention has been directed to it in the advertisements published by the Chicago Surface Lines.

Automobile Parking a Problem.—Louisville's police authorities have taken up in earnest the matter of control of automobile parkings on the down-town streets and are approaching the proposition from the viewpoint of the public. In order to formulate a plan of action the Board of Public Safety has called for an expression on the subject from citizens. Samuel Riddle, superintendent of transportation of the Louisville (Ky.) Railway, in discussing the problem for publication in local papers, declined to submit a plan, but pointed out to the police that the practice of allowing automobiles to stand along Fourth Street made the operation of cars on that thoroughfare exceedingly difficult and dangerous especially during rush hours.

Subjects Discussed in Milwaukee Talks to Patrons.—Up to Oct. 26 The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., had published six advertisements in its series "Plain Talks to Our Street Car Patrons," the first of which, dealing with the need for a readjustment of fare, was reproduced in part in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23 page 889. The second talk dealt with the size and usefulness of the street railways as a factor in city growth, the third with how Milwaukee's city government broke its 1900 agreement with the company and prevented the earning of a fair return under the conditions agreed upon, the fourth with the decline of the average cash return per passenger from 5 cents to 2.98 cents, and the fifth with the sums spent by the company for paving that owners of abutting property on a few favored street ought to have paid for.

Rehearing Refused in Lockport Interchange Case.—The Public Service Commission for the Second District of New York has refused the application of the New York Central Railroad for a rehearing of the Lockport freight interchange case. The case was decided on Sept. 21, when the commission directed the New York Central and the International Railway to install in Lockport switch or other track connections and such other track facilities as might be necessary to afford adequate and convenient interchange of freight between the two lines, and requiring the roads to enter into an agreement as to the plans and report to the commission before Oct. 25. Both companies notified the commission that they would appeal the case. As the first step in this proceeding the New York Central applied for a rehearing of the case before the commission on Oct. 25. The commission found the application raised no new question and denied the request in order that final determination in the courts may be reached as speedily as possible. The opinion of the commission in the case was referred to at length in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, page 783.

Twenty-three Instances of Careless Driving in a Month.—J. A. McCrea, general manager of the Long Island Railroad, made public a statement on Oct. 30 which shows that in the last month twenty-three persons, while operating automobiles and other vehicles, violated the railroad's mandate to stop before starting over grade crossings. That only three people were injured in these twenty-three instances of careless and reckless driving, Mr. McCrea indicates, was due partly to the vigilance of motormen, engineers and crossing watchmen, but he attributes immunity from serious or fatal accidents in the majority of cases largely to good luck. Twelve automobiles, five motor trucks, five wagons and one motorcycle make up the list of conveyances that were driven across the tracks of the Long Island Railroad during the last thirty days, without regard either for the safety of human lives or the preservation of property. Twelve of these vehicles, mostly automobiles, plunged wildly through lowered crossing gates, breaking eight of them. Four traffic signposts, on crossings, were also damaged and a number of lanterns or lamps were demolished.

Telling the Public About the Disposition of the Nickel.—With a teaser in the way of a yellow card on which is raised in the minds of passengers the question as to what becomes of the nickels they drop in the fare boxes, the Louisville (Ky.) Railway has begun a new educational movement, through which the officials of the company hope to obtain the interest and the co-operation of the public. The first card will be followed by a series, each of which will set forth some piece of information about the company in its relations to the public. The full text of the series of cards has not been worked out as yet, but all of them will be designed to acquaint the passengers that the nickels they pay for rides do more for them than merely to pay their fares. Statements will be made as to the amounts paid out by the company on the payrolls, as to the amounts expended in Louisville for materials, as to the amounts of taxes which are paid into the city treasury by the company, etc. This new series of cards will take the place of the safety-first cards which have held the place of honor at the front of the coaches, though from time to time a safety-first card or suggestion will be inserted in place of the informative cards.

"Near Accidents."—F. H. Miller, superintendent of motive power of the Louisville (Ky.) Railway, advises the men under him that a "near accident" gives just as much reason for study of safety principles as a calamity itself. Mr. Miller says: "Every time an operating man realizes that either he or his machinery has had a close call, conditions are ripe for just the kind of study we have in mind. Such 'near accidents' include occurrences like a narrow escape from injury on account of dropping a heavy pipe wrench into the firing aisle; slight overheating of motors due to excessive speed of a motor; ignition of waste in an open holder by a carelessly thrown match; blowing of a lighting fuse because of careless wrapping of a lamp cord around a metal support; accumulation of condensed steam from a leaky pipe joint in a cable duct line and sluggishness of governor action due to insufficient cleaning and lubrication. On the electrical side of a generating station many occurrences fall within the class of 'near accidents,' especially those due to insufficient care in approaching live circuits and terminals, temporary arcs and flash overs caused by improper handling of switches, regulators, etc., and burn-outs of minor character caused by inadequate fusing, poor mechanical contacts, insufficient insulation and the making of wrong connections. By observing the cause of 'near accidents' we are in position to prevent their recurrence. 'Prevention First' means 'Safety First' and 'Never an Accident'."

Results with Railway-Ferry Transfers in New York.—The annual report of the New York (N. Y.) Railways for the year ended June 30, 1915, contains the following reference to the transfer arrangement between the city and the company providing for transfers to the Staten Island municipal ferry line: "Under date of Sept. 9, 1914, an agreement was entered into with the city of New York effective on Sept. 15, 1914, providing for the exchange of transfers between the Staten Island division of the municipal ferries and certain lines operated by this company, viz., the Broadway and Columbus Avenue line, the Sixth Avenue line and the Eighth Avenue line. Out of the 5-cent far in effect under the terms of this agreement the city of New York receives 2 cents for each passenger transferred from our lines, while this company collects 3 cents for each passenger it carries transferred from the ferry lines. During the period Sept. 15, 1914, to June 30, 1915, there were 1,317,135 transfers lifted on our lines, while the municipal ferry lifted 1,185,449 transfers, the average number of passengers per month transferring from the Staten Island ferry to our lines being 138,646, while the number transferred from this company's lines to the municipal ferry averaged 124,784 per month. The total of such passengers carried during this period of nine and one-half months was 2,502,584, an average of 263,430 a month. The amount of gross revenue collected by the city of New York under this transfer arrangement during the period indicated was \$50,051.68 and by this company \$75,077.52. The receipts during the past few months indicate a growth in this traffic."

Personal Mention

Dr. Charles P. Steinmetz, consulting engineer of the General Electric Company, Schenectady, N. Y., has been elected president of the Common Council of the city as the representative of the Socialists.

Mr. Thomas Cheyne has been elected as an additional vice-president of the Reading Transit & Light Company and Metropolitan Electric Company in Reading, Pa. Mr. Cheyne prior to 1915 was with Haskins & Sells, accountants, New York.

Mr. C. L. Stone, formerly general manager of the Manila Electric Railroad & Light Corporation, Manila, P. I., has been appointed general manager of the Otsego & Herkimer Railroad, Colliers Light, Heat & Power Company and the Hartwick Power Company, Cooperstown, N. Y., to succeed Mr. S. Walter Mower, resigned.

Mr. Frank Harris, who has for the last four and one-half years acted as publicity agent for the British Columbia Electric Railway, Ltd., with offices at Vancouver, B. C., recently presented his resignation and on Nov. 1 he severed his connections with the company. Mr. Harris went to Vancouver from New York in 1904 and served on the Vancouver daily press for several years before taking up the post from which he has just resigned. He will take a much needed rest, after which he will again enter business.

Mr. Chester F. Gailor, assistant chief engineer of the United Railways & Electric Company, Baltimore, Md., since Dec. 15, 1913, has resigned from the company to become chief engineer of the Atlantic Welding Corporation, New York. Mr. Gailor was formerly roadmaster of the Hartford Division of the Connecticut Company. Mr. Gailor is a graduate of Lansingburg Engineering Academy, Lansingburg, N. Y., and began his railway career as a rodman with the Hudson Valley Railway. He has done much inventive work in electric rail welding. A portrait and a biography of Mr. Gailor were published in the *ELECTRIC RAILWAY JOURNAL* of Dec. 6, 1913.

Mr. F. A. Nichols, vice-president and general manager of the Ottumwa Cold Storage & Ice Company, Ottumwa, Iowa, has disposed of his interest in the company and has resigned, effective on Jan. 1, 1916. On June 1, 1914, Mr. Nichols resigned his position as electrical engineer of the International Railway, Buffalo, N. Y., to become general manager of the East Liverpool Railway & Light Company, East Liverpool, Ohio. He resigned from the company at East Liverpool late in 1914, and early in 1915 became an officer of the Ottumwa Cold Storage & Ice Company. Mr. Nichols is a technical graduate and has had more than ten years' experience in engineering, construction and street railway work. He has not yet made any definite plans for the future.

Mr. Norman McD. Crawford has resigned as president and general manager of the Reading Transit & Light Company. Mr. Crawford succeeded Mr. W. S. Barstow in 1913 in this position. He was formerly president of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio. Mr. Crawford was for several years vice-president of the Ohio Electric Railway, Cincinnati, Ohio, and previously, for a long time, was general manager of the Hartford (Conn.) Street Railway. As a contractor he built the Glastonbury line of the Hartford Street Railway in 1891 and was afterward retained by the company as engineer. In 1894 he was made general manager of the company, which position he held until the Hartford Street Railway was taken over by the Connecticut Company. In December, 1908, Mr. Crawford was elected president of the Mahoning & Shenango Railway & Light Company. While Mr. Crawford has not announced his personal plans for the future, he anticipates continuing his residence in Reading until after the first part of the coming year.

Mr. Erastus L. West has been elected president of the Reading Transit & Light Company, Reading, Pa., and Metropolitan Electric Company to succeed Mr. Norman McD. Crawford, resigned. Mr. West was graduated from Cornell in 1899 and was awarded a fellowship for 1900. He spent the following eight years with J. G. White & Company in New York and London. From 1908 to 1912 he was general manager of the Central Colorado Power Company, Denver,

leaving there in March, 1912, to become general manager of the Connecticut Power Company, Worcester, Mass. In September, 1914, he was appointed to make an expert examination of the various properties in which W. P. Bonbright & Company, bankers, New York, are interested. There will be no further change in the management of the company at Reading, which will continue under the ownership of W. P. Bonbright & Company and the supervision of W. S. Barstow & Company, New York. Mr. West's headquarters will be in Reading. The Reading Transit & Light Company is controlled by the Eastern Power & Light Corporation. The system at Reading includes a general light and power business in that city and vicinity and more than 170 miles of electric railway, operating more than 240 motor cars.

Mr. S. Walter Mower has resigned as general manager of the Otsego & Herkimer Railroad, Colliers Light, Heat & Power Company and the Hartwick Power Company,

S. WALTER MOWER

Cooperstown, N. Y., following a change in ownership of the properties. Before becoming connected with the Otsego & Herkimer Railway in October, 1912, Mr. Mower was general manager of the London & Lake Erie Railway & Transportation Company, London, Ont. He was born at Grand Haven, Mich., on Aug. 13, 1876. In 1890 he moved to Detroit and in 1900 entered the service of the Detroit (Mich.) United Railway as assistant to Sir Albert Stanley, then general manager of the company. Five years later he

was appointed assistant superintendent of the Port Huron division of the Michigan United Railway. In June, 1906, he was appointed general manager of the Southwestern Traction Company, succeeded by the London & Lake Erie Railway & Transportation Company. Mr. Mower was secretary-treasurer of the American Electric Railway Engineering Association from its organization in 1903 until 1908. The *Otsego Farmer*, in expressing its regrets at the retirement of Mr. Mower, said: "There will be a general feeling of regret not only in Cooperstown but throughout Otsego County and among the employees of the local road at the announcement of the resignation of Mr. Mower. Mr. Mower has been in charge of the road for three years, and in that time has won the hearty commendation of the patrons of the line for his untiring efforts to improve the property and give the public the best service possible. The harmonious relations with the local communities served by the railroad and lighting companies are well known and appreciated and must continue to be a source of gratification to Mr. Mower in other fields. This spirit also extends to the employees, a fact which speaks highly of the confidence and mutual esteem between management and men."

OBITUARY

Reagan Houston, for many years attorney for the San Antonio (Tex.) Traction Company and at one time president of the company, died at his home in San Antonio on Oct. 24 at the age of fifty-six, after an illness of about two weeks.

Ralph S. Rowley, general claim agent of the Chicago (Ill.) Surface Lines, died suddenly on Nov. 2, 1915. Mr. Rowley was born at Marshall, Mich., in 1866. He entered the service of the Chicago City Railway's claim department in 1895 as a claim investigator. In 1900 he was made chief clerk to the general claim agent, and in 1905 he was made claim agent. In 1912, upon the resignation of Mr. J. W. Crawford, Mr. Rowley was appointed general claim agent. In January, 1914, when the Chicago City Railway was merged with the Chicago Railways, forming the Chicago Surface Lines, Mr. Rowley was appointed assistant to Mr. Sidney Ossoski, general claim agent. Upon the resignation of Mr. Ossoski in August, 1914, Mr. Rowley was appointed general claim agent. He is survived by a widow and six children.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Muscatine & Iowa City Railway, Muscatine, Iowa.—Incorporated in Iowa to provide electric service on a 104-mile leased section of the Rock Island Railroad, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30. Capital stock, \$400,000, of which \$100,000 is common and \$300,000 preferred. The headquarters of the company will be at Muscatine. The incorporators consist of business men of Muscatine, Iowa City, Wellman and Montezuma. A. D. Bowen, Muscatine, has been elected president. [Oct. 9, '15.]

***Huntington-Chesapeake Bridge Company, Huntington, W. Va.**—Incorporated in West Virginia to construct a line in Huntington and Chesapeake, Ohio. The company proposes to build a highway bridge with double-track street car line. Incorporators: R. P. Aleshire, Paul Hardy and J. C. Miller.

FRANCHISES

Los Angeles, Cal.—The Pacific Electric Railway has asked the Council for a franchise to construct a line on Front Street, O'Farrell Street, Newport Street and Bay Street. Bids for this franchise will be received by the City Clerk until Nov. 9, 1915. The Pacific Electric Railway has received an ordinance from the Council consenting to and accepting the abandonment of its line on Ninth Street between Tennessee Street and Santa Fé Avenue.

Randolph, Mass.—The Bay State Street Railway has asked the Council for a franchise to lay a double track on South Main Street from its present terminus at the Randolph-Avon line to Central Square.

Pontiac, Mich.—At a recent election residents of Pontiac approved the thirty-year franchise asked for by the Detroit, Pontiac & Owosso Railway. [Oct. 9, '15.]

Salem, N. J.—The Salem-Pennsgrove Traction Company has received a franchise from the Council in Salem. The Board of Chosen Freeholders has also granted the company a fifty-year franchise to operate a line over the county roads and bridges. It is expected that the township committees of Lower and Upper Penn's Neck will shortly take similar action.

Buffalo, N. Y.—Providing the Council grants the application of the International Railway Company at once for a franchise through Bailey Avenue from Clinton Street to Kensington Avenue, about 3 miles, E. G. Connette, president of the company has promised to have the work completed in three years instead of four years, as was proposed. Some opposition developed toward the company's four-year plan and the present three-year proposal is favorable to residents in this section of the city. The company agrees to lay double tracks between Clinton Street and Broadway the first year; between Broadway and East Ferry Street the second year and between Delavan Avenue and Kensington Avenue the third year. It is expected the franchise will be granted at once.

Corvallis, Ore.—The Southern Pacific Company has received a franchise from the Council to construct a double track on Sixth Street. Electrification may now be begun whenever the company is ready.

Linnton, Ore.—O. M. Clark and associates have filed an acceptance of the franchise granted by the Linnton Council. It is proposed to construct a line between Portland and Linnton. [Sept. 4, '15.]

Ogden, Utah.—The Utah Light & Traction Company has filed an acceptance of the franchise granted by the Council on Aug. 26 to construct, maintain and operate an electric heating, lighting and power system in Ogden.

Huntington, W. Va.—The Huntington-Chesapeake Bridge Company will ask the Council for a franchise to construct a line from Fourth Avenue and Sixth Street, Huntington, over the Ohio River to a point in Chesapeake, Ohio.

TRACK AND ROADWAY

Pacific Electric Railway, Los Angeles, Cal.—This company will construct an elevated track from Sixth and Main Streets to San Pedro Street. The cost is estimated at about \$300,000. A contract has been awarded to Robert Sherer & Company, Los Angeles, for grading the roadbed for this company's line between Hawthorne and Iona Avenues on the Redondo via Watts line. It is estimated that the cost will be about \$20,000.

Connecticut Company, New Haven, Conn.—Plans are being made by this company to reconstruct its tracks extending through Waterville. It is proposed to construct a double track from Homer Street, where the tracks enter Boyden Street, through Thomaston Avenue.

Georgia Railway & Power Company, Atlanta, Ga.—This company will begin at once the construction of an extension of its line on Lakewood Avenue to the main fair ground entrance.

Lewiston-Clarkston Transit Company, Lewiston, Idaho.—It is reported that this company will construct an extension to the eastern section of Lewiston if local interests warrant such an extension.

Illinois Traction System, Peoria, Ill.—This company has been asked by the village of Oakwood, Ill., to move its track from the south side to the north side of Main Street through that village.

Winnipeg (Man.) Electric Railway.—This company is constructing a double-track line on concrete base on Webb Street, Winnipeg.

Bay State Street Railway, Boston, Mass.—Material has been received and work will be begun at once by this company double-tracking its line on Main Street, Haverhill.

Springfield (Mass.) Street Railway.—This company has begun construction on the extension of its East Street line in Chicopee Falls to the factory of the Westinghouse Electric & Manufacturing Company at East Springfield. The extension has been delayed on account of opposition in Chicopee to the use of T-rails, but last week the local board of aldermen authorized the use of this type of construction, in order to enable the Westinghouse Company to utilize the tracks for war order shipments.

Worcester (Mass.) Consolidated Street Railway.—It is reported that this company may soon extend its Lake View line to Lake Avenue, thence to Sunderland Road to the city line.

***Joplin, Mo.**—A committee consisting of A. S. Wilson, J. F. Lanier and Albert Schmidt has been appointed by the Commercial Club of Joplin to consider the construction of an electric railway out of Joplin.

Trenton, Lakewood & Seacoast Railway, Trenton, N. J.—Construction has been begun on this company's line between Lakewood and Point Pleasant. The roadbed has been graded, poles erected and the supporting standards placed in position. George O. Vanderbilt, Trenton, is interested. [July 17, '15.]

International Railway, Buffalo, N. Y.—The new double-track line between Buffalo and Niagara Falls which is to be built by this company calls for an elevated line through the business and residential sections of North Tonawanda. Some opposition to the elevated tracks has developed in North Tonawanda as the company's franchise calls for tracks at grade through the city except where the line crosses Sweeney and Tremont Streets. The Board of Public Works will convene in special session to consider the project.

Cincinnati (Ohio) Traction Company.—An agreement was closed on Oct. 30 through which the Cincinnati Traction Company will be able to construct tracks to Bond Hill over Paddock Road, Cincinnati. This agreement was signed by the company, City Solicitor Schoenle and the residents of Reading Road who are affected by the line. These residents will be reimbursed by the company for their expenditures in the long fight against the city and the company to prevent the construction of the track, a period of about ten years. Officers of the company state that the line will be in operation in about eighteen months and until that time it will co-

operate with the bus line now serving the territory by issuing and receiving transfers.

Steubenville & East Liverpool Railway & Light Company, Steubenville, Ohio.—The Council of Steubenville has awarded a contract to this company for street lighting for a period of ten years. The contract provides for a considerable amount of new construction work in the near future.

Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.—This company plans to reconstruct its Wilson Avenue and Federal Street lines in the spring. It is expected that the cost will be about \$175,000.

Lawton Railway & Lighting Company, Lawton, Okla.—Work has been begun by this company repairing its track on Second Street. A concrete base will be constructed beneath the tracks and new ties will be put in on the line between C and Gore Avenues.

Choctaw Railway & Lighting Company, McAlester, Okla.—Plans are being made by this company to extend its line from the terminus at Hartshorn to Gowen and Wilburton.

Toronto, Ont.—Having heard the report of Sir Adam Beck, chairman of the Ontario Hydro-Electric Power Commission, upon the proposal to construct a hydro-electric radial railway between Toronto and Guelph, representatives of fifteen municipalities interested passed a resolution indorsing the scheme and declaring that the electors in each place should be allowed to pronounce upon it by voting upon a by-law in January. The Hydro-Electric Power Commission submitted plans for a system of radial railways to connect Toronto, Port Credit, Milton, Guelph, Berlin, New Hamburg, Stratford, St. Mary's, London, Strathroy, Arkona and Sarnia.

Lehigh Valley Transit Company, Allentown, Pa.—The Lehigh Valley Transit Company, lessee of the trolley line which is operated between Nazareth and Farmersville Junction, is making an attempt to have this branch abandoned. Insufficient receipts is said to be the reason.

North Branch Transit Company, Bloomsburg, Pa.—A. W. Duy, receiver of this company, has asked the court for permission to issue receiver's certificates to the amount of \$62,000, to be expended for needed improvements to the company's road and equipment. The petition set forth that it is necessary to replace the present aqueduct at Rupert with a steel bridge, to replace the present bridge over Boone's race with a steel structure and to replace the present wooden overhead near Willow Springs with a steel structure. It is also necessary to replace 7 miles of ties, to equip the road with continuous joints and to make repairs to the Catawissa bridges.

Milford, Pa.—The project to build a railway from Milford to Port Jervis, about 8 miles, is being revived. It is reported that residents of Milford have guaranteed an amount of \$25,000 to aid in the project to construct the line. Gifford Pinchot, Milford, is interested. [June 5, '15.]

Pottsville & St. Clair Electric Railway, Pottsville, Pa.—A contract has been awarded to Smith & Campion, Mahanoy City, Pa., to construct a tunnel under the tracks of the Reading Railway. This tunnel will enable the new line being constructed between Pottsville and Shenandoah to take an easy grade up Broad Mountain. This roadbed has been almost completed to the tunnel.

Philadelphia & West Chester Traction Company, Upper Darby, Pa.—Plans are being made by this company to extend its Collingdale division from its present terminus at Parker Avenue, Collingdale, to the Chester pike, Sharon Hill. The company also plans to double track its Media Short Line division.

Williamsport (Pa.) Passenger Railway.—Plans are being made by this company to begin work at once on the double tracking of its Third Street line from the end of the present double track at Park Street to the west line of Maynard Street.

Dallas (Tex.) Southwestern Traction Company.—Surveys have been completed of this company's line from Glen Rose to Stephenville, 80 miles. E. P. Turner, Gaston Building, Dallas, president. [Oct. 9, '15.]

Southern Traction Company, Dallas, Tex.—At a conference of representative business men of Waco, and E. J.

Strickland, president of the Southern Traction Company, plans were made for the establishment of a bus feeder line from Bellemead, a settlement just outside of Waco, to the terminus of the East Waco Street line. This was considered more practicable at present than an extension of the line, as was first suggested.

San Antonio & Austin Interurban Railway, San Antonio, Tex.—The plans of this company to build a line between San Antonio and Austin have been revived and negotiations for financing the project are now in progress. Most of the right-of-way for the line has been secured. The proposed line will extend through New Braunfels, Hunter, San Marcos, Kyle, Buda and Manchaca. V. P. Brown, San Antonio, is interested. [June 5, '15.]

Van Horn Valley Railway, Van Horn, Tex.—It is reported that this company has completed 15 miles of grade for track laying on its proposed 70-mile railway from Lobo to a point in New Mexico. R. H. Owen, 511 Andrus Building, Minneapolis, Minn., president.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—This company's extension to Spanish Fork has been completed, and the line will be extended to Payson. It is expected that the line will be finished by Jan. 1.

Utah Light & Traction Company, Salt Lake City, Utah.—This company will replace its wooden poles on Eleventh East Street between Ninth South Street and Yale Avenue with steel poles.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—Plans are being made by this company to extend its electric transmission line to Merton and Lake Five.

SHOPS AND BUILDINGS

Boston (Mass.) Elevated Railway.—The East Boston car-house of this company, containing twenty-two semi-convertible cars, two snow plows and other valuable equipment, was destroyed by fire on Nov. 1, with a loss of about \$240,000. Further reference to the fire is made on page 966 of this issue.

New York Municipal Railway Corporation, Brooklyn, N. Y.—This company has applied to the Public Service Commission for the First District of New York for permission to enter into a contract with the George W. McNulty Company, for the construction of the Coney Island terminal of its elevated railroads. The company, in its application, states that the McNulty Company, in its opinion, is well equipped to do the work, and that the prices which it agrees to perform the work for are reasonable. The McNulty Company is the same concern which constructed the Sea Beach line for the New York Municipal Railway Corporation.

The International Railway, Buffalo, N. Y.—This company has prepared plans and specifications for an enlarged freight and passenger terminal in Lockport, but permission to proceed has been denied by the city. The proposed improvement was to have cost about \$9,000. Public Service Commissioner Hodson has directed the city officials and the railway company to arrive at an agreement and present their agreement to the commission for its approval. The city of Lockport recently filed a complaint with the commission against the alleged inadequate terminal facilities in the city.

London & Port Stanley Railway, London, Ont.—Work has been begun by this company on the construction of a car-house south of Phillips Street, London. The contract was awarded to Hyman & Son, London, for \$27,000.

Montreal & Southern Counties Railway, Montreal, Que., Can.—A passenger station is being constructed by this company at Abbotsford.

POWER HOUSES AND SUBSTATIONS

Carbon Transit Company, Mauch Chunk, Pa.—A report from this company states that it will enlarge and concentrate its power plants at once, adding a 250-hp. boiler and a 300-kw., 600-volt d.c. generating unit.

Sherbrooke Railway & Power Company, Sherbrooke, Que.—Plans are being considered by this company to construct a substation at Waterville, Que.

Manufactures and Supplies

ROLLING STOCK

Durham (N. C.) Traction Company will order six new cars.

Toronto (Ont.) Civic Railway contemplates securing thirty motor cars this winter.

Union Traction Company of Indiana, Anderson, Ind., is rebuilding three cars for winter use at the Anderson shops.

Mississippi Valley Electric Company, Iowa City, Ia., which has taken over the Fort Madison (Ia.) Street Railway, expects to equip its system with four new cars.

Morrison & McCall, St. Louis, Mo., have purchased four cars from the Southern Car Company for their properties, the Laredo Railway & Electric Company, Laredo, Tex., and Walnut Ridge & Hoxie Light, Power & Transit Company, Walnut Ridge, Ariz.

Detroit (Mich.) United Railway has just ordered twenty-five motor and twenty-five trail cars from the G. C. Kuhlman Car Company, in addition to the order for twenty-five motor and fifty trail cars placed with the same company about four months ago.

Interborough Rapid Transit Company, New York, N. Y., has issued requests to car builders for bids on 311 new steel subway cars of practically the same type as those recently ordered by the company for use on its new extensions in the Bronx and Queens. This equipment includes 234 motor cars and 77 trailers. Deliveries on the cars are expected to commence during February, 1916, and end in April.

Boston (Mass.) Elevated Railway has ordered from The J. G. Brill Company twenty-five new trailers of a type now being used on suburban lines of the company. Doors will be equipped with the National Pneumatic Company's air operating device. It is understood that some of the trailers will be used in the Mattapan Square-Dudley Street line and that others may be used on the Jamaica Plain-Dudley Street line, running by way of Center Street. This railway company on Nov. 1 lost twenty-two semi-convertible cars and two snow plows in a fire which destroyed its Eagle Street carhouse.

Wilmington & Philadelphia Traction Company, Philadelphia, Pa., has ordered thirty-one cars from The J. G. Brill Company, instead of twenty-five as previously reported. The new cars will be of the Brill semi-convertible type. They will measure 29 ft. in car body length and 41 ft. over all, with seating capacity for forty-four persons. The cars will have cross-seats and will be equipped with folding doors. Four-motor electrical equipment will be provided by the General Electric Company. Ring curtain fixtures and Rex all-metal rollers will be supplied by the Curtain Supply Company. It is reported that this railway company will completely overhaul the old cars on the recently acquired lines to New Castle and Delaware City.

TRADE NOTES

B. E. Tilden & Company, Chicago, Ill., have been organized to manufacture railway supplies of all kinds. E. A. Biggs, J. E. Early and G. H. Hubbard are interested.

General Electric Company and Edison Lamp Works have removed their Los Angeles offices to the twelfth floor of the Corporation Building, 724 South Spring Street.

Nova Scotia Car Works, Ltd., Halifax, N. S., have gone into voluntary liquidation, being unable to effect a compromise at 50 cents on the dollar with its creditors or to secure financial assistance from the city.

Industrial Works, Bay City, Mich., have established a Philadelphia office in the Widener Building, where complete data and information can be obtained regarding this company's line of locomotive, wrecking and freight handling cranes, pile drivers, grab buckets, etc.

Lindsley Brothers, Minneapolis, Minn., have established a southwestern sales office in St. Louis, Mo., in charge of Frank O. Grayson, who will be located at 405 La Salle Building. This territory was formerly handled by the Grayson Railway Supply Company, St. Louis. The new office will cover the States of Missouri, Kansas, Oklahoma, Texas, Louisiana, Arkansas, Tennessee and southern Illinois.

Hess-Bright Manufacturing Company, Philadelphia, Pa., announces that the Standard Roller Bearing Company, Philadelphia, Pa., the New Departure Manufacturing Company, Bristol, Conn., Gurney Ball Bearing Company, Jamestown, N. Y., and the U. S. Ball Bearing Company, Chicago, have arranged for permanent licenses under the Conrad patent and are now fully authorized to manufacture under this patent.

ADVERTISING LITERATURE

Diamond State Fibre Company, Bridgeport, Pa., has issued a catalog describing and illustrating its fibre gears.

MacGovern & Company, New York, N. Y., has issued a catalog, dated Oct. 15, of their electrical and steam machinery, cars, car equipment, etc.

General Electric Company, Schenectady, N. Y., has issued a complete catalog describing and showing numerous illustrations of its line material and rail bonds for the construction of overhead trolley systems and track return for electric haulage in mining and industrial plants.

Mesta Machine Company, Pittsburgh, Pa., has issued a catalog analyzing the savings effected by its barometric condensers by means of vacuum produced, low first cost, low cost of power required by auxiliaries, freedom from shut down and repairs, and other advantages.

NEW PUBLICATIONS

Proceedings of Seventh Annual Convention Pacific Claim Agents' Association.—San Francisco, Cal., June 24, 25 and 26, 1915. 92 pages. Paper. Secretary, H. G. Winsor, general claim agent Tacoma Railway & Power Company.

This publication contains a list of officers and committee members of the Pacific Claim Agents' Association, as well as the complete and indexed proceedings of the convention held in San Francisco last June. This convention was reported in the *ELECTRIC RAILWAY JOURNAL* of July 3 and 10.

Comparative Railway Statistics—United States and Foreign Countries, 1912. Bureau of Railway Economics, Washington, D. C. 78 pages.

The purpose of this bulletin is to present comparative data regarding the steam railroad situation in the United States and in the principal foreign countries. The year 1912 is made the basis of comparison because it is the latest year affording essentially complete official data. Part I gives consecutively the tabular matter for the thirty-eight countries covered, while Part II brings together in tables the significant averages and ratios pertaining to railroad operation in the different countries. On account of the lack of a sufficiently approximate common basis, no figures for accidents are included.

Principles of Depreciation. By Earl A. Saliers. The Ronald Press Company, New York. 200 pages. Three-quarters leather, \$2.50.

The author has endeavored in this volume to discuss fully the subject of depreciation as a factor in valuation and income tax accounting. The theoretical and legal aspects of the subject are considered, for a knowledge of these are held to be necessary in the application of the mathematical formulas used in depreciation calculations. The various methods of determining depreciation are also described, with the algebraic formulas fully explained, specimen problems solved and graphic representations formulated. In an appendix the author presents a depreciation bibliography and an explanation of the use of logarithms.

While the reader may not at all times agree with the writer's theory of depreciation in valuation work, the book is a valuable source of general practical data. Its scope may best be shown by the following list of contents: Part I, Theory: Character of Industrial Plant; Analysis of a Hydroelectric Plant; The Plant Ledger; Depreciation Reserves vs. Depreciation Funds; Depreciation and Efficiency. Part II, Practical Applications; Regulation by Courts and Commissions; The Income Tax; Valuations; Land in Valuations. Part III, Determining the Depreciation Charge; Methods of Depreciation; The Straight-Line Method; The Reducing Balance Method; The Sinking Fund Method; The Annuity Method; The Equal-Annual-Payment Method and The Unit Cost Method.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK SATURDAY, NOVEMBER 13, 1915

No. 20

SUBSTANTIAL PROGRESS ON SAFETY CODE

After many preliminary conferences held in different parts of the country during the past year the work on the proposed national electrical safety code which is being fathered by the National Bureau of Standards has assumed much greater importance than heretofore through the two-weeks conference held recently in New York. The sessions were marked by earnestness and concentration of purpose and the delegations of the many interests represented contained many of the best-known specialists in the country. Among these interests were the American Electric Railway Association, the American Railway Association, the National Electric Light Association, the National Electrical Contractors' Association, the Association of Edison Illuminating Companies, the Electrical Manufacturers' Club, the Western Association of Electrical Inspectors, the General Electric Company, the Westinghouse Electric & Manufacturing Company, Gibbs & Hill, the Commonwealth Edison Company, and many other associations and commercial organizations. These names are mentioned to indicate the widespread interest in the movement. The proposed code is now being taken seriously by electric power producers, distributors and users. With their co-operation it is being modified to fit the complicated conditions of the business. Unquestionably with the New York conference the code entered upon a new stage in its career. In its revised form it will be much more applicable to commercial conditions than before and should have careful study by every electric railway company.

"RECALLED TO LIFE"—ELECTRIC RAILWAY BUYERS

Our trusty barometer of the industry, the JOURNAL rolling-stock column, like similar columns of our steam railroad contemporaries, seems to be beginning to return to a normal average after a prolonged anemia dating from August, 1914, at the outbreak of the European war. Car orders within the last month have shown a distinct increase both over the same period in 1914 and over any one previous month in 1915, except March, April and May, the regular heavy buying season. The larger passenger car orders recently placed include eighty cars for Cleveland, fifty for Detroit, twenty-five trailers and forty-eight articulated center-sections for the Boston Elevated Railway, thirty-one cars for the Wilmington & Philadelphia Traction Company and ten for the Buffalo & Lake Erie Traction Company. These, with a noticeably high average number of small orders, cannot betoken merely a mushroom activity, especially in view of a correspondingly large number of prospective purchases now current. The

most important of the latter include 311 new subway cars for the Interborough Rapid Transit Company, fifty cars for the Des Moines (Iowa) City Railway, fifteen for the United Traction Company of Albany, thirteen for the Toronto Civic Railway, twelve for the San Francisco-Oakland Terminal Railways and ten for the Trenton & Mercer County Traction Corporation. These prospects are all the more encouraging at this time when many other railways have not yet voted on their expenditures for the coming year. In fact, the period is closing wherein the supply man felt it necessary to pack up his traveling bag and rush off at the slightest wild-cat rumor of an up-state one-car purchase.

WHAT IS THE RAIL HEAD?

When ultimate wear limits for various plain-girder and grooved-girder rail sections are considered it is of prime importance to know what fixes the rail head. For plain-girder rail the head has been defined as that portion of the rail section above the intersection of the two lines forming the underside of the head. Some may venture the assertion that this area is not entirely available for wear, hence a horizontal line connecting the points of intersection of the gage and base lines should be used. Similarly there is a difference of opinion regarding the defined head limits of grooved-girder rail, in fact, if the head of this style of rail has ever been defined it is not a matter of record. In the article on girder and high T-rail renewals, printed in the issue of the ELECTRIC RAILWAY JOURNAL for July 31, page 179, the head of a grooved and tram-girder rail was considered as that portion above the rail-head base line extended to the groove. It was found that in many sections this line was tangent to the bottom of the groove. If that portion of the grooved and tram-girder rail head available for wear is limited by wheel flanges riding on the groove floor, then our limit appears logical. If the wheel flanges are permitted to cut into the groove floor until other complications dictate that a rail renewal should be made, then, perhaps, the rail head should be defined as that portion above the base line of the groove extended across the web. However, the amount of vertical head reduction fixes the depth the wheel flanges can cut into the groove floor, hence there does not appear to be any important reason for including more than the rail head proper. In any event a discussion of this subject would be interesting and a decision may only be reached by obtaining a consensus of opinion. If the rail heads for various sections can be defined, it will then be possible to discuss intelligently the ultimate permissible head reduction in definite terms.

ELECTRIFICATION ON THE PENNSYLVANIA

Electric operation of part of the suburban service at Philadelphia has been inaugurated by the Pennsylvania Railroad, as described on another page of this issue, primarily because of the unusual topographical conditions existing in the vicinity of the terminal in that city. Under steam operation the great Broad Street Station had reached the limit of its traffic capacity, not so much on account of an insufficient trackage in the station itself but rather because of extreme congestion of the approach tracks during the rush hours, this being emphasized by the necessity for handling a heavy suburban service in and out of the city. The terminal is of the stub-end type, and steam locomotives have no means of running around the strings of cars that they bring into the station, having to back out behind the trains and thus duplicate train movements over a restricted approach.

Electrically operated multiple-unit cars are, of course, free from any difficulties involved by the necessity for quick "turning" of suburban trains at the end of the run, and the electrification of some of the suburban lines offered an obvious alternative to a costly enlargement and rearrangement of the terminal. Electric operation, of course, has involved a considerable outlay of capital, but it has the advantage of bringing operating economies sufficient to pay a small interest charge on the investment—something that the extension of the station could not do. The relief that has been thus provided is equivalent to a reduction of 8 per cent in the total number of trains using the station, and this may be extended by electrifying other suburban lines from time to time as required, thus taking care of the normal growth of traffic for several years to come. Here, then, is a reason of sufficient importance to warrant the electrification in question, aside from any considerations of future replacements of steam by electricity.

Nevertheless, it is difficult to avoid the thought that the installation constitutes but a preliminary step in plans of vastly greater magnitude. Based upon the number of passenger trains arriving and departing from Broad Street Station in each hour of the day, there is little to choose between the load factors, or "service factors" (if such a term can be coined), of the suburban service and the through service on the main-line division west of Philadelphia. In addition, the daily total of through passenger trains on the main line to the West is nearly two-thirds of the number now operated by electricity, and on the division north of Philadelphia, which extends to New York, the density of the through service is actually greater than that of the suburban service that has just been electrified. Since both terminals of the latter division are now electrically equipped it would seem logical that they, at least, should be linked together eventually.

Of course, the electrification of through service does not result in all the reductions in operating costs and terminal charges that are inherent in the use of multiple-unit cars. But as opposed to this is the possibility, in trunk-line electrification, of economies through the electric operation of freight trains, which may be sand-

wich in between the peaks of passenger service to the betterment of the load factor at the power house and the service factor of the expensive distribution and contact system. Theoretically, this advantage should be an ample basis for clinching the argument that, if the suburban service can carry the investment of electrification, a through service of greater density should pay a handsome profit on it, but from the practical standpoint these savings are only a possibility, because their extent has not yet been definitely established.

That such savings are inevitable, of course, cannot be disputed, but until recently the question whether there will be 2 per cent or 20 per cent profit on the investment for an electrification that includes heavy freight service has had to be answered largely by calculations based upon generalities. This, it would seem, should cause hesitancy in undertaking an over-ambitious program in trunk-line electrification, and it is only natural that a thoroughly conservative company like the Pennsylvania Railroad would move with the utmost deliberation in a matter of so large a capital expenditure as that involved by the New York-Philadelphia project. There are, in fact, other divisions on the system where the electric operation of freight trains presents materially greater possibilities for savings, such, for example, as the mountain region of western Pennsylvania. Here the concentration of the large demands for power that are made by the heavy trains on the severe grades works especially to the advantage of electric operation, not only by cutting down transmission distance but also by making full use of the great potential tractive effort of the electric locomotive.

Therefore, it is quite likely that electrification of the through lines on the Atlantic Seaboard will come only after the economy of the electric locomotive in heavy freight service has been demonstrated by an installation on one or more of the grades in the Alleghenies.

ACCOUNTING FOR RENTS

To what extent rental charges should be included in operating expenses or among deductions from income seems to be a perplexing question—one upon which commission classifications show no unanimity of opinion. In general, two distinct methods are followed, as illustrated in the accounting regulations of the Interstate Commerce Commission. For steam railroads only office and minor equipment rents are included in operating expenses, whereas rents for locomotives, cars and other major equipment, trackage rights and leased roads are classed as deductions from income. In the case of electric railways, however, office and other minor rents, charges for joint tracks and facilities, and rents for equipment are deducted as operating expenses, and only rents for leased lines and equipment covered by the leases are charged among the deductions from income. This second method constitutes, we believe, a real advance in utility accounting, secured through the earnest efforts of electric railway accountants, and we do not favor giving it up for the steam-railroad method, as proposed by one speaker before the recent Accountants' Association convention in San Francisco.

When accountant-economists disagree as to the fundamental difference between "operating expenses" and "deductions from income," the only logical course is to forget the hair-splitting of economic thought and to realize that the purpose to be attained by an accounting classification should be the controlling factor in its construction. Now, to our mind, a classification should be so made as to indicate in the clearest and quickest way whether or not a utility is securing a reasonable return on the fair value of its property. By its property we mean all the property that is or would be covered by a valuation in a rate case. The difference between all the direct and indirect revenues from the activities of the company and all the expenses incurred in its maintenance and operation, forms the gross income or actual return upon the fair value of the property. It should be noticed that this term "gross income" is here used in its official technical sense according to the Interstate Commerce Commission classification and not in its somewhat popular sense of total receipts. In order, however, that the gross income figure, as defined, may justly be used to show the real return in comparison with a reasonable return on the fair value, it is necessary as a condition precedent that all rents be classified and accounted for in the income statement in a manner compatible with the way rented property is treated in the valuation total.

While the valuation practices of commissions are not sufficiently standardized to admit of exact generalities, it may be said that usually the valuation of a public utility would include all property that is owned outright or property that is used regularly in connection with the company's own property, of which a long-term lease is usually the concrete evidence, while property whose use is merely temporary or accidental or which is owned and maintained by another corporation primarily for its own purposes, would not be included. For example, rented lines with accompanying equipment held under a long lease would be included in the valuation as the non-owned portion of the operating property, while rented cars and miscellaneous equipment used on a daily basis, lines of other companies used under trackage agreements, office rooms in buildings not owned by the company, etc., would be excluded from the valuation. The difference between included and excluded property items gives the basis for making a distinction in accounting for rents. Rents on items that are excluded from the valuation total must be treated as operating expenses incurred in conducting the company's activities. Rents on items that are included, however, represent a portion of the gross income of the company, a part of the return on its fair value.

In other words, the gross income of a company with leased property consists of three parts. The first part represents the portion of the return that covers the foreign plant included in the valuation. The second and third parts represent the portion of the return upon the company's own property, part being the interest on the funded debt and the balance the stockholders' equity. If the rents for the valued foreign plant were included in operating expenses, the gross income would not show

the real return upon the company's fair value. Nor would such be the case if the various rents on non-valued property were classed as deductions from income. All rent items, therefore, should be treated as operating expenses with the exception of the permanent charges on property held under long leases. This is the present electric railway practice, and we would oppose any reversion to the steam railroad method. If any change is made, it should be by the latter carriers. For those whose economic souls are horrified by classing rents on non-valued property with "true" operating expenses, a concession might be made by combining such items with taxes, etc., as a supplementary group of operating costs, but the main point is to have them deducted before the gross income figure is obtained.

THE AUTOMOBILE NUISANCE

We had occasion last week to refer in these columns to the competition which electric railways suffer from private automobiles, and also to the higher taxes which electric railway companies, in common with all taxpayers, have to pay to provide good roads for pleasure automobile driving. There is another and perhaps an even more serious burden which automobiles are placing upon the public in general and upon the railways in particular which demands radical reform. We refer to the reckless driving of high-powered cars over electric railway crossings and on public highways at speeds which should not be permitted except on a protected right-of-way. This driving is done not only by men who show an utter disregard of even the most elementary safeguards but by minors who would never be permitted in charge of the much more safe operation of an electric car.

If these people who thus run amuck in the public streets risked their own lives only it would not be a matter of such vital importance. But they endanger also, and to a much greater degree, the lives of all other occupants of the streets, and accidents are becoming so common as a result of this practice as to call for stern repressive measures. We have only to instance the testimony given on the recklessness exhibited by automobile drivers at the last two meetings of the Claims Association and the efforts of the Long Island and other railroads to protect their grade crossings from accidents with automobiles to show that a real evil exists. We are glad, therefore, to chronicle this week the fact that the subject is to be taken up seriously under the direction of the Public Service Commission for the Second District, New York, by a committee composed of electric railway managers, representatives of the commission and officials of three of the State automobile associations.

The committee has a task of great magnitude ahead of it. Those whom it will have to control have had freedom so long to do about as they pleased, but we hope that the committee will recommend to the Legislature severe penalties for the misuse of the highways and the neglect of safety precautions at electric railway crossings which has been so common on the part of automobile drivers since the advent of the high-powered car.

PHILADELPHIA-PAOLI ELECTRIFICATION—VIEW OF CROSS-CATENARY OVER NINE TRACKS, SHOWING READY VISIBILITY OF SEMAPHORE SIGNALS NOTWITHSTANDING COMPLICATED OVERHEAD CROSS-OVERS

Philadelphia-Paoli Electrification

Operation of This 20-Mile Suburban Electric Zone Has Been Begun by the Pennsylvania Railroad with Multiple-Unit Cars Having Repulsion-Starting, Series Motors, Single-Phase Power Being Supplied from an 11,000-Volt Catenary Contact System Carried on Cross-Wire Bridges

The recent establishment of regular suburban service over the single-phase electric zone of the Pennsylvania Railroad at Philadelphia marks an important step in the electrification plans of that company and makes a description of the details of the installation particularly timely. At present the electrified tracks extend only from the Broad Street Station in Philadelphia to Paoli, 20 miles to the west on the main line, but work is under way also on the electrification of the Chestnut Hill line, 12 miles northward from Philadelphia. Both of these installations, as outlined in an account that was published exclusively in the *ELECTRIC RAILWAY JOURNAL* for April 18, 1914, were projected primarily to relieve congestion at Broad Street Station, and it is expected that they will take care of the normal growth of traffic for the next seven or eight years.

For the Philadelphia-Paoli service the rolling stock consists of ninety-three standard all-steel cars, eighty-two of which are for passenger service, nine for combined passenger and baggage service and two for combined baggage and mail service. All are motor cars, as no trailers are operated on the electrified suburban runs. Trains of from two to seven cars are operated regularly, the average acceleration on a straight level track being approximately 1 m.p.h.p.s. up to 30 m.p.h., with a balanced speed of 60 m.p.h.

ELECTRICAL EQUIPMENT ON CARS

The equipment of each car consists of two 225-hp. Westinghouse single-phase, air-blast-cooled motors mounted on one truck. Automatic acceleration is provided with the control, and automatic multiple-unit electro-pneumatic brake equipment has been installed. All of the main pieces of the electrical apparatus are mounted on one end of the car and the brake equipment

is mounted at the other end. This gives an uneven weight distribution on the two trucks, approximately 60 per cent of the total car weight being on the driving wheels. The cars are designed for double-end operation.

The motors, which are connected in series, are started and operated up to approximately 15 m.p.h. as repulsion motors, with the auxiliary or compensating field, the armature and the main field in series. With these series connections the armature is short-circuited through resistance. Resistance is also inserted in series with the motors on the first step and is cut out on the second step. The third step changes the connections to energize the auxiliary field from one portion of the transformer and the armature and main field, connected in series, from another portion of the transformer, thus affording doubly-fed connections. The armature short-circuit is removed when the motors are operating with the double feed. Subsequent steps in the control are obtained by increasing the motor voltages.

Power for the control system is supplied in the usual manner from a motor generator set, which is in parallel with a storage battery, through a control plug, and the movement of the master controller handle to the right or to the left energizes the proper control circuit for forward or for reverse movement of the train. The closing of the unit switches is governed by a current limit switch which has two settings, one for repulsion connections of the main motor and the other for the doubly-fed connection, the change in the limit setting being obtained by energizing a battery coil on the limit switch. All of the switches are interlocked through the No. 9 switch, so that no switches can close until the No. 9 switch is closed. A small knife-switch is placed in the control circuit of the No. 9 switch, and opening this switch cuts off the supply of current to the main

PHILADELPHIA-PAOLI ELECTRIFICATION—STANDARD CATENARY CONSTRUCTION ON TANGENTS

motors. Ten control wires between cars are necessary to operate cars in trains, one of these wires performing in the dual function of the third operating wire and the "trolley unlock" wire.

Each motor has a continuous rating of 200 hp. when ventilated with 1200 cu. ft. of air per minute. The armature is of standard construction, the commutator and the laminations being mounted on the spider, the former being undercut 1/16 in. The armature is wave-wound and cross-connected, and no resistance leads are used between the windings and the commutator. The field windings consist of two entirely independent sets of coils, one being the main field circuit for producing the effective magnetic field, and the other the auxiliary or compensating winding which balances the armature reaction on the field. In addition, the latter has a neutralizing effect on the sparking voltage. The field consists of six poles, the coils being of copper bars suitably insulated, connected at the ends by straps.

Flexible gears are used, the gear ratio being 24 : 55. Each gear is made up of a rim on which the teeth are cut, a center, a cover plate and spring details. The rim is spring-mounted on the center, the periphery of the center and the cover plate acting as the bearing surfaces for the rim.

One pantograph of especially light construction is installed on each car. The springs which raise it are designed to give flexibility to the framework, so that in operation a slight dragging of the contact shoe takes place, resulting in its following the wire much closer than with a rigid framework. In addition, the shoe is spring-mounted on the framework. The pantograph is provided with four insulators suitable for 11,000-volt service, and the whole mechanism is mounted on a base provided with insulators similar to those of the pantograph, thus providing double insulation. The pantograph is lowered and unlocked by air at 70-lb. pressure, a small hand pump being provided for unlocking it when no air pressure is available.

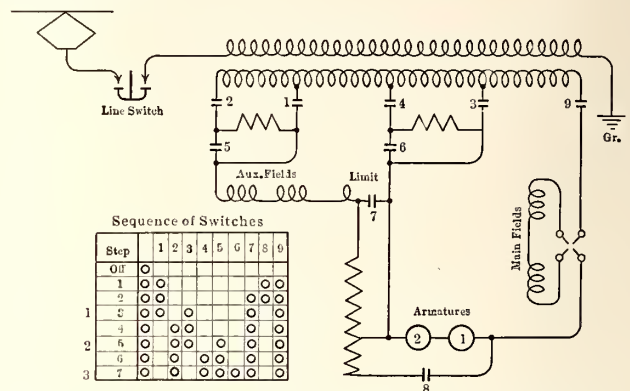

The safety-first principle has been carried out in the provision of a grounding device of novel design. Steps for mounting to the roof are provided at one corner of the car only, and a lever is placed on the roof at this corner. When one climbs to the top of the car this lever is thrown up, thus locking the trolley in the down position and grounding the entire framework.

REPULSION MOTOR PRINCIPLES

In American practice it has not been customary heretofore to short-circuit the armature of an a.c. commu-

tator motor, and the adoption of this plan in the Philadelphia-Paoli electrification for even a part of the accelerating period is of more than passing interest.

The invention of the repulsion motor is due to Prof. Elihu Thomson, who more than twenty-five years ago developed the scheme shown diagrammatically at A in the diagram on page 983. This diagram represents a two-pole motor having field coils wound on laminated

PHILADELPHIA-PAOLI ELECTRIFICATION—SCHEMATIC DIAGRAM OF REPULSION MOTOR CONNECTIONS

field cores and connected to an a.c. supply line, an armature with brushes and coils connected to the commutator bars as in a d.c. motor, and a connection short-circuiting the brushes. The brushes are shifted from the normal position as shown.

If the brushes were placed under the middle of the field poles the magnetic field flux would pass transversely through the spaces inclosed by the armature coils and a current would flow between brushes, because the passage of alternating magnetic flux through a loop of wire sets up current flow in the wire, in accordance with the well-known principle on which a transformer operates. The short-circuiting of the brushes would permit a current that would be limited only by the impedance of the electric circuit. This flow of current in the short-circuited coils would set up torque, because each conductor would be within a magnetic field. No net torque would be produced, however, because the current would flow in the armature conductors in opposite directions on opposite sides of the brushes and the torques produced on the two sides of the armature would balance each other. But if the brushes are shifted as shown in diagram A, the bal-

PHILADELPHIA-PAOLI ELECTRIFICATION—VENTILATED REPULSION MOTOR—FLEXIBLE GEAR WITH COVER PLATE REMOVED TO SHOW SPRINGS

ance is disturbed and net torque is produced, because the torque of the windings on one side of the brushes overcomes the lesser torque of the windings on the other side.

The principle of the repulsion motor can be explained also by means of the second diagram, shown at B. This motor is equivalent in every way to the preceding. Here the winding is represented as divided into two parts, main and auxiliary coils, one furnishing the field for the production of torque and the other inducing the armature current. It is evident that the compensating winding used in the a.c. series motor, shown crudely in principle in C, could be used as an

PHILADELPHIA-PAOLI ELECTRIFICATION—DIAGRAMS ILLUSTRATING REPULSION MOTOR PRINCIPLES

auxiliary winding, to produce a shifting of the magnetic field equivalent to a shifting of the brushes. A series motor can therefore be readily adopted to repulsion starting.

In the Philadelphia-Paoli motor the original scheme of Professor Thomson is still further modified by the addition of the series connection of armature and field. The armature and field windings are therefore both "conductively" and "inductively" connected. To the extent, however, that current is induced in the short-circuited armature because of the transformer effect of the auxiliary winding it is a repulsion motor. On account of the low resistance of the armature short-circuit the induced current during the starting period has a high value.

ELECTRO-PNEUMATIC BRAKE

The air-brake equipment on the cars is designed to be used either in steam or electric service, and differs

from the ordinary pneumatic brake in that the brake pipe reduction is made on each car by means of electric control instead of being made entirely with the engineer's brake valve. The addition of electric control to the pneumatic brake does not change its function in any way, but shortens the time required to get the brakes applied on all cars.

The motorman's brake valve contains both electric contacts and pneumatic parts, the electric portions being mounted above the pneumatic portions. There are six positions: (1) The release and running; (2) the electric holding; (3) the handle off; (4) lap; (5) service, and (6) emergency. The first-named position is to the left and in this position all train brakes are released and the system charged. The "electric holding" position, as the name implies, holds the train brakes through the electric control system, but recharges the system. Pneumatically this position is identical with the release and running position. All ports are closed in the "handle off" position, and the handle may be removed, and in the "lap" position the ports are also closed. The "service" and "emergency" positions are the regular ones for setting in service or emergency applications. For the service application a limiting valve is provided in conjunction with the brake valve, and this allows a maximum reduction of 20 lb. in the brake pipe. A small cut-out plug is provided for cutting out the electric operation when desirable.

The universal valve is built up of five different portions: (1) The pipe bracket, which contains a quick-action chamber and a quick-action closing chamber for use in emergency application; (2) the equalizing portion, which contains the moving parts employed in service and emergency operation; (3) the quick-action portion, which contains the moving parts employed in producing quick action; (4) the high-pressure cap, which contains the parts employed in securing a high cylinder pressure in an emergency application, and (5) the magnet brake portion, which contains the magnet valve for electric control of brake operation, an emergency switch, and a cut-out cock. This universal valve controls the charging of reservoirs, the application of brakes and the release of brakes. It is mounted at the side of the car near the trailer truck.

The main reservoir pressure is 100 lb. and the brake-

PHILADELPHIA-PAOLI ELECTRIFICATION—PANTOGRAPH WITH DOUBLE INSULATION ON CAR ROOF—END VIEW OF STANDARD CAR

PHILADELPHIA-PAOLI ELECTRIFICATION—STANDARD MULTIPLE-UNIT CAR

pipe pressure is 70 lb. To permit the operation of these equipments in steam service, where the brake-pipe pressure is 110 lb., without making adjustment, a main reservoir by-pass and limiting valve is employed. By its use the same cylinder pressure is secured in making an emergency application in either steam or electric service, although the operation of the universal valve is the same for either. In steam operation the pipe line, which is used as a main reservoir line in electric service, is used as a signal line.

Eight wires, including the battery plugs, and ground wires are required for the electric control of the brakes, for governor synchronizing and for train signaling. Since the two battery wires are common to the brake control and the unit switch control, a seven-point receptacle and jumper is used to carry the brake control wires. Two receptacles are mounted on each end of the car and on each side of the coupler, and these are connected in multiple in the same way as the nine-point receptacles for the unit switch control.

CAR-INSPECTION BUILDING

A very substantial and completely-equipped car-inspection building has been constructed at the Paoli yard.

This has been planned to serve not only the cars required for the present electrification, but also for the cars required by other divisions when electrified. Adjacent to the inspection building proper is a small service building, which contains boilers for heating, locker and wash rooms, air compressors and motor generators for supplying power for the tools and signals. Current for the operation of the motor generator sets is obtained from the Paoli substation, in which are located two 11,000/2200-volt transformers.

POWER SUPPLY AND TRANSMISSION

Power for traction purposes is purchased from the Philadelphia Electric Company and is generated in its main power station at Christian Street on the easterly bank of the Schuylkill River about 1 mile south of the West Philadelphia passenger station. It is delivered to the railroad company at a substation at Arsenal Bridge, on the westerly bank of the Schuylkill River, opposite the main generating station, the connection between the power house and the substation consisting of armored submarine cables under the river.

While the present service is on one phase only of the power company's three-phase generating system, the

PHILADELPHIA-PAOLI ELECTRIFICATION—SHOP AND INSPECTION BUILDING AT PAOLI

PHILADELPHIA-PAOLI ELECTRIFICATION—HALF PLAN OF INSPECTION BUILDING SHOWING ARRANGEMENT
OF SHOP SECTION

plan is to supply succeeding electrifications from the remaining phases. The power is delivered to the railroad company's substation at 25 cycles and 13,200 volts. Here it is stepped up to 44,000 volts, and by means of duplicate single-phase overhead circuits is transmitted to the step-down substations. Special provisions have been made by the Philadelphia Electric Company to balance this single-phase load as well as to correct for the relatively low power factor in order that the full three-phase capacity of the generating units may be available.

From the Arsenal Bridge substation four 44,000-volt single-phase transmission lines extend to the West Philadelphia substation. These four lines will tee into the West Philadelphia substation and two of them continue on to the Bryn Mawr and Paoli substations. The other two lines will later go to the Chestnut Hill substation. The four transmission lines are carried on brackets on the side of the elevated structure between the Arsenal Bridge substation and the West Philadelphia substation, but beyond the West Philadelphia substation they are carried on the catenary supporting structures. Along the right-of-way the lines are carried on both sides of the tracks.

The transmission lines are No. 00, seven-strand, hard-drawn copper wires. They are spaced 5 ft. apart where the two wires of a single-phase feeder are on the same cross-arm, and where there is more than one circuit on a pole the vertical spacing is 3 ft. 6 in. The lines are protected by a 3/8-in. steel ground wire on the top of the poles. Where the transmission lines pass under

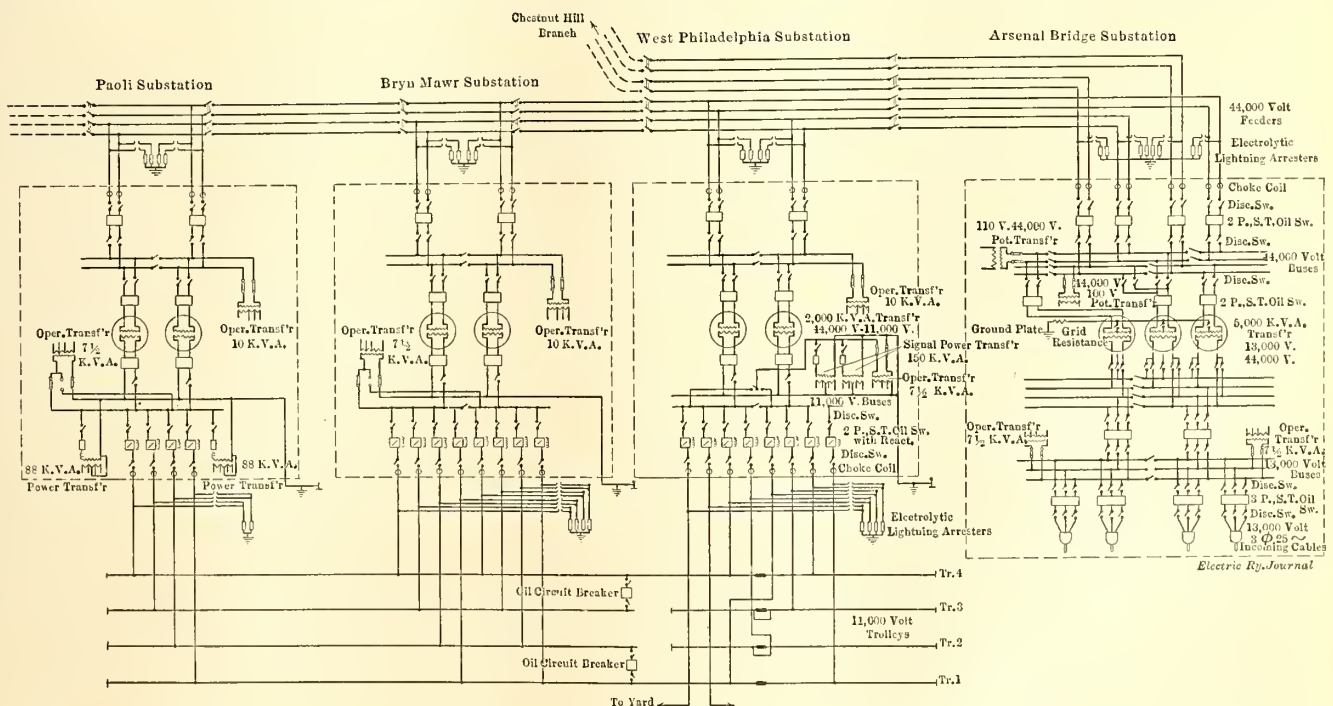

PHILADELPHIA-PAOLI ELECTRIFICATION—CROSS-SECTION
OF INSPECTION BUILDING

highway bridges the ground wire is dead-ended on the bridge structure and the wires carried on post-type insulators.

Where the lines pass under the Belmont and Girard Avenue bridge, which approaches tunnel conditions on account of its width, they are covered with rubber and varnished cambric insulation. The joints between the bare and insulated wire either side of the bridge are made outside of porcelain sleeves filled with compound. The wire is continuous throughout the sleeve, the insulation being tapered off inside the sleeve.

At the Arsenal Bridge substation the lines are protected by relays which operate on overload and on an unbalanced load on either side of the circuit caused by a ground. In the other substations the relays operate only differentially, and in case of a ground between substations, the circuit on which the trouble occurred

PHILADELPHIA-PAOLI ELECTRIFICATION—GENERAL WIRING DIAGRAM FOR SUBSTATIONS AND TRANSMISSION SYSTEM

would be cut out first in three of the substations, and finally at the Arsenal Bridge substation. Overload relays are provided in the 13,200-volt lines at the Philadelphia Electric Company's power station, and there are reverse current relays in these feeders in the Arsenal Bridge substation.

The pin-type porcelain insulators used on the transmission lines are 8 7/16 in. high and 12 in. in diameter, made up of four parts. These insulators withstand tests for dry flashover at 165,000 volts, for wet flashover at 120,000 volts, and for puncture at 250,000 volts. After erection the complete transmission lines were tested out to ground at a potential of 66,000 volts, or far in excess of the working pressure.

SUBSTATIONS

Transformer substations are provided at suitable points along the 93 track-miles of electrified railroad for stepping up the voltage for transmission and for reducing it to that required in the contact conductors. These are substantial fireproof brick buildings adjacent to the tracks. Electrolytic lightning-arrester equipment and high-tension-feeder sectionalizing switches are located on the roof, the busbars and switching equipment on the second floor, and the transformers on the ground floor. Space is provided in all substations for 100 per cent increase in capacity. The installed capacity of the substations are as follows:

Arsenal Bridge	Three 5,000 kva. step-up transformers
West Philadelphia	Two 2,000 kva. step-down transformers
Bryn Mawr	Two 2,000 kva. step-down transformers
Paoli	Two 2,000 kva. step-down transformers

The transformers in all substations are of the 25-cycle, single-phase, oil-insulated, water-cooled type, with the usual voltage taps on the primary and secondary coils. They were furnished, together with the switching equipment, by the Westinghouse Electric & Manufacturing Company. The cases are mounted on wheeled trucks, and in each substation a transformer truck and chain hoist are provided for handling the transformers and cores. Thermostats have been provided to operate an alarm bell in case of high temperature in the transformers. Oil filtering and drying apparatus is located in each substation.

The neutral point of the high-tension winding of the step-up transformers is grounded through a grid re-

PHILADELPHIA-PAOLI ELECTRIFICATION—LIGHTNING ARRESTERS AND HIGH-TENSION WIRING ON SUBSTATION ROOF

sistance, thus limiting the potential to ground from either side of the 44,000-volt transmission lines to 22,000 volts. All 44,000-volt circuits are connected to the buses in the various substations through oil circuit breakers with boiler-plate tanks arranged along the floor without barriers.

The circuit breakers of the 11,000-volt and 13,200-volt circuits are of the oil type, those on the 11,000-volt trolley circuits having two poles with a reactance connected across one pole. The circuit breakers are automatic and remote controlled.

Open buses mounted on insulators and carried by pipe framework are used throughout. In general, all power wiring is bare, and copper tubing or solid wire is used, sufficient clearance having been provided so that no barriers are required between buses or wires except in the case of the incoming cables from the Philadelphia Electric Company in the Arsenal Bridge substation. Control, instrument and lighting wires are rubber insulated and run in conduits. The 44,000-volt and 11,000-volt buses are sectionalized in each station, normal operation being carried on with these bus-disconnecting

PHILADELPHIA-PAOLI ELECTRIFICATION—VIEW OF SUBSTATION SHOWING ARRANGEMENT OF 44,000-VOLT TRANSMISSION CABLES AND 11,000-VOLT FEEDERS

PHILADELPHIA-PAOLI ELECTRIFICATION—INTERIOR VIEW OF SECOND FLOOR OF TYPICAL SUBSTATION SHOWING BUSBAR AND SWITCHING EQUIPMENT

switches closed, and in the step-down substations one transformer is connected to each side of the bus. One leg of the 11,000-volt side of all step-down transformers is connected to a bus through a disconnecting switch, this bus being connected to the track rails.

Low-voltage power for the opening and closing of oil circuit breakers is obtained from the 25-cycle buses, but 60-cycle power is also provided in all substations to trip circuit breakers in case of the loss of the 25-cycle traction power.

Except in the West Philadelphia substation, where the power director, or system operator, is located, there are no attendants. A switchboard with the necessary instruments, controllers and indicating lamps is provided in signal towers near the Arsenal Bridge, Bryn Mawr and Paoli substations. This board is connected with the board in the substation through a control cable, and the opening and closing of circuit breakers is done by the interlocking plant operator in the tower. Telephones are provided in all substations and in the signal towers controlling them, so that the power director is in constant touch with all substations and tower men. An alarm bell connected to the thermostat on the transformers is located in each signal tower.

CATENARY SYSTEM

One of the notable features of the installation is the use of what are called the "tubular cross-catenary bridges" for carrying the contact wires. This construction was described in detail in the *ELECTRIC RAILWAY JOURNAL* for April 18, 1914. In brief, it consists of National tubular steel poles on either side of the tracks grouted into concrete foundations and anchored by double guys that are made of steel rods with turnbuckles. Spanning the tracks between the poles are two cross wires that form a cross-catenary support for the longitudinal wires.

The cross wires are of Roebling's extra-high-tension galvanized-steel strand, the upper strand usually being $\frac{3}{4}$ in. and the lower one $\frac{1}{2}$ in. in diameter. Both are socketed at each end, and at one side a turnbuckle is

installed to permit of adjustment. The top and bottom cross-wires are joined together by means of a vertical $\frac{3}{4}$ -in. rod and suitable malleable iron clamps at the points where insulators carrying the longitudinal wires are located. Each insulator consists of three suspension-type units made by the Locke Insulator Manufacturing Company, the porcelain being 8 in. in diameter and the flashover value of the three being many times that of the line voltage.

The cross-wire bridges are located about 300 ft. apart on tangents, but are closer on curves, the exact spacing depending upon the degree of track curvature. Insulators are suspended over the center of each track, being offset toward the outside of the curves. The main messenger wire, which is strung out and suspended from the insulators, is a $\frac{1}{2}$ -in., extra-high-tension, seven-strand, double-galvanized steel cable, having a sag of 5 ft. in a span of 300 ft. At intervals of approximately 1 mile this messenger is socketed and dead-ended on one of the heavy structural signal bridges which are spaced about $\frac{1}{2}$ mile apart. The messenger is insulated from the signal bridge by using two or more sets of three-unit suspension type insulators, these insulators being similar to those used for suspending the messenger from the cross-wire and other bridges.

Every 15 ft. on curved track and 30 ft. on tangent track a hanger supports the lower two wires from the messenger wire. The top one of these two wires, called the auxiliary messenger, is of No. 0 round copper, and its purpose is to give suitable current capacity to the system. The contact or trolley wire is a No. 000 grooved phono-electric conductor furnished by the Bridgeport Brass Company. Both wires are carried in a vertical plane, generally about 22 ft. above top of rail, except where they drop down to pass under an overhead highway bridge having insufficient clearance to permit this height.

In the terminal division, which includes the first 5 miles from Broad Street Station, and where the dense steam locomotive traffic causes a great deal of smoke and corrosive gas, a non-corrodible tube hanger is used.

PHILADELPHIA-PAOLI ELECTRIFICATION—TYPICAL CATENARY CONSTRUCTION ON SHARP CURVE

The hanger tube, which is 9/16 in. outside diameter and made of No. 18-gage metal, is fastened to a casting at each end by rolling or crimping the tube into grooves turned in the shank of the casting. Some of the tubes are of Monel metal, while others are composed of a bronze mixture containing 90 per cent copper.

On the Philadelphia division, where there is relatively less steam traffic, wrought-iron strap hangers 1 in. wide by 3/16 in. thick are used. The main messenger cable at the hanger clip is protected from corrosion by a collar of zinc inside of the annealed brass or Monel metal clip, which is bolted to the hanger strap. The flat-strap hangers, which have a quarter turn in them to minimize the area exposed to the wind in the direction crosswise with the tracks and to resist bending when placed on curves, are bolted to the castings that clamp the auxiliary messenger and trolley wires.

On tangents the castings at the bottom of the hangers hold only the auxiliary messenger, and the trolley wire is, in turn, supported from this auxiliary messenger every 15 ft. at points equidistant from the hanger. This insures a very flexible or smooth riding trolley wire.

On curves the two lower wires do not hang directly beneath the messenger, but the whole system swings into a curved plane until a balance is reached between its weight and the tension in the wires. The tensions in both the auxiliary messenger and trolley wires are selected so that in extreme hot weather there will be enough tension to prevent sagging, and yet in extreme cold weather the contraction will not cause stresses beyond the elastic limit.

The catenary system over each of the four main tracks is separated electrically from those over the other tracks, and trolley sectionalizing points with switches are provided at all cross-overs so that sections of the line may be temporarily cut out of service for repairs. On the main running tracks sectionalizing is of the "air-break" type, wherein the two ends of the trolley wire are spread apart, each end being lifted up at a different point, and an insulator is placed in each wire at a point above that where contact is last made with

the pantograph. Thus, while the pantograph is making contact with one wire the other is lifted up and sectionalized.

At cross-overs and in yards the trolley wires are sectionalized by means of wood stick insulators that have runners or gliders on each side, these being so arranged that, while the pantograph always makes contact with at least one of the runners, they are separated electrically. The switches are of the disconnecting knife type, mounted on top of the wood section insulators, and are operated from the ground by means of a long impregnated wooden switch stick.

An interesting detail in the erection of this catenary work was the use of cars, the top platforms of which could be readily raised or lowered by means of chain hoists. The cars were also equipped with removable outriggers so that in the four-track section the work could be completely erected over one of a pair of tracks without in any way interfering with the regular steam traffic on this track.

The electrified route is crossed in many places by overhead highway bridges of restricted height, and in such cases, where it was impracticable to raise the highway bridge, the trolley wires had to be carried underneath, each catenary system being steadied by being held with post-type insulators supported by brackets on the bridge structure. The transmission wires on either side of the main line tracks are also carried down underneath the bridge and supported from the bridge structure by insulators, the metallic brackets carrying the insulators being carefully bonded together and earthed by means of ground plates. To prevent pedestrians on the bridges from contact or interference with the wires, there have been erected solid wooden fences, either vertical or inclined, of sufficient height to shut out all view of the wires. To protect the trainmen, general orders have been issued that no employees are allowed on top of any car in the electrified zone.

TRACK-BONDING, SIGNALS AND TELEPHONES

Throughout the electric zone the rails are bonded with pin-type expanded-terminal bonds furnished by the

PHILADELPHIA-PAOLI ELECTRIFICATION—TYPICAL ANCHOR AND SIGNAL BRIDGE LOCATED AT END OF CURVE; TRACK-BOOSTER TRANSFORMERS MOUNTED AT BOTH SIDES

American Steel & Wire Company, the Electric Service Supplies Company and the Ohio Brass Company. One end of the bond has a terminal solidly welded to the bond while the other end has a soldered terminal. This enables the bond to be installed by being slipped back of the splice plate without the necessity of removing the plate. Each rail joint has two No. 0 bonds, but through the interlockings only one rail of each track is bonded, although all of the traction rails are connected together.

To minimize the inductive effect of the traction currents on adjacent telephone and telegraph wires, series or track-booster transformers have been mounted on the signal bridges at approximately 1-mile intervals. Details covering the method of operation of this scheme were published in the *ELECTRIC RAILWAY JOURNAL* for May 2, 1914. The need for this equipment, however, applies only to commercial circuits in towns along the route, because the railway company has had all wires along the right-of-way installed underground for some time, this action having been taken subsequent to the heavy sleet storm of March, 1914, which did a great deal of damage to overhead wires throughout the Eastern States.

In the electrified portion of the Philadelphia division, about 15 route-miles of four-track line, the old form of semaphore signals have been replaced by position-light signals made by the Union Switch & Signal Company. With these different rows of five lights each indicate the various positions of clear, caution and stop, the mechanical operating device being replaced by relays and Kerite wire. The signals are operated by 60-cycle current track circuits in the usual manner, but to nullify the induction effect of the traction current in the signal circuits of adjacent tracks, resonant shunts have been installed which permit the local induced currents to be shunted around the track relays and thus avoid disturbing the signal circuits.

In addition to the usual telephone facilities between substations and between the electric power director and the train dispatchers, there are permanent telephone boxes located at every signal bridge, approximately $\frac{1}{2}$ mile apart, throughout the electrified zone. In consequence prompt and reliable intercommunication by telephone is possible between any parts of the whole system.

ENGINEERING AND CONSTRUCTION

The design and construction of the electric installation was carried out by Gibbs & Hill, consulting electrical engineers for the railroad company, in co-operation with the engineering department and the officials of the railway. All construction except that of the substation buildings and inspection building, which were covered by outside contracts, was carried out by a specially organized force. The mounting of the multiple-unit car equipment on the cars was carried out by the railroad forces at the Altoona shops under the direction of the motive power department, and the signal equipment and the changes in telegraph and telephone lines were designed and installed under the direction of the signal and telegraph departments respectively.

Surprise Tests on the New Haven

During the first six months of 1915 the New York, New Haven & Hartford Railroad made a total of 12,899 surprise tests covering signal observance by trainmen, and these developed a percentage of 99.75 that were perfect. In the period covered by the tests 31 per cent fewer employees were killed on the New Haven Railroad than in the corresponding six months of 1914, twenty-two employees losing their lives in the first six months of 1915, and thirty-two in the first six months

of 1914. No passenger was killed by train accidents on the New Haven Railroad during the period covered by the tests.

New Station at Eugene

Colonial Station Built by the Oregon Electric Railway at a Cost of \$50,000

The accompanying views show the interior and exterior of a new station recently completed at Eugene, Ore., on the line of the Oregon Electric Railway. This station is 122 miles from Portland, the northern terminal of the Oregon Electric Railway. Although the station is much more elaborate than would be found in the East in a

INTERIOR OF PASSENGER STATION AT EUGENE

city the size of Eugene, it is not greatly different in appointments to several other passenger stations on the line of the Oregon Electric Railway.

The building is of the Georgian Colonial type with red brick and stone trimming. The interior is a buff terracotta tone, the walls being finished in rough plaster. Quartered oak is used in the finishing, the walls being panelled. The general waiting room is 32 ft. x 56 ft.,

NEW STATION AT EUGENE, WITH TWO-CAR TRAIN

the baggage room is 28 ft. x 30 ft., and there is an express room 28 ft. x 28 ft. The floors of the main waiting room are of marble terrazzo.

A view of one of the limited electric trains on the Oregon Electric Railway, with a standard coach for the first car and an observation coach for the second car of a two-car train, is shown standing in front of the station.

Conference on Valuation

Delegates in Philadelphia in First Four Sessions Discuss Questions Dealing with the Reproduction Theory of Valuation, Original Cost as a Valuation Basis, Franchise Values and Land Values

The Conference on Valuation was held in Philadelphia, Pa., on Nov. 10, 11 and 12 under the auspices of The Utilities Bureau. Beginning with Wednesday evening, seven sessions were held, each one being devoted to some subject of particular importance in valuation work. These, in their successive order, were as follows: "The Reproduction Theory," "Original Cost," "Franchise Values," "Valuing Land," "Depreciation," "Going Value" and "Valuation and the Future of Public Utilities." The report below deals with only the early sessions, the others remaining to be covered in a later issue.

THE REPRODUCTION THEORY

The opening session of the conference on the reproduction theory of valuation was called to order Wednesday evening with Hon. Rudolph Blankenburg, Mayor of Philadelphia, as presiding officer. The opening remarks were made by Morris L. Cooke, director of public works, Philadelphia, and acting director of The Utilities Bureau, who described the formation and development of this bureau and its intention to take up questions similar to that of valuation at future conferences. He further stated that nearly all discussions between cities and municipally-owned utilities on the one hand and privately-owned utilities on the other are of interest to a middle group. This group, however, does not consist of the actual investors in the private companies or their actual operators, but rather of those who market their securities. He believed that disputed questions can be settled harmoniously between investors and public interests without there being much at issue. These parties would probably select the amount of cash actually invested as the best criterion of fair value, but the other interests, unsatisfied with this basis, have stirred up much confusion on the subject.

MR. ESHLEMAN'S CRITICISM OF REPRODUCTION THEORY

After Mr. Cooke's remarks the first address on the reproduction theory of valuation was delivered by John M. Eshleman, Lieutenant-Governor of California and former president California Railroad Commission. Mr. Eshleman first discussed the term "threat price," or that price which is determined by the amount of the commodity possessed by the prospective purchaser and has no relation to the cost of production. In competitive industries the tendency to exact a threat price is regulated within reasonable bounds by actual or potential competition. All monopolies possess the power of imposing a threat price and of producing a threat value to the patron. As soon as it is admitted that public utilities or natural monopolies should not be destroyed as such monopolies, then it becomes necessary to devise a method of preventing them from imposing a threat value.

Mr. Eshleman then took a supposed valuation of a gas property and showed how every element of threat value that the monopoly character of the enterprise makes possible is included, and the reproduction value is based upon what it would cost another or the government agency itself to build a similar plant entirely independent of the need of such a duplicate plant. This, to his mind, forms the entire basis of the reproduction theory of valuation. Monopoly lawyers and engineers contend for a price based upon an analogy with condi-

tions existing under competition, and instead of measuring the price by what has been sacrificed or done, they want all that the public can be forced to give rather than build an alternative plant or induce a second utility to build such a plant. Mr. Eshleman believed that there are two absolute bars to such a theory. The one is the impossibility of imagining the monopoly never to have existed and the conditions which such monopoly has produced to be still there. The other is the impossibility of having the condition of the property of a monopoly affected by a duplicate competing agency and still remain unchanged.

As to particular phases of the reproduction method, Mr. Eshleman criticised the inconsistency of adopting the historical method with reference to some elements and rejecting it for others. He also deplored the logic of those who urge that original cost should always be used even in their reproduction theory when it would give more than present cost to reproduce, and at the same time repudiate costs of land and similar property when such costs are less than the present market value.

While opposed to the general reproduction theory, Mr. Eshleman stated that the historical method of reproduction is extremely valuable in supplying secondary evidence of original cost when the primary evidence is lost.

The proper amount upon which the utility should be permitted to earn in each case is an amount to be determined only by the governmental authority after consideration of all the facts, historical and otherwise, all the engineering and accounting data and everything to be learned about the utility. A general set of rules is impossible for existing enterprises, but in the future a liberal return upon the investment actually made would be all that is justified.

When government is dealing with monopoly it must of necessity deprive such monopoly of the power of taking all that it can get from its patrons. In this case the government must determine as a substitute what the monopoly ought to receive, and in this the safest and most just guide is what the agency has sacrificed and what service it has performed for the public. A different rule should obtain for the future than for the past. For the past there should be allowed such a valuation basis for earnings as equitable considerations warrant. The investor should receive that treatment which he has a right lawfully to expect and which, if possible of determination, accords the minimum return which would have induced the investment could it have been known in advance. For the future, according to Mr. Eshleman, an inducement which the investor is willing to accept must be held out as long as there is private ownership of utilities. The cost of doing the business plus a return upon the capital necessarily invested in the business, which return shall be as great as that offered in other businesses of similar hazard, is all that ought to be granted.

REPRODUCTION VALUE VERSUS FAIR VALUE

After Mr. Eshleman came H. Findlay French, attorney-at-law, Baltimore, Md., who gave an address on the relation of reproduction value and fair value. Mr. French mentioned that with the exception of a recent Maryland valuation covering only telephone instruments, no attempt has ever been made to estimate the

cost of putting in not a duplicate plant but a plant located along the most economic lines, taking into consideration every present condition. He alluded to this failure not by way of suggesting that true reproduction cost should consist of an estimate of the cost of the most efficient and economic plant which could be constructed under prevailing conditions, but rather to point out that the present method of arriving at reproduction cost results in a figure which is not value in the ordinary sense of the word.

Under the reproduction method as applied, the calculations are based upon the costs of labor and materials as they exist to-day. It is well known, Mr. French said, that those costs have been steadily rising for years, and that therefore the values obtained by this method are almost certain to be higher than the actual costs incurred by the public utility. This criticism is really one which, while it affects the public adversely at the present time, might easily be one that some time or other might return to plague the investor. It would not seem fair to the public utility, if cost of labor and supplies had gone down rapidly in the last ten years, to state arbitrarily that the value of its property devoted to public use had decreased in equal amount. It likewise does not seem fair to the public to raise the value of the public utility's property for the reason that costs have risen. To carry this plan to its logical conclusion, it would be necessary to change the value of the property of public utility companies each time that there was a fluctuation in the prices of labor and materials, and such a change would, of course, lead to unstable and undesirable conditions.

In Mr. French's opinion, however, the reproduction method has a true value in that it is of service in ascertaining the present value. In other words, the reproduction method is of service when reasonably applied in the valuation of most kinds of physical property, but it is of no real service in estimating the value of other classes of property, such as rights-of-way, developed business, etc., for the values arrived at by its use are based upon mere conjecture. To obtain the fair value of the property of a public utility company it is necessary to take every relevant fact into consideration, and reproduction value is only one and by no means the most important of the many relevant facts.

DISCUSSION OF REPRODUCTION THEORY

The foregoing addresses were followed by a discussion which was opened by Prof. Morris Knowles, director course in valuation of public utilities, University of Pittsburgh. Mr. Knowles felt that estimates of the cost of reproduction are useful only when carefully and honestly made. Instances of intended inflation of this figure, however, are rare, and he objected strongly to the suggestion that reproduction cost and the current methods of estimating it were invented by engineers for the purpose of maintaining high rates of utility companies. This is certainly quite as far from the truth as would be the statement that original cost was invented by municipal officials for the purpose of depriving utilities of a portion of their property. Furthermore, it is no better argument for the opponents of the utilities to say that cost of reproduction is wrong because it is higher than original cost, than it would be for the utilities to say that original cost is wrong because it is lower than cost of reproduction. The relation of reproduction cost to fair value, according to Mr. Knowles, may be considered from two different points of view, that of law and that of equity. From the point of view of existing law, the speaker believed that a perusal of court decisions can lead to no other conclusion than that the cost of reproduction is the most

important item of evidence in determining present value, and that upon it, with occasional modification, most of the decisions have actually been made. Such a conference as the present one, however, need not spend so much time in discussing the question from the point of view of law as from that of equity. It may well interest itself, not so much in what the law is as in what the law ought to be. There is a sense of compensation, of reciprocity, in the word "return" and in equity, when one speaks of a fair return, he means not a reasonable income upon some kind of valuation, but a giving-back to the investor a complete and fair equivalent for what he has devoted to the public service. Consequently, the amount upon which a utility is entitled to earn a fair return is the actual legitimate total investment in the property as determined by the total expenditures, not only in dollars and cents, but in time, energy, ingenuity and effort. Mr. Knowles believed that to the extent that the courts recognize cost of reproduction as the sole measure of fair value, they are in error and will eventually correct this by a reversal of position. Furthermore, the courts will be able to pierce through the fallacy that the basing of rates on actual original historical cost is a taking of property without due process of law.

A. B. Du Pont, consulting engineer, Cleveland, Ohio, was of the opinion that value varies directly in proportion to expected profits and inversely in proportion to risk. He said that for an appraiser to measure the value of a public utility property is for him to express at a given time what he believes to be the market price of the evidences of title to the property, and for an appraiser to measure the non-monopolistic value, he must express what he believes at a stated time would be the market price of the title if the profits and the certainty of the profits were not in any degree based upon monopoly.

Mr. Knowles then introduced several illustrations to show the difficulties of comparing two similar utilities on the basis of reproduction cost and summed up by saying that value is not dependent upon reproduction cost but upon the price of capital, the difference between expected earnings and expected expenses and the future activities of the utility within the limits expected to be imposed by government.

James E. Allison, consulting engineer, St. Louis, Mo., expressed the thought that it is not the business of commissions and other valuation bodies to find an existing value, for this they cannot do on account of their necessary regulation of rates. Their duty is to create a value that will be a just amount, based upon the exact sacrifice of the enterprise—in other words, the value that would have induced the creation of the utility. Then upon this value must be allowed a satisfactory rate of return.

The concluding remarks of the session were then made by Mr. Eshleman, who pointed out that "value" should be left out of the discussion, for what is being sought is simply an equitable amount that can be used as a basis upon which to allow earnings or to set a purchase price.

ORIGINAL COST

The session on Thursday morning was called to order with C. W. Kutz, chairman District of Columbia Public Utilities Commission, in the chair. Before introducing George W. Anderson, attorney-at-law, Boston, Mass., as the first speaker, Mr. Kutz described the beginnings of valuation work accomplished by his commission since a suitable appropriation was obtained a year and a half ago. Mr. Anderson then presented his address.

He discussed the question of how to get rid of the reproduction cost theory rather than the scheduled topic of actual cost as a basis for fair value.

GETTING RID OF REPRODUCTION COST THEORY

Mr. Anderson said that the reproduction cost theory is a menace to public safety, for it is not capable of sound and honest administration. He cited the case of the New York, New Haven & Hartford Railroad, in the case of which a reproduction value submitted to the validation board several years ago was widely understood to be a finding of the board itself and misled both stockholders and the public. He said that the reproduction cost theory originated with the courts. Rate-making power belongs solely to the legislatures, but the legislatures only half finished the job and the courts in taking over the legislative function made a bungle of the remainder of the program. The courts adopted the fair-value concept simply because the legislatures did not act, although the function of the courts is only to interfere to prevent confiscation. Mr. Anderson enumerated the only two things which to his mind are furnished by the private investor—i.e., money and management, and the actual investment is in general all upon which the investor has a right to secure a return. For future cases the actual investment should be the criterion of valuation, while for existing properties the right to include land grants, etc., depends entirely upon specific factors in the company's history or any contract provision in its charter whereby the basing of a return solely upon the actual investment is prevented.

Mr. Anderson described how in Massachusetts, as a result of cases like that involving the Middlesex & Boston Street Railway, the capital honestly and prudently invested is treated as the controlling factor in the basis for fixing fair and reasonable rates. He noted that this practice has never been declared unconstitutional, and he predicted that if the question should come before the United States Supreme Court the validity of this theory would be upheld. In closing he advocated that national and state laws be passed requiring that rates be calculated on the basis of the actual capital furnished by the utility.

ORIGINAL COST AS CHIEF BASIS

Following the address of Mr. Anderson, Prof. Edward W. Bemis, of the Board of Supervising Engineers, Chicago, Ill., spoke on original cost as the chief basis for fair value. He defined original cost in the case of physical assets as the actual cost of the property now in use. In reproduction cost an attempt is made to determine the present-day costs of replacing the existing property, if it were suddenly removed or destroyed. In both cases, depreciation, or the estimated decline in units of service, should be considered. Estimates also are necessary, in both lines of investigation, but with the important difference that reproduction cost is all an estimate, based on current prices of labor and materials, while the original cost is only partly based on estimates, being obtained in large degree, and in some cases in almost its entirety, from the records of the company. The speaker said that the tendency to rely only upon reproduction cost has of late received many a deserved blow. Actual cost appeals to one's sense of justice and fair dealing and leads to security of investment, more than does the reproduction cost. How many investors who now champion the reproduction theory of valuation would adhere to it when it meant a rating down of their original investment by a decline in price levels? The oldest of the state commissions, the Massachusetts Gas & Electric Light Commission, has always sought to base a fair value or rates on capitalization, and capitalization on

that part only of the cost that has been borne by direct contributions of the stockholders and bondholders. Professor Bemis did not discuss the propriety of this further step, successfully maintained in the recent Haverhill gas case, but mentioned it only as it is based on the acceptance of original cost as all-important.

DISCUSSION ON ORIGINAL COST

The discussion on the preceding addresses was opened by Robert H. Whitten, secretary Board of Estimate & Apportionment committee on the city plan, New York City. Mr. Whitten thought that the subject of valuation should be discussed from the point of view of the proper theory rather than that of existing law. He believed that under regulation the reasonable rate is that fixed by the normal cost of production, which is itself determined by the normal cost of labor and materials, the proper amount of depreciation and a fair return on the capital cost. The normal capital cost is difficult of determination as to whether it depends on actual cost or reproduction cost. As a general proposition, however, the public is entitled to a cost that is based on the reproduction of the service rather than of the identical plant. Yet because of the difficulties involved in creating a modern and improved design capable of giving the same service, the reproduction theory in practice has deteriorated to involve the reproduction of an identical plant. After discussing how the fair rate of return may be varied from year to year to offset appreciation or depreciation in reproduction cost, Mr. Whitten finally stated that any basis fair to all parties must sooner or later get back to actual capital cost. Utility service is continuous, and present cost is as much a result of past life as of present conditions. Normal actual cost has one advantage from the public point of view in that it does not involve fluctuations in cost, and no utility should be expected to assume the risks of speculation in land, materials and the like.

Edward P. Burch, consulting engineer, Detroit, Mich., stated that engineers were inclined to use an ethical basis in judging inventory items. If a railway actually paid for the paving between its tracks, the cost should be allowed but not otherwise. Attorneys, he felt, were less inclined to consider inventory items on the ground of equity and actual sacrifice. In regard to original cost, however, Mr. Burch was of the opinion that this can seldom be known and must be determined from secondary evidence secured by the reproduction method. Yet so far as the cost can be based upon the actual sacrifice of the investor, one important factor not complicated with hazy intangibles is obtained for a rate basis.

In reply to a question by Prof. John H. Gray of the University of Minnesota, Mr. Anderson stated that so far as he recalled there was nothing in the recent Fall River gas decision that would affect the ultimate upholding of the Massachusetts theory by the highest court. F. W. Stevens, general valuation counsel New York Central Lines, remarked that he had nothing to withdraw from his various attacks on the reproduction theory while on the Public Service Commission for the Second District of New York, but he never had been and is not now in favor of the unqualified statement that rates should be based on original cost. He did not believe that such a method is workable or just in a large number of cases, although in some cases it is absolutely right. The weakness of the whole discussion seemed to him to be the assumption that rates should be based on ethical theory, for no agreement can be reached as to what constitutes an ethical basis in spite of the correctness of such a basis.

Frederic P. Stearns, consulting engineer, Boston, Mass., heartily agreed with the idea that actual cost

should be the basis for the future and he supported the plea for legislation to permit the use of this basis. For old properties it may not be possible or just to use the cost basis on account of equities that may have developed. Reproduction under present conditions, however, brings in irrational ideas, and Mr. Stearns saw no reason why the necessary reproduction should not be carried on according to the way in which the utility was actually produced. Every effort and element appearing in the course of development should be included in the reproduction total, except property never created by the utility. The requirements of ethics can be maintained by using original conditions in determining the reproduction cost of both physical property and overhead charges.

INVENTORIES

The subject of the making and maintenance of priced inventories was then taken up by Charles L. Pillsbury, chief engineer valuation bureau, District of Columbia Public Utilities Commission.

Mr. Pillsbury said that the inventory of physical items should be a matter of fact, not of controversy, and disputes should be settled in the field and not in court. Inventories can be maintained to advantage by the operating companies. The public will pay the cost in any case as the inventory maintenance will become an operating cost. A permanent valuation staff should be organized within the company, and the maintenance of the inventory will become a much more simple task than is generally assumed. A large proportion of the requisite data can be obtained almost automatically and with moderate extra labor. Inventory maintenance in this manner would result in highly desirable standardization of purchasing and construction methods and cost keeping.

Mr. Pillsbury's paper was discussed by James W. Phillips, of the grade crossing division Bureau of Survey, Philadelphia, Pa.; F. W. Ballard, commissioner and chief engineer Division of Light & Heat, Cleveland, Ohio, and R. J. Meigs, valuation engineer Western Union Telegraph Company, New York. Mr. Phillips spoke of the importance of having a proper inventory and the great care that should be taken in its formation and maintenance. He believed that the inventory should have the same general foundation regardless of the expected use. Mr. Ballard said that the reproduction cost is the basis of financial valuation and that even when available original cost is of far less value than reproduction cost. Mr. Meigs was of the opinion that the future use of the inventory data should be taken into consideration in making the inventory. He emphasized the importance of co-operation between commissions and utilities in making inventory investigations and said that the lack of a uniform method, a uniform understanding and general broadmindedness were adverse influences in inventory work that should be overcome.

FRANCHISE VALUES

The presiding officer at the Thursday afternoon session was L. S. Rowe, president American Academy of Political & Social Science. Before the main topic of the session, franchise values, was taken up, a paper by John G. Morse, appraiser Associated Factory Mutual Fire Insurance Companies, Boston, Mass., on the subject of valuation by approximation was read and discussed.

VALUATION BY APPROXIMATION

Mr. Morse described the methods of his organization whereby an accurate appraisal of manufacturing property for insurance purposes is made in a few days of actual field work and a few more of office work. He

asserted that it is useless to waste time on minor detail in appraisal work when a large proportion of such work must of necessity be based on estimate. In cases where his organization had the time to make an examination of the usual detailed appraisal it always found the usual proportion based on estimate only and errors large enough to counterbalance the value of whole pages of minor items so laboriously collected. These errors do not materially affect the final result, as the law of averages takes care of that, but the same law of averages applies to the shorter or approximation method and the final figure obtained by the detailed method is no more accurate than that made by the shorter method.

In answer to the assertion that the courts will not recognize an appraisal unless made in fine detail, Mr. Morse said that it would take very little effort to demonstrate to any court how largely estimate enters into any appraisal and that an appraisal made on broad common sense lines can be just as accurate as one made in great detail.

The advantages of valuation by approximation were discussed by Mr. Cooke and W. N. Polakov, consulting engineer, Stamford, Conn. The plan of making inventories in minute detail possessed little value according to Mr. Cooke, who cited the case of the inventory made by the Philadelphia Electric Company at an approximate cost of \$200,000. This might have been cut to one-fifth that amount had valuation by approximation been used. He maintained that manufacturing and industrial establishments underestimate the value of inventories, whereas public utility companies lay entirely too much stress on valuations. Moreover, he contended that public utility valuations are not made with a view to ascertaining the cost of service but solely for financial reasons.

The necessity for minuteness of inventories, Mr. Polakov thought, was not nearly so important as care in operation. In the New Haven power plants he was able to cut operating expenses 25 per cent without adding a cent to the investment by merely changing the methods of operation. It was pointed out by Mr. Stevens, however, that minuteness in inventory is a necessity in many cases. In a case in which he is interested the addition of just 1 cent to the value of a railroad tie would increase the value of that one item by \$500,000. His experience when a member of the Public Service Commission for the Second District of New York, indicated to him that when utilities are treated no better or no worse than a manufacturing company, they do not complain of unfairness. Railroad men, he said, do not look with apprehension on the present valuations because of rate considerations, but because of the possible effect such valuations may have on the credit of the railroads in securing the millions needed for improvements.

DR. WILCOX ON FRANCHISE VALUES

The first address on the subject of "Franchise Values" was by Delos F. Wilcox, deputy commissioner Department of Water Supply, Gas & Electricity, New York City, and consulting franchise and public utility expert. Dr. Wilcox took up the various principles of franchise values as concerned in valuations for the purpose of (1) taxation, (2) rate-making, (3) condemnation (4) involuntary sale, (5) voluntary purchase, and (6) capitalization. In connection with the first point he stated that it is admissible to tax franchise values without reference to the possibility of their being reduced or destroyed in the future by any means. The value for such taxation purposes is to be determined primarily by the capitalization of the net earning power of the fran-

chise after the deduction of a fair minimum return upon the physical property. The duration of the franchise and the fixity of rates are important indirectly as they affect the security of the property or its earning power and thus increase or decrease the fair rate of return.

In relation to franchise values in rate-making cases, Dr. Wilcox said that the valuation in a tax case has no significance. He cited the Passaic Gas case and the final reversal granting no separate allowance for franchise value, and said that it is reasonably well-settled that no separate and distinct value need be assigned to franchises except in peculiar cases where these values have been measured and capitalized by authority of the State itself. Moreover, where franchise value is allowed for an original compensation paid for the instrument, it must be based on actual cost or assumed actual cost, without depreciation where the franchise is perpetual and with proportionate depreciation where its life is limited.

In condemnation proceedings the present worth of the prospective earning power, based on fair and reasonable future rates, is the real criterion. Fixed rates are an important consideration, but it must be remembered that in some cases they may prove disadvantageous to the corporation. Public regulation with its requirements results in a tendency toward conservative franchise valuations. The chief value of a perpetual franchise consists of the life and security it gives the physical property, and any attempt to measure its separate value is almost certain to lead to over-valuation, for the future net earnings are likely to be less than any definite estimate on the basis of past figures. This is caused partly by past neglect of depreciation and partly by the constantly increasing expenditures resulting from higher standards of service and greater interferences with operation. As regards limited franchises, these are undesirable to both grantor and grantee, which fact should receive major consideration in valuing them. If the full going value of the physical property without amortization charges is allowed, the value of the franchise should be greatly reduced. If, on the other hand, the franchise is allowed at its full value on the basis of its earning power in excess of a fair return without amortization charges, the present value of the physical property should be considered in the light of the fact that it will have only scrap value at the expiration of the grant. This suggestion, Dr. Wilcox admitted, is revolutionary, and probably a fair valuation would be derived by a method half-way between this and the usual one of basing the valuation upon the expected net earnings above a fair return.

In involuntary sales, or sales enforced in accordance with franchise or contract terms at the option of the city, it is not unusually provided that the property be taken over without franchise value being considered. Even if this agreement is extorted as a condition of securing the franchise, the utility is not entitled to any additional franchise allowance because the property is involuntarily surrendered. Franchise values in cases of voluntary purchase are matters of bargaining. Such values most frequently appear in resettlement cases, where the determination of a future purchase price is a primary factor and the city for certain considerations of fares or service agrees to capitalize the prospective earnings under the unexpired franchise on the old basis. As for capitalization cases, no franchise should be capitalized except to the extent of the necessary original cost to the grantees in the form of lump-sum payments to the public authorities. Annual fees should be treated as operating expenses. In closing Dr. Wilcox mentioned "fag-end" franchise, or franchises covering different routes and expiring at different times, and stated that the valuation of these should be made on

the basis of their value to the owner as complete independent operating rights. If they have no value except in connection with other rights that do not exist, no value should be assigned.

DISCUSSION ON FRANCHISE VALUES

H. DeF. Baldwin, president and counsel Queens County Water Company, New York; C. A. McLain, lecturer Harvard University, and A. Bettman, attorney-at-law, Cincinnati, Ohio, dwelt on certain legal phases of the question of franchise values. Mr. Baldwin admitted that net earnings were an important element in arriving at the value of a franchise, but that the bare permission to use the streets did not enhance the value of a franchise in the case of a company skillfully managed and thereby enabled to show fair profits. In such a case the going value of the concern was enhanced and not the franchise. No other property is appraised as are public utilities, and a frank recognition of the fact that capital has to be paid for should be evidenced in the allowance made for going value. He did not agree with Mr. Wilcox that reductions in rates give stability to a franchise and claimed that the security of the franchise depended on the ethical standards of the community.

Mr. McLain discussed the legal and administrative aspects of the problem. He said a franchise was a privilege, and all privileges may be taxed. His discussion had to do chiefly with the strictly legal side of the definition and limitation of a franchise and of the rights of the public and of the investors. A franchise, he said, was not an element for rate purposes. Mr. Bettman claimed that only for determining compensation in condemnation proceedings did a franchise possess a value. In all other cases its function is to protect, but beyond that it is valueless. The theory of condemnation proceedings should be that the franchise is simply revoked on payment of a sum sufficient to protect the investors who relied on the continuance of the franchise.

VALUING LAND

The session on Thursday evening, on the subject of land values in valuation work, was presided over by Charles F. Jenkins, proprietor *Farm Journal*, Philadelphia. The order of business covered an address by Hammond V. Hayes, consulting engineer, Boston, Mass., on the subject of the principles to be applied in such work, and discussion thereon.

PRINCIPLES TO BE APPLIED IN VALUING LAND

Mr. Hayes said that before any question of the value of land can be considered, two figures must be found, one representing the original cost of the land and the other what it would cost to obtain the land now in use and useful, if held in private ownership and acquired by the railroad company at the time of the appraisal. This last figure is the cost of reproduction. An analysis of both the original cost and the cost of reproduction shows that each may be divided into two parts, (1) the figure which would be assigned in condemnation proceedings as the price which a company should pay for the land acquired by it, and (2) the costs of condemnation, of damages, and of purchase.

The method which should be employed in ascertaining the first portion of both the original and the reproduction cost is that in which the normal market value is ascertained of adjacent similar lands as revealed by the prices paid in voluntary private sales, both at the time of the original acquisition of the lands by the company and at the time of the appraisal. The normal sales value of adjacent similar property should be found not for the time of the appraisal alone but as of the date

of the original acquisition of the land under valuation. Moreover, each parcel of land—a parcel being defined as a separate and distinct purchase—should be associated with similar adjacent lands of which the past and present market value can be ascertained. In addition to the two normal basic figures thus found, the amount paid to the original owner of each particular parcel should be found and entered against that parcel. By this method the price paid by the company and the normal market value at the time of purchase is shown for each particular parcel, and there is revealed the difference between the cost to a company of its land and the amount which was paid at that time in voluntary normal sales of similar land. Thus a ratio is established by the use of which the reproduction cost may be found from the normal market value of similar and adjacent land at the time of the appraisal.

The figures obtained through the use of this method, according to Mr. Hayes, give the original cost and, for the reproduction cost, the price which a company has paid and in all reasonable probability would have to pay at the present time for the land now used for the benefit of the public. The fair present value, however, is not the reproduction cost necessarily or the original cost. If the normal market price of the land is increased by a well established multiplier the reproduction cost of the land thus found would be large, but it would show with all reasonable accuracy what it would cost to reproduce the land at the date of the appraisal, and it would give a measure of a maximum beyond which no reasonable claim for a fair rate base could be made. On the other hand, the original cost less depreciation is, in the majority of cases, the minimum cost. Between these two costs, concluded Mr. Hayes, the fair value must be assigned with fair and impartial judgment in the light of all other relevant facts and figures.

DISCUSSION ON LAND VALUATION

In discussing Mr. Hayes' address A. E. Helm, commerce counsel Kansas Public Utilities Commission, advocated strongly the theory that public utilities are really public property, and the stockholders are only the managers. For these reasons the public cannot allow any private speculation in land values, and the unearned increment becomes a negligible factor. Mr. Eshleman opposed the agency theory. In California the courts have decided that no class of companies can be made utilities and forced into public use unless the companies voluntarily acquiesce. He thought that the unearned increment as an element of value in the case of railroads was decreased in importance because these carriers enjoy their right-of-way on the express condition that it be devoted to only railroad use. Under such a condition the property is less valuable than that which may be used in any way. Mr. Stevens brought out the point that under the agency theory the public assumes all of the benefits and none of the risks. He stated that the court conception of value is now what it has always been—present market value. He mentioned the criticism that some railroad property was wrongfully acquired, but he insisted that by digging into the past the public did not restore such property to the original owners, but only wanted to acquire itself what it had never paid for.

Milo R. Maltbie, member of the advisory board division of valuation, Interstate Commerce Commission, next advocated the inclusion of appreciation of land values as an item of income to be credited as such, on the same theory that depreciation is allowed as a charge to operating expenses. A. Sapolski, member of valuation board, Delaware & Hudson Railroad, Albany, N. Y., objected to Mr. Maltbie's theory from the accounting point of view, for the appreciation as income would

not be supported by any cash or other negotiable asset.

The session on Thursday evening then concluded. A report of the meetings on Friday, Nov. 12, will be published next week.

Express Car for Coffeyville, Kan.

Several unique features worthy of mention were embodied in the new locomotive-express car recently put in operation by the Union Traction Company of Coffeyville, Kan. This car is 40 ft. long over all and is of semi-steel construction with an arched roof. The underframe is built with center and intermediate sills formed of 8-in. 25½-lb. I-beams which extend continuous from bumper to bumper. The side sills are 8-in. 25½-lb. channels also extending the full length of the body, but reinforced under the wide center-door openings. The center sill is also reinforced at the center of the car by an additional 8-in. 25½-lb. I-beam which extends as far each way from the center of the body as truck clear-

COFFEYVILLE (KAN.) EXPRESS CAR

ances will permit. Features in the design of this car are corner windows, which slide toward the center of the car, and two drop sash openings, one on each side of the center and end doors. In plan the car body is rectangular but the underframe extends beyond the car ends forming semicircular exposed platforms. These platforms are provided with hand rails and, together with the window arrangement, have been found very convenient in switching and road service. The motorman's stand at each end of the car is surrounded by a 1¼-in. wrought-iron pipe bulkhead equipped with a motorman's curtain. This car body is mounted on St. Louis Car Company's No. 61 high-speed interurban trucks, equipped with 33-in. M. C. B. wheels with a 7-ft. wheelbase. The electrical equipment includes Westinghouse 306-volt motors. This car was built complete by the St. Louis Car Company, St. Louis, Mo.

Measuring Specific Resistance of Earth

The Bureau of Standards has just reprinted from the Bulletin scientific paper No. 258. The paper explains a method for measuring earth resistivity without disturbing the soil, which has been used by investigators of the bureau. It consists in inserting four electrodes in a line in the soil, sending alternating current between the outermost two of these and making measurements of the electrical conditions between the other two by means of a bridge arrangement. In the nature of the case the measurement is not a simple one in theory, but would appear not to be extremely difficult in practice.

In the article on "Seven Years of Operating Experience of a Single-Phase Interurban Railway" printed in the issue of Nov. 6, the captions of the two tables appearing at the top of page 943 were inadvertently transposed. As was explained clearly in the article, there was a very great reduction in train delays in 1915 as compared with 1912.

American Association News

Biographical Sketches of New Officers of Washington Company Section—Details of the Two Week's Conference on the National Safety Code in New York—Notes on Engineering Association Committee Meetings

NEW WASHINGTON SECTION OFFICERS

As already announced, at the recent election C. S. Kimball was selected as president of the Washington Railway & Electric Company section and R. A. Vetter, secretary. Mr. Kimball has been in electric railway work since he was fifteen years of age, and is widely known in engineering and railway circles. He is a charter member and was an incorporator of the Washington Society of Engineers and is a member of the American Society of Civil Engineers. He is also a member of the executive committee of the American Electric Railway Engineering Association, and has served on its committee on way matters for the last five years, having been chairman of the way committee for two years.

Mr. Kimball was born in Dubuque, Iowa, in 1879, and was educated in the public schools in New York City. He started practical work in the engineering department of the Metropolitan Street Railway under the late

C. S. KIMBALL

President

Washington Company Section

R. A. VETTER

Secretary

Washington Company Section

F. S. Pearson. While at work he kept up his studies in the science of engineering. After six years with this company he joined the engineering staff of William Wharton, Jr., & Company as designer and computer of special track work layout, leaving this firm to join the staff of John Van Vleck, who was engaged on the design of structural steel for the Rapid Transit Subway Construction Company. In 1902 he returned to the Metropolitan Street Railway as assistant engineer, leaving a year later to enter the bridge department of Westinghouse, Church, Kerr & Company, which was at that time designing the Pennsylvania Railroad station in New York. Since 1904 Mr. Kimball has been with his present employer as engineer of way and structure. He has charge of all construction, maintenance and building work, including overhead and underground trolley systems aggregating in excess of 163 miles of track.

Mr. Vetter is a much younger man, having been with the company but four years after serving elsewhere in one or two capacities of lesser importance. He hails from Ohio. After an elementary training in public and private schools he studied in Mt. Union College and Georgetown University, from the latter receiving the degree of Bachelor of Laws. Since entering the service of the company he has been the round of the managing,

accounting and treasury departments, being at present connected with the legal department, the work of which includes the handling of claims.

SAFETY CODE MEETING

A preliminary note on the New York conference on the proposed national electrical safety code was printed in the issue for Nov. 6, page 953. At this conference the American Association was represented by the following delegation: W. J. Harvie, Syracuse, N. Y., chairman; C. L. Cadle, Rochester, N. Y., and B. F. Wood, New York, N. Y., and A. S. Davis, New Haven, Conn., alternates. These men were members of the sub-committees on lines, stations, operation and utilization respectively.

Each day's sessions of the two weeks' conference consisted of general morning meetings and afternoon and evening sub-committee meetings. As the work of the sub-committees progressed the revisions developed were referred to the general conference for approval. At the sessions the code was read rule by rule, and the results of the application of each were considered and numerous revisions were adopted.

Each of the members in attendance upon the conference and others who have presented suggestions to the committee will receive the complete revision as made at the New York Conference, in memorandum form, in order that they may have an opportunity to review the proposed code as it now stands. In addition to this, each member company of the American Electric Railway Association will receive through the secretary a copy of the memorandum code, with a request that the code be immediately studied with a view to its application on each individual property. Suggestions which these companies desire to make will be received at the secretary's office and forwarded to the committee for consideration. It is probable that the rules will shortly be recommended by the Bureau of Standards to the various regulatory and administrative bodies for trial use during a period of approximately a year, prior to their promulgation for definite and final adoption.

ENGINEERING ASSOCIATION COMMITTEE MEETINGS

A meeting of the Engineering Association committee on subjects was held in New York on Nov. 11 to plan the work for the year. In attendance were J. H. Hanna, Washington, D. C., and Martin Schreiber, Newark, N. J.

The executive committee met on Nov. 12 with the following members in attendance: John Lindall, Boston, Mass., president; W. G. Gove, Brooklyn, N. Y., third vice-president; J. H. Hanna, past-president, Washington, D. C.; C. S. Kimball, Washington, D. C.; C. L. Cadle, Rochester, N. Y.; C. F. Bedwell, Newark, N. J., and E. B. Burritt, secretary, New York, N. Y. E. R. Hill, New York, was represented by S. A. Spalding. The committee is in session as this issue goes to press, but it has already completed the subjects assignments for the committees and these will be announced as soon as the committees have been duly notified.

The subject and executive committees of the Transportation & Traffic Associations will meet in New York on Nov. 18 and 19 respectively.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Where a Single Winder Maintains 951 Motors

BY JOHN SUTHERLAND, MASTER MECHANIC TRI-CITY
RAILWAY & LIGHT COMPANY, DAVENPORT, IOWA

When a single winder can maintain, without difficulty, 951 motors averaging 4000 miles a month, it is evident that the system of inspection must be right or this enviable record could not be obtained. This result is attributed to recent improvements in the system of inspection and repairs effected by the mechanical department of this company. In 1913, with 667 motors in

TRI-CITY RAILWAY'S MOTOR-REPAIR METHODS—YOKE FOR POTENTIAL TEST

service, 306 motor-defect cards were turned in, of which eleven were for poled motors, the remainder for minor defects, many of which should properly have been charged to other parts of the equipment. Two winders were required at that time in the motor-repair department, whereas in 1914 only eighty-four motor-defect cards were turned in with 793 motors in service, and one winder had no difficulty in maintaining all the motor equipment in the service at a high standard. In addition to the 793 railway motors, this winder also maintained 158 compressors and did some outside work for the lighting and power department. This winder, an experienced man at this work, received 37½ cents an hour and, charging his entire yearly wage to railway motor work, the annual cost of winding per motor was \$1.16. This is an exceptionally low figure, particularly when it is considered that the motor equipment included eight different types, seven General Electric and one Westinghouse.

The success which has attended motor maintenance methods on the Tri-City Railway is largely attributed to the methods of testing for electrical weaknesses and of keeping up the bearings, coupled with minor changes in the quality of material used in making repairs. All motors, regardless of their condition as revealed by inspection, are carefully tested before and after repairs. Whenever a truck is brought into the shop for wheel

changes the motors are removed and also submitted to a potential and current test. The mechanical department is satisfied that the current test is more important than the potential test. First-quality material, combined with experienced workmanship, is considered a strong safeguard against weak insulation. As a check on the condition of the insulation, however, it receives a 110-volt a.c. test with a load of 30 amp. This potential test is made with the usual yoke mounted on a portable stand, which is shown in one of the accompanying illustrations.

Two different current tests are employed, depending upon the judgment of the winder as to the necessity for them. In the test generally employed the motor is mounted in the truck, the wheels are blocked with wedges and the motor leads are connected temporarily to a rheostat, after which the wheels are spun. In case this is deemed insufficient to develop all defective conditions the trucks are placed under a car in which position the repaired motor is required to move the car. Either of these energy tests will indicate weak solder joints or open circuits between the commutator and the winding. The excessive energy flow resulting from spinning the wheels is also considered an additional check on the condition of the insulation. Aside from the test value of spinning a motor under a car, the mechanical department knows that, in case of trouble, any car on the system may be brought into the shop with one motor.

In no case is the card report of the inspector taken as final. All armatures and fields are thoroughly inspected and tested whenever they are brought into the shop, which insures the electrical and mechanical condition of all motors when they are returned to service. The fields are also carefully examined and tested with a Century testing outfit. In many cases it is found that the field-coil cushions which were fitted when the motor was new no longer hold the fields secure. This is due to shrinkage both in the cushions and in the coils, and

the condition is relieved by supplying as many additional cushions as may be required to restore the coil to the correct position. These cushions are made of scrap Pantasote or canvas, cut to the same form as the field coils, and two or three thicknesses of this material are sewed together for one cushion. To preserve them, the cushions are dipped in linseed oil and permitted to drain

Owing to the monolithic character of concrete pavement, careful attention must be given to track design so that the necessity for frequently tearing up tracks will be eliminated. Efficiency of concrete paving between car tracks, therefore, depends greatly upon developing and using a type of track construction that will insure that the rails and other track fittings will endure as long as the pavement itself. Steel as well as wood ties, entirely embedded in concrete, have been used, and time has proved that both properly embedded in well-made concrete are protected from decay and corrosion, hence will certainly last as long as the pavement. Repairs to street railway tracks consist largely of rail joint maintenance. Unless a welded or riveted joint is used, no present-day type of rail connection escapes the necessity for occasional maintenance.

In most cities where concrete has been used for paving between the tracks the material has been placed in practically the same manner as when paving the remainder of the street. Only granite and trap rock should receive consideration as coarse aggregate for concrete pavements in the track space. As vehicular traffic largely follows the tracks, especially in winter when the railways have swept away the snow, shock and abrasion are more extensive on this portion of the paved area than on the remainder of the street. If either granite or trap rock is used the pavement surface exposed to wear offers resistance to abrasion equal, in a properly proportioned and graded mixture, to that afforded by granite block pavement. When the film of mortar that is flushed to the surface by floating the concrete has worn off as a result of traffic abrasion, a properly constructed pavement will present the appearance of a mosaic in which the units consist of granite chips varying in size from $\frac{1}{4}$ in. to $1\frac{1}{2}$ in.

As the street section occupied by car tracks often receives more than its share of heavy vehicle traffic, wear along the rails is excessive. Heretofore the practice has been to lay stone block beside the rail, but where the amount of traffic is not great concrete can be laid directly against the rail. Two methods of construction have been followed when concrete is used. In some cases a construction joint is placed parallel to the rail and directly over the ends of the ties, and in other cases the concrete is laid from the rail to the curb in an unbroken stretch. When a joint along the track strip is contemplated the form is set and the concrete deposited for the street pavement between this form and the curb. After this strip is hard the form is re-

moved and the space between it and the outside of the rail is concreted, leaving nothing between the two stretches of concrete except the construction joint at the ends of the ties. Whether a joint running at right angles with the ends of the ties is used or not, is very much a matter of personal choice. If used, there is no necessity for cutting the street pavement proper when renewing rails or repairing tracks. If the street pavement proper is laid directly against the rails, the track must be very carefully constructed, otherwise if there is settlement or movement, the pavement usually cracks. Rail wear on curves is more rapid than on straight track, hence rail renewals are more frequent, and it

CONCRETE PAVEMENT—DESIGN FOR CONCRETE PAVEMENT BETWEEN STREET RAILWAY CAR TRACKS

is generally considered advisable to place a construction joint at the ends of ties on curves even though such practice is not followed on tangents.

When concrete is used for the entire pavement between rails, provision must be made for car-wheel flange clearance where the ordinary type of T-rail is used. In such cases the concrete flangeway is generally made 1 in. to $1\frac{1}{4}$ in. below the rail top. Investigation has disclosed that there is a strong tendency in present-day practice to form a deep groove for wheel-flange clearance. When the usual horse-drawn vehicle follows the line of rails, a detrimental prying action is exerted particularly when the wheels turn out of this groove, often resulting in chipping the pavement. To overcome this action a gradual crown can be obtained by using a strikeboard or template which is rested on the rails when striking of the concrete. Such a crown also provides drainage for the space between rails.

Generally speaking, the crown in the devil strip between tracks should start at the rail $\frac{1}{4}$ in. below the top and continue as a circular curve to the center line of the strip. The $\frac{1}{4}$ -in. clearance at the rail will allow for false flanges which otherwise cause the formation of a chamfer varying from $\frac{1}{2}$ in. to 2 in. wide by $\frac{1}{2}$ in. deep when the concrete is finished off flush with the

CONCRETE PAVEMENT—BLOCKING OF JOINT PROTECTION PLATE IN POSITION PREPARATORY TO CONCRETING OUTSIDE OF OUTER RAIL; SPOUTING WEARING COURSE OVER MESH REINFORCEMENT LAID ON LOWER COURSE

CONCRETE PAVEMENT—JOINT PROTECTION SET
IN PLACE

rail top. As the car wheel tread is always equal to and usually greater than the width of rail head, any false flange wear will extend beyond the outside of the rail. Often wear in the wheels forms a slight flange on the tread, thus causing the outer portion of the tread to come in contact with the pavement surface unless the $\frac{1}{4}$ -in. clearance is provided.

When concrete pavement is used in the track allowance rail braces instead of tie rods seem preferable, as the tie rods tend to decrease the net section of concrete. If tie rods are used, however, those having a circular cross-section are preferable to the rectangular type now common in track construction where block pavement is used.

Owing to the severe shock due to the diversion of traffic near switch and frog points, extreme care should be exercised in the concrete construction at these points. Perfect bond between rails and pavement can be secured if the pavement is properly and sufficiently protected while hardening. For this reason special care should be taken to practise the best curing methods and close the paved portion to traffic while the pavement is acquiring strength.

In the fall of 1914 there was constructed in the village of Lyons, Ill., about 8500 sq. yd. of concrete pavement. About 4450 ft. of this pavement included two car tracks with a devil strip and a 12-in. strip of concrete outside of the outer rails. The pavement was 11 in. thick between rails and 7 in. thick between tracks. Two-course construction was followed, the top or wearing course being 2 in. thick, calling for one part Portland cement and two parts aggregate, the latter consisting of two parts sand and three parts of granite chips ranging from $\frac{1}{4}$ in. to $\frac{1}{2}$ in. in size. The base consisted of a 1:2½:5 mixture in which a clean, hard, crushed limestone ranging from $\frac{1}{4}$ in. to 1½ in. in size

CONCRETE PAVEMENT—COMPLETED STRETCH OF
CONCRETED TRACK

formed the coarse aggregate. A machine mixer delivering concrete by means of a spout was used on this work. Crown between rails and in the devil strip was obtained by the use of a template resting on the rails while striking off the concrete, and wooden hand floats were used for finishing.

Transverse joints 50 ft. apart were installed by using Baker plates and $\frac{3}{8}$ -in. Carey Elastite. Several views of this work in progress are shown in the accompanying illustrations. An inspection of this work showed that many of these joints were low and uneven, which probably was a result of neglect properly to adjust the plates in the installing device and to finish even with the top of the plates. Finishing with a split hand float would have in part compensated for this. A longitudinal joint was placed at the tie ends and formed by two Baker plates, one was placed in the street pavement when it was laid and the other was placed with the 12-in. strip along the rails. Between these two plates a $\frac{3}{8}$ -in. Elastite expansion joint was installed. As the plate in the street pavement proper was sometimes placed too low and again too high, the contractor found it impossible to finish a neat joint. The only method of holding the inner plate up to the plate in the street pavement proper and against it was by braces set between rails and plate. This often required such a firm setting of braces that the track was thrown out of line. If any defects occur in this track construction later they are likely to consist of transverse cracks in the pavement between the rails at the rail joints and over tie rods owing to the nature of the track construction, which the paving contractor, of course, could not remedy. Rigid rail joints were not always secured in the track and cracks may later develop at these. Old rails and old ties were used and these will not give the desired results.

Cleveland Adopts Steel Coal and Sand Storage Bins

Permanency governed the design and construction of the Cleveland (Ohio) Railways operating station facilities, and in conformity with the general plan the mechanical department designed and constructed standard steel coal and sand storage bins for all of these stations. The steel bins are not only fireproof and waterproof, but they are practically indestructible. In these bins the gravity feed system is employed to supply coal and sand to the buckets, thus avoiding the use of shovels, and materially reducing the time required. The feed system adopted also eliminates waste at the bins, as it includes graduated slides in the chutes which enable the operator to cut off the supply of sand or coal instantly. Aside from the advantage gained by the elimination of waste, the neat appearance of the bins and surroundings is greatly in their favor. The design details of one of these bins is shown in one of the accompanying illustrations, while

two halftones illustrate an installation at one of the company's new operating stations.

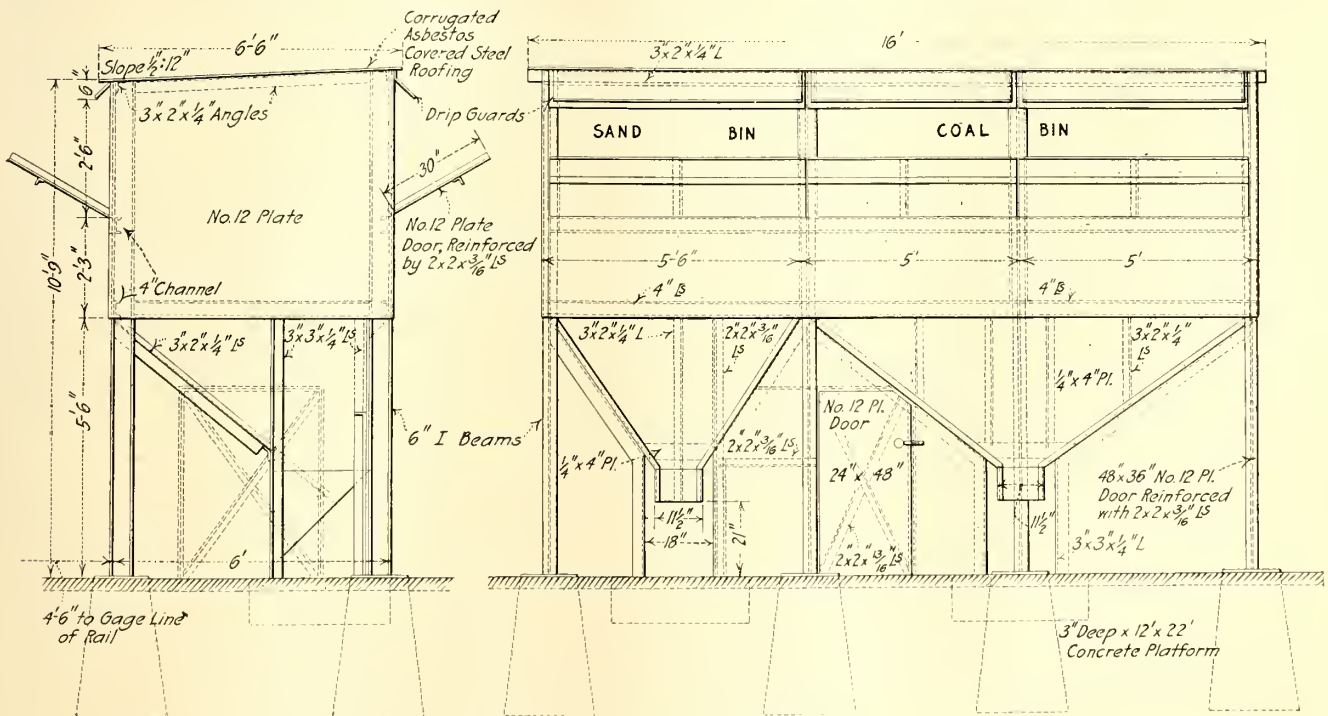

Coal and sand are supplied from a central storage yard, being delivered to the various stations by the company's supply cars. Dry sand is handled in bags, and a plank is laid between the car and the bin so that workmen may carry the bags to the bin door and deposit the sand inside. The coal bin has a capacity for 8 tons of anthracite egg coal, and the sand bin has a capacity for 160 cu. ft. The supply cars delivering coal to these bins have a capacity of $6\frac{1}{2}$ tons, hence, when approximately $1\frac{1}{2}$ tons of coal remain in the bin a fresh supply is delivered. The space below the sloping sides of the bins has been inclosed to provide storage for kindling, coal hods, brooms and other necessary tools which are used by the car cleaning crews. The cost of each bin installed on a concrete foundation and furnished with a concrete platform is approximately \$500. Beside the bin shown in one of the accompanying halftones is one of the railway company's standard concrete trash bins. As a rule

CLEVELAND'S STEEL SAND AND COAL BINS—FRONT OF BIN STRUCTURE

CLEVELAND STEEL SAND AND COAL BINS—BACK OF BIN STRUCTURE

CLEVELAND'S STEEL COAL AND SAND BINS—END AND SIDE ELEVATIONS OF BIN STRUCTURE

three of these combined sand and coal bins are provided in a storage yard at points convenient for the crews to replenish the cars, and a fourth bin is installed near the outlet to the yard beside the loop track, so that it is convenient for the crews on the regular cars when they are being looped for the return trips to the downtown district.

The bins are 16 ft. long over all by 6 ft. 6 in. wide by 11 ft. high. They are supported on substantial frames composed of 6-in., 12.25-lb. I-beam columns with 4-in. channels forming the transverse members. Drop doors, made of No. 12 steel plate reinforced with angles, open just below the roof line on each side of the structure so that the supply cars can refill the coal and sand bins from two sides. The roof is covered with corrugated, asbestos-covered steel roofing, given a slope of $\frac{1}{2}$ in. per foot and designed to carry a snow load of 30 lb. per square foot. These bins are painted yellow to conform to the standard color adopted by the railway company for structures of this kind. They were designed in the office of Terrance Scullin, master mechanic, and installed by a contractor.

Steel Tie for Universal Service

In order to provide the greater bearing surface required for sand and other foundations lighter than concrete, The International Steel Tie Company, Cleveland, Ohio, has brought out a modification of its well-known twin steel tie. In the original design, the bearing plates are 13 in. x 36 in. in area and are flat. In the

VIEW OF MODIFIED STEEL TIE CUT AWAY TO SHOW INVERTED TROUGH-SHAPED PLATES

PLAN AND SECTION OF MODIFIED TWIN STEEL TIE INSTALLATION

modified tie the plates are 15 in. x 36 in. and are turned over at the edges, as shown in the accompanying cross-section. This beveling converts the plate into a shallow, inverted trough of maximum bearing surface.

It is obvious that when such a plate is installed it will seat itself firmly in any kind of foundation.

Furthermore, such a plate is particularly desirable for keeping the track in line at curves. It also permits tamping to be done from either side of the rail because the 45-deg. bevel of the plate will retain the ballast that is driven under it regardless of whether the ballast is stone or concrete.

Behavior of Treated Ties in Alkali Soils

In 1907 the Los Angeles & Redondo Railway (now part of the Pacific Electric Railway) treated a few thousand Oregon pine ties with "C-A" wood preserver and placed them in sandy, alkali soil. In 1910 a commendatory letter on the behavior of these ties was received from the engineer of that property; and in May, 1915, H. H. Gerhard, president of the C-A Wood Preserver Company, St. Louis, inspected the same ties. Had it not been for the old rail marks still showing on the ties Mr. Gerhard would not have been able to identify them because the Pacific Electric Railway no longer had the Los Angeles & Redondo Railway records. A photograph taken in 1907 served as first aid in getting the exact location of the ties.

One of the eight-year-old ties was taken out during September, 1915, and one-half of this tie is now in the company's office at St. Louis. Mr. Gerhard states that the solid condition of this tie would lead one to believe that it had been in the tracks only a few months. He also learned from the railway company that on this line the life of untreated Oregon ties does not exceed four years.

Another confirmation of the fact that the use of "C-A" wood preserver on ties resists the alkali action is found in the experience of the Union Electric Light & Power Company of St. Louis. This corporation has a switch track, the ties of which are exposed to hard conditions because cars of wet cinders stand over the ties for a day or so at a time. Four years ago the company asked this manufacturer for advice, fearing that the water which drained through the cinders to the ties might contain sulphuric or other acids. The water was analyzed and found to contain alkali, but no sulphuric acid. Thereupon the Union Electric Light & Power Company was advised to use black or red oak ties dipped in the preservative. This counsel proved correct, for although these ties are of cheap, inferior wood they are still in perfect condition. Heretofore the costlier untreated white oak ties had been removed every two years.

Deterioration of Fusible Boiler Plugs

The recent investigation of fusible boiler plugs, conducted by the National Bureau of Standards, developed the fact that the tin in certain plugs which had failed had become oxidized in service, the resulting oxide, SnO_2 , melting above 1600 deg. C. Of four kinds of deterioration noticed one could be pronounced especially dangerous. This consisted in the formation of the above-mentioned oxide, either as a solid mass at the fire end of the plug, or as a network throughout the tin filling.

It was discovered that this form of oxidization in service was dependent on the presence of zinc in amounts as small as 0.3 per cent. Zinc is easily corroded by many kinds of boiler water, and the oxide product of this zinc, together with the tin (which is afterward attacked) may form a solid mass that can withstand the pressure of the boiler even after the uncorroded tin has melted out of the plug. The conclusion arrived at is that only material equal to Banca tin 99.9 per cent pure should be used for boiler plugs.

News of Electric Railways

JOLIET ARBITRATION DECISION RENDERED

Findings of the Board of Arbitration on the Chicago & Joliet Electric Railway

The decision of the board of arbitration selected to adjust the wage dispute between the Chicago & Joliet Electric Railway, Joliet, Ill., and Division No. 228 of the Amalgamated Association was handed down on Oct. 30. The demands of the men for an increase in wages were denied.

The company has been operating under a ten-year working agreement with the union. This agreement went into effect on May 8, 1907. It provides that the schedule of wages may be readjusted every two years upon demand, and in the event of a failure to agree that a board of arbitration be appointed. Prior to the expiration of the two-year period ended July 1, 1915, both the company and the union went on record as desiring a readjustment of the schedule. The company asked for a reduction and the union for an increase in wages.

There have been several supplementary agreements, and one arbitration previously under the contract. The present wage scale ranges from 26 cents an hour on the city lines in Joliet to 30 cents an hour on the Chicago division, a line running into the city limits of Chicago. The company contended that wages should be reduced 1 cent an hour on all lines while the union demanded an advance of approximately 6 cents an hour. Other demands made by the union included increased wages for shop men and a "closed shop."

The representatives of the company and of the men were unable to come to an understanding and each of the parties selected a representative for the board. Eneshia Meers was named by the company and Samuel J. Drew by the men. They in turn chose a third arbitrator. That this last was a difficult proceeding is indicated by the fact that the umpire was not decided upon until Sept. 11, four months after the opening of negotiations, when John W. Doney was appointed. All of the arbitrators are lawyers.

The board convened on Sept. 14. Three weeks were consumed in hearing the evidence and arguments. Counsel for the union stated in his opening address that the demands of the men for increased wages were founded upon the high cost of living and the fact that the men were receiving less than the average rate of wages paid to union labor in Joliet. Motormen, conductors and their wives testified as to what it cost them to live and submitted itemized statements of their expenditures; merchants compared current prices with those of five years ago; union officials, representing practically all the trades, testified as to the rates of wages paid in other industries.

The company based its case largely upon its financial inability to pay even the present rate of wages. In proof of this it exhibited the annual reports to the Illinois Public Utilities Commission. In his argument C. L. S. Tingley, vice-president of the company, proved from the union's own evidence that, while the men were receiving a lower hourly rate than that paid to other union men in the city their average yearly wage was considerably higher than the average yearly wage received in other trades. With regard to the increased cost of living he showed that if the average prices for foodstuffs as given in the union exhibits were applied to the weighted average amounts of food consumed in a workingman's family, as determined by the United States bureau of labor, there had been an increase of only 6 per cent in the last five years, during which time the wages as paid by the company had been advanced nearly double that percentage.

In a majority report, from which the representative of the union dissented, the board first of all concludes that its function is to decide the question of wages only, under the clause in the contract whereby it was created, and consequently if other questions were passed upon the decision with respect to them would not be binding upon the parties. The report, after setting forth the demands of both sides, goes on to make the following statement: "The decision

of these questions necessarily requires an investigation of the financial condition of the company to determine its ability to pay the increase" and finds after stating the figures involved, that such ability is lacking. The inability of the management of the company to raise fares under the city ordinances, it says, makes the improvement of this condition impossible.

There was no question in the minds of the board from their personal knowledge and the evidence as to the wages paid to motormen and conductors on other roads in Joliet and surrounding cities, that the employees of the company were receiving more than the usual rate for such work. It could not be contended, the board said, that the cost of living was higher in Joliet than in contiguous cities with larger population and consequently a living wage was being paid. The report concludes with the following findings:

"1. We find, from the evidence, that the demands of the association, for an increase of the wage schedule, contained in the contract of May 8, 1907, and the amendments thereto, should be and the same are hereby denied.

"2. We also find that the demand of the company for a reduction in the wage scale, contained in said contract, and the amendments thereto, should be and the same is hereby denied."

MUNICIPAL LOOP PLANNED FOR ST. LOUIS

A detail plan for a proposed municipal loop to the downtown district of St. Louis, Mo., in connection with the free bridge has been prepared by Charles S. Butts, chief designing engineer for Director of Public Utilities Hooke, and is being considered by the Board of Public Service of that city. The plan proposes to utilize the old City Hall at Eleventh and Chestnut Streets as a new central interurban passenger station, to be the terminus of all interurban lines entering St. Louis. The old Four Courts will be remodeled and used as a central interurban express freight station, according to the plan, and would be reached by a loop for express cars only. An entrance to Cupples Station for all interurban lines would be provided by a loop on Spruce Street, branching off from the central loop to the passenger and express stations. The Illinois Traction System would be given the desired connection with Cupples station by the Butts plan, provided it will extend its line to the proposed new central passenger station in the old City Hall block.

The construction of the new passenger station will be with an idea of future use by a subway from the west, which Mr. Butts declares must come within a few years to care for St. Louis street railway and interurban lines to Missouri towns adjacent to St. Louis. In carrying out this subway plan Mr. Butts recommends that when the free bridge is completed the train service on the Eads bridge be diverted to the free bridge, leaving the lower deck of Eads bridge and the terminal railroad tunnel available for the interurban electric lines from the East Side. The electrification of the Eads bridge and the tunnel would make necessary an extension of the present tunnel from Eighth and Chestnut Streets, the end of the wagon and street car approach to the free bridge, according to Mr. Butts' plan. Surface stations every two blocks in the shopping district could be installed.

Mr. Butts has expressed the opinion recently that the St. Louis Terminal Railroad will be willing soon to make use of the free bridge for steam traffic and abandon the old structure to electric roads and vehicles. The loop proposed by Mr. Butts would begin at Seventh and Papin Streets, the end of the wagon and street car approach to the free bridge. It would extend north on Seventh Street to Chestnut Street, west on Chestnut to Eleventh, south through the new central interurban passenger station (now Old City Hall) to Walnut, east on Walnut to Seventh and looping back to Seventh Street to the free bridge.

President Kinsey of the Board of Public Service says that public hearings will probably be held on the problem of a municipal loop in connection with the free bridge before a definite decision is reached.

HEARING ON PROPOSED BUS FRANCHISE IN NEW YORK CITY

The question of additional bus lines for New York was taken up again by the Board of Estimate of that city on Nov. 8. This action followed the recommendation made on Oct. 15 by the franchise committee of the board that a franchise be granted to the New York Motor Bus Company to operate buses over 31 miles of streets in the borough of Manhattan. At the hearing on Nov. 8 William D. Guthrie for the Interborough Rapid Transit Company, operating the present subway and elevated lines and the prospective operator of new rapid transit lines now under construction, entered a protest. This company is controlled by the Interborough-Metropolitan Company, which also controls the New York Railways, operating surface lines, and the Fifth Avenue Coach Company, operating motor buses on Fifth Avenue. In the course of his remarks Mr. Guthrie said:

"My client is the largest taxpayer in the city and it is the city's partner in the dual subway systems in which the Interborough has bound itself to invest \$76,000,000 and the city \$66,000,000. The city's good faith is pledged to honest dealing with its partner. There can be no question as to that fair play demands that the city shall not force the surface lines into renewed bankruptcy, which is certain if hundreds of motor buses are allowed to take the cream of the short-haul traffic in the most congested parts of Manhattan Borough.

"If the proposed franchise is granted, there will be competing with subway lines 5.3 miles of 5-cent bus lines and 3.26 miles of 10-cent bus lines; there will be competing with elevated lines 0.10 mile of 5-cent bus lines and 0.31 mile of 10-cent bus lines, and there will be competing with surface lines 5.35 miles of 5-cent bus lines and 5.55 miles of 10-cent buses."

FORT WAYNE STRIKE SITUATION

Governor Ralston Intercedes for Former Employees— Hearing in Bondholders' Injunction Suit

Governor Ralston of Indiana, at the request of city officials of Fort Wayne, Ind., has named eight residents of that city as a "conciliatory" committee to attempt to bring about some settlement between the striking trainmen and the Fort Wayne & Northern Indiana Traction Company whereby the old men may be permitted to go back to work and resume their positions on the cars which have been filled for some weeks by new men employed by the company. The Governor announced the appointment of the committee in a letter addressed to Samuel M. Foster, in which he reviewed the deplorable conditions first brought about by the strike, and the consequent loss of wages to the employees and reduction in revenues of the company. He then called attention to the contract existing between the company and its employees which, the company asserted, set forth a method by which troubles of the kind under consideration could be adjusted, and that this contract is at this time involved in an action in the Federal Court.

The Governor stated that he would not do anything that would affect the contract in any way, and that the course he had determined to pursue must not be interpreted as an expression of his opinion of the contract, that he had no power or authority to interpret it and that this was a matter to be decided by the courts. He therefore appointed the committee of eight business men of Fort Wayne to use their own best judgment as to how to proceed to bring about a settlement, if possible, between the company and its employees. The newly-appointed committee held two meetings on Nov. 4 and stated that they would continue to hold such meetings for some days in an effort to arrive at some solution for a settlement of the differences between the company and its employees.

Judge Anderson in the Federal Court at Indianapolis on Thursday afternoon, Nov. 11, dismissed the action of the United States Mortgage & Trust Company in behalf of the bondholders of the Fort Wayne & Northern Indiana Traction Company for an injunction against Joseph C. Colgan, city officials of Fort Wayne and others to prevent activities against the property rights of the company and interference with its railway and lighting business. The court ruled on two points raised by the pleas of the defendant,

first, that Colgan is a citizen of Illinois and beyond the jurisdiction of the Indiana court, and, second, that the Fort Wayne & Northern Indiana Traction Company is a necessary party to the suit, which would remove the case from the jurisdiction of the United States Court.

On Sept. 27 the employees of the city lines of the Fort Wayne & Northern Indiana Traction Company went out on strike in the face of a temporary restraining order granted by Judge Anderson in the Federal Court. The trainmen violated their working agreement with the company and demanded a new form of contract between the company and the Amalgamated Association involving recognition of the newly formed union and the closed shop. Within a few days the company was in full operation on schedule and new men were assigned to the regular runs. The labor unions then through their officers and sympathizers brought about a boycott of the city lines by intimidation, threatening with discharge from their occupation all persons who rode on street cars. Through city officials and employees the patrons of the lighting service of the company were induced to break contracts with the company and take current from the city lighting plant. The suit for an injunction was brought to obtain relief from these attacks.

NEW TOLEDO MAYOR CALLS FRANCHISE CONFERENCE

Mayor-elect Charles M. Milroy of Toledo, Ohio, called a conference on the afternoon of Nov. 4 to consider the franchise question in that city. The invitation to the conference was sent to Johnson Thurston, president of the Public Utilities Conservation League; James Thompson, president of the Citizens' Franchise Association; Edward P. Usher, president of the Central Labor Union; Carl B. Spitzer, president of the Commerce Club; Henry L. Doherty, of the Toledo Railways & Light Company; Negley D. Cochran, editor of the *News-Bee*, and to the editors of the *Times* and the *Blade*. In his invitation to the conference the Mayor said:

"Believing that the people of Toledo want the street car question settled at once by the adoption of an ordinance which is just to every interest, and in the framing of which every interest has had its view, I venture to invite you to meet with representatives of the other organizations which took an active part in the recent franchise election, at the Commerce Club, for the purpose, if possible, of devising some proper plan or agreeing upon an ordinance which will be wholly just to the people of Toledo and to the company while it operates under the same, and will absolutely assure the right of the city to take over the street railway when it is ready and able to do so."

At the conference, attended by all but three of those who were invited, an informal organization was formed to push the proposal for an immediate settlement of the street railway question. Mr. Milroy announced to the conference that it is not his intention to preside at the subsequent meetings. He said:

"This question fills the whole civic horizon. I am anxious to have it settled early in my administration, so we can go ahead with other constructive work. For this reason I am offering my good offices to get together the factors which were most energetic in the recent campaign in which the Dotson ordinance was defeated. I myself am favorable to municipal ownership, as you know, and I do not believe that any franchise ordinance will be accepted by the people which does not make clear and indisputable the right of the people to take over the street railway system whenever they wish it. We can't get anywhere while we are all working at cross-purposes. We are all for Toledo and wish to play the Toledo game. We want to see Toledo go ahead. This is the spirit the newspapers have been advocating. Therefore, it seems to me to be the most propitious time to get the forces together. Having done that, I will step out. I have no plan to offer."

Previous to the meeting on Nov. 4 Mr. Doherty was reported to have said:

"It is our intention to do the best we can under the circumstances. If we can obtain any more money for the improvement of the property without a franchise we will do that, but I deem that is impossible. I shall wish to consult with other members of the company before I make any definite announcements as to future policies."

SEATTLE COMPANY'S CASE FOR RELIEF FROM PAVING EXACTIONS

Charles A. Reynolds, chairman of the Washington State Public Service Commission, has fixed Feb. 1 as the date for a hearing on the petition of the Puget Sound Traction, Light & Power Company, Seattle, to be relieved of certain of its franchise obligations.

The petition of the company asks that an order be made by the commission relieving it of franchise obligations requiring it to pave its right-of-way at the same time the city paves the remainder of the street; requiring the payment of 2 per cent of its gross earnings annually to the city and the payment of a portion of the cost of construction of bridges utilized. In 1914 the 2 per cent of the gross earnings amounted to nearly \$72,000, and the paving item amounted to considerably more, inasmuch as the company is required by its franchise to pave with the same material, and in the same manner, the 18 ft. in the center of the street at the same time the city paves the remainder of the street. Officials of the company assert that the Second Avenue repaving job, carried out last year, included new track construction, and cost the company about \$90,000.

In fixing the date for a hearing on the petition the Public Service Commission declines to accept the offer of the company to advance \$10,000 for the completion of the commission's valuation of the street railway property in Seattle. In advising the City Council of the rejection of the offer, and the fixing of the date of hearing, the commission points out that the company has expended large sums of money for experts in the valuation of its properties, and that common justice demands that a hearing be granted. The commission will allow the city to use all of the data now in the possession of the commission and authorize the city's experts to investigate the books and accounts of the company, to ascertain the true value of its properties.

The valuation placed on the property of the Puget Sound Traction, Light & Power Company, exclusive of power, by experts employed by the company is \$19,737,122 as of March 31 last. The gross earnings of the company for the last fiscal year were \$3,474,885. Including an item of \$288,105 for depreciation, the net earnings for the year were \$537,105, which equals a return of 2.71 per cent on the money invested. The valuation of the company's properties was undertaken by the Public Service Commission more than a year ago, and the work was about three-fourths done when it was abandoned because of lack of funds. It was because of this situation that the company offered to advance \$10,000 to complete the valuation, with the understanding that the commission would ask the next Legislature to make an appropriation to repay that amount.

PRESIDENT PELLISSIER TESTIFIES IN HOLYOKE ARBITRATION

The arbitration board sitting in the wages and hours of work case of the Holyoke (Mass.) Street Railway was scheduled to reconvene on Nov. 12 at Holyoke, following a recess of about a week. At the hearings last week L. D. Pellissier, president of the company, was called to the stand and testified at length upon the company's history, its consolidation with the former Amherst & Sunderland Street Railway, and the working agreement last framed. It was arranged that the arbitrators should receive a copy of all agreed matters to assist in the decision of those in dispute. Mr. Pellissier said that as a rule the company's employees did their work well, but that he was not prepared to say that he would grant increased wages at present, even if the money for this purpose were available. Between 1903 and 1912 hourly rates rose from a minimum of 20 cents to a maximum of 26.75 cents, with reductions in the graduated scale to four years. Since 1891 the company has paid dividends at the rate of 8 per cent, but has not earned the dividends in the last three years. No signed agreement with the union dated back of 1912. At the last hearing representatives of the men urged that the board refuse to consider the financial condition of the company as a factor in the wage issue, and various testimony relative to the increased cost of living was submitted by the men. A former president of the union admitted that the steadiness of the work was a good feature of car service.

ELECTION AFTERMATH AT CLEVELAND

As soon as the franchise vote in Lakewood, suburb of Cleveland, is legally certified the Cleveland (Ohio) Railway will put the new system of fares into operation, and ten-minute service will be restored to the Clifton Boulevard line. The rate of fare between points in Cleveland and any point in Lakewood will be 5 cents straight instead of eleven tickets for 50 cents. Within the city of Lakewood the fare will be at the rate of five tickets for 15 cents, the same as in Cleveland.

The company has not yet devised a system of payment whereby passengers between points within Lakewood and those riding between Lakewood and the city can be identified. Officials of the company are of the opinion that the receipts from Lakewood business will not be materially affected by the change. While the fare between cities will be slightly higher, the Lakewood reduction will just about offset the gain. The traffic within the city of Lakewood is heavy, as there are a number of very large factories on the south side of the town and many of the employees live within its limits. One of the provisions of the franchise is the extension of the double track on Madison Avenue from West 117th Street to Rocky River, a distance of 2½ miles. Work on this extension will be begun as early in the spring as possible.

On Nov. 3 the Cleveland Railway filed with the District Board of Complaints a demand for a reduction of almost \$500,000 in the valuation of its real estate, made for tax purposes in 1914. It claims its property has been appraised at almost double the amount fixed on adjoining property. If the appraisement is reduced to the amount fixed for 1913, the company expresses its willingness to pay the taxes. Theodore Bates, president of the board, expressed the belief that the demand has merit. This board must consider the demand and then consult the State Tax Commission and the local deputy tax commissioners.

RIOTING MARKS ATTEMPT OF WILKES-BARRE COMPANY TO RESUME OPERATION

After the first attempt to operate cars on Nov. 4 had resulted in the show of disorder by strike sympathizers, T. A. Wright, general manager of the Wilkes-Barre (Pa.) Railway, held a conference with Mayor Kosek and agreed to allow the city authorities twenty-four hours in which to perfect the police organization before again trying to run cars. The Mayor consequently swore in 100 special policemen. Half of this number were turned over to a former member of the State Constabulary who drilled them for mounted police duty. The other fifty men were spread over the city to do patrol duty in place of the regular patrolmen, who were placed on posts and held as reserves to meet riot calls. This truce of holding the cars in the car-house did little good, for during the following day strike sympathizers tried to rush the Wood Street carhouse where the new men are quartered. As a result of this attack a number of shots were fired and three of the attacking party were hit.

Later in the day, Sheriff Kniffen refused to swear in as deputy sheriffs the 250 new men engaged by the company. He defended his stand on the ground that there are plenty of men in Luzerne County whom he can call in case of emergency. The sheriff, however, sent an appeal to the State Constabulary for aid in preserving order in the outlying towns. About fifteen men arrived as a result of this request, to aid the troops regularly stationed near Wilkes-Barre.

Other attempts by the company to operate cars on Saturday were met by rioting, particularly in the suburban districts. Public Square Park, where rioting had occurred earlier in the week, has been roped off and no one was permitted to enter.

Late on Nov. 6 some of the engineers and firemen at the power plants left their posts and joined the striking trainmen. The company, apparently anticipating this move, pressed other men in their places.

Continued rioting by mobs that gathered all over the territory served by the lines of the company prompted Sheriff Kniffen to appeal to the authorities at Harrisburg to send 100 additional men of the State Constabulary to aid in pre-

serving peace. The company has succeeded in opening more lines each day and several additional cars have been placed in operation on the lines which were reopened last week.

The latest show of feeling against the State Constabulary by the labor unions is the injection of politics into the strike situation by the action of residents in several of the suburbs in campaigning for legislative candidates known to be in favor of the abolition of the Constabulary. The Burgess of Edwardsville, a suburb, where much of the most vicious rioting has occurred, requested the Sheriff to withdraw the State police from that borough, asserting that they were not needed there to preserve order. In view of the facts the Sheriff ignored the request.

Letters containing threats to dynamite the residence of Mr. Wright have been sent to servants in his employ. Other letters threatening violence have been received by Mr. Wright.

SPRINGFIELD TROLLEY SERVICE CONFERENCE

Service on the Springfield (Mass.) Street Railway is at present under investigation by the Board of Aldermen. At a conference on Nov. 9 Clark V. Wood, president of the company, stated that traffic difficulties at this time are due to the following: the institution of the eight-hour day in manufacturing plants engaged in filling war orders and other work, which has increased the rush-hour peak load; temporary congestion at the Plainfield Street bridge, and the necessity of routing practically all cars through Main Street. Eighty-eight regular cars are now running, and to meet the evening rush traffic eighty-one extras are being used, compared with eighty-seven regular and forty-four extras last year. Additional cars, crews and inspectors have been put on and soon the company will have twenty-nine more cars in service than a year ago. Delays at the Plainfield Street bridge will be reduced greatly in the future and service at the Carew Street carhouse will be improved by the construction of a new carhouse at Hooker Street. H. M. Flanders, general manager, said that thus far there seemed to be no legal means to stop smoking by passengers in car vestibules. The gross earnings are 5 per cent better than a year ago, but the service is 33 per cent greater. Mr. Flanders said that the company hoped to begin the construction of a new carhouse and shop at Hooker Street at a cost of \$250,000 inside of a few months. Postmaster Thomas J. Costello of Springfield said that the company was giving first-class mail car service; that the cars were almost invariably on time and the crews diligent. Recognition of the company's financial burdens and of insubordination in the ranks of union employees has been emphasized by citizens as contributory causes of present operating difficulties.

NEW YORK COMMISSION INQUIRY

The inquiry being conducted by the Thompson legislative committee into the workings of the Public Service Commission of the First District of New York was turned during the latter part of the week ended Nov. 6 into an investigation of the holdings of Chairman Edward E. McCall, prior to his appointment, in the stock of the Kings County Electric Light & Power Company. The par value of the stock with the accretions due to the exercise of subscription rights subsequent to the original purchase is about \$50,000. The holdings are in four certificates. Three are for 100 shares each and one for eighty-seven shares.

Mr. McCall insists that the stock was transferred to his wife just before he was appointed to the commission. It appears, however, that since 1908 the stock has been held in the name of John J. Mackin, Mr. McCall's former court officer, although a separate power of attorney or memorandum for transfer to Mrs. McCall was made out but never exercised. Mr. Mackin understood that the stock was Mrs. McCall's and he indorsed the dividend checks to her.

Commissioners McCall, Hayward and Williams were all examined by the committee on Nov. 11. Mr. Hayward said that there were 119 cases before the whole commission since April 1 last and that all the commissioners were present at fifteen of these cases. The record of attendance for the cases was: Hayward, seventy-nine; Williams, seventy-nine; Wood, seventy; Cram, thirty-five; McCall, thirty.

BAY STATE OPENS FARE CASE

Entire Financial and Operating History of Company Subject to Investigation—Hearings May Last Several Months

The Bay State Street Railway fare case was opened before the Massachusetts Public Service Commission at Boston on Nov. 8. So great was the popular interest in the petition for the right to establish a 6-cent unit, with local modifications, throughout the Massachusetts lines of the company, that the commission transferred the hearing to Kingsley Hall, Ford Building. James F. Jackson, former chairman of the Massachusetts Railroad Commission, and Sheldon E. Wardwell, Boston, appeared as counsel for the company. About 100 counsel and officials were registered in opposition on behalf of municipalities served by the company. No official opposition developed, however, from the city of Boston on the opening day.

Chairman McLeod of the commission announced in opening the hearings that the company's case will first be presented, after which an interregnum will be allowed to permit ample study of evidence by the rebuttal. It is expected that the case will be on the docket for many weeks if not for several months, as the commission ruled on the opening day that the entire financial and operating history of the company may be subject to investigation, without necessarily limiting inquiry to matters subsequent to decisions of the former Railroad Commission.

In his opening statement, Mr. Jackson emphasized the faith of the management in the fair-mindedness of the public, once the issue is understood. The company now consists of thirty-eight formerly separate roads consolidated into a single system of about 940 miles of track. In the consolidation process union took place upon the common basis of a share for share exchange; the aggregate stock and indebtedness was not increased, and reductions in fare and additions to facilities were immediately realized. Those behind the enterprise believed that through possible economies and a greater financial strength, the outcome was bound to be a larger and better public service with fair return upon private investment. Events have proved that they were too optimistic about some things, mistaken about others and fated to meet obstacles that the wisest would never have foreseen. Traffic increased, but not at the rate predicted; repairs and reconstruction requirements mounted beyond anticipation; advance in wages and in cost of supplies, competition with other kinds of transportation, seasons of business depression and the multiplication of demands from municipal authorities made inroads upon income that were not anticipated.

In the last fifteen years the company has been compelled to contribute millions of dollars to the cost of constructing, maintaining and improving highways and bridges, eliminating grade crossings and developing parks and boulevards. The following table is significant:

	1901	1915
Taxes	\$341,569	\$653,380
Construction and maintenance, highways and bridges	\$567	\$287,727
Platform expenses in per cent of operating revenue	25.29	29.80
Total operating expenses, in per cent of operating revenue	61.38	72.04

The total amount paid by the Bay State and constituent companies from 1892 to 1915 for paving alone aggregated nearly \$4,000,000.

The total outstanding securities of the Bay State company and its leased lines in Massachusetts are \$47,534,500. Though these securities are lawfully outstanding, this capitalization undoubtedly represents to a greater or lesser extent over-issue of securities in the early history of constituent companies, which cripples it as a measure of capital cost. The construction account is \$46,559,327, but this is in insufficient detail, owing to practice in bookkeeping before the consolidation was effected. As a basis for fare readjustment, the company engaged Sloan, Huddle, Feustel & Freeman, Madison, Wis., to make an inventory of the property. They placed the investment cost of the property in Massachusetts at \$43,635,365. In the same report the reproduction cost appeared as \$46,361,266.

The company requires additional yearly revenue to the

amount of \$1,615,165 in order to pay a reasonable return (taken at 7 per cent) upon its investment. The imperative feature of the situation is not a call from present stockholders for larger dividends, but the necessity of continuing dividends in order to get the new money required in conducting the service. In other States companies are generally given a free hand to obtain money upon stocks or bonds, but in Massachusetts capital cannot be obtained upon bonds until an equal amount has first been obtained upon shares of stock issued at not less than par. Unless the risk of the business is reduced so that money is ready to take it, i.e., unless reasonable dividends are practically assured, the financing of a railway comes to a halt, and extensions and improvements stop. Dividends for the last fifteen years have averaged only 4.9 per cent. The benefits of centralization have been enjoyed by the communities served, and as a direct result of consolidation there has been a saving in interest of more than \$1,000,000, reducing to that extent the amount upon which future returns on capital are based and depreciation calculated in connection with the proposed increase in revenue. In view of the uncontrollable increasing costs the company submits that additional revenue is imperative.

At the hearing on Tuesday, Nov. 9, the company agreed to provide a considerable number of blue printed copies of tabular data for the use of town and city counsel. Charles R. Rockwell, vice-president and treasurer, then reviewed the company's financial history in detail. The surplus account was \$794,565 in 1901, compared with \$5,751 in 1915. In this period investment increased \$18,270,453, or 62.17 per cent, and operating revenue increased \$3,720,515, or 66.2 per cent; while operating expenses, including taxes, increased \$3,683,978 or 97.18 per cent.

Robert M. Feustel of Sloan, Huddle, Feustel & Freeman, then took the stand. He described the methods utilized in taking the Bay State inventory and presented the results of eighteen months' work in this connection by an average staff of fifty men. A description of these methods and a summary of the results obtained and presented at the hearings will be published in a later issue of the *ELECTRIC RAILWAY JOURNAL*. The inventory was made on the basis of the detailed investment in the property checked by an exhaustive survey of the physical plant with items listed according to the Interstate Commerce Commission classification of accounts.

At the hearing on Nov. 10 Mr. Feustel continued the presentation of the valuation report, after which adjournment was taken to Nov. 16, at which time the commission will hear counsel as to the jurisdiction of the board in the matters at issue. Counsel in opposition to the company raised the point that the proposed fare increase is an interstate matter and therefore subject to the jurisdiction of the Interstate Commerce Commission.

NEW LOCKPORT-NIAGARA FALLS LINE OPPOSED

The Public Service Commission for the Second District of New York has received final briefs in the petition of the Niagara River & Eastern Railway for a certificate to build and operate a double-track electric railway for passenger and freight service between Lockport and Niagara Falls, N. Y. The proposed line is opposed by the New York Central Railroad, which claims that Niagara County has adequate railroad facilities at present and that its road with the aid of the International Railroad is capable of handling more business than the section produces. It also maintains that a permit to a new road would be unfair to the vested interests of stockholders in existing lines. The Niagara River & Eastern Railway purposes to connect with the International Railroad and the Buffalo, Lockport & Rochester Railway at Lockport and with trunk lines of steam railroads in Canada by means of a new bridge across the Niagara gorge at or near Lewiston. It is also proposed to handle freight on the Buffalo, Lockport & Rochester Railway and connect with the Erie and the Pennsylvania Railroads at Rochester. Charles Hickey, Lockport, is president of the Niagara River & Eastern Railway, and officials of the International Railway, Buffalo, and the Beebe syndicate, which owns the Buffalo, Lockport & Rochester Railway, are connected with the new project.

New Oregon Line Opened.—The Willamette Southern Railway, extending from Oregon City, Ore., to Mount Angel, a distance of 32 miles, has been opened for traffic. Grant V. Dimmick, Oregon City, is president of the company.

Clay County Appeal Made.—The appeal in the case of the Interstate Railway vs. the Kansas City, Clay County & St. Joseph Railway to the Supreme Court of Missouri against the recent verdict for \$1,500,000 in favor of the plaintiff has been perfected by the filing of a bond for \$3,400,000 given by the National Surety Company. Judge Woodson of the Supreme Court approved the bond. This assures the case being heard on the appeal in the highest court of Missouri.

Albany Arbitration Postponed.—On account of the absence of Judge William E. Woollard from Albany, N. Y., on Nov. 4 the meeting of the United Traction Company arbitrators was postponed until Nov. 19. The arbitrators, Judge Lynn J. Arnold, chairman; Mayor Cornelius F. Burns of Troy, and Judge William E. Woollard of Albany will take up the question of the differences between the company and its employees which led to the strike of Sept. 6.

Maine Trolley Plan Revived.—It has been announced at Bangor, Me., that financial arrangements have been completed for the construction of a 23-mile electric railway from Mattawamkeag to Millinockett and East Millinockett, between the Maine Central and the Bangor & Aroostook Railroads, under a charter held by C. W. Mullen and I. B. Wood, Bangor; Artemus Weatherbee, Lincoln, and Frank J. Rich, Mattawamkeag. Power is to be derived from a privilege on the Mattaceunk stream. Stone & Webster, Boston, Mass., are the fiscal agents, and a survey under their direction indicates a favorable route.

Trade Commission Extending Export Inquiry.—The Federal Trade Commission is sending out 30,000 letters of inquiry, followed up by a brief schedule, as a part of its investigation of conditions that affect American foreign trade. A return postcard accompanying the letter is designed to give the commission a broad yes or no referendum on the advisability of export combinations, and to put it in touch with those who are willing to assist the commission by furnishing further facts and suggestions. The schedule inquiries are only one part of the study of conditions which may affect American export trade being conducted by the commission. It has also held a series of public hearings; is engaged on systematic research work covering trade and financial papers, official publications and reports of the United States and foreign governments and other published material, and will send agents abroad to study conditions on the ground.

Ontario Board Refuses to Interfere.—The Ontario Railway Board has refused to interfere in the Yonge Street extension difficulty, pending a decision by the Privy Council upon the legal position of the Toronto Railway and the city. The company sought to have the board enforce its order directing the city to do the preliminary work for the construction of the extension, but the board held that the city's appeal to the Privy Council should be disposed of first. H. S. Osler, appearing for the company, was sure that the Privy Council would uphold the company's right to extend to Farnham Avenue, but added that, if the company were allowed to go on with the construction now, and the decision was an adverse one, it would immediately hand over the extension to the city at cost. Chairman McIntyre pointed out that the validity of the board's order rested upon the construction of the agreement between the city and the company. He did not think the board could facilitate the carrying out of the order so long as there was any doubt as to the legal basis upon which the order rested.

New York Authorizes Another Rapid Transit Route.—The secretary of the Public Service Commission for the First District of New York has reported to the commission that the necessary number of property owners consents have been obtained to legalize Route No. 61, the so-called Sixtieth Street-East River route. This line is a two-track underground railroad, beginning in Fifty-ninth Street west of Fifth Avenue. It curves diagonally under Central Park

and Fifth Avenue into Sixtieth Street, runs through Sixtieth Street to and under the East River to North Jane Street, Long Island City, where it will emerge from the ground and connect with the new elevated lines in Queens Borough. On the Manhattan side the new route connects with the Broadway, Seventh Avenue and Fifty-ninth Street line, which is for operation by the New York Municipal Railway Corporation. The new route is made necessary by the substitution of the river tunnel for the use of the Queensboro Bridge, as at first proposed by the commission. The change in routes was made at the request of the Board of Estimate & Apportionment of the city.

Terre Haute Abandonment Case Settled.—In the Superior Court at Terre Haute, Ind., on Nov. 3, in the suit of the city of Terre Haute vs. Terre Haute, Indianapolis & Eastern Traction Company, an agreement was reached between the parties whereby the company agreed to return to the city the street known as Cherry Street, one block in length, between Eighth and Ninth Streets, which had been vacated by the city in favor of the company by order of the City Council of Terre Haute in December, 1910. The order was made at that time in consideration of the company giving to the city a tract of land adjoining the alley between Eighth and Ninth Streets, it being thought desirable at that time to make such an agreement to provide a proper site for an interurban terminal building which the company proposed to erect in Terre Haute. At the present time only a temporary one-story building has been erected on the terminal building site, although the Arcade Building, which gives a direct entrance from Wabash Avenue to the proposed terminal station, has been completed for some time. By the new order of the court the city agrees to vacate the platted alley running north and south through the land used by the traction company for a site for its terminal station.

PROGRAMS OF ASSOCIATION MEETINGS

National Railway Appliances Association

The eighth annual exhibition of the National Railway Appliances Association will be held at the Coliseum and Annex, Chicago, Ill., beginning on March 20 and concluding March 23. During the same week the seventeenth annual convention of the American Railway Engineering Association and the March meeting of the Railway Signal Association will be in session at the Congress Hotel. The meeting of the Association of Railway Telegraph Superintendents will be held during the same week at Chicago. These annual exhibitions are for the purpose of exhibiting the products of members of the National Railway Appliances Association in the field of steam and electric railway construction, maintenance and operation. Applications for space by intending exhibitors should be made to C. W. Kelly, secretary-treasurer of the National Railway Appliance Association, 122 Michigan Avenue, Chicago.

Central Electric Railway Association

The program has been announced for the fall meeting of the Central Electric Railway Association, to be held at the Claypool Hotel, Indianapolis, Ind., on Nov. 18 and 19. The business session and the presentation of reports of committees are scheduled for 9 a. m. on Nov. 18. The other program for that day follows:

Address, "The Question," by G. K. Jeffries, general superintendent Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

Address, "The Interurbans," by J. F. McClure, of the Public Service Commission of Indiana.

Lecture and motion pictures, "From Ore to Finished National Pipe," by W. A. Phillis, metallurgist National Tube Company, Pittsburgh, Pa.

The program of papers for Nov. 19 follows:

Paper, "Automatic Substations," by Edward Taylor, engineer General Electric Company, Chicago, Ill.

Paper, "Package Freight on Passenger Cars," by J. F. Strattan, treasurer, and W. L. Foreman, trainmaster Louisville & Northern Railway & Lighting Company, New Albany, Ind.

Financial and Corporate

ANNUAL REPORT

Boston Elevated Railway

The statement of income, profit and loss of the Boston (Mass.) Elevated Railway for the fiscal year ended June 30, 1915, follows:

Gross operating revenues.....	\$17,798,607
Operating expenses:	
Maintenance of way and structures.....	\$1,429,567
Maintenance of equipment.....	1,203,351
General expenses.....	1,738,629
Traffic expenses.....	5,290
Transportation expenses.....	5,620,829
Power.....	1,290,317
Total operating expenses.....	\$11,287,983
Net operating revenues.....	\$6,510,624
Non-operating income.....	87,942
Gross income.....	\$6,598,566
Payments on account of leased lines.....	3,056,011
Balance.....	\$3,542,555
Other deductions from income.....	2,218,336
Net income.....	\$1,324,219
Dividends.....	1,313,367
Surplus for year.....	\$10,852

The operating revenues and the non-operating income together increased \$100,571 or 0.56 per cent during the year, the gain of \$168,991 or 0.96 per cent in operating revenues being cut to this figure by a decrease in non-operating income. The operating expenses decreased \$9,878 or 0.08 per cent, but the total charges against income for taxes, rent of leased roads, rent of subways and tunnels, and interest on funded debt, unfunded debt and miscellaneous items increased \$223,399 or 4.4 per cent. Consequently not only was the increase in gross income absorbed, but the net income as compared with the preceding year was reduced \$112,949 or 7.8 per cent. Taxes increased \$28,242, rent of leased roads \$61,087, rent of subways and tunnels, \$147,595 and miscellaneous \$4,587, small decreases in some items and adjustments in accounts giving the preceding net increase of \$223,399. The taxes would have shown a much greater increase if the capital stock of the West End Street Railway and the Boston Elevated Railway had not been abnormally low on April 1.

In regard to the Cambridge subway it is said that neither any increase in business nor the incidental economies effected were sufficient to take care of the large increase in annual charges made necessary by the additional investment, which, with the Boston connections, amounts to \$12,293,604. At present the loss in net revenue caused by the construction of the Cambridge subway, including additional taxes, interest and dividends on the investment, is estimated to be approximately \$315,000 per annum.

The total requirements for taxes, rentals, interest and dividends at the rate of 6 per cent call for \$6,702,523. The amount of income actually available therefor this year was only \$6,598,566. Hence the earnings were sufficient to pay only 5½ per cent dividends and to allow \$10,852 to be credited to surplus. The payment of reasonable dividends is said to be important in connection with the obtaining of new money to meet growing public demands for improvements, and the directors state their firm conviction that in the near future some adequate provision must be made for a substantial increase in the net income of the company. During the last year the total revenue passengers carried increased 3,135,535 or 0.91 per cent, and the operating expenses showed a slight decrease, as before noted, but in the judgment of the directors no adequate relief should be expected from the ordinary increase in business, from a reduction of operating expenses or from any decrease in the charges ordinarily incident to the capital investment.

In speaking of the difficulties surrounding new security issues the report says that under the law in force in Massachusetts the amount of bonds which the company may issue is limited to the par value of its capital stock plus paid in premiums. The company can now issue, therefore, only \$3,286,828 of additional bonds until it has issued additional stock. New stock cannot be issued for less than par, and

the outstanding stock is at present quoted on the market at substantially below par. Under present conditions, therefore, the company has no means of providing additional capital of its own for paying for further additions or improvements to its property by the issue of either additional bonds or stock. Any additional money can be obtained only by short time loans, which method of financing is unsafe and not to be used if it can be avoided, or by the issue of West End securities as far as additions are made to the leased property.

The relation between the increases in investment and in total receipts of the company is well brought out in the report. In 1897, just prior to the lease of the West End Street Railway by the Boston Elevated Railway, the investment in street railway properties of the West End Street Railway was \$25,291,913. On June 30, 1915, the investment of the system operated by the Boston Elevated Railway in substantially the same territory, including subways, was \$112,013,280. This last amount does not include either the East Boston Tunnel extension (estimated cost with equipment, \$3,000,000) or the Dorchester Tunnel (estimated cost without equipment, \$9,900,000), which have not yet been completed. During the same period the total receipts of the system increased from \$8,719,032 to \$17,886,549, or 105 per cent. The increase in the investment was 343 per cent. Of this increase in investment more than 69 per cent is represented by the cost of \$26,414,878 for the elevated structure and its stations and the cost of \$33,394,532 for the subways with their connections. In 1897 the investment was \$2.90 for each \$1 of total receipts. In 1915 it was \$6.26 for each \$1 of total receipts.

During the year the company added a net of 5,345 miles of surface track, making the total now 520,722 miles. It expended for reconstruction and maintenance of tracks \$617,399 or \$1,272 per mile for surface lines and \$83,967 or \$2,278 per mile for rapid transit lines. On buildings the maintenance and repair costs totaled \$119,158. The company put in operation during the year forty-three stepless prepayment middle-entrance vestibule cars, and it received 100 large trailer cars. Two-car train operation so far has proved satisfactory, and it is the present intention to buy twenty-five more such cars.

In connection with transfers it is noted that the number of points at which transfers are honored is 109. The paper transfers issued for the year ended June 30, 1915, totaled 104,307,102. The number of paper transfers received during the same period was 83,415,829. It has been estimated that if at fourteen points where paper transfers are now issued paper transfers can be done away with the company can eliminate 64 per cent of all paper transfers. In other words, it would have left ninety-five points at which there would be received only 36 per cent of the present paper transfers. The company is making careful studies to determine what paper transfer points can be transformed into points for bodily transfers without paper tokens.

The cost of the safety-first campaign during the year was \$3,188. The result of the campaign in the reduction in accidents may be summarized as follows: "For July, 1914, when a special account was kept, there was a total reduction of 25.3 per cent in the number of accidents reported as compared with July, 1913, and this in spite of an increase of 9.9 per cent in the number of passengers carried and an increase of 6.8 per cent in the number of trips run."

The net cost to the company of the workingmen's compensation act for the year 1913-1914 was \$59,109; for the year 1914-1915 by estimate, \$76,184. The Legislature of 1914 increased substantially the benefits to be received by injured employees and the new law went into effect on Oct. 1, 1914. This accounts for the increased cost over preceding years, although the number of employees injured has slightly decreased.

Operating officials of the company believe that during the next year the freight and express business will be substantially increased on account of the additional facilities which are to be provided. Moreover, the public has had an opportunity to see that the company can fittingly enter this field and at the same time perform the service without in any way interfering with the proper operation of the company's primary business of carrying passengers.

STOCKHOLDERS IN KANSAS CITY

Supplementary Plan for Reorganization Provides for Segregation of Railway and Lighting Properties and Deposit of Old Stocks

The final section of Judge Hook's plan for a reorganization of the Kansas City Railway & Light Company, Kansas City, Mo., was made public on Nov. 8. In this the way in which the stockholders will be taken care of in the adjustment is provided for. The section is supplemental to the court's plan announced on July 30, 1915, which made provision for the bondholders of the New Jersey holding corporation and those of the underlying properties. Two commissioners, W. W. Gurley of Chicago and John H. Atwood of Kansas City, have been appointed to carry out the stockholders' plan, and all creditors and stockholders must file with these commissioners their claims and acceptances of the plan before Dec. 20.

As previously announced, the plan insists upon the complete dissolution of the railway and light company. It provides that 80 per cent of the outstanding stock shall determine the basis of division as between the two companies. The stock of these two segregated operating companies shall be deposited with two sets of three trustees each, one to be selected by the preferred stockholders, another by the common stockholders, and the third by these two. They will issue preferred and common beneficial certificates, one for each share of stock now outstanding. The old status as between preferred and common stocks to be maintained as between the preferred and common beneficial certificates, except that the preferred is to be cumulative instead of non-cumulative.

The stock deposit committee is composed of the following men: George M. Reynolds, chairman; G. W. Bacon, New York; Oscar Fenley, Louisville, Ky., and H. T. Abernathy, Kansas City, Mo. More than 90 per cent of each class of stock has been deposited with the committee, which met on Nov. 6 and voted to submit the entire plan in all its details to the stockholders immediately. In the meantime all non-depositing stockholders will be offered further opportunity to participate.

RECEIVER FOR EMPIRE UNITED

Default in Bond Interest Leads to Friendly Receivership For Purpose of Readjusting Finances of Company

Owing to a default in the bond interest due on Nov. 1 Justice W. S. Andrews on that date appointed H. S. Holden as receiver of the Empire United Railways, Inc., Syracuse, N. Y. The interest due was approximately \$122,000 on bonds of the Rochester, Syracuse & Eastern Railroad and \$70,000 on bonds of the Syracuse, Lake Shore & Northern Railroad and the Auburn & Northern Railroad. Justice Andrews directed that the interest coupons of the Syracuse, Lake Shore & Northern Railroad and Auburn & Northern Railroad be paid by the receiver on Nov. 2. The principal cause of lack of revenue was the general falling off in receipts during the last season. Contributing factors were the good highways paralleling the Rochester-Syracuse division, the excessive amount of rainfall this season, the prevailing business depression and an unfavorable contract for entrance into Rochester and labor troubles.

The appointment of Mr. Holden, who is vice-president and a director of the company, was the result of a friendly action looking toward a readjustment of the company's finances. A representative of the Attorney-General's office of the State of New York filed an objection to the appointment of Mr. Holden on account of his relation to the company, but Justice Andrews decided to make a temporary appointment. On Nov. 27, however, he is to hold a hearing for the purpose of determining whether or not Mr. Holden's receivership shall be made permanent. In the meantime, a bondholders' committee has been formed, consisting of A. W. Loasby, president Trust & Deposit Company, Onondaga, N. Y.; Elbert A. Harvey, representing Lee, Higginson & Company, Boston, Mass., and Deforest Settle, of Bentley & Settle, Syracuse, N. Y. This committee, acting under a bondholders' protective agreement, is securing the deposit

of bonds with the Trust & Deposit Company, Onondaga, N. Y., and the Old Colony Trust Company, Boston, Mass. It is expected that this committee will have a very large voice in any reorganization plans which may finally be consummated.

C. D. Beebe, president, has issued the following statement regarding the future:

"The parties interested in the property expect to bring forward at a very early date a plan for the readjustment of the company's finances, which will probably mean some readjustment of the interest charges for a period on the Rochester, Syracuse & Eastern Railroad bonds and a change in the position of the Empire United Railways, Inc., first and refunding mortgage 5's. Moreover, a part of the plan will be to provide for the capital expenditures on the Rochester, Syracuse & Eastern Railroad that will be needed during the next eighteen or twenty-four months. The plan will also cover the same general line of capital expenditures on both the Lake Shore and the Auburn & Northern divisions."

The board of directors of the company was recently reduced from fifteen members to nine members in order to expedite the transaction of business. The new board consists of H. S. Holden, W. A. Holden, E. I. Edgcomb, C. D. Beebe, Joshua Bachman, Lewis P. Smith and William Nottingham, Syracuse, N. Y.; W. O. Morgan, New York, and F. W. Roebling, Jr., Trenton, N. J.

Arkansas Valley Railway, Light & Power Company, Pueblo, Col.—The Arkansas Valley Railway, Light & Power Company recently retired \$50,000 of first mortgage sinking-fund gold bonds of the Pueblo & Suburban Traction & Lighting Company, purchase having been made through the International Trust Company, Denver, trustee.

Atlantic Shore Railway, Kennebunk, Me.—Frederick O. Conant and C. Southworth, respectively president and treasurer of the Atlantic Shore Railway, were on Nov. 1 appointed receivers of the company by the United States Circuit Court in Portland. The appointment was made in response to a bill in equity filed by the Consolidated Coal Company as a creditor. Shortly before the court proceedings the directors voted not to oppose the suit. In court they admitted the allegation in the bill and asked to be permitted to join in the suit. The financial condition of the company was briefly described in the *ELECTRIC RAILWAY JOURNAL* of Nov. 6 in connection with an Oct. 1 bond interest default.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—At the receiver's sale of the Birmingham, Ensley & Bessemer Railroad, on Oct. 28, the property was purchased for \$700,000 by J. D. Kirkpatrick, representing the bondholders' committee. Steps will be taken to carry out at once the plan for reorganization, as described in the *ELECTRIC RAILWAY JOURNAL* of Oct. 2. As soon as the sale has been approved by the court, the new company will take over the property.

Boston (Mass.) Elevated Railway.—A bond issue of \$3,286,000 was authorized by the stockholders of the Boston Elevated Railway at the annual meeting on Nov. 1. The bonds, if approved by the Public Service Commission, will be used for the partial funding of the floating debt, construction, equipment, etc., as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30 in connection with the application to the commission.

Buffalo & Niagara Falls Electric Railway, Buffalo, N. Y.—Sealed proposals will be received on Nov. 15 by the Bankers' Trust Company, New York, for the purchase of \$10,000 of second mortgage sinking-fund gold bonds of the Buffalo & Niagara Falls Electric Railway, dated July 1, 1896. No tenders at a rate exceeding 105 per cent and accrued interest from the last interest date will be accepted. This is one of the companies now included in the system of the International Railway.

Croyden (England) Corporation Tramways.—The traffic receipts of the Croyden Corporation Tramways for the fiscal year ended March 31, 1915, amounted to £87,833, and the total revenue to £88,614. The working expenses totaled £70,307 and the war allowances £1,974, leaving a credit balance of £16,332. After deductions for income tax,

interest and sinking fund there remained a net balance of £190, which was carried to the renewals fund. From April 1 to July 31, 1914, the traffic receipts increased £2,382; while the net increase during the last eight months amounted to only £525 on account of the war. The combined increases, however, represented 3.42 per cent. Passengers carried increased 619,524 or 3.22 per cent, working expenses £564 or 0.81 per cent. and miles run 2497 or 0.09 per cent.

Manaos (Brazil) Tramways & Light Company.—The report for the year ended April 30, 1915, states that the gross receipts of the Manaos Tramways & Light Company amounted to £110,420, a decrease of £22,457. The expenses were £84,240, a decrease of £12,608, and the net earnings £26,180, a decrease of £9,848. The fall in exchange resulted in a loss of £6,180 on remittances during the year. After providing for interest, London charges, etc., placing £1,725 to debenture sinking fund and £300 to depreciation on furniture, there remained a profit balance of £4,002 to be carried forward. The state, federal and municipal governments are still in arrears with their accounts, although as a result of strenuous efforts some collections were made during the year.

Memphis (Tenn.) Street Railway.—Bertron, Griscom & Company, New York, have completed arrangements to pay \$1,000,000 of 6 per cent two-year debenture notes of the Memphis Street Railway, due on Nov. 1. The payment will be made from part of the proceeds of \$1,500,000 of 6 per cent two-year collateral gold notes recently sold, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9.

Merrill Railway & Lighting Company, Merrill, Wis.—It was announced in the *ELECTRIC RAILWAY JOURNAL* of July 24 that the Merrill Railway & Lighting Company had decided to surrender its franchise and vacate the streets. This action was decided upon because the Council insisted that the company, instead of laying its track in concrete, should pave between the tracks with brick, which would necessitate taking up and relaying all track besides paving it and would involve a cost of \$3 per foot. When the company announced the suspension of service, however, the newspapers and business men took a hand and the Council by a fifteen to one vote decided to allow the use of concrete between the tracks, which lessened the cost to \$1 per foot. The question has now been adjusted to the satisfaction of all parties without a franchise surrender.

Minneapolis & Northern Railway, Minneapolis, Minn.—Judge William E. Hale of the District Court for the Fourth Judicial District of Minnesota on Nov. 6 filed an order requiring F. H. Hunter, receiver Minneapolis & Northern Railway, and all creditors of this company to show cause at a hearing on Nov. 13 why an order of the court requiring the receiver to wind up his affairs and execute a deed of conveyance of the property to the Minneapolis, Anoka & Cayuna Range Railroad should not be entered as a final decree. This action is taken on the application of Charles P. Bratnober, one of the trustees who came into possession of the property by foreclosure. The formation of the Minneapolis, Anoka & Cayuna Range Railroad to take over the property from the trustees was described in the *ELECTRIC RAILWAY JOURNAL* of Aug. 14.

Northern Electric Railway, Chico, Cal.—The Northern Electric Railway and its allied companies have filed an application with the California Railroad Commission for the approval of the proposed reorganization plan, which was described in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23.

Otsego & Herkimer Railroad, Cooperstown, N. Y.—The receivership of the Otsego & Herkimer Railroad under C. H. Lewis and James J. Byard, whose appointment was mentioned in the *ELECTRIC RAILWAY JOURNAL* of Sept. 4, was recently terminated by Judge Ray as a result of an application by the Equitable Trust Company, New York, which had purchased the bonds and stock of the company and taken assignments of all the outstanding indebtedness of general creditors.

Portland (Me.) Railroad.—Upon the application of the Portland Railroad the Maine Public Utilities Commission has authorized the company to mortgage its properties to the New York Trust Company to secure \$7,500,000 of bonds, the mortgage to be dated as of Nov. 1, 1915, and due on

Nov. 1, 1945. The company may deposit with the trustee as additional security for indebtedness, now or hereafter, secured by mortgage, its first consolidated mortgage gold bonds, dated July 1, 1901, and due on Jan. 1, 1951. The commission also authorized the company to issue at not less than 90 and accrued interest \$1,000,000 of 5 per cent first lien and consolidated gold bonds, the proceeds thereof to be applied to the discharge of \$500,000 of Portland Railway extended first mortgage 5 per cent bonds due on Nov. 1, 1915, and of \$400,000 of Portland & Cape Elizabeth Railway first mortgage bonds, due on Nov. 1, 1915. A syndicate of bankers composed of A. B. Leach & Company, Charles H. Gilman & Company, Maynard S. Bird & Company, Merrill Trust Company and Fidelity Trust Company has already sold this entire \$1,000,000 issue at 97 and interest. These bonds are callable at 105 on any interest day.

Portsmouth (N. H.) Electric Railway.—President Huestis of the Boston & Maine Railroad has notified the Citizens' Railway, Portsmouth, that the Boston & Maine Railroad will give up the operation of the Portsmouth and Greenland line at once, the lease with the road having expired. The road has been operated in connection with the Portsmouth Electric Railway, which is owned by the Boston & Maine Railroad.

San Diego & South Eastern Railway, San Diego, Cal.—The California Railroad Commission recently issued an order authorizing the San Diego & South Eastern Railway to issue a two-year promissory note of \$25,000 to the First National Bank, San Diego, interest not to be more than 6 per cent. This note refunds a similar one issued without authorization by the commission.

Southern Iowa Railway & Light Company, Albia, Iowa.—It is reported that Judge Hunter has ordered the sale of the Southern Iowa Railway & Light Company property. Stockholders have protested and may carry the case higher. A note of the appointment of a receiver for this company was made in the ELECTRIC RAILWAY JOURNAL of June 26.

Utah Securities Corporation, New York, N. Y.—The Utah Securities Corporation, through the \$500,000 available for the retirement of its ten-year 6 per cent notes, has purchased \$578,000 of the issue at an average price of 85½ and interest. Similar purchases previously made were described in the ELECTRIC RAILWAY JOURNAL, issues of March 6 and 20.

Washington-Oregon Corporation, Vancouver, Wash.—The sale of the properties of the Washington-Oregon Corporation, under foreclosure, to Harry N. Putnam, Portland, was effected on Oct. 30. The sale was conducted by Major Charles O. Bates, Tacoma, as special master in chancery. The purchase price offered by Mr. Putnam was \$1,569,000. Mr. Putnam deposited with the special master a certified check for \$35,000 to bind the sale. In consideration of the transfer of the properties of the Washington-Oregon Corporation by Mr. Putnam to the North Coast Power Company, that company will issue to Mr. Putnam all of its preferred and common stock, aggregating in par value \$1,750,000, and bonds of the face value of \$675,000. Mr. Putnam will turn over the securities so received from the North Coast Power Company for distribution among the bondholders of the Washington-Oregon Corporation. Referring to the option given by the reorganization agreement to unsecured creditors and second-mortgage bondholders, Mr. Childs, who represents the reorganization committee, said: "The bondholders are willing to let the unsecured creditors and the second-mortgage bondholders take over the property and business of the new company, provided the investment of the first-mortgage bondholders is made good to them. We think it is fair to give the creditors any value there is in the property over and above the amount which has been invested by the bondholders. The North Coast Power Company is not controlled by the stockholders or officers of the Washington-Oregon Corporation, but is organized by the secured creditors of the corporation. The management and policies of the new company will be in the hands of entirely new interests. Herbert L. Harries, who is now managing the properties for the receiver, will be general manager of the North Coast Power Company. The company expects to take over the properties of the Washington-Oregon Corporation about the middle of November."

DIVIDENDS DECLARED

American Railways, Philadelphia, Pa., quarterly, 1 per cent, common.

Bristol & Plainville Tramway, Bristol, Conn., quarterly, 2 per cent.

Central Arkansas Railway & Light Corporation, Hot Springs, Ark., quarterly, 1½ per cent, preferred.

Detroit (Mich.) United Railway, quarterly, 1½ per cent.

Illinois Traction System, Peoria, Ill., quarterly, three-fourths of 1 per cent, common.

Massachusetts Consolidated Railways, Greenfield, Mass., 1½ per cent, preferred.

Pacific Gas & Electric Company, San Francisco, Cal., quarterly, 1½ per cent, original preferred and first preferred.

Traffic and Transportation

JITNEY JOTTINGS

Philadelphia Ordinance Sustained—The Case Against the Jitney in Atlantic City

In an opinion filed on Nov. 4 Judge Patterson, in Common Pleas Court No. 1 at Philadelphia, Pa., dismissed the suit of the jitney men for an injunction restraining the Mayor and Director of Public Safety from enforcing the jitney ordinance. He found that the evidence offered by the complainants failed to establish that the ordinance is unconstitutional, unreasonable, oppressive, prohibitive, discriminatory, confiscatory, or that it conflicts with any existing law. Judge Patterson finds in his conclusions of law that the city, in granting permission for the operation of motor buses in the streets, may by ordinance impose conditions under which such rights may be enjoyed. It may require the owners or lessees of such buses to charge a certain designated maximum rate of fare and to fix maximum lengths of routes, and to require such vehicles to travel the full distance of such routes before returning to the starting point. Judge Patterson quotes from decisions of the Supreme Court of California and the Federal Court in Tennessee. In conclusion he says: "It is well settled, of course, that an ordinance, even when passed pursuant to legislative authority, must be a reasonable exercise of the power conferred by the Legislature, or it will be pronounced invalid. But in considering this question, it is well to remember that the complainants in this case have no vested right in the use of the streets for operating vehicles for hire. No person or persons can acquire the right to haul passengers for hire over the streets or to make any other special or unusual use of the public highways except by grant from the sovereign power. The responsibility in dealing with this question rests with Councils, and not with the courts. Councils have been given ample authority by the Legislature to pass ordinances regulating motor buses in the city streets."

This decision is regarded as dropping the final curtain on the jitney fight in Philadelphia. Unless appeals are taken to the Supreme Court, which is regarded as exceedingly unlikely, particularly as jitney competition has almost ceased to exist for some time, the decision finally disposes of the plans of the jitney drivers to prevent the enforcement of the Broad Street zone provision of the ordinance. The suits were based upon the complaint that the ordinance was prohibitive, as the jitney buses could not be run at a profit at a 5-cent fare over the route prescribed.

At a meeting held in Atlantic City, N. J., to discuss the jitney question and its effect on the investment of the Atlantic City & Shore Railway, a resolution was adopted calling upon the City Commission to pass an ordinance barring the jitney operators from Atlantic Avenue and other streets covered by franchises to the electric railways and requiring the jitneys to furnish a bond of \$2,500 each. Isaac H. Silverman, president of the railway, said that the corporation had suffered a loss of \$80,000 during the last summer and faced a receivership. H. E. Kohn, of Bachman & Company, Philadelphia, financial agents of the company, said the company was being subjected to a guerilla warfare, which threatened to become ruinous to many investors. Albert T. Bell expressed the belief that the company could solve its problem by adopting the zone system of fares for Atlantic Avenue. Charles Evens, vice-president of the company, said that every dollar the city derived from jitneys was spent in employing policemen to keep them from killing people. Ex-Judge Allen B. Endicott, a bank president, insisted that the city protect residents who have invested their money in the electric railway and the banks which hold its securities. William F. Hanstein, president of the Hotelmen's Association, proposed that jitneys be excluded from Atlantic Avenue. Joseph A. McNamee, a banker, said that a receivership for the company would depreciate every investment in Atlantic City 25 per cent and set back lower resorts ten years. The jitney men are supported by Mayor Riddle and one or two of the newspapers, while most of the city commissioners are silent on the subject.

CONFERENCE ON AUTOMOBILE ACCIDENTS

Meeting at Syracuse Results in Appointment of Committees —Another Meeting in Albany on Nov. 17

The increasing number of automobile accidents occurring at grade crossings, especially on electric railroads, has been the subject of consideration on the part of the Public Service Commission for the Second District of New York. To facilitate its work in this direction the commission deemed it advisable to solicit the co-operation of organized automobile people, and a communication was accordingly addressed to the presidents of the New York State Automobile Association and the Motor Federation, copies being sent also to each automobile club in the district within the jurisdiction of the commission. This communication contained an invitation to these State organizations and affiliated clubs to meet with representatives of the electric railroads in the Onondaga Hotel, Syracuse, on Oct. 27, at 10 a. m. to discuss before the Public Service Commission matters affecting safety of operation at grade crossings of electric railroads.

Suggestions favoring both mechanical and educational methods for preventing accidents, coming from more than fifty sources and freely discussed by ninety persons at the meeting, will be considered by a committee of nine to be appointed by the Public Service Commission. A resolution adopted at the meeting provides that this committee, with the aid of sub-committees which it will appoint, make a thorough study of the grade crossing situation and prepare suggestions of ways and means for the eliminations of such hazards as now exist. Other than the resolution asking the appointment of this committee no action was taken by the conference. Following the moving of this question the meeting spent the time listening to suggestions.

The representatives of the railway companies present advocated education as the method of lessening the casualties. The automobile men were more or less insistent that mechanical means be devised to inform the motorist that danger is near when railroad and railway crossings are approached. Both forces, however, agreed that publicity emanating from both railway and automobile sources and promulgated through the press, direct correspondence with automobile owners and through the publications of automobile clubs, possesses the greatest possibilities as a cure for the evils. It was agreed that a uniform system of signs notifying motorists of their approach to a crossing is an essential detail needing immediate attention. In discussing the matter of signs, J. P. Barnes, general manager Buffalo, Lockport & Rochester Railway, recommended that they be not regarded as danger signs, but rather as safety signs. He said the word "danger" to a certain class of motorists invited taking a chance.

Chairman Van Santvoord of the commission on Nov. 8 appointed the executive committee to consider means for greater safety at the grade crossings of electric railways in New York State, and a meeting of the committee has been called for Nov. 17, at the offices of the commission. The members of the committee are as follows: Peter G. Ten Eyck, Albany, representing the New York State Automobile Association; John B. McNerny, Rochester, representing the New York State Motor Federation; George C. Diehl, Buffalo, representing the American Automobile Association; E. G. Connette, Buffalo, president of the International Railway; B. E. Tilton, Utica, general manager of the New York State Railways; J. P. Barnes, Rochester, general manager of the Buffalo, Lockport & Rochester Railway; Mr. Van Santvoord, Francis M. Hugo, Secretary of State, and Edwin Duffey, State Commissioner of Highways as ex-officio members, and Charles R. Barnes, electric railway inspector of the Second District Public Service Commission, representing the commission.

At the meeting to be held in Albany sub-committees will be appointed to study the various suggestions for safer grade crossings of electric railways, which were submitted by the commission to the Syracuse conference and by many other persons in attendance at that conference. The reports of these sub-committees will be passed upon at a future meeting of the executive committee and the result will be embodied in a report to be submitted to the Public Service Commission.

TORONTO RUNNING BOARD CASE DECIDED IN COMPANY'S FAVOR

The Ontario Railway Board on Nov. 2 issued an order, on the application of the Toronto (Ont.) Railway, relieving it from responsibility for the operation of cars with running boards. Vice-Chairman Ingram and Commissioner Kittson heard the argument and adjourned the hearing *sine die*. Two hours later they issued the order desired by the company in the following terms:

"Upon hearing the counsel for the applicants and respondents and the board having been investigating the question of the change of the type of summer cars in use on the applicant's railway, and having conducted experiments and inspected the tracks and devil-strips of the said railway company's system, and the board being of the opinion that the space between the tracks, commonly called the devil-strip, is not sufficiently wide to permit cars with seats for passengers facing the front with an aisle sufficiently wide to allow the passage of the conductor, the board orders that the applicants be hereby relieved until a final disposition of this application from the obligation imposed by Sub-Section 1, of Section 107, Ontario railway act, to all routes upon which the company operates its street cars."

New Working Agreement in Fort Smith.—The Fort Smith Light & Traction Company, Fort Smith, Ark., has entered into a new contract with its men which runs until Nov. 1, 1916. Under the new contract the present length of the working day and working conditions other than those of wages remain unchanged. The pay of the trainmen, however, is increased 2 cents an hour.

Detroit Patrons Urged to Consider Skip Stops.—The Detroit (Mich.) United Railway, in *Electric Railway Service* for Nov. 5, urged upon its patrons their consideration of the skip stop. The company has asked its riders and readers to let it hear from them as to their opinion of the skip stop. In conclusion the company said: "The discussion will result in good to all of us, and it may lead to the adoption of some plan which will help materially in the transportation of the public."

Trenton Fare Hearing.—The hearing in regard to fares on the lines of the Trenton & Mercer County Traction Corporation, Trenton, N. J., was resumed on Oct. 29. Three reasons were assigned by Rankin Johnson, president of the corporation, as to why the receipts of the company have decreased in the present fiscal year from the total receipts for the same months of 1914. The first reason was the increase in the use of automobiles. The second was the development of the commercial automobile, known as the jitney. The third was the general depression.

How the Louisville Nickel Is Divided.—Passengers on the cars of the Louisville (Ky.) Railway are getting their first lessons in the interdependence of themselves and the company. This is a part of the campaign which the *ELECTRIC RAILWAY JOURNAL* recently mentioned. It will be continued indefinitely. The first card read as follows: "How the trolley nickel is divided.—2.02 cents for wages. 0.78 cent for expenses. 0.55 cent for taxes. 1.06 cent for interest. 0.59 cent for dividend. Our interests are mutual.—Louisville Railway."

Skip Stops in Washington.—It is announced that the Washington Railway & Electric Company, Washington, D. C., is about to establish an express service from Fifteenth Street and New York Avenue to the District line at Chesapeake Junction, cars running every six minutes between 4 p. m. and 6 p. m. It is further stated that these cars will not take city passengers, and will stop only at indicated points on the road. These indicated points number twelve between Fifteenth Street West and Fifteenth Street East, being the compulsory stops at track intersections and "fire stops."

New Express Rates of Northern Texas Traction Company.—The Northern Texas Traction Company, Fort Worth, Tex., has put into effect a new schedule of express rates over its line extending from Dallas to Fort Worth and Fort Worth to Cleburne, which reduces by approximately one-half the rates charged under the old classification of "merchandise"

or "general specials." The Texas Railroad Commission classification of first, second, third or fourth classes is used, and rates corresponding to these classes, the same as are charged by the steam railroads, are assessed, giving express service for freight rates.

San Francisco Municipal Railway's Largest Day.—Receipts from fares on the San Francisco (Cal.) Municipal Railway system on Nov. 2, San Francisco day at the exposition, were the largest in the history of the municipal line. The total cash fares on all branch lines amounted to \$14,007, eclipsing by several hundred dollars the receipts on opening day. The exposition attendance on Nov. 2 was about 348,000. It is estimated that more than 280,000 persons rode on the city car lines. No accidents were reported. The total receipts of the municipal line from all sources during October were \$215,231.15.

Increase in Wages on Massachusetts Line.—The conductors and motormen in the employ of the Boston & Worcester Street Railway, Boston, Mass., have been granted an increase in wages. The new schedule provides that the men will receive a minimum of 26 cents an hour and a maximum of 32 cents. The old rates called for a minimum of 24 cents and a maximum of 29 cents. The men who have been employed by the company six months or less get 26 cents under the new rate. The second six months the wage is advanced to 27 cents. The wage for the second-year men is to be 28 cents and the third-year men 29 cents. The fourth-year men will receive 30 cents and after this period of service all the uniformed employees will receive the maximum of 32 cents.

New Regulations for Safety in Streets.—Many important recommendations to provide for new traffic regulations with the view to minimizing the number of accidents occurring upon the public streets were approved at a meeting of the street traffic committee of the New York Safety First Society held on Nov. 4. It was the consensus of opinion that the campaign of education being conducted by the Safety First Society was accomplishing much good, but that greater authority must be given to the traffic police to regulate and direct pedestrian travel upon the public streets and that it should be unlawful for any person to cross a street in the middle of a block. The Detroit ordinance, which gives the police commissioner power to regulate and direct the course of pedestrian travel, was approved. An important recommendation provides for an ordinance making it a misdemeanor for any person to "hitch on" or trespass upon a motor vehicle, street car or horse-drawn vehicle, unless employed by the owner thereof.

Accident Fakir Apprehended in New Jersey.—On Oct. 6, 1915, James Ryan, alias James Morrissey, alias Charles Miller, alias Harry Peterson, was arrested on complaint of Claim Agent Van Buskirk of the Central Division of the Public Service Railway, Newark, N. J., charged with attempting to obtain money under false pretences. He received a hearing before Recorder Feister of New Brunswick, pleaded not guilty and was held under bail to await the action of the Grand Jury. This man, giving a different name on each occasion, has presented four claims against the Public Service Railway in different parts of the State, and his attempts to collect at the same office twice led to his arrest. He invariably gives his occupation as that of a carpenter. In all of the cases his claim is based on a fall inside of a car. In each case he showed symptoms of a fractured skull and got away with it. His story has been that he fell as a result of tripping over a protruding nail in the car. He usually extracted this nail from his shoe in the presence of witnesses at the hospital. He appears to be about fifty years of age; height 5 ft. 9¼ in., weight 190 lb.; hair slightly gray; drooping gray moustache; eyes blue-gray. Ryan has now been positively identified as having made similar claims against the Connecticut Company, in which he used the name of Charles Miller; against the Fonda, Johnstown & Gloversville Railway, in which he used the name of Richard Boshart, and against the Worcester (Mass.) Consolidated Street Railway, in which he used the name of John Meyers. In all of these cases he deceived the examining physicians and the physicians at the hospital.

Personal Mention

Mr. Bury I. Dasent has been appointed publicity agent of the British Columbia Electric Railway, Vancouver, B. C., to succeed Mr. Frank Harris, resigned.

Mr. E. B. Heath, trainmaster for the Spokane, Portland & Seattle Railroad, Portland, Ore., has been appointed assistant superintendent of the Spokane & Inland Empire Railroad and the Spokane Traction Company, Spokane, Wash.

Mr. Walter N. Polakov has resigned as superintendent of power of the New York, New Haven & Hartford Railroad to engage in consulting practice. He had been in charge of the operation of the power plants of the New Haven for eighteen months.

Mr. A. S. Henry has been appointed superintendent of transportation of the Lockport division of the International Railway, Buffalo, N. Y., including the Lockport city lines and the Buffalo and Lockport branch. He was formerly superintendent of the Lockport division of the company.

Mr. Thomas W. Connette, son of Mr. E. G. Connette, president of the International Railway, Buffalo, N. Y., who has been assistant superintendent of transportation of the Buffalo city lines of the company, has been promoted to the position of superintendent of transportation of the Buffalo city lines.

Mr. Edward Schlant has been appointed to succeed Mr. Thomas W. Connette as assistant superintendent of the Buffalo city lines of the International Railway, Buffalo, N. Y. Mr. Schlant was formerly in charge of the Hertle and Forest stations, in which capacity he will be succeeded by Mr. A. H. Hock.

Mr. H. M. Wilson, vice-president of the McGraw Publishing Company, Inc., was struck by an automobile on Nov. 5, in Scarsdale, N. Y., while returning to his home in the evening. The automobile carried no front lights. Although thrown to the ground and severely wounded in the face, Mr. Wilson escaped other serious injury and is now doing as well as can be expected.

Mr. Paul Shoup, president of the Pacific Electric Railway, Los Angeles, Cal., addressed the Jovian League in that city recently. Mr. Shoup reviewed electric railway history in that State, covering some of the points brought out by him in his speech before the American Electric Railway Association in San Francisco, Cal. Out of twenty-two electric railways in California on which he had secured figures only one paid a dividend to stockholders last year.

Mr. E. H. Henning has been appointed superintendent of transportation of the lines of the International Railway, Buffalo, N. Y., radiating from Niagara Falls, including the Buffalo and Niagara Falls division, the Niagara Falls city lines, the Park and River division on the Canadian side of the Niagara Gorge and across the Suspension Bridge and the new fast line between Buffalo and Niagara Falls soon to be built. Mr. Henning was formerly superintendent of the interurban lines of the company.

Mr. Herbert L. Harries, who has been managing the properties of the Washington-Oregon Corporation, with headquarters at Vancouver, Wash., for the receivers, has been appointed general manager of the North Coast Power Company, the successor to the Washington-Oregon Corporation, the property of which was sold under foreclosure on Oct. 30. Mr. Harries became connected with the Washington-Oregon Corporation in May, 1915. Before that he was assistant operating superintendent of the General Hudson Gas & Electric Company, Poughkeepsie, N. Y., having been theretofore assistant general manager of the Louisville Gas & Electric Company, Louisville, Ky., of which his father, Gen. George H. Harries, is president.

Mr. George G. Yeomans has been appointed purchasing agent of the New York, New Haven & Hartford Railroad, New Haven, Conn., to succeed Mr. H. A. Fabian. Mr. Yeomans was graduated from Princeton in 1879, and after leaving college worked for about two years in the rail mills of the Philadelphia & Reading Coal & Iron Company. He

then became connected with the Chicago, Burlington & Quincy Railroad as a rail inspector on the staff of the purchasing agent. After two years in this work he took a clerkship in the department, and filled practically every position in the purchasing agent's office, finally being made purchasing agent, which position he held for seven years. He was in the service of the Chicago, Burlington & Quincy Railroad for twenty-three years, resigning to become assistant to President F. A. Delano of the Wabash Railroad. He held that position for six years, until the road went into the hands of receivers in 1911. Since then he has made a specialty of investigating methods of purchasing and handling supplies on various large roads.

Mr. C. L. Stone, who has been appointed second vice-president and general manager of the Otsego & Herkimer Railroad, Colliers Light, Heat & Power Company and the Hartwick Power Company, Cooperstown, N. Y., was formerly vice-president and general manager of the Manila Electric Railroad & Light Corporation, Manila, P. I. Mr. Stone was with the General Electric Company from 1898 to 1902, first in the testing department and later in the power and mining, the engineering and the commercial departments. From 1902 to 1904 he was assistant to the master mechanic of the St. Louis (Mo.) Transit Company. Since 1904 he has been connected with the J. G. White Management Corporation, New York City. He went to Manila for the J. G. White organization before the electric railroad and lighting property there began operation, and had charge of a considerable amount of construction work. Operation in Manila was started in 1905, and Mr. Stone was appointed electrical engineer of the property. Later he was made assistant general manager of the Manila Electric Railroad & Lighting Company, in which capacity he served for a period of five years. He was vice-president and general manager of the properties there for approximately two years prior to his departure from Manila.

Mr. George O. Nagle has resigned as second vice-president and general manager of the Wheeling (W. Va.) Traction Company and as president and general manager of both the Pan Handle Traction Company and the Steubenville & Wheeling Traction Company, controlled by the Wheeling Traction Company. His resignation becomes effective on Dec. 1. Mr. Nagle has been with the properties in Wheeling as general manager since July, 1903. Mr. Nagle's incumbency at Wheeling has been marked by an immense amount of new construction work and reconstruction and witnessed the early restoration of the company to a place in public confidence which too few public utilities of

G. O. NAGLE

the kind enjoy. At no time in the twelve years of Mr. Nagle's work in Wheeling has labor trouble threatened. Mr. Nagle was for Wheeling first. He entered into all work for community betterment, became an influential member of the Board of Trade, entered the Playground Association and recently was appointed by Governor Hatfield of West Virginia to represent the State as a member of the Panama-Pacific Exposition Commission. The esteem in which Mr. Nagle was held is instanced by the following statement made by the *Wheeling Intelligencer*: "Probably no other man in Wheeling during the time Mr. Nagle has lived here has been more highly regarded or has made a more profound impression upon the community at large. As an employer of labor, as an enterprising and aggressive street railway manager, as a citizen interested in civic affairs, and in the welfare of the community in general, Mr. Nagle has taken leadership and filled a place that will be difficult for any other man to fill." Mr. Nagle was born in Milton, Pa., on Dec. 31, 1868. He received his early education in Lima, Ohio, and moved to Chicago in 1886. Shortly after

this he entered the employ of the Chicago, Burlington & Quincy Railroad, serving first in the ticket auditor's office and later in the general auditor's office. In February, 1891, he entered the employ of the Chicago (Ill.) City Railway as junior in the claim department. Six months later he was promoted to the position of private secretary to the superintendent, which place he held until appointed superintendent on Jan. 18, 1898. After Mr. Nagle resigned from the Chicago City Railway he became connected with Stone & Webster, Boston, Mass., taking the position of manager of the Savannah (Ga.) Electric Company, which controls the lighting and railway properties there. Mr. Nagle remained at Savannah for several years. Early in 1903 he retired from the management of the Savannah company to take charge of the Stone & Webster properties in the Southeast. In July of the same year he was appointed to the company at Wheeling.

Mr. Charles A. Call, general passenger and freight agent of the New York, Westchester & Boston Railway, New York, N. Y., has been appointed manager of the industrial bureau of the New York, New Haven & Hartford Railroad, to succeed Mr. W. H. Seeley, resigned. Mr. Call entered railroading in 1883, when he became connected with the New York & New England Railway in its passenger department. In 1898 he became passenger agent at Boston, Mass., and in 1905 was appointed general agent of the passenger department of the New York, New Haven & Hartford Railroad with offices in New York City. Mr. Call became general agent of the New Haven at Boston in 1908. He became general manager and freight agent of the New York, Westchester & Boston Railway in 1912.

Mr. Nelson H. Brown, who for the last two years has been superintendent of transportation of the Buffalo division of the International Railway, Buffalo, N. Y., has been promoted to the new position of general superintendent of transportation of the entire system of the International Railway, including the Buffalo, the Niagara Falls and the Lockport city lines, and the Buffalo and Niagara Falls, the Buffalo and Lockport, and the Park and River divisions. The appointment is effective on Nov. 15. Mr. Brown entered the railroad business with the New York Central Railroad in 1891, with the mechanical department. Later he was a fireman between Syracuse and Albany. He resigned from the New York Central in 1894 to become identified with the Consolidated Street Railway, Syracuse. During the year and a half following he was employed as a conductor, but in 1896 he became a motorman for the Syracuse company. In 1898 Mr. Brown was appointed cashier, a position which he held for a year, when he was promoted to inspector. About that time the various street railway properties operating in Syracuse were consolidated, and Mr. Brown was made an inspector with the newly organized company, known as the Syracuse Rapid Transit Company. He remained inspector until 1907, when he resigned to accept a position at Worcester, Mass., as general inspector for the Worcester Consolidated Street Railway. On Sept. 1 of that year he was appointed superintendent of the Worcester & Southbridge Street Railway, at Charlton City, Mass. After five years of service at Worcester, Mr. Brown resigned to accept a position with the Albany Southern Railroad, as superintendent, with headquarters at Rensselaer, N. Y. Early in 1913 Mr. Brown resigned from the Albany Southern Railroad to assume the position of assistant superintendent of transportation of the International Railway, Buffalo, N. Y., and continued in this capacity from Feb. 1 to June 1, when he was appointed to the position of superintendent of transportation of the Buffalo division, in charge of operation in the city of Buffalo and vicinity.

N. H. BROWN

Mr. Edward Dana, assistant superintendent of surface lines of the Boston (Mass.) Elevated Railway, has been appointed superintendent of the recently created department of traffic. In his new work Mr. Dana will have charge of the laying out of surface car service, routing and time-tables, and will co-operate with the superintendent of transportation in all matters relating to traffic. Mr. Dana was born at Bernardston, Mass., in 1886. He completed the academic course at Harvard College in three years and was graduated in 1907. He entered the employ of the Boston Elevated Railway in 1907 as a conductor, and rapidly rose through the transportation department to the assistant superintendency of the surface lines of the company. Mr. Dana is widely known as an expert in traffic problems and has contributed many valuable articles to the *ELECTRIC RAILWAY JOURNAL* upon the scientific aspects of car service.

EDWARD DANA

OBITUARY

Carl Witt, storekeeper of the Union Traction Company of Indiana, Anderson, Ind., for the last three years, died suddenly on Nov. 2. He had previously been auditor of the Indianapolis, New Castle & Eastern Traction Company, now a part of the Union Traction system. Mr. Witt was thirty-four years old. He is survived by his widow.

William J. Smith, a street railway pioneer of Kansas City, Mo., died on Nov. 8, at his home in that city. Mr. Smith was born in New York. In 1882 when Kansas City had horse car lines Mr. Smith conceived the idea of building a cable railway, and built the Ninth Street incline, which carried cable cars to the old Union Depot. He later built the Troost Avenue and the Independence Avenue cable lines, and the Summit Street road. Mr. Smith sold his street railway properties to the Metropolitan Railway in 1895.

August J. Reglin, division superintendent of the United Railroads, San Francisco, Cal., was suddenly stricken with heart failure and died on Oct. 22. Mr. Reglin was born in Troy, N. Y., on July 19, 1874. He entered the employ of the Public Service Corporation, Newark, N. J., on July 5, 1895. He served on the platform for fourteen months, when he was promoted to night clerk. He rose steadily in the work, and was called to San Francisco by the late George F. Chapman, general manager of the United Railroads, and on Feb. 8, 1904, he assumed charge of the Twenty-fourth and Utah Division of the United Railroads.

P. A. B. Widener died at his home at Elkins Park, near Philadelphia, Pa., on Nov. 6. Mr. Widener had been ill for some time. He was eighty-one years old. For a third of a century Mr. Widener had been known primarily as a traction financier in Philadelphia, New York and other cities; but as he increased the great fortune based upon street railways, his interests multiplied and he became a director of many industrial corporations, steam railroads and gas and electric companies. Mr. Widener was born in Philadelphia on Nov. 13, 1834. Early in his business career Mr. Widener became associated with the late William L. Elkins. They pooled issues and obtained control of all the surface lines in Philadelphia. In 1886 Mr. Widener entered the New York traffic situation. With Mr. Elkins, Mr. William C. Whitney, Mr. Thomas Fortune Ryan and Mr. Peter Dolan he figured in Metropolitan Traction Company and later Metropolitan Street Railway finance. Mr. Widener stopped active work years ago and gradually shifted his business cares to the shoulders of his son. In 1910 Mr. Widener was still recorded as vice-president of the Cresson & Smithfield Coal Company, and director of the Allegheny Valley Railroad, American Tobacco Company and Union Traction Company, Philadelphia. Five years earlier he had sat on the boards of a score or more corporations.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Waukegan & Woodstock Traction Company, Waukegan, Ill.**—Incorporated in Illinois to construct an interurban line between Waukegan and Woodstock. Capital stock, \$50,000. Incorporators: L. C. Roberts, C. A. Spenny, H. A. Hirst, Thomas Howorth, Michael Nelson, F. C. Nickels and F. E. Corliss, all of Chicago.

McComb & Magnolia Railway & Light Company, McComb, Miss.—Incorporated in Mississippi to construct a line in McComb and an interurban railway to Summit, Fernwood and Magnolia. Capital stock, \$500,000. Guy M. Walker, New York, president, and A. H. Jones, McComb, general manager. [Oct. 9, '15.]

***Kansas City & Tiffany Springs Railway, Kansas City, Mo.**—Chartered in Missouri to construct a line from Kansas City to Tiffany Springs, 15 miles. Capital stock, \$500,000. Incorporators: T. N. Smith, Charles J. Smith, Bayless Steele and C. W. Chandler, Kansas City, Mo.; J. N. Baird and Henry G. Post, Kansas City, Kan., and Robert Engelman, Parkville, Mo.

***South Dakota Short Line Railway, Mitchell, S. D.**—Incorporated in South Dakota to construct an electric railway from Mitchell to Pierre. Capital stock, \$2,000,000. G. W. Adams, Council Bluffs, Iowa, is interested.

FRANCHISES

Clarkston, Idaho.—The Lewiston-Clarkston Transit Company has received a franchise from the Council to construct an electric railway in Asotin County from the city limits of Clarkston on Sixth Street to Highland Street and on Highland Street to Thirteenth Street, 1¼ miles.

Henderson, Ky.—The Council of Henderson is considering the matter of renewing the franchise under which the Henderson Traction Company is operating in that city. The ordinance has been drawn for some time and provides that the company, in consideration of the extension of the franchise for twenty years, will make extensions of its lines and will pay an annual franchise fee.

Millersburg, Ohio.—The Dover, Millersburg & Western Railway recently received a twenty-year franchise from the Council to construct and operate an electric railway in Millersburg. The company has also been granted a franchise by the Holmes County Commissioners to build an electric railway in Holmes County to connect Millersburg with Sugar Creek and Canal Dover. [Sept. 18, '15.]

***Henryetta, Okla.**—The Henryetta, Oklahoma & Western Railway has received a franchise from the Council to construct an electric railway in Henryetta. An election on the franchise will be held on Nov. 30.

Walkersville, Ont.—The Sandwich, Windsor & Amherstburg Railway was refused an extension of its franchise at a recent election in return for the construction of a belt line to serve the factory and residential districts.

Astoria, Ore.—The Pacific Power & Light Company has received a franchise from the Council to construct a line on Franklin Avenue, Astoria.

Tacoma, Wash.—The Tacoma Railway & Power Company has received a fifty-year franchise to construct a line from the Fort Steilacoom Insane Asylum to the town of Steilacoom, about 2 miles. The franchise provides that the road must be built in six months. The Council of Steilacoom has already granted the company a fifty-year franchise to operate on its streets.

TRACK AND ROADWAY

Pacific Electric Railway, Los Angeles, Cal.—Preliminary to the construction of the \$12,000,000 subway to the beaches, this company will rearrange its tracks at the Hill Street station. The subway planned contemplates the construction of a tunnel under Olive Street, west of the sta-

tion, and when completed will be more than 6 miles long. The exact date when this work will begin has not been set, but the preliminary work on altering the tracks is to be begun at once. The rearrangement of the tracks at the Hill Street terminal will cost approximately \$40,000.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—It is reported that this company, which recently acquired the Wilmington, New Castle & Delaware City Railway, has ordered the equipment necessary to convert the road into an overhead trolley line. Work will be begun the latter part of November or early in December and it is expected that cars will be operated by overhead trolley before the first of next year. The line has heretofore been operated on the electric storage-battery system. The Orange Street line of this company between Sixth and Thirteenth Streets has been abandoned by the company following the recent changes in the routing of the cars of the company. The tracks of the line will be removed preparatory to repaving the street.

Georgia Railway & Power Company, Atlanta, Ga.—It is reported that this company is considering an extension from Atlanta to Alpharetta via Roswell or Crabapple.

Hawkinsville & Florida Southern Railway, Macon, Ga.—This company will operate a gas-electric car on its line and plans to inaugurate double daily passenger schedules. Another gas-electric car will soon be placed in service as a substitute to a steam train.

Joliet & Eastern Traction Company, Joliet, Ill.—Plans are being considered by this company to extend its line from Chicago Heights, Ill., to Hammond, Ind.

Kankakee & Urbana Traction Company, Urbana, Ill.—This company has about completed concrete abutments for a new bridge to be erected on its extension from Ludlow to Paxton. The grading has been completed almost to Paxton. Rail-laying will be begun within the next week.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company has entered into a contract with the Battleground Light & Power Company to furnish that company with light and power for twenty-five years. The current will be taken from the high-tension wires at Buck Creek. The Battleground Light & Power Company will build the line between the two places.

Mattawamkeag & Northern Railway, Bangor, Me.—It is reported that financial arrangements have been completed for the construction of the Mattawamkeag & Northern Railway from Mattawamkeag to Millinocket and East Millinocket, 23 miles, under a charter held by Charles W. Mullen, Bangor, a member of the Main Public Utilities Commission; I. B. Wood, Bangor; Artemas Weatherbee, Lincoln, and Frank J. Rich, Mattawamkeag. Stone & Webster of Boston are the fiscal agents, and a survey has been made under the direction of that concern. [Nov. 14, '14.]

Winnipeg (Man.) Electric Railway.—The public utilities commissioner has issued an order directing this company to proceed immediately with the construction of a double-track extension on Watt Street, Elmwood.

Bay State Street Railway, Boston, Mass.—Work has been begun by this company extending its double track in Methuen. The new line will extend from the present terminus at the corner of Hampshire, High and Lowell Streets to Railroad Square on the east side of the tracks of the Massachusetts Northeastern Street Railway. The company will repair its tracks on Montello Street between Plain Street and Perkins Avenue, Brockton.

Milford & Uxbridge Street Railway, Milford, Mass.—Work has been begun by this company repairing its trestle bridge on Medway Road. Granite supports and foundation will be substituted for the timber now being used. It is expected that work will be completed within a month.

McComb & Magnolia Railway & Light Company, McComb, Miss.—This company has taken over the plant and equipment of the McComb City Electric Light & Power Company and will begin at once the preliminary surveys for its line in McComb and the interurban lines to Summit, Fernwood and Magnolia. X. A. Kramer, Magnolia, will construct the lines and additional power plants. A. H. Jones, McComb, general manager. [Oct. 9, '15.]

Metropolitan Street Railway, Kansas City, Mo.—Work has been begun by this company on the construction of the double-track extension of its Thirty-first Street line from Indiana Avenue to Brighton Avenue.

Niagara River & Eastern Railway, Niagara Falls, N. Y.—The Public Service Commission for the Second District of New York has received final briefs in the petition of this company for permission to build and operate a double-track line for passenger and freight service between Lockport and Niagara Falls. The Niagara River & Eastern Railway proposes to connect with the International Railway and Buffalo, Lockport & Rochester Railway at Lockport and with trunk lines of steam railroads in Canada by a new bridge across the river at Lewiston. It is also proposed to handle freight on the Buffalo, Lockport & Rochester Railway and have connections with the Erie Railroad and Pennsylvania Railroad at Rochester. Charles Hickey, Lockport, president. [July 31, '15.]

Oakwood Railroad, Dayton, Ohio.—This company is building an extension of its line along the Lebanon Pike and Patterson Road for a distance of about a mile, and it is expected that operation will be begun about Dec. 1. The estimated cost of the improvement is approximately \$60,000.

Tiffin, Ohio.—It is reported that forty miles of right-of-way have been purchased for the proposed railway between Tiffin, Bucyrus and Fremont. Contracts for the Tiffin-Fremont section of the line are to be let within two months. Entrance into Toledo from Fremont is proposed over a leased line. A. W. Nyquist, Tiffin, is interested. [Sept. 18, '15.]

***Henryetta, Okla.**—It is reported that plans are being considered by R. D. Long, Muskogee, to construct an electric railway from Henryetta to several small towns.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—At a special meeting of the Council of Galena a resolution was passed calling for an election on Nov. 23 for the purpose of voting on a bond issue not to exceed \$15,000 to aid in the construction of this company's line from Columbus and Baxter Springs to Galena. [Oct. 23, '15.]

Sapulpa & Oil Field Railway, Tulsa, Okla.—Work will be begun by this company some time this month on its proposed line from Drumright to some point on the St. Louis & San Francisco Railroad. As published in the *ELECTRIC RAILWAY JOURNAL* for Oct. 30, J. A. Frates has been elected president of the company and C. F. Hopkins vice-president and general manager. The following directors were elected: J. A. Frates, St. Louis; Frank Brown, Independence, Kan.; C. F. Hopkins, Sapulpa; S. W. Barns, Kansas City; W. A. Moore; J. T. Langtry, Sapulpa, and J. H. Grant, Oklahoma City. The headquarters of the road will be at Tulsa, where offices have been established. An electric locomotive will handle the regular freight cars and the rails will be standard gage. Two electric cars, with a capacity of forty-four persons, and one electric locomotive have been ordered for the preliminary business.

Mimico, Ont.—Presenting the views of Mimico, Reeve Coxhead at a joint meeting of the various municipalities interested in the proposed Toronto to London hydro-electric railway, urged that the Ontario Hydro-Electric Commission appropriate the present line of the Toronto & York Radial Railway from the Humber River through Etobicoke Township. It was stated that plans have already been prepared to be submitted to the Toronto and Hamilton Highway Commission for the widening of the Lake Shore road to 86 ft. to give ample space for the double-tracking of the line. If taken over the line could be put in a condition measuring up to the standard of the other commission-owned lines throughout the province and thereby the conflict of service could be avoided.

Toronto (Ont.) Railway.—This company has placed in operation the extension of its Harbord Street line in conformity with the order of the Ontario Railway & Municipal Board. Some time ago the city laid tracks on Ossington Avenue, north from Bloor Street to Hallam Street, west on Hallam Street to Dufferin Street, north on Dufferin Street to Lappin Avenue and west on Lappin Avenue to Lansdown Avenue. The cars on the Harbord Street line will now

operate over the new route. The extension is about 1¼ miles.

Portland & Oregon City Railway, Portland, Ore.—This company has purchased the right-of-way through the tract owned by the Multnomah Mohair Mill Company in Sellwood near Willsburg. This practically gives the company right-of-way from Milwaukie to Portland. Track has been laid through Milwaukie from the south side along the east side of the Crystal Lake Park. South from Milwaukie track has been laid nearly to Bakers Bridge over the Clackamas River. The company is working from Milwaukie toward Portland. [May 1, '15.]

***Ballinger, Tex.**—Business men of Ballinger and Abilene are contemplating the construction of an electric railway to connect the two cities. The present steam railroad is considered inadequate for the traffic.

Petersburg & Appomattox Railway, Petersburg, Va.—Following a conference in Richmond recently between the officials of the Petersburg & Appomattox Railway and the Virginia Railway & Power Company, it was announced that an agreement had been entered into whereby the Virginia Railway & Power Company will furnish to the Petersburg & Appomattox Company current for the operation of its cars between Petersburg and City Point. An agreement was also entered into whereby the Petersburg & Appomattox Company will use the tracks of the Virginia Railway & Power Company from Wythe and Main streets, the terminus of the former company, to the office of the latter company at Bollingbrook and Sycamore Street. The company is rapidly pushing the construction of its line between Petersburg and Hopewell to completion, and it is expected that the road will be in operation to Hopewell on or before Jan. 1. [Oct. 16, '15.]

Washington-Oregon Corporation, Vancouver, Wash.—The light and power properties of the Washington-Oregon Corporation have been purchased by Harry N. Putnam, Portland.

Charleston (W. Va.) Interurban Railroad.—Operation has been begun by this company on its line between Charleston and Marmet, 10 miles. The line will be extended to Montgomery.

Chicago & Wisconsin Valley Railroad, Madison, Wis.—At a recent meeting of the stockholders of this company resolutions were adopted changing the name of the company to the Wisconsin Interurban System. It was also decided to amend the charter, extending the line west from Sauk City and Prairie du Sac to Viroqua and northeast from Madison to Fond du Lac. It is proposed to begin construction next spring. [Oct. 30, '15.]

SHOPS AND BUILDINGS

Tri-City Railway of Illinois, Rock Island, Ill.—This company plans to construct a street car terminal at Watch Tower Park on the site of the old roller skating rink, which has been torn down.

Metropolitan Street Railway, Kansas City, Mo.—Members of the board of control of this company have approved the plans for an ornamental shelter house 48 ft. x 12 ft. to be constructed on the east side of the tracks south of the Main Street viaduct for persons waiting for cars at the Union Station. The ends will be of cement, the sides of glass and the roof of Spanish tile. It is to contain no benches or concessions, but will be only a shelter from the wind and rain.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—Arrangements have been completed whereby this company and the Salt Lake & Ogden Railway will acquire the corner on South Temple and West Temple Streets for a new interurban terminal. The property is to be given to the interurban lines by the Mormon Church authorities and property owners of upper Main Street. The property has a frontage of about 200 ft. on West Temple Street and 330 ft. on South Temple Street. A right-of-way has been secured from First West Street to the terminal site. It is planned to expend about \$250,000 for the erection of a station and other improvements on the new site.

Manufactures and Supplies

ROLLING STOCK

Lehigh Valley Transit Company, Allentown, Pa., expects to purchase additional cars.

Port Arthur (Ont.) Civic Railway has just constructed a new air-equipped snow plow in its own shops.

Sapulpa & Oil Field Railway, Tulsa, Okla., a new line, has ordered one Westinghouse electric freight locomotive and two electric cars with a capacity of forty-four persons.

Hawkinsville & Florida Southern Railroad, Macon, Ga., has ordered one gas-electric car which it expects to place in service in about a month. A second car will be acquired at a later date.

TRADE NOTES

Automatic Ventilator Company, New York, N. Y., has received orders for its ventilators from the Buffalo & Lake Erie Traction Company and the Davenport & Muscatine Railway.

Frank Ridlon Company, Boston, Mass., has been appointed New England representative of the Van Dorn & Dutton Company, Cleveland, Ohio, for its electric railway motor gears and pinions.

Van Dorn & Dutton Company, Cleveland, Ohio, has moved its New York office from 50 Church Street to 556 West Thirty-fourth Street. Frank Van Anden has been appointed as district sales manager in charge of the New York office.

E. B. Van Patten has been appointed sales representative for the Acme Supply Company, Chicago, Ill. Mr. Van Patten's territory will include the Southwestern States, where he is well acquainted, having represented other railway supply concerns in that district for the past eight years.

National Tube Company, Pittsburgh, Pa., on Nov. 18 will show a series of three industrial motion picture films before the Central Electric Railway Association in the Assembly Room of the Claypool Hotel, Indianapolis, Ind., illustrating the manufacture of "National" pipe from ore to finished product.

Perfection Springs Company, Cleveland, Ohio, has increased its capital stock from \$1,500,000 to \$2,500,000 and F. F. Prentiss, C. C. Bolton and T. E. Borton have been added to the board of directors. The increase in the capital stock was needed because of the heavy increase in business and the construction of large factory additions.

John A. Roebling's Sons Company, Trenton, N. J., on Nov. 11 lost by fire its factory building for the manufacture of small wire rope. The loss is estimated at \$1,000,000. The factory for heavy rope was not affected. The company will use new buildings, about completed, for the manufacture of small rope, and expects to be in operation in about two months.

Shaw Insulator Company, Newark, N. J., has completed a plant for the molding of composition into insulating parts for all electrical purposes such as generators, motors, starters, magnetos and special requirements. This insulation is manufactured from non-conducting materials carefully selected and tested in laboratory in actual service and is said to be free from excessive contraction and expansion, moisture absorption, varied dielectric strength, carbonization, mechanical imperfection and surface leakage. The material is impervious to acids and will exceed standard requirements for heat.

Paul M. Lincoln, whose term as president of the American Institute of Electrical Engineers expired on July 1 and who has for a number of years been prominently identified with the engineering department of the Westinghouse Electric & Manufacturing Company, has resigned his position with this company in order to be able to devote his time to the manufacture of a meter which he has recently invented. Mr. Lincoln was first connected with the Short Electric Company in Cleveland and then joined the Westinghouse Electric & Manufacturing Company. At the opening of the Niagara Falls Power Company's plant he became its electrical superintendent, but returned to the Westinghouse Company in 1902 and has been connected with it ever since.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces a number of changes in the supply department, which have recently been put into effect. S. A. Chase, formerly special representative; T. J. Pace, formerly in charge of illuminating and rectifier divisions, and Carl G. Schluederberg, formerly head of switchboard sales, have been appointed assistants to Manager J. J. Gibson. C. E. Stephens, engineer of lighting, has been appointed manager of the illuminating section to succeed Mr. Pace. C. Streamer, formerly head of the order division, succeeds Mr. Schluederberg as manager of the switchboard section, and A. P. Joseph is appointed head of the order section to succeed Mr. Streamer. M. C. Morrow, formerly of the Philadelphia office, is appointed manager of the appliance section, which is a combination of the former heating, fan motor and ozonizer divisions of the supply department. M. C. Rypinski, formerly manager of the D. & S. division of the New York office, becomes manager of the meter section. The power department, E. H. Sniffen manager, also announces the following section managers: W. H. Garrett, contracts; J. G. Worker, stokers, and H. D. Storer, auxiliaries.

ADVERTISING LITERATURE

Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., has issued a bulletin describing and illustrating its various types of telephone equipment. This company has also issued new price lists of its telephone construction material and supplies.

Lakewood Engineering Company, Cleveland, Ohio, has issued book No. 16 describing and illustrating its various type of industrial cars. These cars include side dump, bottom dump, end dump, all around dump, rack cars, removable sides, gate dump, scale cars, incline cars and platform cars. Many of the types of cars and trucks shown in the catalog can be furnished electrically equipped, either for overhead or underground trolley, third-rail or storage-battery operation, and with either flanged or flat tread wheels.

Calebaugh Self-Lubricating Carbon Company, Inc., Philadelphia, Pa., has issued a catalog describing completely its large number of types of "No-Spark" carbon brushes. A comprehensive price list of brushes adapted for a wide field of electrical machine design is included. The brushes have a complete range of varying resistances, from low to high conductivity, and embrace a wide scope of hardness, specific gravity and other properties necessary to successful operation. The catalog points out the types of brushes particularly adapted for street and interurban railway motors.

Spray Engineering Company, Boston, Mass., has issued a reprint of a paper read by Lee H. Parker, president of this company, before the convention of the National Association of Cotton Manufacturers at New London, Conn. The reprint traces the development of spray cooling of condensing water and contains illustrated descriptions of a number of typical installations. It also shows the advantages in general of a spray system over a cooling tower as regards the following points: saving in power required for operation, flexibility, less make-up water required, usability of spray cooling ponds as a source of supply for fire pumps, longer life and lower first cost.

Carnegie Steel Company, Pittsburgh, Pa., has issued a publication entitled "Steel Sheet Piling," tenth edition, which supersedes a similar pamphlet, ninth edition, issued in 1912 and which covers steel sheet piling for use in cofferdam construction, retaining walls, mine shafts, sewer trenches and other construction where wooden sheet piling is in service. The pamphlet contains tables and data not only on the sections manufactured by this company but on the uses of driving and pulling appliances together with a general discussion on earth and water pressures and the computation of bracing systems for cofferdams, retaining walls, etc., and contains notes on concrete and safe bearing loads for piles. The book also includes information on the weights of materials, strength of hoisting ropes, lifting capacity of tackle, tables on metric conversion and other tables, and thus covers all the ordinary requirements in a handbook intended for foundation engineers and contractors. While intended for free distribution to engineers and contractors engaged in foundation work, copies are available for general sale at 50 cents each.

No. 21

THE DECLINE OF THE JITNEY

As we predicted some time ago, the jitney wave is receding. It is settling down from its original stage of mad enthusiasm to one of sober second thought, the inevitable result of which will be fewer jitneys. As one looks over the motley crew in any city where the craze has been active, he notices that the vehicles are getting to look more and more disreputable, the drivers less cheerful and the public less enthusiastic over this new mode of transit. Moreover, we are approaching a time of the year, certainly in the Northern States, when this condition is bound to increase. With the advent of real cold weather it is safe to say that the average person would very much rather ride in a warm street car than in a dilapidated touring car of the vintage of 1910 with an extemporized cover. The jitney was never intended to contend against snow, and the first real storm will probably send most of those remaining on the streets to winter quarters. Whether they will reappear next spring in the same numbers as during the spring of 1915, we consider very doubtful. The experience of the past year has shown that repairs cannot be postponed indefinitely, and that the average patronage was not what was expected. Moreover, in most cities adverse legislation has been passed to protect the public against irresponsible jitney drivers and decrepit cars, and there should be more this winter to discourage the reappearance of jitneys in the spring.

THE EFFECT OF THE JITNEY

Although the jitney is on the decline it will leave its effect behind. One of these is that the railway companies will be less able to make needed extensions and improvements because of the losses which they have experienced from jitney competition. This is a lesson to the public. It ought to have realized that the main work of urban transportation would have to be undertaken by the local electric railway system, and that the more its revenues were depleted by pirate competition the less able was it to maintain its growth equally with that of the city. To the railway company it has also brought some lessons. One is in favor of lighter cars and more of them, so as to increase the frequency of service. The other is to emphasize the desirability of a light motor bus for certain classes of service for which the electric car is not suited, because the traffic to be obtained could not support the larger investment which would be required in permanent fixtures. For service of this kind the motor bus, at a fairly high charge per mile, would occupy a field which is not filled now by any other public means of trans-

portation except the horse-drawn stage, as, for instance, in handling strictly summer business at ocean and mountain resorts. A motor bus is certainly a vast improvement over the ramshackle "depot wagon," familiar at shore stations all along the seaboard. What was good and useful in the jitney bus idea is due to survive, but the disappearance of the wandering jitney, prowling around on rickety wheels and waiting for trusting passengers, will have no mourners.

THE REPULSION- STARTING SERIES MOTOR

The single-phase electrification on the main line of the Pennsylvania Railroad out of Philadelphia, described in last week's issue of this paper, brings this system into the focus of interest once more. On the technical side a most interesting feature of this installation is the departure from the familiar design of a.c. series motors which was adopted. The usual high resistance leads inserted between the armature winding and the commutator bars to limit the transformer currents in the coils short-circuited by the brushes have been omitted. Instead, during the starting period, when the transformer currents in the coils short-circuited by the brushes are maximum, the short-circuit voltages are kept down to the values at which the brushes, through their resistance, can prevent the formation of serious sparking. Information as to just how this is done is not yet available for publication, but an important element is the use of the "repulsion" starting principle commonly employed with single-phase induction motors of moderate size. Up to 15 m.p.h. the armatures of the motors are short-circuited, reducing the armature voltage to a very low value. By suitable proportioning of the windings it is possible to produce an armature current in this way for starting which is much larger than that drawn from the transformer secondaries. Returning to the short-circuited coils and the usual resistance leads it is obvious that the latter are a source of construction cost and originally were the cause of some operating trouble. They are also the source of heat, to offset which the active armature conductors must be made large and a liberal supply of armature iron provided. The successful omission of these leads would therefore be desirable, as the a.c. motor armature would then not differ essentially from the d.c. motor armature. As the resistance is needed only at starting, it follows that if the armature can be brought up to speed with good commutation by any other means such commutation can be maintained without difficulty thereafter. The significance, therefore, of the choice of the repulsion-starting type of motor by

the Pennsylvania Railroad, rather than the usual series type, is that it secures thereby a cheaper and lighter motor, one with an armature not radically different from that of a direct-current motor.

ORIGINAL COST IN VALUATION WORK

When commissioners, lawyers, economists, engineers and accountants assemble, as they did in Philadelphia last week, to discuss moot topics in the still undeveloped field of public utility valuation, a marked unanimity of opinion as to detailed theories and practices is not to be expected. Yet varied as were the opinions expressed at Philadelphia there was a marked tendency among many of those present to emphasize the importance of original cost in valuations for rate making rather than reproduction cost. The principal reason for this attitude, not always openly expressed but ascertainable by reading between the lines, is the thought that such a plan would give a lower valuation in most cases of steam railroad valuation than reproduction cost, owing to the increase in land values and present higher costs of material and labor. This, of course, is no reason at all and has no foundation in ethics. The choice of either original cost or reproduction cost as a sole basis of valuation or the determination of the comparative weight of these two costs as factors in present value are questions that are dependent for their solution upon equity and not upon the mere belief that one method or another will give a higher figure.

It is probably true that where original cost can be completely ascertained and properly compiled, it is of more value in showing the sacrifice of the investors than the fluctuating reproduction cost based on present conditions. As long as courts have to act upon this question, however, the point of practicability will undoubtedly have to be largely the guiding principle. On account of missing records and undeveloped accounting methods in the past it is doubtful whether in most cases a just finding of original cost can be made, and the theory of reproduction cost will by virtue of necessity in such cases have a greater weight. Indeed, in the decisions of the courts up to this time, original cost and reproduction cost have been recognized as the two most important factors in the present value of a utility, but the greater ease of applying the reproduction cost theory has led to its acquiring a predominating influence in most valuations. Even where the original cost is to a large extent sufficiently determinable for fair use, the reproduction cost must be used in supplying secondary evidence as to the part of the original cost where the primary evidence is lacking.

While we believe that much can be said in favor of the theoretical equity of the original cost basis, especially in the case of a company which has been through many vicissitudes and changes in equipment, we are opposed to the agency theory in its support as was advanced at Philadelphia. Under this theory, the utility is supposed to have been simply the agent of the municipality in developing the service and should be credited only with the sums actually expended, while being required to return to the public all large profits.

There are two vital objections to this theory. One is that it presupposes a guarantee of the agent by the principal against loss. This was never the case with public utilities and cities in the past. If the public claims a right to all past large profits of the successful utilities it should recompense the stockholders of those which were not profitable for their losses of both return and investment. Actually, the successful utilities at the present day are a part only of those which were launched with seemingly equally bright prospects, and as the stockholders in the successful utilities took the risks they are entitled to the profits earned. The other answer to the agency theory is a legal one. The title to the property has always been with the utility, showing it was the principal and not the agent.

After all, equitable considerations must govern the treatment of old companies on all points. In valuation matters the original cost need not be and in many cases can not be the sole basis of valuation for such companies, but it must be considered a prime factor in according to the investor the treatment which he has a right lawfully to expect—in other words, in fixing the valuation basis and rate of return which would have induced the investment, could it have been known in advance. Above all, the combination of the valuation figure and the rate of return constitutes the important figure to be used in judging fairness, and until these are both settled for each particular case the question is largely academic.

The question of a rate basis for the future is not so difficult, for there seems to be no doubt even on the part of public representatives that the real criterion for a rate basis must be the actual legitimate investment honestly made, and on this basis a return must be allowed which the investor is willing to accept, as long as his co-operation is to be secured in utility development.

GREATER SAFETY ON THE STREETS

A marked tendency of the times is the increased attention being given to the promotion of safety on the streets by means of street traffic regulations. It is not many years ago that such regulations were enforced only in the cities of the larger class, and in them only at a few congested corners. Now the marking of safety zones for the guidance of pedestrians when they are crossing the street and the erection of traffic guide posts for the direction of vehicles when turning corners are becoming more common now in even the smaller cities. This is partly due to the fact that there is a larger number of street vehicles now than formerly. In part it is caused by a more general awakening to the necessity of taking precautions and to the activities of the safety-first societies, which have been organized in many cities. Whatever the cause, the electric railway companies are benefited. In congested streets the pedestrian who cuts corners or crosses the street between the regular crossings now does so largely at his own risk and so is more apt to be considered guilty of contributory negligence in case of accident, and vehicles which do not comply with the growing number of rules

of the road which govern them are equally out of the pale of legal protection in case of injury.

While these reforms are being made we believe that it would be very desirable to provide for greater protection of passengers during their journeys between the cars and the sidewalk when they are leaving and entering the cars. One way to do this is to provide a penalty for automobiles which pass a car while it is loading and unloading passengers, and where this rule has been enforced it has proved very helpful. As the electric car is confined to its tracks, its passengers are entitled to adequate protection while moving between car and curb.

Still another plan to help in this matter was introduced recently on Broad Street, Newark, N. J., and has been in use for a longer time on Market Street in San Francisco. This is a series of raised boarding and alighting platforms, installed in the street by the municipality, to introduce a safety isle just where passengers enter and leave a car. The operation of these island platforms in San Francisco was watched with the greatest interest by many of the delegates at the recent railway convention in that city, and we understand that the results there and in Newark have been very satisfactory. They are suitable, of course, particularly to broad streets with large traffic, but in all such places are worthy of consideration by municipal engineers.

PREPAREDNESS IN TRANSPORTATION

However unsuspecting one may be, the fact stands out with sinister prominence that war is likely to come unannounced even in times apparently pacific. In the great movement for preparedness to insure peace which is sweeping the country, it behooves the electric railway interests to play a patriotic part. Their share in the work is in the main of most pacific form, tending not only to help the country but by active co-operation to help each other. Whether or not the employees are interested in military training, a good thing in itself for efficiency and discipline, makes comparatively little difference, since it is the great problem of transportation in time of necessity that most concerns us. This country is peculiarly weak in railways of strategic importance. Although we have enormous railway mileage we also have a prodigious area of country, and the railways, steam and electric, have been built for definite purposes of inter-communication, without the slightest reference to military affairs. Germany owes an enormous debt in the present war to the carefully planned lines of communication between the eastern and western frontiers and their ability to permit the rapid distribution of men and supplies. If the United States should unhappily get into trouble, the transportation situation would be a very serious one, as was shown only too plainly during our little brush with Spain.

Now the electric railways of the country are in a position, if they will but plan to co-operate, to give very vital assistance in case of need. They run not only from city to city but penetrate the country in all directions, often furnishing parallel lines of transportation to help

out an over-burdened railroad, and in particular running to and along the sea coast in a fashion that has a great military value. For instance, along the coast, from Portland, Me., to Norfolk, Va., electric lines run along the shore most of the way, crossing the railroad lines which lead seaward from the trunk systems further inland. There is hardly a spot on the coast to which men and munitions could not be quickly brought, if a suitable system of unified transportation for strategic purposes were properly worked out. Moreover, the transportation managers of electric roads have special training in handling crowds in an emergency. A regiment under arms is a good deal easier, by reason of its discipline, to manage than a baseball or circus crowd, and electric railway men will understand the art of massing cars and sending them out in quick and orderly succession.

The one thing most needful is organization for inter-connection, as between one electric road and another, and as between the main line railways and the electric lines. One can pick out, off hand, many spots on the coast which are, so far as main transportation is concerned, very inaccessible but where, by the organized service of electric systems, not one but two or three trunk lines could be utilized for the massing of forces to be distributed as need requires. It would be immensely helpful in the organization of national defense by the general staff if the electric roads through their associations or otherwise could simply schedule their routes, running times, interconnections and supply of rolling stock so as to place the information in orderly fashion before the general staff to aid in its work. Thus fortified, the staff would be put in possession of information such as, for example, the following:

At a given point on the coast two electric railway systems are available, both reaching a trunk line within a running time of an hour. Each has fifteen cars but has power supply of its own, or borrowed from inter-connections, able to handle forty. The additional rolling stock could if necessary be borrowed from roads connecting further inland, and everything could be made available on short notice before railway trains could reach the points of intersection. With the electric roads properly organized for co-operation a few telegrams to the men responsible would result in the massing of cars ready to throw a considerable force to the point threatened in very short order. Undoubtedly the general staff tries to acquire more or less information of the character necessary, but it can be furnished so readily by a little patriotic co-operation among street railway managers that the duty of getting together is obvious. Incidentally, the accumulating of this information is a permanent asset for the railways themselves in time of peace, for it enables them to organize through traffic for ordinary purposes with an efficiency which now is conspicuous by its absence. Few people in this country are anxious for trouble, but the chance of its coming quite unasked is sufficient to justify immediate activity, particularly when the steps to be taken are advantageous in themselves.

CLEVELAND REPAIR SHOPS—PANORAMIC VIEW 0

Cleveland Railway Occupies New Repair Shops

Outline of How the Cleveland Railway Operates Its New Repair Shops, the General Features of Which Were Described in the *ELECTRIC RAILWAY JOURNAL* of Jan. 23, 1915—This Article Also Describes Special Equipment and Unique Crane Installations

To plan and build one of the most complete street railway repair shop layouts in this country was in itself a big undertaking for the mechanical department of the Cleveland Railway, but to continue repairs while the shop equipment was being moved 6 miles across the city from the old to the new shops was an even greater task. Both of these were accomplished, however, without perceptible delay in the progress of repairs, and the mechanical department, after about six months in transit, is now housed in its new quarters. Although it is scarcely settled, organization and shop procedure have been put in perfect running order. Larger areas devoted to the entire layout as well as increased space assigned to the various shop departments naturally simplified the problems for each department, but at first complicated those of the complete shop operation. The men had to be familiarized with new machine tools and the means of transferring materials and repair parts between departments, but this has been done, and the entire shop organization and equipment move forward practically automatically.

RECEIVING AND DISMANTLING CARS

The essential features of this general shop layout were described on page 168 of the *ELECTRIC RAILWAY JOURNAL* of Jan. 23, 1915. It is the purpose of this article to deal with the methods of operating this large shop layout and describe the special equipment which has been introduced to simplify shop operations. Because the level of the shop property at the corner of Harvard Avenue and East Forty-ninth Street was more than 6 ft. above the street, track entrances which naturally belonged at that point could not be provided. All cars in need of repairs or overhauling, therefore, must enter the shop yard by the two-track leads from Forty-ninth Street, just south of the wood-working shop building. Track outlet from the shop buildings and yards is by way of a ladder track and leads into Harvard

Avenue on the opposite side of the property. Unless there is track space in the motor or truck shop bad-order cars are stored in the open yard between Forty-ninth Street and the intersecting transfer-table pit beyond the erecting shop. As space is made available for them, these cars are switched to the transfer table and moved either to the truck or the motor shop, preferably the truck shop, but either serves when cars are to be dismantled.

As shown on the general layout plan, eight tracks in groups of four each pass through these two buildings, and an assembling and dismantling aisle is provided between the two sets of tracks. The truck shop is 157 ft. 11 in. wide by 184 ft. long, and the motor shop is 209 ft. wide by 184 ft. long. Three of the tracks in each group pass over repair pits extending practically the full length of each building. Over the center line of each of these tracks is a monorail crane runway. As shown in one of the accompanying illustrations, two of these monorail cranes, each equipped with a yoke, will raise a body clear of the trucks which are rolled from beneath and dummy trucks are substituted for them. On these dummy trucks the body is again moved to the transfer table and taken to the erecting shop at the other end of the transfer-table pit. While the trucks remain on the track where they were when the body was removed, the monorail picks up the motors one at a time and transfers them to the motor shop. Afterward the trucks are also picked up and transferred to the truck-dismantling and assembling aisle, which is served by a 7½-ton Toledo bridge crane.

Transverse movement of the monorails in both shops is made possible by overhead transfer bridges at each end of the building. The operator moves the monorail to a transfer bridge, which in turn is unlocked from the runway from which the monorail has just moved. A set of switches under the control of the operator permits this bridge to be moved transversely with the shop,

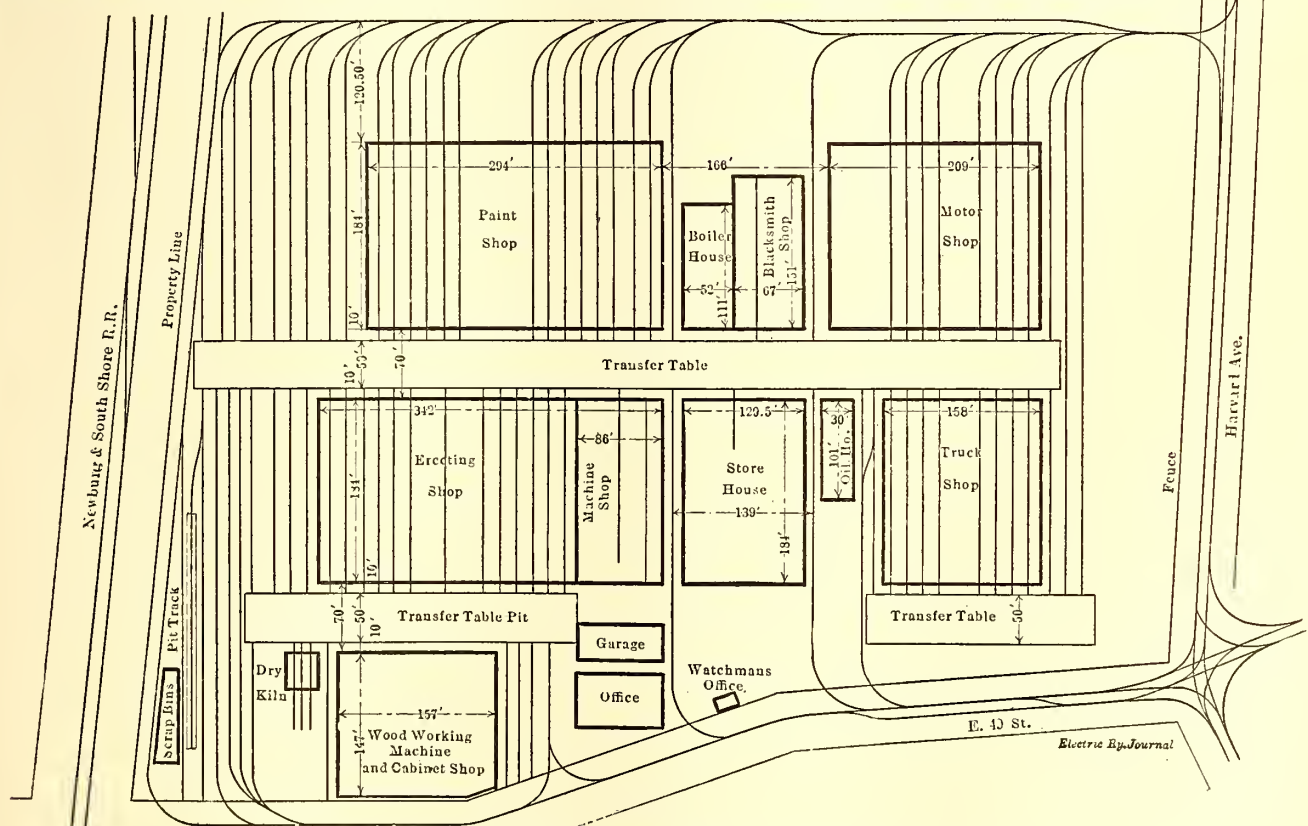

SHOP BUILDINGS FROM EAST FORTY-NINTH STREET SIDE

just like a bridge crane. Through his control and locking device the operator may move the bridge to any other parallel runway, lock it in position and move the monorail from the bridge. The entire runway system is suspended from the bottom chords of the roof trusses.

These monorails were built by the Maris Brothers

ated doors and across the transfer aisle into the motor shop. The monorail runway and overhead transfer-bridge arrangement is the same in the motor shop as in the truck shop. It will also be noted that the trolley wire serving the monorail also serves to move completely-equipped cars about the

CLEVELAND SHOPS—GENERAL ARRANGEMENT OF BUILDINGS AND TRACKS

Company, Philadelphia, Pa., and have a capacity of $7\frac{1}{2}$ tons each. This is ample to pick up and transfer the heaviest completely-equipped trucks in the service of the Cleveland Railway. The general layout of the monorail runways and transfer bridges is shown in one of the accompanying illustrations. It must be noted that these monorails pass through automatically-oper-

shop. The live trolley through each of these two shop buildings is intercepted at the monorail-transfer-bridge aisle, which has a width of 15 ft. Across this bay the trolley-wire clearance is reduced from 22 ft. 6 in. to 15 ft.

In addition to the monorail-overhead-crane system in the motor shop, overhead traveling jib cranes were in-

stalled in the four aisles between the tracks passing over the repair pits. One of these cranes is shown in one of the accompanying illustrations. While this crane cannot be moved about the shop with the same facility as the monorails, it has the advantage of an 8-ft. revolving-jib arm which may be used to pick up a motor in one track and set it in the aisle or in the next parallel track. This crane has a capacity for 3000 lb., the maximum weight of the railway's heaviest motor. It is operated by pendant switches and requires a two-beam runway instead of a single beam as is the case of the monorail. Four of these traveling jib cranes were installed in the motor shop, and they were built by the Euclid Crane Company of Cleveland. Each repair pit in the motor shop is also equipped with portable hydraulic pit jacks for removing armatures.

In connection with the monorail installation it is interesting to note that besides permitting the installation of live trolley wires, four of these monorail cranes took the place of eight bridge cranes. They move much faster and, when two are not required to lift a car body, each with its separate operator is available for general shop use. Over the assembling and dismantling aisle in the motor shop a small bridge crane, operated by pendant switches, was also installed. Energy at 600 volts is supplied from one feeder for the cranes and the energy for the trolley wires is furnished from another feeder.

It is also interesting to note that the steel bridge structure necessary to support the monorail runway across the transfer aisle also afforded, with slight alterations, a place for well-lighted locker, lunch and toilet rooms. By building these rooms over the transfer-table aisle the company was able to make the entire floor areas of both the motor and truck shops available for shop use. At the same time if the plan followed in other buildings of the shop group had been adopted, or that of having these facilities on a second floor over

the office, it would have complicated the monorail-transfer-bridge installations.

Another interesting feature in these two shop buildings is the repair-pit construction. This is shown in detail in one of the accompanying illustrations. Special attention, however, is directed to the wheel-changing pit and jack in the truck shop. The central pit in each three-track group was designed especially to facilitate wheel changing. In this pit the track rail is supported on a triangular reinforced-concrete cantilever, which extends 24 in. out from the center line of the supporting columns. This permitted a standard-gage track to be laid in the bottom of the pit to which car wheels may be lowered by the pit jack and then rolled from beneath the truck or car body. Wheels are raised to the floor level, set on the track by the monorail cranes, and when a number have accumulated, they are rolled to the transfer table and moved to the machine shop for wheel renewals or turning.

In connection with the wheel-changing facilities a special jack was provided. This is a unique installation in that the drop-pit portion of the track is supported on structural-steel columns. In the elevated position these close the gaps in the track rail, and in the lowered position they close similar gaps in the track in the pit. The lifting capacity of these is 10 tons which is sufficient to raise the end of a car and truck so that they can be blocked to remove the wheels. The two sections of the jack are mounted on the piston of a large air cylinder installed in a sub-basement 20 ft. 6 in. below the shop floor. The locking and control levers for this jack are operated from the pit.

TRANSFER TABLE

Especially-designed transfer tables embodying several unique features were selected for this shop layout. In the 862-ft. aisle between the two main groups of buildings a 25-ton capacity table for handling street-

CLEVELAND REPAIR SHOPS—SECTION OF STANDARD REPAIR PIT; WHEEL-CHANGING REPAIR PIT AT RIGHT

CLEVELAND REPAIR SHOPS—VIEW OF FRONT OF OFFICE BUILDING

CLEVELAND REPAIR SHOPS—VIEW OF FRONT OF STOREROOM BUILDING

railway equipment and a 75-ton capacity table for transferring loaded steam railroad cars were provided. The other two transfer tables in the two smaller pits are also of 25-ton capacity. The transfer table proper is 49 ft. long, while the roof projects over the pit walls approximately 10 ft. to within 6 in. of the faces of the buildings. An overhead structure was necessary to support the live trolley wire on the table, and a roof over the table was considered desirable to afford protection from all kinds of weather.

The transfer-table construction is somewhat unusual in that it is of the shallow-pit type and supported on eight pairs of standard car wheels which move over four standard-gage tracks. Four pairs of car wheels on one side of the table are geared through a line shaft to a single 101-B Westinghouse railway motor. This is controlled by a standard railway controller, and a low gear ratio was selected so that the table can be moved at a speed not to exceed 7 m.p.h. Energy is supplied to this motor from a trolley wire installed beneath the overhang of the 10-ft. concrete walkway on one side of the transfer-table aisle. This is also the source of energy for the overhead trolley wire on the transfer table. Details of the transfer table and a view of one of the tables in the long pit are shown in two of the accompanying illustrations.

FACILITIES FOR HANDLING MATERIALS

Aside from yard tracks, a steam railroad connection, overhead cranes and transfer tables for handling materials, it was necessary to afford a means of transporting light repair parts and materials between the different shop departments. This is done by three 2-ton, electric storage-battery Buda trucks. One of these trucks is assigned to the store room and two to general shop use. Each has a platform 37 in. wide by 9 ft. 6 in. long, and each motor is of sufficient capacity to pull two trailers. The truck platform is low and equipped with

an elevating device so that it may be run under a rack or platform upon which material has been deposited, raise it from the floor and transfer it to any part of the shop. Ten-foot walkways between the buildings and the transfer-table pits were provided to afford a roadway over which these trucks could be operated. Movement across the transfer pits is either by way of the tables or at the ends.

These storage-battery trucks will also be used for moving 11½-yd. dump cars which are used in transporting scrap to the scrap bins or trash to a depressed track where it is unloaded to larger dump cars. As will be noted in the general plan of the shop layout, the scrap bins and the depressed track are beside the track entrances from Forty-ninth Street at the extreme southeast corner of the shop layout. Concrete bins below the yard level are provided for five classes of scrap and when full contain a carload. Steam railroad cars are set on a track beside these bins, and the scrap is loaded into them with a magnet crane.

Another means of transporting material short distances within the shop departments is afforded by small material trucks or transveyors. These have a capacity of 2 tons and were furnished by the Cowan Truck Company, Holyoke, Mass. These transveyors are three-wheeled trucks fitted with steel platforms not more than 6 in. in height. As shown in one of the accompanying illustrations, these trucks may be backed under a wooden platform or steel rack. In this position the truck handle is connected to a small air-pumping mechanism, and when the handle is moved back and forth this mechanism raises the rack or platform clear of the floor. The handle is then released, and the transveyor with its load is moved by hand. Pressure on a foot pedal releases the air from the cylinder and lowers the load to the floor. In the erecting shop, car bodies are stripped of the sashes and doors, which are set in steel racks. These when full are transferred to the sash-washing and re-

CLEVELAND REPAIR SHOPS—VIEW DOWN 862-FT. TRANSFER-TABLE AISLE

CLEVELAND REPAIR SHOPS—VIEW OF TRANSVEYOR AND LOAD ON RACK

CLEVELAND REPAIR SHOPS—VIEW OF LOADED TRANSVEYOR

pairing department by the transveyors. Material in the wood shop and elsewhere in the various shop departments is moved in this manner.

In connection with material-handling facilities it must also be noted that a depressed track for the receipt of steam railroad cars enters the storeroom building. With the aid of steel aprons and a 1-ton capacity overhead traveling monorail crane operated by pendant switches, material may be loaded or unloaded readily. As shown in one of the accompanying illustrations, an elevated platform for receiving and delivering materials to teams or auto trucks was provided across the front of the storeroom building. An awning over this platform also supports an extension of the monorail crane runway and permits it to be used in handling

CLEVELAND REPAIR SHOPS—VIEW OF TRAVELING CRANE

materials at this point. A monorail runway system in the basement of the storeroom building and an incline to permit the electric trucks to descend to the basement level from the concrete platform beside the transfer-table pit also simplify the handling of materials.

Incidentally, all materials exclusive of lumber, car wheels, oil and paint are placed in this storeroom. Car wheels are stored in the basement beneath the machine shop where manhole openings in the floor permit the 5-ton capacity overhead bridge crane to lower wheels to the basement floor from a steam railroad car which may be run into the building. Paint and oil for mixing it are stored in tanks and barrels in a room partitioned off of the paint shop. Lumber is stored in the wood mill, where special racks have been installed for it.

CLEVELAND REPAIR SHOPS—GENERAL VIEW OF MACHINE SHOP

CLEVELAND REPAIR SHOPS—VIEW OF BABBITTING EQUIPMENT

Tracks on each side of the storeroom, as well as of the oil house and the heating plant, permit steam railroad cars to be unloaded directly into these buildings.

ARMATURE-ROOM FEATURES

Special equipment in the armature room, which occupies a 50-ft. completely-inclosed bay on one side of the motor shop, includes an overhead bridge crane spanning the entire room and one monorail runway. For the present a 5-ton bridge crane originally intended for one aisle in the erection shop has been installed in the armature room. The monorail runway permits cranes from the motor and truck shops to enter this department through openings in the partition wall. These openings are equipped with automatically-operated fire doors.

A baking oven, occupying a space 13 ft. wide by 36 ft. long and 9 ft. high, was installed beside the partition wall at one end of the armature room. This oven is divided into two rooms; in one the coils are dipped and allowed to drain and in the other they are baked. A complete equipment of draining and baking racks as well as tanks was provided for this purpose. Armatures held in storage in this department are set on steel racks fitted with wooden bearing blocks to protect the

armature-shaft bearings. All work of the armature department is done on contract and must pass the test of a company inspector, who occupies a testing room partitioned off from the rest of the armature room. The usual potential and current tests are applied to ascertain the quality of the work.

Equipment in the forge shop, which is 67 ft. x 151 ft. in size, includes the usual bulldozers, forges and trip hammers conveniently arranged. One special hammer was provided, however, which is worthy of mention. This is a self-contained machine which compresses its own air. In other words, a motor-driven compressor mounted on the hammer bedplate automatically supplies the air with which it is operated. This hammer is of 1500-lb. capacity and was furnished by the Nazel Engine Works, Philadelphia, Pa. Another feature of the forge shop is an electric-welding room completely inclosed with asbestos curtains. Considerable space is devoted to this department, and the curtains protect the remainder of the forge-shop force from the light rays given off during welding operations.

Another portion of the forge shop is given over to the bearing-babbitting department. A view of this room is shown in one of the accompanying illustrations. The steel tables and racks conform to the permanent character of construction used throughout the shop. A unique feature in the babbitting equipment is the kettle-type melting pots suspended in furnaces, the fronts of which may be lowered. When bearings are poured the melting kettle is tilted by means of a goose-neck handle, and the metal flows from the bottom of the pot, thus eliminating skimming and assuring clean metal. The mandrel method of babbitting bearings is employed, and the mandrels are driven out of the finished bearing by an air cylinder mounted on the frame which supports the hood over the furnaces. After the mandrel has been removed, air pressure and a special U-shaped wedge are used to split the halves of the mold. All babbitted bearings are machine broached before being put in stock ready for service.

SPECIAL EQUIPMENT IN THE MACHINE SHOP

The machine shop is, perhaps, one of the most complete of its kind in the country. It occupies a space 86 ft. 9 in. x 184 ft. in size at one end of the erecting shop building. In addition to the ground-floor space, as will be noted in the general view, a balcony along one side

CLEVELAND REPAIR SHOPS—VIEW OF MONORAIL LIFTING CAR CLEAR OF TRUCKS; WHEEL-CHARGING JACK AT RIGHT

affords space for the sheet-metal and fare-box departments. Special equipment in this machine shop includes a cornice brake for sheet metals up to $\frac{1}{4}$ in. thick and 12 ft. long. The size of this brake makes it possible to manufacture many of the special pressings employed in steel-car construction. It also eliminates riveted connections where it is possible to supply a flange to the sheet metal.

A set of six Reed-Prentice lathes, motor driven and equipped with a push-button stop and start and with a full-gear head, are arranged along one side of the shop. These are served by four jib cranes pivoted to the columns supporting the machine-shop gallery, and each jib-crane arm is equipped with a Dake chain and wire-rope hoist furnished by the Dake Engineering Company, Grand Haven, Mich. While the entire machine shop is served by a 5-ton Toledo bridge crane, jib cranes serve most of the individual machines. One of these is a traveling wall jib which serves two wheel presses, an axle straightener and a lathe, all arranged along one of the shop walls. This crane is controlled by pendant switches and travels along the building wall. A 1-ton motor-driven hoist, which travels horizontally the length of the 16-ft. jib arm, gives a wide range to this equipment. This crane and the tools it serves are shown in the general view of the machine shop.

In another part of the machine shop a Putnam wheel-turning lathe of the most modern type has been installed in a pit provided for it in the shop floor. A sheet-steel apron resting on the lathe bed and the shop floor permits wheels to be rolled between the mandrels. An elevating and lowering device at the lathe end of this apron permits it to be set to accommodate wheels of any size. This lathe installation is shown in one of the accompanying illustrations. In connection with the motor-driven tools it is of interest to note that all the automatic-control equipment is installed in the basement below the shop floor. Although the machine tools were installed at the most convenient points on the shop floor, the control sets are concentrated in two groups, one beside each of the two building walls.

STEEL CAR STRAIGHTENER

Undoubtedly the most unique feature in the erecting shop is the steel car straightener. Occasionally a steel

CLEVELAND REPAIR SHOPS—VIEW OF CABINET SHOP

underframe or a steel car body is bent out of square or buckled in a collision, and in cases of this kind the car straightener is employed. It consists of six structural-steel angle bearings on each side of a car track with adjustable bearing beams which rest in a horizontal position on the vertical legs of these angles. Against this bearing beam as many screw jacks may be set as are required to straighten the bent members. Each bearing angle is designed to take a load of 15 tons, and the set of six of these bearing angles on each side of the track permits the jacks to bear against each other on the two sides of the car body. Since the erecting shop has been in service several cars have been straightened with most satisfactory results. Incidentally, these angle bearings are pivoted at their right angles, so that they may be dropped beneath the floor when out of service, or raised and locked in the position shown in the illustrations. Small differential chain hoists mounted on a trolley above each set of bearings are employed in handling the bearing beams and jacks.

Large shop areas devoted to different operations may, if facilities are not provided, result in much lost motion. To meet this condition each department of these shops

CLEVELAND REPAIR SHOPS—VIEW OF CAR STRAIGHTENER IN SERVICE; WHEEL-TURNING LATHE IN PIT

has its tool room and foreman's office. Within the departments numerous portable work benches, punches, shears, compressed-air tools, riveting furnaces, grindstones and pipe threaders are supplied to increase efficiency. The necessity for portable equipment is particularly apparent in the erecting and paint shops. One of the handiest tools in the former is a combined punch and shear. This will punch four sizes of holes and shear sheet steel up to $\frac{1}{8}$ in. in thickness. This tool was furnished by the Union Manufacturing Company, New Britain, Conn.

In the wood-working shop and the cabinet shop adjoining it, adjustable pipe, lumber and cabinet racks form an important part of the equipment. These are shown in the general view of the wood-working shop and in the view of the cabinet shop. Material deposited on these racks is classified and tagged accordingly. In the view of the cabinet shop the structural-steel gluing racks and the standard work benches used throughout the shops are also shown. The work benches are 33 in. in height, 30 in. wide and 14 ft. long. Each bench is

of the telephone operator in the office building. These gongs, through a code of signals, summon the different department heads to the nearest telephone. Immediately back of the office building is the garage, 40 ft. x 86 ft. in plan, where all the company automobiles are repaired. The Cleveland Railway operates three auto buses as suburban feeders, and they are also maintained at this point.

FIRE PROTECTION

While all the buildings in the shop group are constructed of non-combustible material, a complete sprinkler system served by city water pressure has been installed in all the buildings. Supplementary to this and affording a reserve water supply is a 1,500,000-gal. underground reservoir and an underwriters' specification motor-driven centrifugal pump of 1500-gal. per minute capacity. In case of fire this pump is cut in automatically by a certain decrease in the water pressure in the city mains.

Every detail necessary to make shop operation effi-

CLEVELAND REPAIR SHOPS—GENERAL VIEW OF WOOD-WORKING SHOP

fitted with two large drawers and a 2 $\frac{1}{2}$ -in. hard maple top. The legs of the benches are of cast steel with diagonal bracing.

HEATING PLANT, OFFICE AND GARAGE

A heating plant, 52 ft. x 111 ft. in size, adjoins the blacksmith shop and serves the entire shop group. This plant is equipped with stokers, coal bunkers and coal and refuse conveyors. Underground tunnels leading from this plant to the various buildings in the group carry the steam-heat, feed and return pipe systems, as well as the shavings and refuse exhaust system from the wood-working shop.

The supervisory and designing forces of the mechanical department are housed in a separate office building, 57 ft. x 87 ft. in plan, situated beside the employees' entrance to the shop property. Occupying one corner of this building is a company surgery where a trained nurse is regularly on duty. A view of this office building is shown in one of the accompanying illustrations. An interesting feature in connection with the system of communication between the various shop departments is a Tele-Call system furnished by the Mead Electric Signal Company, Cleveland, Ohio. Large gongs in each shop department and as many as are required to be audible in any part of the shop are under the control

cient and appearance neat and orderly has been carefully planned and executed. A concrete retaining wall along East Forty-ninth Street and Harvard Avenue, where the shop property is above the street level, has been constructed, and surmounting this is an ornamental iron picket fence. At the track and employees' entrances hinged gates are provided, and along the inside property lines is an 8-ft. board fence on concrete fence posts which makes it possible completely to inclose the railway company's property. Open spaces have been made into attractive lawns, the tracks have all been filled rail level with stone screenings, and concrete walks and driveways have been provided wherever needed.

Terrance Scullin, master mechanic, is responsible for the arrangement and complete equipment of this shop. It is the result of an exhaustive study of repair shops and a collection of the best ideas in repair-shop arrangement and equipment to be had in this country. Charles H. Clark, engineer maintenance of way, supervised the track installation, and L. P. Crecelius, electrical engineer, the electrical features. The actual design and supervision of construction was done by David W. Morrow, formerly an engineer of the company and now of the firm of Morrow & Cross, civil and architectural engineers, Cleveland, Ohio.

Conference on Valuation

The Final Sessions of the Conference in Philadelphia Were Devoted to Papers and Discussions on the Subjects of Depreciation, Going Value, and the Relation of Valuation to the Future of Public Utilities

The Conference on Valuation in Philadelphia, the proceedings of which on Nov. 10 and 11 were reported in brief in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13, was continued on Friday, Nov. 12. The three sessions on this day dealt with the topics of depreciation, going value, and valuation and the future of public utilities, as shown in the following report. The Utilities Bureau, under whose auspices the conference was held, is planning to publish the proceedings in full in the January issue of *The Utilities Magazine*.

DEPRECIATION

The chairman for the morning session on depreciation was Frederic P. Stearns, consulting engineer, Boston, Mass., who made some introductory remarks regarding a diversity of understanding rather than of opinion between speakers on depreciation topics and their hearers. Two addresses were then made, one on court decisions on depreciation by J. H. Goetz, of counsel for the Public Service Commission for the First District of New York, and the other on the relation of depreciation to fair value by Halford Erickson, member Wisconsin Railroad Commission.

COURT DECISIONS ON DEPRECIATION

Mr. Goetz stated that while the decisions already promulgated have helped in delimiting the excursions of legislators, regulators and judges in this field, they have also contributed in no small degree to the contention and confusion which usually characterize a fresh attempt to deal with the question. The analysis and comparison of the decisions made by the speaker hardly disclosed any marked passion for uniformity. To his mind, the importance of distinguishing between the various purposes of depreciation has not been grasped. In the earlier rate cases, growing out of state or local legislation or out of determination by supervising officials, usually without adequate investigation of relevant data, the public utilities were obliged to invoke the aid of the courts to prevent the confiscation of their property rights, and in the decision of that question the first inquiry was, what are the property rights? As property which by expiration had ceased to exist could not be the subject of confiscation, the courts, with the object only of determining what property rights were affected, soon adopted the method of reproduction-cost-less-depreciation for ascertaining what the property was.

The depreciation deduction, said Mr. Goetz, was therefore confined to actual depreciation. Yet when the question of earnings came to be considered, a new light was cast upon the subject. The duty and importance of providing out of earnings against the impairment of the capital invested, and for the maintenance of the integrity of the plant for continuous and efficient service, was already realized. In this relation functional depreciation and accrued depreciation received recognition. A failure to distinguish between the different purposes of depreciation, however, soon brought about a confusion as to the measure of depreciation which should be applied to the different purposes, and the expression used in the case of one was applied to the other. Mr. Goetz then endeavored to show the underlying differences connected with depreciation when a particular case involved a valuation for a rate-making basis, a calculation of

earnings attributable to the return under a specific rate, a condemnation or purchase, a tax levy, an accounting or capitalization.

DEPRECIATION AND ITS RELATION TO FAIR VALUE

Mr. Erickson was of the opinion that if the treatment of depreciation in valuation largely depends on whether depreciation was provided for in the rates and whether the funds so provided were paid out to stockholders, it would seem to follow that where the amounts provided were used for necessary and proper renewals and for the accumulation of a reserve to cover the accrued but unmatured depreciation of the property still in use, no reduction from the cost new, because of depreciation, should be made in determining the fair value for rate-making and certain other purposes. He felt, however, that the situation might be different when the reserves for accrued depreciation which were provided by the customers had been appropriated by the investors for their own private use. In such cases as this, a situation was created under which justice might demand that the accrued depreciation be deducted from the cost new, and that the cost new less such accrued depreciation be used as the controlling evidence of value in the appraisals. In general, therefore, he considered that the most equitable basis of fair value would be determined by the formula—cost new minus depreciation plus depreciation reserve. Then if the latter had been dissipated in dividends, the company would be penalized accordingly in its valuation. Yet in the case of old companies like railroads, where only maintenance charges were covered by the rates, and there was no collection of accrued depreciation, he believed that the stockholders could have withdrawn nothing from the business and no deduction for depreciation should be made.

In regard to the continuing unexpended balance in the depreciation reserve, which may vary from 10 per cent to 50 per cent of the value of plant, Mr. Erickson thought that if conditions remained above normal, and if all the estimates upon which the balance rested were about accurate, it would seem that at least a part of the balance could with safety be paid over to the investors as a return of that much of their investment without greatly endangering the service. He was not certain, however, that it would be to the best interests of either the investors or the customers to follow this course. Because of its usefulness in meeting sudden or extraordinary requirements, and for other reasons, he considered that it might not be in line with the best policy to place too many restrictions upon the balance in the depreciation reserve.

DISCUSSION ON DEPRECIATION

The discussion on depreciation was opened by James E. Allison, consulting engineer, St. Louis, Mo., who criticised the unreliability and speculative character of estimates of expected life. He pointed out that averages are not justly applicable to individual items, and that the composite remainder of life of a plant is an erroneous factor inasmuch as the life of a plant extends indeterminately into the future if renewals are made as necessary.

In connection with the desire of the public that a

continuing unexpended balance in the depreciation account be deducted from the valuation as a part purchase of the plant, Mr. Allison felt that such a procedure would perhaps be ethical for the future if the consumers understood the accumulation to be made for this purpose and the resulting reduction to the investor were fully compensated for by the amount collected from the consumer. It was wrong now to assume, however, that if a theoretical depreciation balance existed as part of surplus not needed above replacements, this had been contributed in the past by the consumer for the setting up of a part-purchase sum. Mr. Allison considered that past profits legally accumulated were the property of the utility, whether or not they are now considered legal.

Prof. John Bauer of Cornell University said that if the basis of valuation were exchange value, no accrued depreciation should be deducted, for present exchange value cannot be depreciated. But for existing utilities the problem is not to find the exchange value but to clear up a confusion of ideas. The reasonable policy for the future is to use for the rate basis the actual investment put into the property through the issuance of securities, but for most existing utilities it is impossible to find out from securities or capital accounts the money invested. In such cases to consider the net sacrifice of the investor and to evaluate earnings that should have been made and were not might produce a total fair value upon which the company simply could not earn a reasonable return, while in other cases the deduction from value of exorbitant past earnings might reduce fair value to nothing or even an actual liability.

The best plan, therefore, Professor Bauer said, is to draw a curtain on the past, and make an appraisal of the physical property on the basis of actual cost or reproduction cost. A deduction from either of these for depreciation constitutes a question of policy. The public is not entirely justified now in making a deduction, but if such is not made the investor may have a rate basis that is filled with junk. The deduction is merely a safeguard in the interests of broad justice. The main thing is to determine now a definite basis for judging existing companies in the future.

Prof. Allyn Young of Cornell University said that in the future the public has a right to set any valuation basis if it grant the proper rate of return thereon. He did not believe, however, in any retroactive rules. It should not be assumed that in the past it was necessary or according to ordinary business practice to accrue depreciation. Most railroad depreciation has been adequately cared for in the past by the maintenance charges to operating expenses. Professor Bauer then in reply to a question by A. Sakolski of the Delaware & Hudson Railroad valuation committee as to whether he would limit losses as well as profits under the agency theory, said that the reasonable return could always be earned if the existence of the utility were justified and the company properly managed. Furthermore, the non-guaranteeing of a reasonable return would be justly covered by the investor's risk when this lack of protection was known in advance.

John M. Eshleman, Lieutenant-Governor of California and former president California Railroad Commission, stated that an investor must be assured of two things—the return of his investment and a fair payment for its use. This payment, however, must be restricted by the cost for which the public could supply the service, or government ownership would be inevitable. He felt that depreciation was a common-sense question, and future rules should be limited in application to the past by the public acquiescence in certain practices. He urged both utility and public experts to stop trying to

secure the greatest possible return to each side and to unite in establishing an honest basis sufficient to induce future investments.

GOING VALUE

In opening the afternoon session on going value, the chairman, General Morris Schaff, member Massachusetts Board of Gas & Electric Light Commissioners, stated in a brief address that the four fundamentals upon which Massachusetts had secured sound and satisfactory regulatory results in a pioneer field were these: Insistence upon freedom of utilities from political exploitation; payment of liberal dividends to capital honestly invested; requirement of as low a capitalization as possible, and insistence upon sound and efficient management. Moreover, the policy of providing abundantly for depreciation, of allowing for uncontrollable contingencies and of countenancing even generous dividends in the case of excellent management had resulted in few disputes. He believed that the financial history of a utility should be carefully studied in order to determine whence came the property values—from the investors, from the consumers in addition to dividends or through creation by the state—such information to be used so as to secure to both the investor and the consumer his every right. Furthermore, he suggested that when commissions were summoned before the courts in rate cases under the Fourteenth Amendment, they should plead for a distinction in the application of the law to properties in competition and to properties under protected monopoly.

MR. THORNE ON GOING VALUE

The first address of the afternoon was that on going value as an element in fair value, by Clifford Thorne, chairman Iowa Board of Railroad Commissioners. Mr. Thorne described the various conceptions as to the meaning and inclusiveness of the term "going value." If one construed going value as meaning the actual deficits or early losses suffered during the experimental or developmental stage, he believed that an allowance therefor as development costs should be made in the rate of return or in the valuation basis. Such losses, however, must be actually proved. On the other hand, if one looked upon going value as that value accruing from losses incurred after the property had passed through its development life of the first few years, or from the enhancement in its value caused by its operation as a profitable concern after it had reached a paying basis, then such a value should not be included as a factor in a rate basis.

In other words, as Mr. Thorne summed up in regard to going value, justice to the owners, as well as the best interests of the public, demands that reasonable expenses incurred in the construction and establishment, on a paying basis, of a public utility, reasonably necessary for public use, should either be returned to the owners or should constitute a part of the value upon which the owners are entitled to an adequate return. In his opinion, the public is willing to pay these development costs in order to obtain service, and there is money awaiting investment, on reasonable terms, where they and nothing more are desired instead of the larger amount under the misleading title of "going value."

In connection with his address Mr. Thorne remarked that he looked upon neither reproduction cost nor original cost as the proper sole basis for fair value, which is only in the process of being defined. Both of these are now important. Reproduction cost will, in his opinion, always be considered as a prime factor when original cost is not ascertainable, but in the broadest

sense original cost will prove the most important factor when properly compiled and presented. This view, Mr. Thorne maintained, will be supported by the court of last resort.

A. M. Fox, Detroit, Mich., agreed generally with Mr. Thorne's theory regarding the propriety of allowing for early development losses but not for the late-deficit or good-will factors of "going value." William J. Hagenah, public utility expert, Chicago, Ill., did not agree with Mr. Thorne that only the early experimental stages should be considered. He held that with the general extravagance of the last generation, going value was a constantly increasing item extending in some cases even up to the present day. He cited the case of a utility in a fast growing Western city which was constantly compelled to extend its facilities into undeveloped sections and never caught up so as to be in a position to prosper with the community.

FINANCIAL ASPECTS OF REGULATION

The following speaker was Robert C. Wood, member Public Service Commission for the First District of New York, who discussed the financial aspects of regulation. Mr. Wood averred that the three objects to be attained by regulation of utilities are (1) a fair rate to the public, (2) a fair return on the capital invested, and (3) the obtaining from time to time of the capital needed to provide for additional facilities that are demanded by the public. He believed that under public service commission regulation the securities of a corporation having an established earning capacity, a capitalization within the limits of a fair and reasonable valuation of property and under specific requirements for setting aside annually from operating revenues proper allowances for renewals and replacements, should prove safe and desirable investments. Mr. Wood also discussed the influence of utilities on city development and the mutual interest of the public and the corporation in making the latter's securities attractive.

VALUATION AND THE FUTURE OF PUBLIC UTILITIES

The concluding session of the conference was the dinner on Friday evening, over which presided Charles R. Van Hise, president University of Wisconsin. The four addresses at this meeting were as follows: "The Meaning of the Constitutional Protection in Valuation," by both Charles A. Prouty, director of valuation Interstate Commerce Commission, and William D. Kerr, attorney at law, Chicago, Ill.; "Opinion Testimony," by Prof. John H. Gray, University of Minnesota, and "Valuation and the Future in Public Utilities," by Milo R. Maltbie, member advisory board to division of valuation Interstate Commerce Commission.

CONSTITUTIONAL PROTECTION

Mr. Prouty said that there is a twilight zone between the maximum rate that may be fixed by legislative authority and the minimum rate which would not be declared confiscatory by the courts, and in this zone the rate-making power of commissions is supreme. No rate, however, can be properly or justly established until the value of the property is known. It seemed to Mr. Prouty that it may finally be held that the action of commissions in fixing value will be conclusive to the same extent and within the same limits as in the case of fixing rates. The courts will correct all legal errors made in the process of valuation, but they will not review conclusions of fact. Apparently the rate of return and the valuation must be considered together. Courts will not interfere unless the result accomplished by combining these discloses confiscation. This will

follow whether it be finally held that the determination by the commissions of questions of fact are within certain limits conclusive or whether the valuation is simply treated as *prima facie* correct. The courts, it is believed, will not set aside a valuation simply because the judges think the amount too small, unless there is palpable or gross error. Hence, concluded Mr. Prouty, the welfare of public utilities is largely under the control of the public service commissioners, and it is of prime importance that the utilities and the public should unite in securing men of the highest grade for these positions and then inform and support them.

Mr. Kerr was of the opinion that the Fourteenth Amendment creates no property rights, but merely prevents invasion by the state of property rights which are vested under general law. There is no property right in things dedicated to a public use that is entirely exclusive, for rate and service regulations necessarily imply some limitation of the right of free enjoyment. The limitation is voluntarily assumed by the corporation as a matter of contract. Mr. Kerr believed that value may be taken as an expression of the intention of the parties to a contract, as such intention is derived from the contract itself and the subsequent conduct of the parties. This view of value, he said, is not far removed from the results reached by the Supreme Court.

OPINION TESTIMONY

Professor Gray, in discussing opinion testimony, first reviewed the evolution of the rules of evidence which resulted in the admission, about 1800, of the opinions of scientists if based on facts testified to by others. As applied to valuation, he said that the so-called expert testimony of engineers was incompetent, that engineers were not trained to a knowledge of wealth or value, and that their expert testimony along these lines was universally regarded by economists as unscientific. Moreover, he held that engineers were not disinterested witnesses, being in effect paid assistant counsel testifying. While the main objection to opinion testimony prior to its first acceptance was held to be the danger of emotions affecting opinion, Professor Gray thought the present effects of cold calculation more dangerous.

Professor Gray also felt that the public was always at a disadvantage in securing opinion testimony in railroad rate cases, because the railroads could combine and pay more for the testimony and because eminent engineers feared to testify for the public because of its effect on their futures. He declared that if the railroads should succeed in foisting their views on valuation on the Interstate Commerce Commission, government ownership would be inevitable.

THE FUTURE OF UTILITIES

Mr. Maltbie in the concluding address before the conference said that the future of public utilities and the attitude of the public toward utilities under private management will depend in a large measure upon the principles followed in determining fair value. If commissions, legislatures and courts decide that a utility can legally require the public to pay rates sufficiently high to yield a return not only upon the actual investment in the enterprise but also upon property, tangible or intangible, which the public has donated, the public will decide that under such circumstances it would be better to give no donation to the utility, or, if such is necessary, to control and manage the utility itself. If the public must stand all shrinkage in values due to depreciation of property and may not share in gains due to land and other appreciation, but must even pay a return upon such appreciation, all will pause to consider whether private ownership and operation are not so un-

fair and burdensome that communities cannot afford to allow utilities to get into private hands. Moreover, in regard to depreciation, if it is finally determined that utility property does not thus decrease in value, then it follows that public utilities cannot collect in operating expenses anything for depreciation from the public through rates. In Mr. Maltbie's opinion, however, the utility which opposes proper depreciation funds or uses them, when accumulated, for other purposes, has not only broken faith with the public but invited retaliatory methods which it would be the first to decry. Furthermore, Mr. Maltbie said that if fair value is based on contemporary unit prices instead of investment or original cost, the stockholders will gain or lose according to economic conditions over which they have no control, development being stimulated in a time of rising prices and retarded in the case of falling prices. In conclusion he said that public confidence is one of the greatest assets that any corporation can have, and those who destroy it through their extravagant claims in valuation matters must face an enormous responsibility.

Lancaster's Experience with Time-Inspection System

BY R. B. HULL, GENERAL MANAGER CONESTOGA TRACTION COMPANY

For some time before we adopted our time-inspection system we were somewhat skeptical as to its efficiency and the need for it on our lines, for we felt that we had always maintained a fairly accurate schedule and, fortunately for us, had done so without any severe accident at any time. Our property, known as the Conestoga Traction Company, includes the street railways of Lancaster, a city of 50,000 population, and a network of lines covering the county branching out from Lancaster, which is the county seat and almost the geographic center of the county. Our lines feed through a splendid

CONESTOGA TRACTION COMPANY OFFICE OF THE GENERAL MANAGER NOTICE

LANCASTER, PA., May 7, 1914.

Effective this day the watch-inspection service of this company under the supervision of S. T. Charles, superintendent of transportation, will be maintained for the purpose of furnishing a careful system of watch inspection for the employees engaged in the operation of cars.

All employees in the transportation department, those in charge of the overhead emergency cars, maintenance of way cars, and such other employees as may from time to time be designated by the superintendent of transportation, will receive orders for watch inspection (Form No. 1) from the general manager, which orders must be delivered promptly to the local watch inspector, from whom will be received an "employee's card certificate" (Form No. 4). These card certificates must be carefully preserved and presented every four weeks to the local watch inspector, on which to enter record and watch comparison.

The following are the rules relative to the time-inspection service:

1. When watches are presented for inspection, care should be exercised not to impose any hardship or annoyance on the employees, and in case of any doubt give the employee the benefit, if it can be done with safety to the service, but safety and reliability must first be considered.

2. The minimum standard of excellence for old watches now in service shall be of American make and a grade equal to what is known among American movements as "15 jewels, Breguet hairspring, patent regulator, adjusted," in such repair as will enable them to meet the time requirement, not more than thirty seconds per week variation. All watches put up in open face cases must wind at figure "12," except such open-face watches as have heretofore passed inspection.

3. The minimum standard of excellence for new watches purchased and going into the service shall be of Hamilton make, 18 or 16 size, 17 jewels, three positions adjusted, open face, lever-set movement, known as grades No. 948 and No. 978 respectively. All new watches going into service must be equipped with safety numerical dial.

4. The designated makes or grades and American watches bearing names of jewelers or other names not standard trade makes or trade numbers, will not be accepted as new watches. Twelve-size watches are not considered standard and, therefore, will not be accepted.

5. Employees having watches which are in good condition and fully up to the previous standard and running regularly

territory and bring a population of approximately 150,000 into the city.

In May, 1914, we inaugurated a watch-inspection service under the supervision of our superintendent of trans-

within the prescribed limit of error (thirty seconds per week), will not be required to get new watches at present, but when new watches are bought, and in case of employees entering the service, the watches carried must be equal to the present standard.

6. Each employee designated will on May 7, 1914, be furnished with a blank certificate for an order for watch inspection, which he must take, together with his watch, to the local inspector who will, if the watch is satisfactory, sign the certificate and return the same to the company. If the watch is below the standard it will be rejected and the company promptly advised.

7. Each employee coming under the inspection order will be required to present his watch once every four weeks to the company's inspector for the determination of its rate and error. This is of special importance and must be complied with. The maximum amount of variation permitted shall be thirty seconds per week or two minutes in the four weeks lapsing between inspections.

8. Inspector should in all cases see the watches rated and record the error on form at the time and not afterward from memory or memorandum.

9. Every watch must be carefully tested for magnetism, and if it is charged to more than its normal degree must be demagnetized.

10. When employees leave their watches with jewelers for cleaning, repairs or inspection "loaner watches" must be furnished them free of charge, to be used in service for a period not exceeding fifteen days, excepting by mutual agreement for a longer term between employee and jeweler.

11. The standard "loaner watches" must have the same careful attention as the employees' watches and be fully up to the standard for new watches according to Rule No. 3, as their correct rating fills a most important requirement of the time service.

12. When watches are cleaned and repaired by the jeweler, the employee should obtain a certificate from the jeweler making the repair, to be submitted to the company's inspector as evidence of the good condition of the watch.

13. The clock at the carhouse in the office of the time inspector will be known as the official standard clock. This clock only must be used in comparing time.

14. Inquiries or complaints in regard to matters arising in the watch inspection service should be addressed to the company.

15. The printed instructions and blank forms provided for this service constitute rules, and will be obeyed the same as though contained in the foregoing.

Signed and approved by

R. B. HULL, General Manager.

TIME-INSPECTION SYSTEM—REVERSE SIDES OF CARD
CERTIFICATE AND STANDARD LOANER CARD

portation, for the purpose of furnishing a careful system of watch inspection for the employees engaged in the operation of cars, namely, the employees in the transportation department, those in charge of the overhead emergency cars and maintenance of way cars, and any other employees who were from time to time designated by the superintendent of transportation to receive orders for watch inspection and an employees' card certificate.

The accompanying copies of our forms show the itemized detail of the system now in use. They include the card certificate, the standard loaner card and our printed rules covering the inauguration of the system.

I want to emphasize particularly the fact that one of the rules of the inspection service is that when watches are presented for inspection care shall be exercised not to impose any hardship or annoyance on the employees. In case of any doubt, we give the employee the benefit, if it can be done with safety to the service; but safety and reliability must be considered first. This rule is particularly important in the successful working out of the system, for without a clear understanding of the rule on the part of the employees there is a tendency to imagine that this is something that is being forced upon them. In reality this time-inspection system is one of the best possible safeguards of the employee's life, and it contributes to the more accurate timing of the cars.

For old watches in service we took as a minimum standard of excellence the conditions that they should be of American made, of a grade equal to what is known among American movements as 15 jewels, Breguet hair-spring, patent regulator, adjusted and in such repair as to meet the time requirements of not more than thirty seconds per week variation.

In view of the great predominance of Hamilton watches on the steam and electric railways in America, we specified that the minimum standard of excellence for new watches purchased and going into the service should be Hamilton make, 18 or 16 size, 17 jewels, three-position adjusted, open face, lever set, known as grade Nos. 948 and 978 respectively. All new watches going into the service must be equipped with safety numerical dials. This latter feature is one which has been very successfully used by the men on steam railways, for it tells at a glance the minutes after the hour.

The time-inspection system has worked out to our entire satisfaction and at a minimum of expense to this company. It has not caused any friction among our employees. In fact, I think it has worked just the reverse, that is to say, our employees are well pleased. This company would not hesitate to recommend the adoption of the time-inspection system by any other railway.

One-Man Cars*

All Closed Cars in the City of Anniston Have Been Rebuilt for One-Man Operation

BY A. L. KENYON, LOCAL MANAGER ALABAMA POWER
COMPANY, ANNISTON, ALA.

Given the right conditions there is no question as to the advantages of the single-truck, pay-as-you-enter car for the smaller cities, especially those of from 15,000 to 75,000 population. The light car, giving quick service at short intervals, furnishes the solution of many railway problems in such cities when the street car company is barely meeting its fixed charges, and in many instances doing this only by "skimping" maintenance. This reacts on the company through the public, which is quick to notice poor roadbeds and illy-kept cars, preferring to walk rather than to ride in such vehicles.

To provide a rapid, frequent service without a prohibitive increase in cost of operation, platform costs must not be increased. Hence one-man operated cars seem to promise a partial solution of the question. But there are several problems involved in one-man service. One is the negro problem. Another is that of steam railroad crossings. Where the steam road does not maintain a flagman, safety regulations require the electric railway conductor to go ahead and flag the car across.

The only way to overcome this is to employ a regular crossing flagman, paid for jointly by the steam and electric roads, or to install an automatic signal system operated by the electric car. On a large system the employment of the flagman is warranted. On a small system, when two to four cars are operating on a fifteen-minute or thirty-minute headway, the expense of keeping two flagmen at each crossing nearly offsets the saving in one-man operation. The remedy for this is to install an absolutely reliable signal system, approved by the State railroad commission. We are now experimenting with the Nachod signal system at a proposed cost of about \$400 per double-track crossing.

All of our cars are electrically heated, and Johnson fare boxes are employed on all, so that except in rush hours one-man operation is easy and possible, but is not as yet practised on all lines. We have one line operating two cars, with a fifteen-minute schedule, running through the heart of the city and with the aristocratic section at one end, that has a light traffic and no difficulty is experienced with it. This line is free from railroad crossings, and it is equipped with pay-as-you-enter, one-man cars. These are new cars, built by the Southern Car Company. They seat thirty-six passengers, are mounted on Brill 21-E trucks with 8-ft. wheelbase and 30-in. wheels, and are furnished with air brakes and folding doors and steps.

All cars operated in Anniston, except the open cars, have been rebuilt this year for one-man operation. All bulkheads were removed, and folding doors and steps were added. The mechanism was arranged for normal operation by one man, but provision has been made for opening the front and rear doors on one side by the motorman if desired. The one-man plan has been of great advantage in reducing petty accidents, due to the impossibility of passengers getting on and off before the cars came to a full stop. While this service has been given for but a short time, so far the public is well pleased. Strict attention to cleanliness and courtesy in all dealings with the public are absolutely insisted upon, and the efforts of the company to please the public are appreciated.

*Abstract of paper presented before the Alabama Light & Traction Association at the meeting held Oct. 20 and 21, 1915.

Exhibition of St. Paul Locomotives

The First 3000-Volt St. Paul Locomotive Was Taken from Erie to Seattle and Shown at Many Cities to Interested Visitors—Tests of Regenerative Features of Another Locomotive Made Last Week in Montana

A decided novelty in methods of publicity was recently carried out by the Chicago, Milwaukee & St. Paul Railway Company in connection with its 440-mile electrification across the Continental Divide, one of the electric locomotives having been hauled across the continent and exhibited at every important city on the route, finally being placed in trial operation on the Butte, Anaconda & Pacific Railway, which joins the St. Paul System at Butte, Mont. That the exhibitions were an unqualified success is shown by an article by E. S. Johnson in the forthcoming issue of the *General Electric Review*, wherein it is indicated that some 60,000 people took advantage of the opportunity to inspect the machine.

The railway company's contract, which was made on Nov. 25, 1914, called for the delivery of the first locomotive in ten months, and shipment was made on Sept. 25, 1915, a delivery that is unusual in view of the fact that the design is entirely new, that the capacity exceeds that of any steam or electric locomotive ever built, that the voltage of the system is higher than that of any direct-current system for commercial operation, and that the important feature of regenerative control, which is included in the design, was entirely untried for direct-current railways. Since the first delivery several additional locomotives have been shipped, so that electrical operation of the first division between Deer Lodge and Three Forks is expected to begin about Dec. 1.

The first public inspection of the exhibition locomotive was held in Chicago at Fulton Street near the Union Station on Oct. 6, from 12 o'clock noon to 4 p. m. It was estimated that 10,000 people gathered to see the great machine and 5000 visitors actually passed through the interior. So great was the popular interest that several "movie" operators were on hand and made films at different points which are now being exhibited throughout the country.

Prominent among these visitors were many railroad officials located in Chicago and university professors; particularly those interested in engineering work at the University of Chicago and at Northwestern University. A number of students were dismissed from class work in order to give them an opportunity to examine the

locomotive. Superintendents of motive power, street and steam railway officials, consulting engineers and city officials from Chicago and points within 200 miles took advantage of the opportunity to inspect the first transcontinental locomotive. Public men of every profession and city officials were especially interested on account of the agitation in favor of electrification of the railway terminals of Chicago.

The feature that evoked the greatest interest was, naturally, the regenerative braking which enables the locomotive to hold back the heaviest trains on long descending grades—at the same time returning power to the line. The air brakes are thus used only for emergency service or in making the final stop. Regeneration is controlled by the engineer through an auxiliary handle on the master controller which causes the motors to return power to the trolley in the proper amount to maintain any desired speed. This feature, it may be said, was very thoroughly tested on the General Electric Company's experimental track at the Erie Works before the locomotive was shipped.

The general public showed much interest in the fact that cold weather offers no obstacles to electric locomotive operation as is the case with steam. It was pointed out that steam locomotives are usually in difficulties in the winter time, necessitating extra leeway in the time-table to take care of delays. With electric operation there will be no delays for fuel or water or cleaning fires and the electric engine will always be ready at a moment's notice. Trains will move exactly as scheduled so the meeting and passing points may be figured to the minute. Fuel trains will be eliminated in the mountain districts, thus giving track-room for additional trains handling revenue freight.

During the inspection at Milwaukee an accurate count was kept, and it was found that 5010 people went through the locomotive. As many more inspected the locomotive from the outside and either did not have the time or the opportunity to make an examination of the interior. Especial interest was displayed by the employees of the railway company, practically the entire office and shop force taking occasion to visit the machine.

In St. Paul 2550 visitors passed through the locomotive, and in Minneapolis nearly 6000. Opportunity

CHICAGO, MILWAUKEE & ST. PAUL LOCOMOTIVE ON PUBLIC EXHIBITION NEAR UNION STATION, CHICAGO, DURING SPECTACULAR TRANS-CONTINENTAL TRIP

was also afforded the faculty and students of the railway engineering course of the University of Minnesota to make a careful examination at a special hour. On the trip west over the Chicago, Milwaukee & St. Paul lines stops were made at Aberdeen, Miles City, Butte and Missoula, an average of 2000 to 3000 visitors inspecting the locomotive at each stop.

At Butte, the president's special car was attached and a trip made over the lines of the Butte, Anaconda & Pacific Railway to Durant and return. It is noteworthy that the locomotive was operated under its own power as a demonstration to these officials the day it arrived at Butte after being hauled more than 2000 miles. Among the officials on the trip to Durant were President A. J. Earling, Vice-President H. B. Earling, Assistant to the President C. A. Goodnow in charge of electrification work, R. M. Calkins, traffic engineer at Seattle; A. M. Ingersoll, assistant to the vice-president; R. Beeuwkes, engineer in charge of electrification; H. A. Gallwey, general manager of the Butte, Anaconda & Pacific Railway, and many others.

Final exhibitions were made at Ellensburg, Spokane, where there were 10,000 visitors on the first day, Seattle and Tacoma. The number desiring to inspect the locomotive at both Spokane and Seattle was so large that it was necessary to allow two days at each place for the exhibition. From Tacoma the locomotive was sent back to Butte to be placed in trial operation. Most of the tests now being conducted on the Butte, Anaconda & Pacific Railway with the new St. Paul electric locomotives received there have applied to the power regenerative feature. The results of one of these tests, conducted on Nov. 13 with locomotive No. 10,201, show the severity of the trials to which the locomotives are being subjected.

TEST OF REGENERATIVE BRAKING

The weight of the train tested was as shown in the following table:

Sixty-five ore cars at 70 tons each.....	4,550 tons
One caboose	15 tons
One business car	94 tons
Total, excluding locomotive.....	4,659 tons
Total including locomotive	4,943 tons

This load was hauled from Rocker to Anaconda yards without the use of air brakes except to stop at Durant and Anaconda yards, electric braking being used to hold the train on the 1 per cent down grade with the current averaging at times as high as 880 amp. at the locomotive, corresponding to approximately 2100 kw. returned to the line at substation voltage. The train was allowed to speed up to approximately 25 m.p.h. on the down grade, and the train was brought to as low as 7 m.p.h. with the electric brakes in order to demonstrate the wide field of application of this method of braking. The braking was very smooth, and the reduction of speed from 25 m.p.h. to 7 m.p.h. was made without the slightest jar to the train. As the braking was done entirely by the engine, the slack between cars was bunched, and at no time was there any danger of breaking the train in two.

The tests were witnessed by the following representatives of the Chicago, Milwaukee & St. Paul Railroad: C. A. Goodnow, assistant to the president; E. H. Barrett, assistant general superintendent; R. Beeuwkes, electrical engineer; George Spaulding, traveling engineer, and H. A. Gallwey, general manager Butte, Anaconda & Pacific Railway. A. H. Armstrong, chairman of the electrification committee General Electric Company, and P. P. Spaulding of the same company were also present.

Australian Railways to Be Electrified

According to a recent commerce report from Sydney, Australia, to the bureau of foreign and domestic commerce, Washington, D. C., two schemes for electrifying existing lines of urban and suburban railways of Sydney are engaging the attention of the local transportation departments. The railway service, known as the North Shore Lines, running from Milson's Point, the traffic center immediately opposite the city proper, to Hornsby, 13 miles away on the main line from Sydney to the north, is about to be electrified. Already a tunnel under the harbor for carrying the necessary feeder cable is being driven, and but for an unexpected interruption, owing to a fault in the rock, would have been nearly completed by this time. The plan is to supply energy for this service from the existing power stations at White Bay on the Sydney side of the harbor. The work is being carried on by the Railway Department of the New South Wales government.

The second project, for the construction of a metropolitan railway, is much more extensive in conception. Parliamentary sanction for the expenditure of \$32,000,000 has just been obtained. J. J. C. Bradfield, who is chief engineer of metropolitan railway construction, is in full charge of the preliminary arrangements.

The electric railways about to be constructed in the metropolitan area of Sydney include: (a) The immediate electrification of the inner zone suburban railways, comprising 64 route-miles or 200 track-miles, and in the near future the electrification of the outer zone suburban railways radiating some 36 miles from Sydney, and additional length of 200 track-miles. (b) The construction of a 16-mile, double-track loop railway around the city of Sydney. (c) The construction of double-track railways to the eastern, western and northern suburbs, connecting with the existing railways and with the city railway, a length of 37 miles of single track. The ruling grades will be about $3\frac{1}{2}$ per cent with the load and $2\frac{1}{2}$ per cent against the load, while the sharpest curve is $11\frac{1}{2}$ deg. All platforms will be 520 ft. long and will be placed in shallow subways; access will be generally by steps. Energy will be supplied from overhead wires to the train motors at 1500 volts.

The railways to the northern and western suburbs necessitate long-span cantilever bridges across the harbor, without piers in the fairway; the bridge to North Sydney is to be 1600 ft. long, center span, accommodating four tracks, and having a main roadway 35 ft. wide, a motor roadway 18 ft. wide and a footway 15 ft. wide. A bill for the construction of this bridge is shortly to be submitted to Parliament, and though the European war may postpone its commencement it is hoped that a beginning will soon be made. The bridge to Balmain is to be 1350 ft. center span, accommodating double-track and the same roadways and footways as the North Sydney bridge. The clear headway for shipping under the bridges is to be 170 ft. at high water. The total cost of the scheme is approximately \$97,330,000.

The construction of the Sydney City Railway, Sydney, Australia, will be begun as soon as the scheme has received the sanction of Parliament. Electric traction will be used, and it is intended to connect the lines with North Sydney and the Nelson's Point Railway. The estimated cost of wiring from the present Nelson's Point terminus to Hornsby is \$526,500; in addition further expenditure will be necessary to provide rolling stock, transmission lines and substations. The question of funds for the electrification of the Nelson's Point-Hornsby Railway will be considered in connection with the next loan estimate.

C. E. R. A. Meets in Indianapolis

Ways and Means of Increasing Electric Interurban Railway Revenue, the Question Raised in the Paper by G. K. Jeffries, Was the Principal Topic Discussed at the Opening Session on Nov. 18

The November meeting of the Central Electric Railway Association was held at the Claypool Hotel, Indianapolis, on Thursday and Friday of this week. More than eighty members were in attendance when the meeting was called to order on Thursday morning, and President Henry presided. The first order of business was the report of the standards committee, which was presented by R. N. Hemming, superintendent of motive power Union Traction Company of Indiana. This committee is collecting and putting in proper form all the standards adopted by this association, with a view of having them printed and distributed in loose-leaf form. Mr. Hemming reported progress and requested the permission of the association to make certain minor changes and corrections before putting these standards into final form. This was granted.

In the absence of S. W. Greenland, general manager Fort Wayne & Northern Indiana Traction Company, and chairman of the committee on uniform charges for repairs to foreign equipment, Secretary Neereamer read the report of this committee. Its recommendations were adopted by the association without change.

President Henry then advised the association of the death of two of its members, George Parker, general freight and express agent Detroit United Railways, and C. M. Witt, storekeeper Union Traction Company of Indiana. Upon motion a committee was appointed to draft suitable resolutions to be sent to the families of the deceased.

Under the heading of new business Mr. Hemming called attention to the difference of opinion among interurban roads regarding the manner of applying the locking pawl on hand brakes. Some roads specify that the operator must hold his foot on the lever which engages the pawl in applying the brakes and must keep his foot on the lever as long as he desires the brakes to be applied. Other roads specify that the automatic pawl, after it has engaged with the ratchet, must stay in that position, and that it may be released only by the operator's foot again being placed on the releasing lever. He said the second method was better practice because it was safer. He said that two types of hand brakes also created an additional hazard, particularly where cars were subject to interchange, because all operators would not be familiar with the peculiarities of the two types of brakes, and accidents might result.

Accordingly Mr. Hemming recommended that this matter be referred to the standards committee for consideration. His suggestion was adopted.

President Henry then called attention to the plan of the Bureau of Standards of preparing standard rules for overhead lines. He said that he understood a number of roads did not agree with the tentative rules and that the bureau would send out revised copies of them for further consideration. Prompt action on the part of those not agreeing with the standards, in submitting their criticisms, would aid in bringing about the desired changes.

The president also announced that the annual meeting of the association would be held at Dayton, Ohio, Feb. 24 and 25. He appointed a nominating committee composed of E. B. Peck, Terre Haute, Indianapolis & Eastern Traction Company; W. H. Bloss, Ohio Brass Company; E. F. Schneider, Cleveland, Southwestern &

Columbus Railway; W. S. Whitney, Ohio Electric Railway, and S. D. Hutchins, Westinghouse Traction Brake Company.

METHODS OF INCREASING REVENUE

The president then announced that the next matter on the program was the presentation of a paper by G. K. Jeffries, general superintendent Terre Haute, Indianapolis & Eastern Traction Company. This paper, which was called in the program "The Question," was devoted to a discussion of the best means of increasing the revenue. An abstract is published on the opposite page. A lively discussion followed the reading of this paper.

W. A. Carson, general manager Evansville Railways, said that his road was not suffering greatly from automobile competition because there were but few good roads in its territory. He was seriously considering the question of buying some automobiles to serve as feeders to his line. These would be operated between small towns in adjoining territory to his line. Mr. Carson said he was now operating boat lines where he could not get private parties to handle the traffic because they considered it unprofitable.

After the first year, these boat lines have succeeded and in addition have increased the railway revenue more than \$100 a month. He expected the automobile lines to be unprofitable at first but to pay after service had been established. C. A. Baldwin, superintendent of transportation Union Traction Company of Indiana, recommended fast through cars that are comfortable and clean to increase passenger travel.

C. N. Wilcoxon, president Chicago, Lake Shore & South Bend Railway, thought that electric interurban lines should branch out and away from the lines followed in the past to increase earnings. He suggested getting into the freight business on an extensive scale. It should equal that of steam railroads and include particularly car-load freight. He said he was satisfied that if electric railways would correct some of their physical errors a general freight business would prove to be profitable.

W. S. Whitney, general freight and passenger agent Ohio Electric Railway, agreed that car-load freight was very desirable for electric railways. He said that it must be borne in mind, however, that this business originated and was delivered on side tracks and at terminals and not on the main line. John F. Keys, general passenger agent Detroit United Railway, was of the opinion that the increase in the number of automobiles would work to the ultimate advantage of electric railways. They created the travel habit, and all people could not own automobiles nor could automobiles travel everywhere and during the entire year. Mr. Keys also told of the advantages of advertising posters within and on cars. He said his road was using posters successfully to stimulate passenger traffic. He urged all railways to use their advertising opportunities to develop the passenger business.

J. H. Drew, Drew Electric & Manufacturing Company, and L. G. Parker, Cleveland Frog & Crossing Company, brought out the importance of systematic advertising and urged using the association as a medium for developing business. Their idea was to operate all

roads in the association as one big system and advertise the service and connections to the general public. Others taking part in the discussion brought out the possibilities of selling light and power and making connections with the trains of steam roads.

OTHER BUSINESS

Hon. J. F. McClure, member Public Service Commission of Indiana, then read his paper entitled "The Interurban." At the afternoon session the members heard an interesting lecture by W. A. Phillips on the complete process of manufacturing steel pipe. This was accompanied by motion pictures showing all the important processes.

A report of Friday's session will appear in next week's issue.

METHODS OF INCREASING REVENUE

BY G. K. JEFFRIES, GENERAL SUPERINTENDENT TERRE HAUTE, INDIANAPOLIS & EASTERN TRACTION COMPANY

I think the subject foremost in the minds of all interurban men at the present time is the development of the best method to increase revenues. We all know that the increased use of the automobile has become a factor which has seriously affected the revenues of practically all the companies. The larger amount of this loss of business is in the short distance travel. There is no indication that the farmer and small town storekeeper and all others who can raise \$450 or \$500 are going to abandon the use of the automobile and return to the electric road for transportation whenever they want to go 3 miles or 4 miles to town or country or even to the principal towns or cities 20 miles or 30 miles away. There is no use injuring ourselves by butting against this wall. We must look to other things to take the place of this lost travel. An editorial in a trade publication recently suggested, as one method of partially eliminating automobile competition, the advocacy by railway officials of a higher license for automobiles, the thought being that the license fee should be about ten times as much as it is now. I am afraid that this would prove a boomerang. It would antagonize the hundreds and thousands of automobile owners and drivers, and they would be even more ready and willing than they now are to take their neighbors and friends with them on their journey.

The principal other source of passenger revenue is the long-haul business, where the use of the automobile is only occasional instead of being the rule, as it is for comparatively short distances. The development of attractive service over long divisions, or between points on different divisions of one system, and more particularly, good service over the lines of two or more connecting companies, should bring good results. We cannot expect to compete in running time with parallel steam roads, but we can, by making the service attractive, secure much of the business that now goes to these competitors. One of the principal items of attraction is through service without change of cars. Another is the elimination of stops. A through service is ruined if the train stops at all the towns. This kind of a train does not equal the peddling locals of steam lines, as the service stops on electric lines are greatly in excess of those on steam roads.

Of two trains making the same time between terminals, one making all town stops and the other those only at the principal cities, the latter would be much more popular with the traveling public. The traveler does not notice the time consumed if the train keeps on

the move. It will not be necessary to increase the speed of our motors to give this faster service. All we will have to do is to eliminate some of the delays, of which stops are the largest item. Of course, regularity and reliability of the service are large factors. Trains arriving at terminals on time are the best advertisement a road can have.

The possibility of long trips via connecting interurbans or interurban and steam roads should be called to the attention of the public in advertisements, and these schedules should be worked out by traffic departments and shown in folders. Very few people know the possibilities of this through travel which, among other things, enables them to save money on interstate journeys as compared with the trip entirely on steam lines. On our own lines we carry quite a number of passengers for Illinois points and St. Louis via Paris, Ill., the passenger getting through for 2 cents per mile. If he goes all the way on steam lines he pays 2½ cents.

Ask the managers of any lines which have originated through fast service and you will find that these trains are the most profitable ones on their lines. I have in mind some fast schedules with Indianapolis as one of the terminals made by trains which have been running for some time and which have been extensively advertised. These trains are so popular that they are always filled, a trailer often being necessary to take care of the travel. I know of others which are just as well advertised and would be equally popular if they were not spoiled by doing local work over a portion of the run. The criticism heard from passengers on these trains is not good advertising, and it injures not only that particular line but it reflects on all electric roads which advertise limited service and then do not give it.

In every interurban district there are points between which travel is heavy, particularly during the summer season, and where the steam road service and connections are poor and where electric lines, either alone or in connection with some steam road, can give superior service. More attention should be given to attracting this travel to the electric road. Many of the steam lines are antagonistic, but none of them will refuse business handed to them or to handle passengers for an interurban connection, and some of the more broad-minded traffic departments are glad to enter into traffic arrangements with us.

The establishment of sleeping car service between cities of from 50,000 to 250,000 population would, I think, be a paying proposition. In many cases the steam road competition would not be serious because the sleepers on the steam lines are on through trains and the passenger can board a sleeper only when the train arrives, and he must leave it when the train gets to his destination. He probably must either remain up until midnight to get his sleeper or rise at a very early hour in the morning to leave it. Where sleepers on electric lines are in operation they are paying well. The fare is less than on Pullman cars, and as the schedule need not be fast, the trip is comfortable and void of dust and cinders and smoke.

If we can get the managers of connecting lines together and have them talk over the possibilities of developing business which now goes to our competitors, I believe much good will come of it.

The *Electrical Review*, calling attention to the growing importance of railway electrification in England, states that the aggregate length of single track now under, or being equipped for, electrical operation in that country is nearly 1000 miles.

COMMUNICATIONS

Wider Use of Public Libraries

FREE PUBLIC LIBRARY

NEW HAVEN, CONN., Nov. 8, 1915.

To the Editors:

It is with great interest that I note the step of The Connecticut Company in making the beginnings of a company library in connection with the Accountants' Association correspondence course, as described in the in the issue of the JOURNAL for Nov. 6, page 953, and commented upon editorially in the same issue.

It is very possible that no railway company, large or small, will purchase enough books for all employees. This thought entered my mind as soon as I read the list of books published in the article referred to. I at once made a list of the books in this library that duplicated The Connecticut Company's list and mailed a copy to the company, requesting that copies be placed in prominent locations in order that their employees might reap the benefit of the city library. It has since occurred to me that as this correspondence idea is big enough to start a company like The Connecticut Company in establishing a library, perhaps other companies would follow suit, and thereby afford a chance for the public libraries to lend a hand.

The above is merely the view I get from my side of the matter. I shall be interested to learn the viewpoint of the electric railway industry.

KENNETH C. WALKER,
Head Department of Technology.

Indexing Car Equipment Data

THE SOUTHWESTERN ELECTRICAL & GAS ASSOCIATION
DALLAS, TEX., Nov. 9, 1915.

To the Editors:

With reference to the classification suggested by Mr. Litchfield in his article on "Indexing Car Equipment Data" in the Oct. 2 issue of the JOURNAL, I would primarily suggest a considerable modification of his main divisions. In the first place Mr. Litchfield's suggested main heads seem to duplicate certain items while they leave out certain others. As a matter of principle in filing there should never be any such thing as a "miscellaneous" file. In practice it will be found that such a file will simply become a dumping-ground for negligence and carelessness in nomenclature. Such a thing is a misnomer, as a portion of a file; to use it violates the very principle of exactitude that is the vital portion of proper filing. If it is really considered necessary to have such a collection of miscellaneous matter, it had better be kept out of the file and in the basket or folder on the desk where it may be "pawed over" at will, for that is exactly what will have to be done with that portion of the file if a "miscellaneous" folder or section is allowed. Every piece of it will have to be "pawed over" to find what is desired. With a little thought and care given to the matter, there is hardly any item that will not naturally fall under some head or subhead or sub-subhead, and if this is found not to be the case it is decidedly better to give it a fixed arbitrary location and index it in such position than to put it into a "miscellaneous" scrapheap with a lot of other anonymous orphans.

As I understand Mr. Litchfield's article he is suggesting a method of indexing and filing all the data that may be desired with reference to car equipment—meaning thereby, according to his classification, the whole of the car and including the body and everything connected with it. If the information desired is strictly with ref-

erence to such, it is necessary to know exactly what information will be desired from such a file. If that information relates only to the physical features of the different portions of the equipment—to their weights, dimensions, the materials of which they are made and the process of making them—in short, their "specifications"—then the plan of making these records and indexing and filing them would be in a certain way and would be a most simple matter.

If, however, as seems to be the case from the classifications shown, there ensue the further matters of costs, progress, mileage, together with the outside matters of the "office" and "transportation and traffic," then the problem becomes a very complicated one, and the suggestion of the writer would be that instead of trying to crowd all this unconnected and irrelevant matter into one file, it would be much more simple and tend to less work and time and to greater accuracy and facility of reference, to separate these sources of information into separate files and indexes. One of the early mistakes that is often made in the beginning of any system of "filing" is to have each file cover too much. While it has been urged that it is wise to have all the possible information with reference to one item, object or subject in one place, this needs the necessary modification of departments; otherwise there would be complication instead of simplification. If the file suggested by Mr. Litchfield were such as to give the car-shop foreman every bit of information with reference to the car equipment—direct as well as indirect—he would have in that file information that was really the property of the accounting, the purchasing, the stockroom, the track, the line and transportation departments. And, in such case, there would either be an enormous duplication of information with its attendant expenditure of time and money if these other departments kept similar files, or if they did not do so they would have to come to the shop files to obtain information needed by them. In a very small railway property where neither the size nor the earnings of the property permitted any great amount of departmentizing, where the manager or superintendent was either the whole of most departments or their technical head, the idea of such a general file might be permissible.

In any railway property which is sufficiently large or prosperous enough fairly and fully to departmentize itself, it would be the wisest and most economical method to have each department keep in its departmental files that detailed information only of which it was the originator. Under such an arrangement there would be a much greater likelihood of accuracy and "up to date-ness" in the records of each, and, for general inquiry or information, it would be much easier and tend to greater accuracy to combine the information from the several departments in the main office than to have this partially done by each separate department. This suggestion is in line with the latest practice of "efficiency," the principle of "the economic division of labor" and "the largest results with the least expenditure," and the writer would strongly suggest to those interested in the article by Mr. Litchfield that, when their railway property has separate and distinct departments, their "department files" consist only of their proper departmental statistical forms or data properly collected, collated and integrated and that the "data and statistics" of all the departments as a whole are better handled by one person or department that makes a specialty of so doing.

It is doubtless pleasing to a foreman or superintendent to have under his hand and eye all the detail relating to the subject of his department and the results attained by that department, but, in actual practice, it is better that any "outside" data and statistics be pre-

pared by others who have all the basic information at hand, whose specialty is such work and who neglect no other work while so doing. Such others will not use the method of classification suggested by Mr. Litchfield if they desire the best and most easily accomplished results. The best results to be obtained from the proper use of "filing" are not by making the files complex or trying to make any one file cover everything.

H. S. COOPER, Secretary.

Association News

On Nov. 18 the committee on subjects of the Transportation and Traffic Association met in New York with the following in attendance: J. K. Choate, New York, N. Y.; L. H. Palmer, Baltimore, Md., and H. A. Nicholl, Anderson, Ind. The committee prepared its report for submission to the executive committee on the following day. The subjects selected by this and the other subjects committees will be announced as soon as they have been submitted to the respective committees concerned.

The executive committee convened at 8.30 o'clock Friday morning and is in session as this issue of the *ELECTRIC RAILWAY JOURNAL* goes to press. The following members are in attendance: H. A. Nicholl, Anderson, Ind., president; R. E. Danforth, Newark, N. J., second vice-president; W. H. Collins, third vice-president; M. C. Brush, Boston, past-president; L. H. Palmer, Baltimore, Md.; J. J. Dempsey, Brooklyn, N. Y.; R. P. Stevens, Youngstown, Ohio, and E. B. Burritt, New York, N. Y., secretary. J. K. Choate, New York, N. Y., and H. C. Donecker, Newark, N. J., also attended part of the session.

Higher Temperature Limits for Electrical Apparatus

At the A. I. E. E. meeting held in New York on Nov. 12, F. D. Newbury of the Westinghouse Electric & Manufacturing Company presented a paper in which the statement was made that the mica-insulated generators installed in the power plant of the Niagara Falls Power Company twenty years ago had operated at temperatures as high as 285 deg. C. His paper brought out a number of comments in favor of more liberal temperature-rise allowances in some classes of electrical machinery.

In a written discussion Philip Torchio of the New York Edison Company called attention to the conditions which resulted in the A. I. E. E. standards committee adopting the present allowable temperature limit of 125 deg. C. for class B insulations. He also referred to temperature guarantees which he had accepted on two 20,000-kva., three-phase generators employed by the United Electric Light & Power Company for supplying single-phase energy to the New York, New Haven & Hartford Railroad. In referring to the data presented by Mr. Newbury, he pointed out that if the temperature obtaining in the Niagara generators were permitted in the United company's machines they would carry continuous single-phase loads of 16,000 kva. and overloads of over 25,000 kva. at 60 per cent power factor. Mr. Torchio declared that on account of the high speeds required for high steam economy the diameter of rotors must be minimized and the radiation sacrificed so that insulating materials capable of withstanding high temperatures must be employed. Again, turbo-generators for carrying single-phase loads must have large overload capacities at low power factors. In this case it is doubly necessary that generator dimensions be minimized so as not to sacrifice steam economy, for in an unduly large machine carrying low power-factor overloads iron and

field losses are likely to be relatively large. Special guarantees on built-up mica insulated machines might be allowed, he suggested, but a special protective apparatus should be provided to minimize stresses on the machine in case this is done. In closing, he questioned the value of applying the data obtained from the Niagara machines to higher voltage generators and those machines in which the windings consist of several wires instead of rigid bars.

Power Station Extension Near Youngstown

The Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, is installing a 15,000-kw., 60-cycle, 2300-volt General Electric turbo-generator at its power station at Lowellville, thereby practically doubling its size. The power station is being extended to house the new machine, and a reinforced concrete and brick-lined stack, 202 ft. high, and 12 ft. 6 in. in diameter, is being erected. Attached to this turbo-generator will be a Worthington surface condenser with 35,000 sq. ft. of cooling surface. A Worthington volute circulating pump, driven by a Terry steam turbine, a Laidlaw-Dunn-Gordon Corliss dry vacuum pump and two Worthington hot well pumps, one driven by a Terry steam turbine, and the other by electric motor, will be used. The boiler feed pump will be of the three-stage Jeansville type, direct connected to a two-stage Terry turbine.

The boiler room equipment will consist of 5400-hp. Babcock & Wilcox boilers in nine units of 600 hp. each. Five of these will be installed at the present time and four will follow later. These boilers will be equipped with Foster superheaters and Taylor underfeed stokers. The latter will be able to drive the boilers under peak load conditions to 300 per cent of their rating.

The engineering and installation of this work is being carried out by the Stone & Webster Engineering Corporation, and it is hoped that the extension will be ready for service by the first of next year.

Swedish Hydroelectric Power Station Nearing Completion

Construction will soon be completed on the new Swedish State hydroelectric power station at Porjus, which will generate electrical power on a large scale for railway and industrial use. The generator equipment is divided into five large units: Two of 12,500 hp. maximum each, intended for the railway load; one of normally 12,500 hp., maximum about 14,000 hp. for supplying power to the iron mines; and a reserve unit. The fifth will only be installed when the requisite demand for power has materialized. The units consist of twin turbines, placed in closed plate cases with horizontal shafts and direct-coupled electric generators, constructed so as to supply single-phase alternating current for the railway traction purposes and three-phase current for the other power distribution. The turbines operate at 225 r.p.m. for the single-phase units and 250 r.p.m. for the three-phase unit.

According to a statistical table recently compiled by the *Commonwealth Engineer*, the total trackage of tramways in Australia amounted to 357 miles. The total capital cost of the properties was \$51,350,424. The number of car-miles run was 44,000,000. Gross revenue amounted to \$13,875,132. There were 12,498 employees in the tramways' service. The track mileage and control are as follows: Government, 284.5; municipal, 110.25; privately-owned, 146.75.

Gages for Measuring Rail Wear

BY A. R. BAILEY, ASSISTANT PROFESSOR OF CIVIL ENGINEERING UNIVERSITY OF MICHIGAN, ANN ARBOR, MICH.

During the last few years a large amount of appraisal work has been done on steam and electric railway lines. In order to arrive at the value to be assigned to rails that have been in service for any length of time it is necessary to determine the amount of wear that has taken place on the head of the rail. Much of this has depended entirely on the judgment of the field inspector.

The best device for use on T-rails is a railograph machine, which gives an exact profile of the railhead. From this it is easy to determine the area of the worn section, which can be deducted from the area of the section when new, leaving the area worn away. The railograph machine so far has not been constructed so that it can be used on girder grooved or tram rails,

RAIL WEAR GAGES—GAGE FOR GIRDER, GROOVED AND TRAM RAILS—GAGE FOR T-RAILS

so that some other method must be used to determine the amount of wear of these rails.

Following is a description of two types of gage, one used on T-rail and the other on rails of the girder type of section. These have both been used during the last six months for measuring rail wear on a large street railway property, and the results secured have been very satisfactory. The T-rail gage was used on several lines where railographs had previously been taken at the same points, and a very careful comparison was made of the results of the two methods. In all of this work the gage readings were an aid to the inspector's judgment in estimating the per cent condition. The tables which were used in connection with the estimates were not followed blindly, but when necessary allowance was made for such items as cupping of joints, corrugations, side wear and condition of track as to line and surface.

As shown in one of the accompanying illustrations, the gage for girder grooved and tram rails is a Starrett depth gage, No. 46-A, with a portion of the horizontal bar cut off and a level tube fastened to the other end of the bar. The length of bar was decided upon only after considerable study had been made on different rail sections under different conditions of wear. The other end of the bar was shortened so that

readings could be taken on sections of girder guard rails. It was left the length shown in the illustration, about $\frac{1}{2}$ in., to allow the finger to be held under it, in order to change the setting of the scale. The gage was first used without the level bubble, but a few trials showed that only a slight inclination would change the reading by $\frac{1}{64}$ in., which is the least reading of the scale.

Each inspector carried with him a table showing the depth of groove for each section of rail used by the company, also the per cent condition of the rail, corresponding to a variation of $\frac{1}{64}$ in. of vertical wear. These figures were adopted after making a study of the different wheel flanges used.

The second gage shown, which was used on T-rail sections, was devised when it was found that openings could not be made in the pavements on certain streets owing to the time and expense required for removing pavement and concrete to allow the placing of a railograph machine. It was a development from the first gage used on girder rails. The principle is the same in that the horizontal bar reaches far enough across the rail head to get the wear at a corresponding point on each type of section.

As shown in the illustration, this instrument is made by using the heads of two Starrett depth gages, No. 237, and placing them on one scale. A level bubble is added for the same reason as given for the other gage.

A portion of the lower head was cut away to make it easy to insert the gage in the joint between two paving bricks without removing the latter. It will also be observed that a portion of the side of the same head has been removed to allow the corner to bear against the under side of the rail head at a fixed distance from the vertical edge.

A table was prepared similar to the one mentioned above, so that gage readings could be quickly transposed into per cent condition.

Trolley Wire on Double-Leaf Bascule Bridge

BY S. L. FOSTER, CHIEF ELECTRICIAN UNITED RAILROADS OF SAN FRANCISCO

In San Francisco the problem recently arose of installing trolley wire for an electric railway line over a double leaf Page-Schnable bascule bridge erected in 1905. The problem was a new one for the local men and help was sought from the designers of the bridge and then from the builders, but nothing of practical value was received. Information as to how this subject had been treated on later bascule bridges in other cities was obtained from several obliging engineers, but none of it seemed to apply to this particular bridge.

The final solution decided on is simple and satisfactory, and as it was unheard of before locally it seems worth describing briefly. It involves no pulleys, tighteners, counterweights or other usual bascule-bridge supplementary complications, and has been in perfect operation now for several months.

The diagram makes the plan clear. It was found that by selecting the points of support for the trolley wire there could be exactly the right amount of slack

thrown into the trolley span at the hinge in the bridge when the leaf was lifted to suffice for this complicated movement of the bascule-bridge mechanism without straining the trolley wire attachments at the terminals of this span.

To prevent the trolley wire from becoming crystallized or broken from repeated up and down flexures that would occur at the openings of the bridge, hinged frogs, *B, B*, were installed at each end of the particular span referred to.

To prevent any injury to the trolley wire, to the bridge structure, or to persons coming into contact with the loose trolley wire of this span which might have occurred if the wire had been left alive, a pair of drawbridge frogs, *C, C*, with special top contact plates, were provided at the outside lower end of the weight box or machinery platform to open and close the electric circuit in a vertical plane. There was a movable frog on the weight box and a permanent one on a permanent structural steel frame beyond, so that the current was automatically cut off the bridge at the instant the leaf and the outside lower corner of the weight

loosely though harmlessly about on the top of the weight box. As the bridge leaf descended, the lower corner of the outside face of the weight box descended and as the trolley wire in the hinge span tautened up to its original condition, the drawbridge frogs at the outside face of the weight box closed the electric circuit and made the trolley wire alive once more and ready for the passing cars to draw power from it.

As the hard-drawn No. 00 trolley wire on a near-by swing bridge lasted fourteen years without renewal, longer life is expected of this tougher phono-electric wire and, with monthly examinations at the time of inspection and overhauling of electric track switches,

SKELETON OUTLINE OF DOUBLE LEAF BASCULE BRIDGE, SHOWING LOCATION OF TROLLEY WIRE AND SPECIAL OVERHEAD PARTS FOR CLOSED AND OPEN POSITIONS OF BRIDGE LEAVES

box began to rise, the latter being slightly beyond the trunnion center of the weight box.

To secure durability in the trolley wire, solid round No. 00 phono-electric wire was selected in preference to stranded or hard-drawn solid copper wire in spite of the smaller conductivity of the first-named wire. To provide for possible emergencies, a section insulator was installed in the trolley wire just beyond the bridge at each end with a fuse and knife switch around it.

As each side of this bridge was fed by different feeder cables there was no necessity for a current-carrying contact device in the trolley wire at the middle of the bridge and a pair of ordinary drawbridge frogs, *A, A*, without contact plates, sufficed.

Thus when the bridge leaf rose, the inside face of the weight box descended and the lower corner of the outside face of the weight box ascended, opening the circuit several inches and making the trolley wire on the bridge dead as it slackened off and began to lie

block signals, sectionalizing switches, etc., on the system, with re-earing of the clinched ears every five years or so, and with perhaps the replacement of an occasional frog, the whole installation is confidently looked upon as likely to require a minimum of attention and maintenance expense. All frogs were provided with case-hardened steel wearing plates.

The electric road over this bridge is a double-track line, but the description and illustrations were made to apply to but a single trolley wire for simplicity. The two trolley wires were cross-connected at each end of each leaf of the bridge, and elsewhere than at the hinge spans were provided overhead with flat 2 in. x 10 in. untroghed wooden guards with 4 in. x 4 in. wooden parallel stiffeners on top to prevent a possible wild trolley pole from coming into contact with the live trolley wire and the grounded steel superstructure of the bridge at the same time, a protection that proved entirely satisfactory on a near-by bridge for fourteen

POSITION OF FROGS WITH BRIDGE CLOSED, SHOWING CONTACT FROGS TOGETHER AND HINGED FROG STRAIGHT

POSITION OF FROGS WITH BRIDGE OPEN, SHOWING CONTACT FROGS APART AND HINGED FROG FLEXED

years. All supporting rods, bolts and other metal parts of these trolley guards and overhead supports combined were hot-dip galvanized, and thoroughly painted after installation.

The electric motors that operate the bridge mechanism and all the lights on the bridge receive their current from the local electric light company so that the railway company's trolley wires are used only for furnishing power to the passing cars. As the bridge opens, there being no cars on it, there is no current to be broken at the switch surfaces on the weight box devices and these switches are likely to require no repairs.

The double trolley line with the two parallel wires cross-connected assures a factor of safety of two in the contact-making devices at the weight boxes providing against the possibility of corrosion of their parts from exposure to the influences of the salt water and the sewage gases of the channel below.

The illustrations show the general layout of the bridge and the contact and hinged frogs in two positions depending on whether the bridge is closed or open.

Detroit United Builds Refrigerator Car

BY C. L. KELLER, ASSISTANT MASTER MECHANIC DETROIT UNITED RAILWAY

As the result of an agreement entered into between the Detroit (Mich.) United Railway and one of its patrons, a refrigerator car was recently built at the company's shops and placed in service to transport milk in cans and cases. This car was one of the company's 50-ft. freight cars, rebuilt with a large refrigerator compartment, a small front vestibule for the motorman and a large rear vestibule inclosed on three sides for the transportation of

the body bolsters in locating nailing strips for the sheathing, but this was overcome and no portion of the floor was left uninsulated.

The floor of the refrigerator compartment was laid on 2-in. x 4-in. scantlings placed edgewise on the old body floor. The 4-in. space between these scantlings was filled with sheets of pressed ground cork. Large

DETROIT UNITED REFRIGERATOR CAR—SIDE VIEW

slabs of cork insulation were also used to line the sides and ends of the car body. Pine sheathing $\frac{7}{8}$ in. thick was laid on top of the cork in such a manner that no metal conductors extend from the inside sheathing to outside car walls except at doors and corner posts.

Two layers of flexible fiber insulation were used in the roof above this compartment because it was impossible to bend the ground cork to the roof contour. The car body walls were formed of two thicknesses of pine sheathing between which felt paper was laid to furnish additional insulation. At the center of the body and on each side are single, automatic, air-tight refrigerator doors weighing 300 lb. each. The front end of the car, back of the motorman's stand is also fitted with a smaller door of the same type.

The refrigeration equipment was furnished by the York (Pa.) Manufacturing Company. The principle of this is a distinct departure from the usual methods of car refrigeration, in that the piping system includes 180 ft. of 6-in. pipe suspended from the roof of the refrigerator compartment. These pipes perform the work of a brine storage as well as that of a circulating system. When the car is first loaded with freight the piping system is connected to a pump at the freight house, the car doors closed and the brine solution kept circulating through the pipes until the interior of the car and its contents are at a temperature of 35 deg. Fahr. when it is ready for the road. In this condition the compartment will remain at a refrigerating temperature for twenty-four hours provided the doors are kept closed. The initial trips of this new car indicate that there will be an increased demand for this class of service which will necessitate additional refrigerator cars in the near future.

DETROIT UNITED REFRIGERATOR CAR—CROSS-SECTION OF BODY

perishable freight which does not require refrigeration. As shown in the accompanying cross-section of the car body, the sides, ends, floor and roof of the refrigerator compartment are blocked to provide a 4-in. dead-air space. Owing to the construction of the body underframe, portions of the car floor are protected by a space greater than 4 in. Some difficulty was experienced at

Four Years of Maintenance of a Track Crossing on Steel Substructure

BY C. A. PRENTICE, DIVISION ENGINEER UNION TRACTION COMPANY OF INDIANA, MUNCIE, IND.

In view of the satisfactory results obtained the readers of the ELECTRIC RAILWAY JOURNAL may be interested in the further history of the International steel tie substructure placed under the two Big Four crossings on Ohio Avenue, Muncie, Ind., on Dec. 3 and 4, 1912. A description and maintenance record of this crossing was published in the issue for Jan. 2, 1915. On Oct. 6, 1913, we spent ninety-two hours in labor at a

HOUSTON PAVEMENT—BRICK ON MORTAR WITH GROUT FILLER LAID IN 1913, 7-IN. T-RAIL

HOUSTON PAVEMENT—BRICK ON MORTAR WITH GROUT FILLER LAID IN 1914

cost of \$16.51 for surfacing; in 1914 we spent 158 hours in labor at a cost of \$29.86 for surfacing, and in 1915 up to Oct. 19 we had spent \$10.38 for filling up crossings with crushed stone and tightening bolts. This year is the first time it has been necessary to use bolts in these two crossings since the steel crossing ties were installed. The total cost in labor for maintaining these two crossings up to the present time is \$56.81, and we have used thirty-four crossing bolts and twenty steel wedges for the steel ties.

I consider this a splendid record considering the amount of traffic that goes over these two crossings every twenty-four hours.

Before the steel ties were installed it was necessary to do something on these crossings nearly all the time. In fact, they were a constant source of worry to me as well as to my section men, but now, in so far as these two crossings are concerned, we can take life easy.

The crossing frogs are nearly as good as the day we put them in, while the L. E. & W. crossing, put in on wooden ties just five days later not 30 ft. from these two, is nearly worn out.

Mortar Cushion in Houston Eliminates Pavement Maintenance

BY W. M. ARCHIBALD, ENGINEER MAINTENANCE OF WAY
HOUSTON (TEX.) ELECTRIC COMPANY

Prior to four years ago considerable difficulty was experienced with brick pavement laid on an ordinary sand cushion. In order to obviate this, it occurred to me that if a mortar cushion was used and the brick pavement grouted with cement, it would make a much

more satisfactory pavement and one that would stay in place better between the rails. Experiments along this line, extending over a period of eight months, indicated that the mortar cushion would solve the difficulty. Many small pieces of maintenance work were installed under the heaviest vehicular traffic obtaining in Houston. In every case these experimental patches proved very satisfactory, and about three years ago I adopted a sand and cement cushion for all brick and wood-block pavements for both new work and repair work. Grout and pitch fillers have proved equally satisfactory in pavements laid in this manner. Every piece of pavement which the Houston Electric Company has laid in the past three years has been constructed in this way.

As evidence of the results being obtained by the substitution of a mortar cushion for the sand cushion, pavements built in this manner under different traffic conditions are shown in the accompanying illustrations. Some of our pavement has now been down four years, and during that period no money has been expended on it in maintenance. As will be noted in these illustrations the pavement surface is perfect and shows no appreciable wear even where this type of pavement is laid along T-rail.

The *Electric Railway & Tramway Journal*, in commenting upon a recent article published in the *ELECTRIC RAILWAY JOURNAL* regarding the method used by the United Railroads of San Francisco to grind out rail corrugation, wherein the blocks for wooden track brake-shoes are replaced by carborundum blocks, states that at least a dozen systems in Great Britain have been using this method for several years past.

HOUSTON PAVEMENT—BRICK ON MORTAR WITH GROUT FILLER LAID JANUARY, 1912, 7-IN. T-RAIL

Highway Crossing Signal with Indicators

The line of the Nashville (Tenn.) Interurban Railway crosses an important highway 9.6 miles out of Nashville. This crossing is at a reverse curve in the line, and cars approach the highway around a curve and on a down grade from both directions. In addition, the view of the motormen on southbound cars is limited by the sides of a cut. At this point a Nachod highway crossing signal has been installed, the general aspect of which is shown in one of the accompanying illustrations. A 12-in. bell forms the top of the pipe standard, and below are attached in succession a railroad crossing sign, a danger transparency, an iron relay box and the base, and all are mounted on a concrete foundation. The control mechanism consists of a special "last-position" relay, with resistances, which is shown in one of the accompanying illustrations. This box also contains fuses and disconnecting switches. The "last-position" relay is similar to the standard track relay and is constructed of Norway iron throughout its magnetic circuit. It has a Bakelite molded top with glass-inclosed contacts, and the windings are of enameled wire. Complete access to the parts is obtained through the door, which is gasketed and fitted with a compression lock. The danger transparency is hinged so that the lamps and shunts are easily reached.

A starting contactor is located about nine poles on each side of this highway crossing, and the stopping contactor is at the crossing. The contactors are of the wiping type and are fastened by the usual trolley ears, so that the wire is neither cut nor bent. The stopping contactor is shown in one of the illustrations. A southbound car passing the starting contactor at full speed sets the bell in operation and lights the lamps in the danger transparency, thus giving both audible and visible signals. A hooded light signal or motormen's indicator is mounted on one of the trolley poles about four spans from the highway and faces the motorman as he

HIGHWAY CROSSING SIGNAL—RELAY AND FUSE BOX

approaches the crossing. This indicator lights up when the crossing bell rings and shows to the motorman that the warning is being given, when he can neither see nor hear the crossing signal. When the car reaches the crossing the alarm is automatically cut out. As the car passes under the contactor beyond the crossing no change is made in the control circuit. An opposing car, however, would operate the crossing alarm in exactly the reverse manner.

Two line wires are required between the starting con-

HIGHWAY CROSSING SIGNAL—SIGNAL INSTALLED ON CONCRETE FOUNDATION; STOPPING CONTACTOR; MOTORMEN'S INDICATOR

tactors and one between the motormen's indicators. The lamps in the danger transparency and motormen's indicators are in series with the bell. Each is individually shunted by a resistance so that the burning out of a lamp will not interrupt the circuit, but only slightly dim the brilliance of the remainder. The bell is rung, the lamps are lighted and the relay is operated by the 600-volt trolley current, so that batteries are not required and no changes are necessary in the track return. The control is based on a space interval and not on a time interval. Bells depending on a timer give false indications at times and, therefore, may be disregarded at a critical moment.

Heavy Duty on a Geared Brake

W. O. Hay, vice-president and general manager Northampton Traction Company, Easton, Pa., reports the successful operation of a home-made flat car under unusual conditions. This car is 8 ft. 9 in. wide and 30 ft. long over all and it is used to carry loads up to 20 tons. It is used on lines where grades of $12\frac{1}{2}$ per cent and curves of 50-ft. radius are encountered. In spite of predictions to the contrary there has been no difficulty

SKETCH OF BRAKE RIGGING OPERATED FROM HAND BRAKE
IN CENTER OF FLAT CAR

in controlling the car by means of a hand-brake rigging like that shown in the accompanying diagram. In this the brake spindle was placed in the middle of the car for simplicity, and a "Peacock" eccentric drum was used to give the necessary brake-chain pull. During three years of use the rigging has given no trouble.

Metal Ticket and Fare Box Effect Saving

The substitution of metal tokens for paper tickets and the installation of a fare box and registering device especially designed to receive and register pennies, nickels, dimes and metal tickets has effected a tangible saving for the Lincoln Traction Company, Lincoln, Neb. The metal tickets and the registering fare box were put in service on April 1, 1915. Coins of the denominations of 1 cent, 5 cents and 10 cents, and metal tickets are dropped into one hopper. The registrations of the coins are made on one dial and show on a separate trip and totalizer. Metal tickets or tokens are registered on another dial with a separate trip and totalizer, and complimentary tickets, transfers and all classes of paper tickets are registered on a third dial having a trip and totalizer. With the three registers an excellent check on the work of conductors is obtained. The combined coin, metal ticket and transfer register was manufactured by the International Register Company, Chicago.

Before the installation of the registering fare box the company was paying a monthly rental of approximately \$200 for registers. It was also spending about \$60

per month for paper tickets, and it is estimated that about \$25 per month was spent for work in the auditor's office, which has also been made unnecessary. After charging off interest and depreciation on the present fare-collection system, the savings effected by its adoption show a considerable financial gain. Aside from these savings, however, and more important, is an increase of 9.07 per cent in the cash fares collected for the months of April, May, June and July, 1915, over the same period in 1914. Ticket fares increased during this period 1.44 per cent and revenue increased 4.79 per cent.

Another important advantage brought out by experience with this fare-collection system was that on lines where schedules were very difficult and almost impossible to maintain, no trouble has been experienced since the new system was installed. This improvement is attributed to the fact that passengers when boarding the car, now usually have the correct change ready, deposit it in the fare box and pass immediately into the car. Under the old system the delay occurred when each passenger stopped to pay his fare to the conductor.

Automatic Fare Collector and Change-Making Machine

A device of very unusual character has just been brought out under the name of "automatic cashier." Of greatest interest is a mechanical change-making feature, which not only assures the owner that every cent deposited in the machine is charged to the operator, but also removes all cause for contention between those who have to do with its operation. This makes the device especially suitable for use on one-man cars, or in ticket booths as a means for replacing the ticket sellers ordinarily employed there. When it is used upon a street car it relieves the conductor of the worry of making and carrying change in his pockets and likewise eliminates all of his responsibility after the fare is paid. The only requirement of the conductor is that he must insist upon the payment of all fares to the machine. In fact, when it is in use there is absolutely no occasion for the handling of fares by the conductor.

The device measures 12 in. x $13\frac{1}{2}$ in. x $17\frac{1}{2}$ in. It is fitted with four slots designed to receive coins of the respective denominations of 5 cents, 10 cents, 25 cents and 50 cents. When the coin is inserted in the machine, the operator presses what is termed the coin lever, and the change mechanism is automatically set to change a

FRONT AND REAR VIEWS OF "AUTOMATIC CASHIER"

coin of the denomination that is inserted. However, the mechanism only opens to the extent of the coin deposited. That is to say, it is impossible to register more than the coin inserted and it is impossible to change a coin without deducting at least one fare. After pressing the coin lever, which allows the coin to drop to a point where it is visible within the machine, the operator presses a second lever, termed the "delivery lever," which instantly records, indicates and delivers change.

There are five levers that serve for delivery and these are numbered from one to five, enabling the operator to register at one stroke any number of fares from one to five. Each one is interlocked, so that if a second passenger inserts a coin in the slot before the delivery of change to the previous passenger the second transaction cannot be recorded nor can change be given until the first transaction is completed. An interlocking arrangement applies also to the coin levers and this makes it impossible for errors to take place which are at the expense of the company.

The machines are so constructed that only the coin of the proper denomination can be inserted in the slot. If any attempt is made to do otherwise the coin passes through the slot and comes back to the passenger's hand. There is also a device which permits ejection of "slugs" or other spurious or non-acceptable coins. The ejector, however, does not throw the spurious coin back to the passenger's hand, but confiscates it. However, before confiscation the coin is visible through a glass cover so that it can be readily shown to the passenger.

Although the machine changes coins only up to the denomination of 50 cents it is possible for the operator, by the use of a Yale key to deliver into the passenger's hand as many 50-cent pieces as may be desired. However, each time that one of these coins comes out of the machine an automatic record is made of it so that it is properly charged to the operator. When the machines are started on a run the magazines are usually loaded with \$3 in 25-cent and 50-cent pieces, \$1.50 in dimes, and 50 cents in nickels. This has been found to be sufficient for all requirements, as each coin, after it is deposited in the machine, immediately enters the magazine or change tube and thus becomes available for change. There is a small till which opens from the back of the machine automatically when the key for expelling the 50-cent pieces is inserted. When the run begins this till is empty, and as soon as a coin or bill is presented which requires change beyond 50 cents, the operator inserts the key and automatically puts change in the passenger's hand, retaining the bill or larger coin which is offered and placing it in the till.

The machines are equipped with four registers, one denoting the total amount of cash fares, and another the amount of ticket fares. A third records operations of the coin ejector, and a fourth serves the device for changing bills. In another form the machine delivers tickets and change simultaneously, this being especially advantageous for elevated or subway railroad operation. The machines have been placed on the market by Henry C. Ebert, Rochester, N. Y., and they are to be sold at a price that is materially less than that of some of the registering fare boxes now in common use.

The work of extending the Saigon-Binhthay line of the Compagnie Francaise de Tramways in Indo-China and of electrifying that portion has been carried on as far as possible. The transformers and traction apparatus could not be delivered, the manufacturing plants which were to furnish them having been captured since the outbreak of hostilities. Electrical operation, therefore, could not be begun on Jan. 1, 1915, as anticipated.

Pressed-Steel Headlight for Interurban Cars

A new type of pressed-steel headlight for interurban cars, known as the "perfect headlight," has recently been put on the market by the Trolley Supply Company of Canton, Ohio. The frame is entirely of No. 20 gage pressed steel. It is $9\frac{3}{4}$ in. deep and $14\frac{1}{2}$ in. in diameter, and the weight, including lamp, resistance, etc., is 25 lb. The reflector is 12 in. in diameter at the front and 6 in. deep. It is made from No. 18 gage brass, double nickel plated and highly polished. The headlight

FRONT AND SIDE VIEW OF HEADLIGHT

is equipped with a 100-watt concentrated filament lamp on a resistance similar to the arc lamp.

At the back of the reflector there is a partition of sheet steel, and the space between the partition and the front of the lamp, $6\frac{1}{2}$ in., is perfectly airtight, so that dust and dirt will not accumulate on the reflector. On the back of the partition and of the lamp proper is a resistance in three units. Two of these units are the main resistance and one is an auxiliary to dim the light while the car is within the city limits. The method used of fastening the resistance units to the partition plate is similar to that used on a cartridge fuse so that either unit can be readily removed and a new one replaced in case of burnout. The resistance units are wound on a porcelain spool

REAR OF HEADLIGHT—RESISTANCE AT BACK

$8\frac{1}{2}$ in. long, threaded twenty-four threads to the inch, and the wire is wound on this thread so that it is impossible for the wire to sag or get out of place. The headlight is said to throw a light a distance of from 800 ft. to 1000 ft. ahead of the car, and the consumption is only 1 amp.

One advantage claimed for this lamp over the arc lamp is that when it is installed on the car and focused properly it will always throw the light directly at the point intended and not change its position if the trolley goes off or passes over a section insulator. Then, of course, no trimming is required.

The method of hanging the lamp to the car is similar to the ordinary arc headlight, and it can be carried from end to end.

New Form of Safety Tread

The American Mason Safety Tread Company, Lowell, Mass., has recently brought out a new form of safety tread called the "Black Diamond," which includes a deformed surface for catching foreign substances and open-end grooves for drainage, thus obviating the annoying pools of water which are sometimes found on flat treads in wet weather. The abrasive mixture used in the tread base is composed of asphaltum and carborundum, and over this is placed a skeleton metal frame, the surface of which presents a series of raised

CROSS-SECTION OF "BLACK DIAMOND" SAFETY TREAD

diamond-shaped openings. As the base is substantially of a mineral-rubber composition it has a tendency to be elastic. Actual tests prove that traffic causes the bearing frame to press slightly downward into the mixture, forcing it gradually upward through the diamond-shaped perforations, so that an even contact surface of both metal and abrasive mixture is insured throughout the life of the tread.

"BLACK DIAMOND" SAFETY TREAD

Each non-slip diamond-shaped unit is surrounded by a frame of metal on edge, thus assuring durability, and as the tread has no metal baseplate, even when it is worn down through the metal frame on the top, a non-slip abrasive surface still presents itself for surface until the tread is entirely worn out. The tread is light in weight and the beveled edges with which it is equipped make it especially adapted for exposed positions owing to the attractive appearance. It is furnished in either steel or brass in lengths up to 8 ft. and in a number of standard widths.

Cleaning Circulating Water Screens

A contributor to *The Engineer* of London outlines a method of cleaning the screens for circulating water that are installed at power houses. In this a high-pressure jet of water is sprayed against the inside of the screen after it rises above the water level in the circulating tunnel, the method being especially adapted to screens that take the form of an endless band which is kept in constant movement by the rotation of a drum at the top, well above water level. The jet washes the screen perfectly clean, regardless of the fineness of the mesh used, and the wash water serves as a carrier for the material that is picked up by the screen, which can thus be discharged along troughs or pipes back into the river on the down-stream side of the intake.

Climbers for Structural-Steel Poles

With the introduction of steel poles originated the joke among linemen that "sky-hooks" were necessary in order to climb them. That was sufficient reason for the Bates Expanded Steel Truss Company, Chicago, Ill., to design a climber especially for its expanded steel poles, an illustrated description of which was published in the *ELECTRIC RAILWAY JOURNAL* of Aug. 28, 1915. This climber consists of a forged steel shoe with large comfortable bearing area for the foot. The toe of the shoe, as shown in one of the accompanying illustrations, curves upward, and is provided with two hardened tool-steel projecting bearing or clamping points, which make it possible to climb steel poles. The fulcrum block is square in section and bolted securely to the shoe. The square section affords four

TOP AND SIDE VIEWS OF POLE CLIMBER FOR LEFT SHOE, SHOWING CLAMPING POINTS

cutting edges which makes sharpening unnecessary until the four edges become dull.

This fulcrum block bears on the outside of the steel pole and a point near the end of the shoe bears on the opposite side. This point is fastened to the shoe with a cotter pin, which permits it to be readily removed and renewed in the field. The clamping action of

STEEL POLE CLIMBERS IN ACTUAL OPERATION

the shoe on the vertical flange of the steel pole is obtained by the pressure of the lineman's weight on the heel end of the climber. Weight naturally comes at this point when a lineman climbs a pole, and when he raises his foot for the step upward the natural move of raising the heel first releases the grip of the climbing shoe. The shoe is strapped to the foot, and weighs about the same as a climber for wooden poles.

News of Electric Railways

CHICAGO TRACTION PROBLEMS CONSIDERED

Consolidation of Surface and Elevated Lines and Construction of Subway Discussed—Commission of Engineers

Authorized to Report on Operating, Engineering and Financial Problems Involved

Improved transportation for Chicago was discussed at a recent meeting of the local transportation committee of the Chicago City Council, to which Samuel Insull, L. A. Busby and B. I. Budd were invited. It was the consensus of opinion that a consolidation of the surface and elevated railways, bringing the latter into a contract with the city similar to that of the surface lines, was important to any plan of improved transportation. Contingent upon this consolidation, however, the terms must be decided upon which universal transfers between the surface and the elevated lines will be granted, and a decision must be reached as to the type and extent of a subway system to give both surface and elevated lines additional downtown terminal capacity.

Mr. Busby spoke for the surface lines. He stated that they desired to consolidate with the elevated roads upon some equitable basis. No other city matter was so important at the present time as the proper solution of Chicago's transportation problem. Many plans for unified operation of the local transportation facilities and for the construction of a subway had been offered, but he was of the opinion that the only way to arrive at a plan satisfactory to all parties concerned was to employ the advice of high-grade, independent experts experienced in making investigations of the kind presented in Chicago.

Mr. Insull, president of the Commonwealth Edison Company and chairman of the executive committee of the associated elevated railway companies, expressed the opinion that the whole question of improved transportation including consolidation, operating arrangements and a passenger subway should be considered as one problem. On the question of legislation necessary to bring about a consolidation of the surface and elevated lines, Mr. Insull said that such legislation was desirable but not absolutely necessary. The consolidation could be brought about by action of the City Council and approved in a referendum by the public, after which legislation authorizing it could be obtained.

The question of the valuation of the elevated roads was then brought up. Attention was directed more particularly to the wide difference between the figures presented by the city's experts and by the experts employed by the elevated railway companies. Members of the committee asked Mr. Insull if he thought that this difference could be reconciled. In reply he said that negotiations at the time the two valuations were presented had never reached the point where the elevated railways were asked to trade. He did not believe that the question of agreeing on a valuation would offer any great obstacle to the consolidation of the properties. Any valuation agreement, however, would have to be based upon the actual cost of the property or very near that. Mr. Insull said that the \$60,000,000 figure placed upon the property by the city's experts was very much too low. In explanation he advised the committee that the companies were earning interest on considerably more than that amount. So long as the companies were solvent and earning interest on their original cost, they could not be bought for less than that amount. Mr. Insull agreed with Mr. Busby's suggestion concerning a plan for bringing about improved transportation for Chicago. He was of the opinion that the experts should be selected by the city.

The local transportation committee of the City Council at a meeting on Nov. 17 adopted a resolution authorizing the chairman to submit a list of engineers from which three are to be selected to investigate and submit a plan for improved local transportation. These engineers must be of high standing with broad experience in solving transportation questions. One must be from Chicago and two must be familiar with the efforts to solve the transportation problems of New York, Philadelphia and Boston. These engineers will be authorized by an ordinance which is now in

preparation to submit a report providing for a unified and comprehensive system of transportation including the present surface and elevated lines and the proposed subway. Specific provisions of this ordinance require that the engineers recommend a plan for unified operation of the surface and elevated lines; value the elevated properties using as far as possible information contained in previous valuations; submit a location and a general plan without detailed specifications for the construction of a subway system to be operated in connection with the surface and elevated lines with a provision for extensions to take care of future traffic needs; present an operating plan which shall provide for the surface and elevated lines in the proposed subway and for a uniform system of transfers between all lines; suggest necessary extensions to the elevated lines and a financial plan covering the investments in the surface and elevated lines as well as methods for securing the additional capital required by the city over and above its accrued traction fund, for subway purposes and for extensions to the elevated lines. This report is to point out specifically the benefits to be derived by any plan recommended and is to be completed by March 1, 1916. The ordinance embodying these features and authorizing that the engineers be compensated from the traction fund will be submitted on Nov. 24.

NORTHERN OHIO FRANCHISE DECISION

The Northern Ohio Traction & Light Company, Akron, Ohio, has issued a statement in regard to the recent decision of the Supreme Court of Ohio with respect to that portion of the railway between Canton and Massillon. The company says in part:

"It should be understood that the rights in dispute have nothing to do with any part of the system excepting only the line between the boundaries of Canton and Massillon—about 4½ miles. The grant to build and to operate an electric railway along the roadway at this point was made by the Stark County Commissioners, to the original Canton-Massillon Railway, the property of which was bought by the Northern Ohio Traction & Light Company. This grant was in the form of a resolution spread on the records of the County Commissioners and no time was specified through which the grant was to run. Two or three years ago the question of the duration of this grant came up in connection with a number of improvements and also a lower fare which were desired and contemplated. The company offered to join in all the improvements and to give a 10-cent fare between Canton and Massillon, with transfers to local cars in both Canton and Massillon, also to extend the 5-cent fare zone, etc., all of which were to be provided in a new twenty-five-year contract. The negotiations came to a standstill, however, because the company would not take entirely upon itself an unforeseen item of \$50,000 for unexpectedly large cost in the proposed widening of the highway. The ouster suit, which was then started by the prosecuting attorney, was based on the contention that the county was at liberty to terminate the grant it had originally given.

"The contention of the company was that the resolution or grant, not limiting the time, was purely because of the very necessities of such a grant, involving the building of an extensive railway and the operation thereof, and the rights of property holders along the line; that for these reasons it was not the intention of either of the parties to the original grant that it could be terminated at any time by either party, and that such a contention would be unfair to both parties and unfair to the property owners along the line. The Supreme Court in its recent opinion, by a fair majority, decided that the grant was not perpetual, but that it was such a resolution and grant that the county or company could at will terminate it. The vote of the judges stood four for and three against the company.

"Although this decision does not in any way affect any of its other property, the company believes that it is of such vital interest and the question involved of such great importance that the Supreme Court of the United States should review the State Court's decision, and to that end the necessary papers will be prepared and filed."

McCALL'S DISMISSAL RECOMMENDED

Legislative Investigating Committee Files Report with Governor of New York

On Nov. 13 the report of the Thompson legislative committee embodying a recommendation to Governor Whitman of New York for the summary dismissal of Chairman Edward E. McCall of the Public Service Commission for the First District was filed at Albany. A summary of the charges against Mr. McCall follows:

Misconduct in office:

First: That at the time of his appointment to office he was the owner and is still the owner of stock in a corporation subject to his official regulation and supervision, which act is in violation of the statutes.

Second: By officially aiding and abetting in procuring approval of the order permitting the acquisition of the outstanding stock of the Amsterdam Electric Light, Heat & Power Company by the Edison Electric Illuminating Company, Brooklyn, while having a financial interest in the subject of such order as a stockholder in an allied company.

Third: In participating in dealings of the commission where matters were under consideration affecting corporations in which he had a financial interest as a stockholder.

Fourth: That while owner of stock in such corporations he knowingly and willfully performed the duties and exercised the prerogative of a public service commissioner.

Neglect of duty:

First: That upon the application of the Edison Electric Illuminating Company, Brooklyn, to acquire outstanding stock of the Amsterdam Electric Light, Heat & Power Company he neglected to perform his official duties by failing to give the application proper consideration; procured the approval of the application against the interests of the city of New York and over its protest and to the irreparable injury of the city of New York and its inhabitants.

Second: In procuring the issuance by the commission of an improper and inadequate certificate of authority for the construction of the third tracks in Manhattan, whereby the city of New York and its inhabitants and the stockholders of the company suffered irreparable injury and whereby extravagance in contracting and in construction was permitted.

Third: That he personally voted and exercised his official power and influence to defeat a resolution introduced at a meeting of the commission to procure the enforcement of an order of the commission directing the repair, improvement and alteration of defective and inadequate construction of the Third Avenue Railway and the Forty-second Street, Manhattanville & St. Nicholas Avenue Railroad.

Fourth: That he failed as a commissioner to protect and safeguard the interest of the city, of its inhabitants, and of stockholders and corporations subject to his official regulation; that he has exercised his official power and influence for the particular advantage and benefit of certain stock interests, and that he has failed properly or adequately to supervise corporations subject to supervision by the commission of which he was a member.

Fifth: With misconduct in office, neglect of duty and inefficiency, in failing to attend the meetings of the commission, improper official action at meetings which he did attend; that he used time required in official business in private law practice for hire; failed to give adequate service as a commissioner in the supervision and regulation of corporations; failed to maintain a proper, efficient, and economical organization of the Public Service Commission, and of inefficiency in the supervision, control, and disposition of the funds entrusted to his charge as public service commissioner for the purpose of creating rapid transit facilities in the city of New York, and had delayed proper action in divers and sundry matters properly the subject of disposition by the commission.

Chairman McCall is allowed ten days by law to answer the allegations, after which a hearing on the charges, either by the Governor himself or by a commissioner designated by him, will begin. The ten days will expire on Thanksgiving Day, and the hearing consequently could begin on Friday, Nov. 26, unless the Governor should find it advisable to set a later date.

NEW YORK BUS FRANCHISE ARGUED

Bainbridge Colby argued on Nov. 15 before the Board of Estimate and Apportionment of New York City the case of the New York Motor Bus Company, which is awaiting the city's approval of a motor-bus franchise practically agreed upon. This was the third of the public hearings held by the board on the advisability of motor buses in Manhattan streets, first proposed in December, 1912.

Mr. Colby answered the arguments of William D. Guthrie and James L. Quackenbush of the Interborough Rapid Transit Company, John M. Bowers of the Third Avenue Railway and George D. Yeomans of the Brooklyn Rapid Transit Company, who, at the two previous hearings, contended that the city would risk its big investment in the dual subway system if it permitted motor-bus competition. He said that the counsel for the existing lines would have it appear as though there was a "traffic famine" in this city. In the course of his remarks Mr. Colby said:

"The Borough of Manhattan is declining in population; its taxable values are shrinking. There is one reason for this, and only one, namely, that it is easier to get from any outlying borough to Manhattan than it is to get from point to point in Manhattan. The conditions in Manhattan are an unanswerable argument in favor of the bus. This borough is suffering from a complete lack of adequate local transportation. This the existing surface lines cannot supply. The bus alone can supply it.

"The opposition is dictated by the Fifth Avenue Coach Company. It filed bids for these routes before we did. It filed two bids to our one, and is now seeking to file a third. The whole purpose of this opposition is to throw the city back three years, undo all its careful progress in that time toward the development of new transit means, in order that the Fifth Avenue Coach Company, which has been outbid, may wipe off the slate and begin all over again.

"The proposed routes are not competitive with the existing surface and subway lines. The purpose of the Board of Estimate, skillfully worked out, has been to devise a supplementary service that will relieve the lack of local transportation in great populous districts now wholly unserved. Transportation in this city has always been ten years behind its needs. The possibilities of a new system are at once swallowed up in the steady and colossal increase of travel."

COMMITTEES AT WORK ON NEW TOLEDO MEASURE

What is known as the sub-committee of the general committee named by Mayor-elect Milroy of Toledo, Ohio, to formulate some plan of settling the street railway question has selected as advisers forty-three men, known to have been opposed to the Dotson franchise ordinance. This sub-committee came into existence through a division of the original committee into factions for and against the Dotson franchise. Its members hope to secure from these advisers the views of those opposed to the franchise to aid them in formulating a plan of settlement. Members of the sub-committee believe that these men represent all the factions of the opponents. This sub-committee has held several meetings to discuss various matters connected with the selection of the advisers. Other members of the original committee have remained inactive in order to give the sub-committee full time to secure information and select its advisers.

At a session of the sub-committee on Nov. 10 Charles S. Ashley suggested that the provisions relating to the rate of fare remain as they are and that all passengers who cannot secure seats be carried at a fare of 1 cent each.

At the regular meeting of the City Council on Nov. 10 legislation was introduced which was intended to force the company to a settlement of what the city claims is its portion of the pavement on several sections of street on which it has no franchise. It is said that this amounts to \$125,000. The city owes the company almost that amount for light service. A sub-committee of the committee on railroads and telegraphs was named to confer with officers of the company on this subject and make a report.

At a meeting of the sub-committee of the general committee named by Mayor-elect Milroy on the evening of Nov. 16,

the men selected as advisers of the committee were asked to express their opinions in regard to the street railway situation and the kind of settlement they desire. This was done by the sub-committee in an effort to secure ideas from those who opposed the Dotson ordinance at the election. Warren L. Smith insisted that the committee stop at nothing less than municipal ownership. Gus Granger suggested that a valuation of the property be determined and the company allowed a return of 6 per cent on this. He would then fix the fares at a sum sufficient to yield an additional 2 or 3 per cent and require that this sum be paid to the city to create a fund with which the property shall be taken over by the city. Many other suggestions were also advanced.

A meeting of the sub-committee of the committee on railways and telegraphs of the City Council was held on Nov. 15 to discuss the claim of the city against the company for pavements laid between its tracks on certain sections of streets. The city auditor reported that the company would owe the city \$6,091.69, after the city debt for lighting is deducted. It was finally decided to await the return of Henry L. Doherty before taking any further steps.

ALL WILKES-BARRE LINES IN OPERATION

Practically all lines of the Wilkes-Barre (Pa.) Railway, the employees of which have been on strike for four weeks, have been opened for traffic. One hundred or more of the troopers of the State Constabulary are now scattered over the lines of the company with strict orders to break up riots and protect the property of the company. This they are doing in salutary fashion. Beyond the slight damage inflicted on the rolling stock the greatest hindrance to the running of the cars has occurred in the outlying districts, where signal boxes have been demolished or switches and tracks damaged.

T. A. Wright, general manager of the company, has notified all municipal authorities that the company will look to them for protection of its property. The notice emphatically declares that the company intends to hold each municipality to strict accountability for any damage done to the company's property. The burgess of Nanticoke, a suburb, informed company officials that the Borough Council had passed an ordinance prohibiting cars from operating in that town. He declared that he intended to enforce the ordinance, and the company prepared to enjoin him from interfering in any way with the service.

HOLYOKE ARBITRATION HEARINGS

Hearings in the wage arbitration case of the Holyoke (Mass.) Street Railway were resumed on Nov. 15 in the aldermanic chamber at Holyoke.

Arthur Sturgis, Boston, who was retained as an electric railway engineer and economic investigator by the employees' union, occupied the witness stand for a large part of the day. Testimony was presented leading to the conclusion that the average increase in the cost of living in Massachusetts in the past fifteen years has been about 42 per cent. Since 1900 the increase in wages on the Holyoke system has been about 42 per cent in maximum rate, 26 per cent of this having been since 1901. Attorney T. D. O'Brien, for the company, announced that cross-examination of Mr. Sturgis on statistics, tables and quotations from various economic authorities included in the testimony would occur later. On Nov. 15 Attorney Vahey, representative of the union on the arbitration board, said that it was hoped that all the evidence on behalf of the union would be presented by Nov. 18.

Thomas Y. Weir, representing the employees, testified on Nov. 16 as to the difficulties of platform work. The witness contended that the double running boards ordered by the Public Service Commission were inconvenient and produced extra work. He acknowledged that the men expected full pay whether or not they worked nine hours a day and extra pay for work beyond nine hours. The witness admitted that if it could be proved that the \$60,000 loss sustained by the company in the recent strikes was caused by the unjustified acts of the men, this should be taken into consideration in the settlement of the contract. He conceded that with the small present margin allowed on the runs there is a temptation for the men to run late in order to get the extra pay.

Chicago Electrification Report Again Postponed.—There has been another postponement of the time at which the report of the Commission on Smoke Abatement and Railway Terminal Electrification is to be presented to the Chamber of Commerce in Chicago. It is now thought that the report may be presented early in December.

Albany Safety Conference Postponed.—The conference over greater safety at grade crossings of electric railroads which was to have been held on Nov. 17 at the offices of the Public Service Commission for the Second District of New York in Albany among representatives of the railroads, the automobilists and public officials forming an executive committee recently appointed by Seymour Van Santvoord, chairman of the commission, has been postponed indefinitely.

Kansas City Franchise Election Protest.—Attorneys for J. D. Wilson, who is the plaintiff in a suit which is being contested to recover damages from certain election judges on account of alleged fraud in the Metropolitan Street Railway franchise election of last July, have filed a protest and brief in support of the objection they have raised before the commission against the approval of the franchise. The protest has been referred to the board in accordance with State laws.

American Employers' Profit Sharing Plans.—The National Civic Federation will have ready for distribution about Dec. 1 the results of its investigation of the subject of profit sharing between employer and employee. The report will contain an analysis of more than 100 plans now in operation in this country, as well as a description of many abandoned ones and the causes of their failure. The views of employees and the attitude of labor unions will be set forth.

Bay State Fare Case Adjourned.—Upon request of counsel for opponents to the proposed fare increase on the Bay State Street Railway, the Massachusetts Public Service Commission has continued the case until Feb. 1, 1916, to give ample time for the study of evidence submitted by the company. On Nov. 29 the board will hear counsel on the contention that the commission has no jurisdiction in the case in view of the interstate service rendered on some of the company's lines.

Indictment for Failure to Comply with Commission Order.—County Judge Lewis in Brooklyn, N. Y., has overruled the demurrer entered by John J. Dempsey, superintendent of the elevated lines of the Brooklyn Rapid Transit Company, to the indictment charging him with failing to comply with an order issued by the Public Service Commission. As a result Mr. Dempsey will be obliged to stand trial in the County Court. The indictment against the superintendent charges a misdemeanor.

Toronto Rapid Transit Report Promised for Dec. 1.—Transportation matters claimed considerable attention at the City Hall, Toronto, Ont., on Nov. 12. Mayor Church announced that the rapid transit report would be issued about Dec. 1. The engineers who have been engaged in the preparation of the report have nearly completed their labors. The Mayor stated that the report would provide for the entrance of the radial lines. After it has been presented to the Council, the Mayor will urge that a traffic commission be appointed to carry out the scheme recommended and to supervise all transportation affairs of the city.

Right of City to Inspect Books Decided.—The Supreme Court of Kansas holds that the legislative act of 1907, giving cities access to the books of utilities holding franchises, does not apply to utilities holding franchises of date prior to the enactment. The city of Wichita had asked a writ of mandamus to examine the books of the Wichita Railroad & Light Company, and compare them with the annual statement filed by the company. The company's franchise in Wichita was granted in 1903, and provides for an annual statement of earnings and expenses. The city was refused access to the company's books and brought mandamus proceedings.

New Haven to Spend \$25,000,000.—Plans for spending \$25,000,000 in the next five years were announced on Nov. 15 by Edward Buckland, vice-president of the New Haven Railroad. The new bridge across the Thames River at New

London will cost about \$2,500,000. Another \$1,500,000 must be spent in electrical facilities in order to get the full benefit of the electrification between New Haven and New York, and diminish, if not abolish, the smoke nuisance in New Haven, so far as the railroad is responsible for it. Three million dollars must be spent for trackage, yards and sidings. Regularity and safety are to be assured by improved and added signals, at an estimated cost of \$1,000,000. Passenger cars, steam engines and freight cars must be supplied, at an estimated cost of more than \$9,000,000.

Further Discussion of Pittsburgh Subway.—Following a hearing on Nov. 11, W. B. Ainey of the State Public Service Commission of Pennsylvania indicated that the commission would not attempt to approve or disapprove a proposed ordinance of the Pittsburgh Subway Company for an underground railway in Pittsburgh. A discussion arose as to whether it was not the duty of Council, instead of the commission, to handle the subway matter. It was explained that Council would be glad if the commission would point a way to a reasonable ordinance. After a statement regarding the history of the subway by A. O. Fording, attorney for the Pittsburgh Subway Company, Chairman Ainey said: "It is self-evident that a subway would be a good thing for the city. For the commission, it seems to me, it is a question of the commission's jurisdiction—what we can lawfully do."

Chicago Investigates Railway's Advertising Campaign.—At a meeting of the Chicago City Council on Nov. 15, an order was passed directing the local transportation committee to investigate how the advertisements are being paid for that are being run in the local newspapers by the Chicago Surface Lines. It was stated that the railway company had spent approximately \$30,000 and that a contract had been made with the Lord & Thomas agency for \$75,000 worth of advertising space. The Alderman who introduced the order said that the purpose was to determine whether the advertising was being paid for out of operation or out of the company's profits. City Comptroller Pike has instructed E. J. Bemis, city representative on the Board of Supervising Engineers, to protest the expenditure if it is being taken from operation, as all charges to operating expenses affect the return to the city under the participation plan.

Officials Study Condition of United Railroads.—Mason B. Starring, New York, president of the United Railroads Investment Company of New Jersey, is in San Francisco with a group of his associates studying the present condition of the United Railroads of that city. With Mr. Starring are J. H. Reed, Pittsburgh; B. S. Guinness, George W. Bacon and Moritz Rosenthal, New York, all officials or stockholders in the holding company. In explanation of the purpose of the present study of conditions first hand, it is pointed out that \$1,800,000 of the Market Street Cable Railway first mortgage 6 per cent bonds, which have been extended, will become due and payable with interest on Dec. 15 of this year. It is also stated that mainly on account of the Municipal Railway and the jitney buses, the number of passengers carried during the twelve months ending June 30 fell off 9,500,000 as compared with the preceding year. The decrease in passengers carried for the calendar year 1915 has not yet been calculated, but has been estimated to be as much as 22,500,000 below normal.

Plans for Extensions in Detroit.—Following the rejection of the plan to have the city purchase the city lines of the Detroit (Mich.) United Railway, Mayor Marx has intimated that within a short time he will take up with the Street Railway Commission the formulation of a plan which will secure several miles of needed extensions in Detroit. He recently informed the Common Council that a plan of some sort would be prepared for submission to the Aldermen at an early date. It is understood that Mayor Marx will ask the Detroit United Railway to build and operate these extensions. The company has previously indicated its willingness to build several miles of track if authorized to do so by the city. Among some of the members of the Municipal Ownership League there is an agitation to have the city build the extensions under their proposal for starting by piecemeal the construction of a municipal system. Inasmuch as the Mayor and the Street Railway Commission opposed this plan as too costly and confusing in the

recent street railway campaign, it is not regarded as likely that they will recommend such a procedure at this time.

Forty-five Operating Railroads in Greater New York.—The Public Service Commission for the First District of New York has issued a 1500-page volume entitled "Documentary History of Railroad Companies," which contains the corporate and franchise history of all railroad and street railroad corporations incorporated at any time to do business within Greater New York. The book summarizes the record of not less than 726 companies that have been organized to operate routes within the present limits of New York City. Of these 455 are now dead, dormant, or inchoate. In other words, there are some 271 companies that are now represented in the existing operated routes. Of these 195 have lost their identity by merger, foreclosure, or change of name, thus leaving seventy-six distinct companies in the present operated systems. Of these thirty-one are operated under lease or agreement by other companies, so that there are actually forty-five companies now engaged in the operation of railroad routes in the city of New York. The general complexity with respect to corporate relationship is well shown by that of the Brooklyn Rapid Transit System. In that system no fewer than eighty-three companies are represented. Of these sixty-seven have lost their identity through absorption. Of the remaining sixteen companies, nine are operated under lease or agreement, so that there are actually seven operating companies in the system, all of which are subject to stock control through the Brooklyn Rapid Transit Company, which is a business corporation and not a transportation company.

PROGRAM OF ASSOCIATION MEETING

Pennsylvania Street Railways Association

The annual meeting of the Pennsylvania Street Railways Association will be held at Scranton, Pa., on Dec. 14 and 15. During the morning of Dec. 14 delegates, representatives and guests will register at the Board of Trade Building. The meeting will be called to order at 2 p. m. The program for the meeting as at present drawn is subject to change. The tentative program for the session on Dec. 14 is as follows:

Address, C. L. S. Tingley, president of the association.

Paper, "Railway Electrification," by N. W. Storer, Westinghouse Electric & Manufacturing Company.

Presentation of problems presented to the "Question Box," in charge of W. A. Heindel.

Paper, "Carhouse Methods," by J. F. Layng of the General Electric Company.

Report of committee on proposed safety rules and code of Bureau of Standards, Gordon Campbell, chairman.

Paper, "Efficiency Through Conservation in Time in Interurban Traffic," by E. C. Spring of the Lehigh Valley Transit Company.

On the evening of Dec. 14 there will be a dinner of those in attendance at the meeting.

The tentative program of the session of Dec. 15, which will be called at 9.30 a. m., is as follows:

Presentation of illustrations of safety devices by H. P. Megargee of the American Railways.

Paper, "State Insurance Against Workmen's Compensation Liability," by H. A. Mackey, chairman Workmen's Compensation Board of Pennsylvania.

Paper, "Mutual Insurance Against Workmen's Compensation," by Walter S. Bucklin, president Massachusetts Employees' Insurance Association.

Paper, "Stock Company Insurance Against Workmen's Compensation Liability," by Walter G. Cowles, vice-president Travelers Insurance Company.

Paper, "Some Practical Questions Arising Under Workmen's Compensation Laws," by Lefferts S. Hoffman, general attorney Public Service Corporation of New Jersey.

The general discussion will follow, after which the "Question Box" problems will be considered. The meeting will conclude with the presentation of the reports of committees, consideration of new business and the election of officers.

Financial and Corporate

ANNUAL REPORT

Virginia Railway & Power Company

The comparative statement of income, profit and loss of the Virginia Railway & Power Company, Richmond, Va., for the years ended June 30, 1914 and 1915, follows:

	1915	1914	Change
Operating revenues:			
Railways	\$2,838,370	\$2,982,065	—\$143,695
Electric light and power and gas	2,271,252	2,173,983	+ 97,260
Total operating revenues...	\$5,109,622	\$5,156,048	—\$ 46,426
Operating expenses:			
Railway:			
Maintenance of way and structures	\$ 268,560	\$ 289,752	—\$ 21,192
Maintenance of equipment..	173,136	187,571	— 14,434
Traffic expenses	6,741	9,436	— 2,694
Transportation expenses ..	901,005	903,518	— 2,513
General expenses	293,156	280,306	+ 12,850
Total	\$1,642,601	\$1,670,585	—\$ 27,983
Light and power and gas....	826,473	795,323	+ 31,149
Total operating expenses...	\$2,469,074	\$2,465,908	+ \$ 3,166
Operating income	\$2,640,548	\$2,690,140	—\$ 49,592
Other income	80,919	80,909	+ 9
Gross income	\$2,721,467	\$2,771,049	—\$ 49,583
Taxes and licenses:			
Railways	\$ 205,537	\$ 217,122	—\$ 11,585
Electric light and power....	80,070	78,163	+ 1,907
Gas	12,944	12,825	+ 117
Total taxes and licenses..	\$ 298,551	\$ 308,111	—\$ 9,561
Income applicable to fixed charges	\$2,422,916	\$2,462,938	—\$ 40,022
Total fixed charges.....	1,337,867	1,307,347	+ 30,520
Surplus	\$1,085,049	\$1,155,591	—\$ 70,542
Other charges:			
Depreciation charged direct..	\$ 100,000	\$ 100,000
Proportion of discount.....	29,262	25,768	+ 3,494
Net miscellaneous charges..	33,284	57,918	— 24,634
Total other charges.....	\$ 162,546	\$ 183,686	—\$ 21,139
Surplus over fixed and other charges	\$ 922,503	\$ 971,905	—\$ 49,402

When the general business conditions and the very considerable losses from jitney bus competition, as indicated in the reduction of railway receipts compared with the preceding year, were all considered, the management felt gratified that the gross income of the company from all sources for the fiscal year showed a decrease of only \$49,583 as compared with the preceding year, or less than 1 per cent. While the management undertook to conserve its resources and reduce expenses as much as practicable to meet the adverse conditions existing, this was not done at the expense of the property. Expenditures for maintenance of way and equipment during the year amounted to 15.56 per cent of the gross railway revenues as compared to 16.01 per cent for the fiscal year ended June 30, 1914, and 14.99 per cent for the fiscal year ended June 30, 1913. Moreover, in addition to the regular charges for maintenance of way and equipment, the sum of \$100,000 was set aside in cash in monthly instalments during the year and carried to the depreciation reserve, half for the railway property and half for the light and power property. An additional sum of \$105,821 was credited to the depreciation reserve and charged against surplus as of Dec. 31, 1914. The balance to the credit of depreciation reserve on June 30, 1915, was \$960,572, as compared to \$856,639 at the close of the preceding fiscal year. The capital expenditures for the year totaled \$336,898, the sum of \$137,570 being in the railway department.

In July, 1914, there was a distressing accident on the Ocean View division of the Norfolk Railway & Light Company in which a loaded two-car train ran into a freight train on the Virginian Railway at a crossing, owing to the motor-man losing consciousness just before reaching the crossing and failing to see the signals or the train ahead of him. Several persons were killed and more than 130 were injured. Settlements were made, without serious litigation, at an aggregate cost of \$107,816, including expenses.

Mostly as a result of this accident the payments and expenses on account of injuries and damages for the fiscal year ended June 30, 1915, amounted to \$235,267, as compared to \$115,577 for the preceding fiscal year. The payments for the current year amounted to \$91,122 in excess of the amount reserved, and, after absorbing the surplus accumulated, left a deficit of \$42,402 against this reserve. The board of directors therefore increased the amount of the reserve on the Norfolk and Portsmouth divisions from 6 per cent to 8 per cent of the gross transportation receipts and this increased reserve is rapidly absorbing the deficit thus created. On account of a much smaller accident on the Richmond division the reserve for injuries and damages here was increased from 3.5 per cent to 5 per cent.

In November, 1914, the property of the Richmond & Henrico Railway, a small competing line in Richmond which had been in the hands of receivers for more than a year, was sold under foreclosure. The purchasers organized the Richmond Railway & Viaduct Company to operate this property, and the Virginia Railway & Power Company, under arrangement with the purchasers, acquired the securities of the Richmond Railway & Viaduct Company under an arrangement effective on July 1, 1915.

In relating the experiences of the company with the jitney bus, the report states that in order to test the profitability of such service the company organized a subsidiary company known as the Motor Transit Corporation, which acquired forty cars in April, 1915, and operated these on regular schedules in that section of the city of Richmond where jitney service was being rendered. The result of these operations demonstrated that the business could not be conducted without a loss, and while the operation was being conducted at the close of the fiscal year it was discontinued in September. In the meantime, the independent operators who started the business in March gradually dropped out until at the close of the fiscal year very few of those who originally started were still in the business. Like other fads in the transportation business, it is believed that the jitney bus will soon pass out of business.

The following table shows some of the more important operating and traffic statistics:

	1915	1914	Change
Revenue passengers carried....	62,271,603	65,695,197	—3,423,594
Transfer and free passengers carried	14,706,115	15,676,096	— 969,981
Total passengers carried....	76,977,718	81,371,293	—4,393,575
Percentage of passengers using transfers	18.10	18.13	— 0.03
Average fare per passenger including transfers	\$0.037	\$0.036	+ \$0.001
Car mileage	12,439,758	12,478,058	— 38,300
Car hours	1,513,612	1,515,016	— 1,404
Total revenue per car mile....	\$0.228	\$0.239	— \$0.013
Total revenue per car hour....	1.87	1.97	— 0.10
Operating expenses per car mile	0.132	0.134	— 0.02
Operating expenses per car hour	1.09	1.10	— 0.01

KANSAS CITY SUPPLEMENTAL PLAN

Further Details of Arrangement for Distributing Railway and Lighting Equities to Stockholders

Further details are now available in regard to Judge Hook's supplemental plan for the stockholders in the Kansas City Railway & Light Company reorganization, described briefly in the ELECTRIC RAILWAY JOURNAL of Nov. 13. Of the authorized capital stock of this company \$9,407,500 of preferred and \$9,543,080 of common stock is outstanding in the hands of the public. These are the amounts entitled to participate in the distribution of the equities involved in the complete separation of the railway property and the lighting property. The remaining \$5,672,000 of stock pledged as collateral is to be cancelled. The representatives of about 90 per cent of each class of this \$18,950,580 of stock now say that no law of any state can be found authorizing the formation of a corporation with both preferred and common shares having no specified par value. They have therefore suggested that the equities be conveyed to trustees who shall distribute among the stockholders preferred and common participating beneficial certificates of no specified par value. The concurrence of the holders of 80 per cent severally of the existing preferred and common stock shall determine the division of equities between the properties.

All the stock of the new railway company representing the equity in its property except that necessary for organization purposes shall be conveyed to three trustees. One trustee shall be chosen by the holders of a majority in amount of the preferred stock allotted to the street railway properties; another by the like holders of the common stock, and the two trustees so chosen shall select the third. A similar course shall be pursued with respect to the stock of the light company, but there shall be no common trustee in the two trusts.

The principal laid down in the plan of preserving, as far as practicable, the relative rights of each class of interests shall apply among the stockholders under the reorganization, and the differential qualities of the preferred stock as between it and the common will be carried into the beneficial certificates, provided, however, that after Jan. 1, 1919, the dividends upon the preferred beneficial certificates shall be cumulative. The reasons for this change are first that the net earnings of the street railway and electric properties have constituted a common source of dividends for the existing preferred stock. In future each class of beneficial certificates of the new railway company or the light company will have to rely for dividends upon the earnings of its particular business without aid from the other in case of deficiency. This is materially to the disadvantage of the rights of the preferred certificates. Again, during the receivership no dividends have been paid upon the preferred stock, though substantial earnings otherwise applicable thereto have been used for permanent improvements and betterments.

While a direct assessment upon the stockholders has been avoided by provisions for new mortgage bonds for the expenses of reorganization, and for payments into sinking funds to discharge new second mortgage bonds from net earnings, there are other costs and expenses which all participating stockholders should bear proportionately. The plan requires the stockholders (a) to take or cause to be taken at par sufficient first and refunding mortgage bonds of the new railway company to pay certain expenses and liabilities chargeable to the street railways and to supply that company with \$1,000,000 in cash for new capital expenditures presently available; (b) to form a syndicate to underwrite the exchange of the old funded debt (excepting the bonds of the Elevated and Westport lines) for bonds of the new railway company and the light company. A responsible depositing stockholder has guaranteed both obligations.

The trustees in either trust may issue and sell first preferred beneficial certificates to raise funds for the purposes of the business of the new railway company or the light company if the holders of two-thirds in amount of each class of beneficial certificates so authorize. Nothing in this plan prevents either new company from issuing and selling preferred stock to the public whenever duly authorized by law and by

the vote of the holders of the beneficial certificates. Whenever a corporation can be lawfully formed with preferred and common shares of no specified par value with authority to take over the stock of another corporation as its assets, each set of trustees shall cause one to be organized and shall turn over to it the stock in their custody.

A formal statement has been filed with the court by the receivers of the subsidiary Metropolitan Street Railway declaring the reorganization plan operative for bondholders. The following amounts were deposited with the reorganization committee: Kansas City Railway & Light Company first lien refunding 5 per cent bonds, 96.6 per cent; 6 per cent collateral gold notes of this company, 96.5 per cent; notes to Kansas City banks, 93.3 per cent; Metropolitan Street Railway consolidated mortgage 5 per cent gold bonds, 99.3 per cent; Central Electric Railway 5 per cent mortgage bonds, 97.7 per cent, and East Side Railway first mortgage 5 per cent gold bonds, 100 per cent. As stated in last week's issue the stockholders' committee, which has already secured deposits of 90 per cent of all stock, has set the limit of participation for stockholders at Dec. 20. The entire reorganization is now to be completed by Feb. 7.

STATISTICS FROM NEW JERSEY COMMISSION

The Board of Public Utility Commissioners of New Jersey has just issued a report containing statistics of public utilities in the State for the year ended Dec. 31, 1913. Among the abstracts of reports for 561 utilities there are reports for twenty-six operating and thirty-eight non-operating electric railways. On account of the lack of reports concerning intra-state revenue, no gross revenue is stated for steam railways, but for the other classes of utilities the amount of such revenue was as follows: Electric railways, \$18,923,587; gas companies, \$12,504,344; electric light and power companies, \$10,530,188; municipal electric light plants, \$145,187; private water utilities, \$4,545,684; municipal water utilities, \$4,771,361; sewer companies, \$185,440, and telephone companies, \$8,863,372—total, \$60,469,163. On account of its interstate traffic, the Hudson & Manhattan Railroad is not included in the electric railway total.

The report presents a short description of the organization of all electric railways, with statements showing the capital stock and funded debt of the non-operating companies and, in addition to these, the income figures for the operating lines. A separate tabulation shows the gross amounts for the various subdivisions of operating expenses and the corresponding average amount per car-mile. Other mileage, traffic and miscellaneous statistics for the different operating companies as calculated by the commission are published in the accompanying table.

	Miles of Track Owned	Capitalization Per Mile of Track	Miles of Road Operated	Operating Revenues Per Mile of Road	Revenues Car-Miles Per Mile of Road	Revenue Car-Miles Per Car-Mile	Average Fare Per Passenger (Cents)	Transportation Revenue Per Car-Mile (Cents)	Transportation Revenue Per Car (Hour)	Total Operating Revenues Per Car-Mile (Cents)	Operating Expenses Per Car-Mile (Cents)	Operating Ratio (Per Cent)

*Miles of track operated.

†Capitalization per mile of track operated, including capitalization of lessor companies.

American Cities Company, New York, N. Y.—D. H. Cantrell, president Little Rock Railway & Electric Company, Little Rock, Ark., has been elected a director of the controlling corporation, the American Cities Company, to succeed the late W. M. Kavanaugh.

Ardmore (Okla.) Electric Railway.—The property of the Ardmore Electric Railway is advertised to be sold at public sale on Jan. 1, 1916. The receiver, whose appointment was noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 14, has made arrangements to resume operations until the date of sale.

Boston (Mass.) Elevated Railway.—The Public Service Commission for Massachusetts has approved an issue of \$3,286,000 of thirty-year 5 per cent bonds by the Boston Elevated Railway. The proceeds of the new issue as set forth in the petition are to be used "for construction and equipment, for funding its floating debt and also for the purchase of such real and personal estate as may be necessary or convenient for the operation of the road."

Buffalo & Williamsville Electric Railway, Williamsville, N. Y.—The Buffalo & Williamsville Electric Railway has been authorized by the Public Service Commission for the Second District of New York to issue \$49,000 of 5 per cent forty-year first mortgage bonds. The bonds are to be sold at not less than 95.

Cities Service Company, New York, N. Y.—At a special meeting of the board of directors of the Cities Service Company on Nov. 10, the officers were authorized to sell \$5,000,000 of preferred and \$2,500,000 of common stock to a syndicate, for \$5,000,000 cash. The syndicate will take over the stock at once, and the proceeds will enable the company to retire its entire floating debt and give ample working capital in addition. Arrangements with the syndicate provide that the stock will not be offered to the public at present, and purchasers may withdraw their stock only on condition that the preferred is sold at not less than 85, and the common at 125. Holders of preferred stock as of record on Dec. 15 will have the right to receive on Jan. 1 5 per cent convertible debenture bonds of the company for the 9 per cent of accumulated dividends to Jan. 1, 1916. These debentures may be converted at any time into stock upon a basis of \$100 of preferred and \$25 of common stock for each \$100 in debentures. The holders of common stock as of record on Dec. 15 will on Jan. 1 have 9 per cent of these debentures set aside for them to be distributed when all holders of preferred stock have received their deferred dividends in full. Regular monthly cash dividends of one-half of 1 per cent will be resumed on the preferred stock on Feb. 1, 1916, payment being made to holders that are of record on Jan. 15.

Cleveland & Eastern Traction Company, Cleveland, Ohio.—An initial dividend of one-half of 1 per cent has been declared on the \$468,865 of 5 per cent non-cumulative preferred stock of the Cleveland & Eastern Traction Company.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich.—The Consumers' Power Company of Michigan, principal generating subsidiary of the Commonwealth Power, Railway & Light Company, has filed in Michigan a mortgage securing an authorized bond issue of \$35,000,000 with the Harris Trust & Savings Bank, Chicago, Ill., as trustee. The new mortgage and the bonds under it are secured by liens on the entire property of the company, and takes the place of the present collateral mortgage. The filing of the new mortgage is one of the final details in the plans of the company by which the Consumers' Power Company holds all its properties in fee, instead of through ownership of underlying stocks and bonds.

Detroit (Mich.) United Railway.—First mortgage 5 per cent gold bonds of the Detroit Railway numbered from 151 to 200, both inclusive, and due on Dec. 1 will be paid at par and interest at the People's State Bank, Detroit, at maturity.

Empire United Railways, Inc., Syracuse, N. Y.—A bondholders' protective committee is asking the holders of the first mortgage 5 per cent gold bonds of the Rochester, Syracuse & Eastern Railroad due on May 1, 1915, to deposit their bonds with the Trust & Deposit Company of Onondaga, Syracuse, N. Y., or the Old Colony Trust Company, Boston,

Mass. The members of the committee are Arthur W. Loasby, president of the Trust & Deposit Company of Onondaga, Syracuse, N. Y.; Elbert A. Harvey, representing Lee, Higginson & Company, Boston, and Deforest Settle, of Bentley, Settle & Company, Syracuse, N. Y. Mr. Loasby is chairman of the committee and Mercer V. White, 100 North Salina Street, Syracuse, N. Y., is secretary.

Fostoria & Fremont Railway, Fostoria, Ohio.—The Ohio Public Utilities Commission has authorized the Fostoria & Fremont Railway to sell for the highest price obtainable, and for not less than 87½ per cent, \$200,000 of its first mortgage 5 per cent gold bonds, now pledged as security for a loan made by the Cleveland Trust Company. The proceeds are to be used to discharge the indebtedness of \$165,870 and accrued interest thereon unpaid to the trust company, any balance being available for corporate purposes.

Memphis (Tenn.) Street Railway.—The Memphis Street Railway has filed for record at Memphis a mortgage to the Guaranty Trust Company, New York, to secure \$30,000,000 of bonds, which are to be issued when necessary in different amounts from time to time to refund maturing securities or to provide for any extension or additions which may be necessary, but only in the proportion of 80 per cent of the cost of such betterments. Moreover, the bonds may be retired by the company at stated periods if desirable to take advantage of any lower interest rates that may at such times be prevailing.

New York (N. Y.) Railways.—A preliminary decision favorable to the plaintiff bondholders has been handed down in the Appellate Division of the New York Supreme Court in the suit of the New York Railways adjustment income 5 per cent bondholders against the New York Railways to recover back interest amounting to about \$50 a share. The Supreme Court has decided, thereby overruling the decision of a lower court, that George B. Leighton, holder of the New York Railway adjustment income 5 per cent bonds, could continue the suit brought by the New York Life Insurance Company against the New York Railways, alleging violation of the terms of the mortgage securing the adjustment income bonds in regard to the payment made as interest for the last three years. The New York Life Insurance Company has discontinued its connection with the case.

Republic Railway & Light Company, New York, N. Y.—A syndicate composed of Lee, Higginson & Company, Boston, Mass.; Drexel & Company, Philadelphia, Pa., and Reilly, Brock & Company, Philadelphia, Pa., has purchased from the Republic Railway & Light Company an issue of \$7,000,000 of five-year 5 per cent bonds of the Mahoning & Shenango Railway & Light Company; and Reilly, Brock & Company have purchased an issue of \$3,000,000 of three-year notes of the Republic Railway & Light Company. The proceeds of the sale of these securities will be used to pay off the \$3,000,000 of 5 per cent notes of the Republic Railway & Light Company, maturing on Jan. 1, 1916, and the \$4,844,000 of Mahoning & Shenango Railway & Light Company first consolidated refunding mortgage 5 per cent bonds also maturing on Jan. 1, 1916, to pay off all floating indebtedness of the Republic Railway & Light and the Mahoning & Shenango Railway & Light and their subsidiaries, and to furnish funds for construction requirements well into 1916.

Seattle, Renton & Southern Railway, Seattle, Wash.—Judge Kauffman in the King Superior Court at Seattle has ordered Scott Calhoun and Joseph Parkin as receivers to wind up immediately the affairs of the Seattle, Renton & Southern Railway and to sell the property. Judge Kauffman found that the company has been hopelessly insolvent since May, 1912. One of the largest creditors is the Puget Sound Traction, Light & Power Company, which has a claim of more than \$100,000 for power furnished. The estimated total indebtedness is \$1,600,000. The appointment of the receivers was noted in the *ELECTRIC RAILWAY JOURNAL* of April 12, 1913.

Toronto (Ont.) Civic Railway.—A by-law to issue twenty-year debentures to the amount of \$108,696 for new cars for the Toronto Civic Railway has been carried by the City Council.

DIVIDENDS DECLARED

Central Mississippi Valley Electric Properties, Keokuk, Iowa, quarterly, 1½ per cent, preferred.
 Citizens' Traction Company, Pittsburgh, Pa., \$1.50.
 Cleveland & Eastern Traction Company, Cleveland, Ohio, one-half of 1 per cent, preferred.
 Northern Texas Electric Company, Fort Worth, Tex., quarterly, 1 per cent, common.

Traffic and Transportation

JITNEY AS STATE AND CITY ISSUES

Four Jitney Cases Before the Illinois Commission—Atlantic City Bill Killed

In four cases now before the Illinois Public Utilities Commission, the question of the right of jitney buses to operate without a certificate of necessity and convenience is squarely before that body for decision. The cases are from Springfield, Rock Island, Quincy and Hillsboro. Interest centers in these cases from the fact that the commission in its decision in the recent Jacksonville case did not take jurisdiction over all classes of jitneys. In Jacksonville, the jitneys were operating over specified routes and on schedules. The commission held that they were, therefore, common carriers and subject to regulation under the utilities act. In the pending cases the situation is different, for the buses in Springfield, Rock Island, Quincy and Hillsboro do not adhere to certain routes and schedules. In the answers filed by all the defendants, except those in Springfield, the jitney bus owners contend that they are no more subject to regulation than cab drivers. The same defense probably will be made by the Springfield men when they file their answer to the petition of the Springfield Consolidated Railway. Another mistaken impression regarding the rules prescribed by the commission for the operation of jitneys is that in the Jacksonville case the commission held that no permit for the operation of jitneys along streets on which street cars operate would be issued. Such is not the case. Commissioner Thompson, who heard the case, issued a statement in which he expressed the belief that this should be the attitude of the commission, but this statement was not written into the commission's ruling. The Rock Island jitney bus case has been before the commission some time, but is not likely that there will be any early decision. A court fight is expected on the question of jurisdiction, it being contended that the operation of jitneys between Rock Island and Davenport, Iowa, makes the jitney company an interstate concern. In all the pending cases complaints were made by the street railways.

The bill introduced before the City Commission of Atlantic City by W. H. Bartlett, director of public safety, and designed to drive the jitneys from Atlantic Avenue, the principal business street, has been killed. Even the sponsor of the bill himself voted for its defeat. J. B. Thompson, director of public highways, alone registered a negative vote. Members of the business men's delegation declared the fight to drive the jitneys from Atlantic Avenue, or to so restrict them as properly to protect the Atlantic City & Shore Railroad, has not been abandoned by any means. Charles Evans, president of the Atlantic City National Bank and vice-president of the railway, said that apparently the members of the commission were willing to permit a corporation which has helped Atlantic City to prosperity, to be ruined by guerilla competition.

Provisions of the jitney ordinance approved some time ago by the Board of Works of Newark, N. J., were discussed on Nov. 10 at a meeting of the license committee of the Common Council. Several changes in the measure were suggested. A scale of license fees, with \$75 as the maximum charge, was approved. One of the suggested insertions to be passed on by the law department would require jitney men operating in Newark to prove at least one year's residence and to present references from at least three reputable citizens. The changes will be presented to the Board of Works when the measure, as revised on Nov. 10, comes before that body, preceding a joint conference.

The Supreme Court of California has upheld the recent finding of the Railroad Commission in that State, which decided that it has no jurisdiction over motor-bus lines, auto trucks or auto stages engaged in the business of transportation. The case was the result of an appeal by the Western Association of Short Line Railroads, asking that the commission be instructed to assume this jurisdiction.

The jitney fleet of the Motor Transit Corporation, a subsidiary of the Virginia Railway & Power Company, Richmond, Va., has been sold at public auction. There were

thirty-three Briscoe and seven Ford cars, and they brought an average of \$216 per car.

A proposition by which the Memphis (Tenn.) Street Railway would receive the exclusive rights to operate over certain streets free from competition of jitney buses, provided the company agrees to sell tickets at the rate of twelve for 50 cents, with transfer privileges, is being considered by the City Commission of Memphis. Commissioner Dies is sponsor for the proposition. A meeting of jitney owners, members of the commission and representatives of the street railway has been called, at which the proposal will be considered and perhaps some action taken. No expression of opinion has been made by the company or the jitney owners.

TRENTON FARE HEARING CONTINUED

An Outline of the Trend of the Hearing in Which It Is Sought to Prevent Elimination of Six-for-a-Quarter Tickets

At the hearing on Nov. 4 in the Trenton fare case counsel for the city sought to prove that all recent changes and improvements made by the Trenton & Mercer County Traction Corporation had been charged to capital account and that in this way the patrons of the company had not obtained the full benefit of the increase in the capital liabilities of the company allowed some time ago by the Board of Public Utility Commissioners. Rankin Johnson, vice-president of the company, contended that at the time the system was being rehabilitated the earnings would not permit of any large charges for renewals or replacements being made against current earnings. On Nov. 5 Frank R. Ford of Ford, Bacon & Davis, was cross-examined by George L. Record, special counsel for the city. On Nov. 8 Mr. Record delved into the intercorporate relations of the Trenton & Mercer County Traction Corporation and the United Power & Transportation Company, which latter company leased the Trenton system. Mr. Johnson insisted that the lessees and the lessors were entirely separate. The testimony on Nov. 9 was concerned largely with the obligations of the company to the city with respect to paving, etc., and with how well the company had lived up to its contractual obligations in this respect. On the same day answer was filed in the United States Court at Trenton by the city of Trenton and the State Board of Public Utility Commissioners to the equity suit brought against them by the Trenton & Mercer County Traction Corporation as a result of the action against the company's desire to increase the rate of fare. The answer denies that the statutes and ordinances referred to in the bill of complaint, in which it was provided that the rate of fare should be a sum not greater than 5 cents for the carrying of each passenger more than five years of age for any distance within the limits of the city of Trenton, constituted contracts; and deny that these ordinances give any right to the complainants to charge and receive the sum of 5 cents for the carrying of each passenger more than five years of age within the limits of the city of Trenton. Similar denials are made regarding like subsidiary corporations of the company.

In the absence of the books of original entry of the Trenton & Mercer County Traction Corporation and its predecessors, President Donges of the Board of Public Utility Commissioners permitted E. C. M. Rand, connected with the late Russell Sage for seventeen years as an expert on property investments and security buying, retained by the city, to testify in regard to the capitalization of the company, adding that the board "would receive the testimony for what it purports to be in the circumstances." On the same day, Nov. 10, the city called as an expert John C. Brackenridge, vice-president Manhattan Bridge Three-Cent Line.

The case was continued on Nov. 15 and 16. Mr. Brackenridge was cross-examined by counsel for the company. Counsel for the city took up again the question of intercorporate relations.

The order of the Board of Public Utility Commissioners suspending the abolition by the company of the sale of tickets at the rate of six tickets for a quarter expired on Nov. 15. The company will respect the order pending a ruling by the board.

NEW JERSEY SCHOOL TICKET DECISION

The Board of Public Utility Commissioners of New Jersey made an order on Nov. 12 in which it declared unreasonable and unjust the increase in fare through the Public Service Railway withholding the special rates of fare from students of business schools. On the lines of the Public Service Railway school children have a fare which amounts to about 3 cents, but the company sought to prevent the students of business schools taking advantage of these rates because these institutions are conducted for profit and it would be an unusual preference. In dealing with the situation, the Board of Public Utility Commissioners, in its opinion, says:

"The fallacy of the argument lies in the assumption that because the teacher may receive a stipend from the pupil for instruction, the latter shall be deprived of a right to which otherwise he would be entitled. There is probably nothing that so manifests itself in the public policy of the State as its fixed purpose to further the education of the young to the end that they may be fitted to assume the duties and responsibilities of citizenship. The citizenship at which the State aims is most likely to be found when the largest possible number are employed in useful pursuits. The business schools supplement the grammar school education, which the State gives, by giving a training for commercial employment to those of high school age who cannot or will not avail themselves of the high school course which the State furnishes.

"The business school course is shorter than the high school course. The end obtained, however, is largely the same, namely, the development of a citizenry intelligent and useful. To hold that the business school pupil of school age shall be denied the right to the same rate of fare as other children of school age is to discriminate against him. To hold that because he pays for an education during the years of his school age, the more quickly to befit himself for a useful occupation, is in effect to penalize him for doing the thing, without expense to the State, that the State aims to do in pursuance of its public policy.

"The Supreme Court has indicated that the issuing of school tickets to school children involved neither injustice nor discrimination, the company, either by agreement with the municipalities or on its own volition without agreement, having constituted itself an auxiliary of the State in furthering the cause of education. The company having failed to show that any reasonable distinction can be made between business school pupils and those of other schools, the Supreme Court decision would seem to include such pupils as among the school children to whom the giving of a reduced rate is not unreasonable or preferential. The board, in conclusion, holds that the company has not made out a case and the fare change, or alteration, is accordingly disapproved."

The case is a sequel to the action of the company in seeking to do away with all special school rates upon the ground that they constituted an unreasonable discrimination and hence were in violation of the law. That action, taken in 1911, was held up by an order of the Public Utility Commission whose findings were subsequently affirmed by the Supreme Court. Failing to obtain sanction for the increase of rates to all school children, the company more than a year ago undertook to make a new order that school tickets should not be sold to pupils attending business schools. The operation of this order was temporarily suspended by the board on Sept. 22, 1914, and by mutual agreement was not enforced by the company pending the determination of the appeal, notwithstanding the lapse of the two months' statutory period for which an order of suspension can be made effective.

Safety-First Posters in New Jersey.—The Public Service Railway, Newark, N. J., is installing in its cars lithographed posters 10 in. x 24 in. in size which depict accidents that result from failure to heed safety-first rules. A series of twelve subjects has been designed, one to be shown each month for a year.

Skip Stops in St. Paul.—The Twin City Rapid Transit Company, Minneapolis, Minn., has decided to run during the rush hours cars which will make no stops between Seven

Corners and Dale Street, on the Selby-Lake and Grand to Cretin lines in St. Paul. The company has announced that if the plan proves successful it will be put into operation on other lines.

Rerouteing Proposed in Providence.—Officials of the Rhode Island Company, Providence, R. I., have presented to the committee on railroads of the City Council a tentative plan for the rerouteing of the cars on ten of the city lines which are subjected to the heaviest traffic. This plan is suggested as a part of the scheme for putting into use the new Fountain and Empire Street tracks.

New Springfield Tariff Suspended.—The Public Service Commission of Massachusetts has suspended until Jan. 1, 1916, operation of the proposed local and joint class rates and minimum tariff filed by the Springfield Street Railway to become effective on Nov. 15, covering business in connection with the Worcester Consolidated Street Railway, Rhode Island Company, and four other street railways.

Open Cars for Brooklyn Smokers.—Except on stormy days, or when the temperature is excessively low, the Brooklyn (N. Y.) Rapid Transit Company plans to run open cars at intervals of approximately fifteen minutes on all its lines. This is primarily in answer to the pleas of smokers. The company has announced that the policy is definitely settled for the operation of the cars throughout the year.

Proposed Fare Increases Suspended.—The Public Service Commission of New Hampshire has suspended for three months proposed fare increases from 25 cents to 32 cents on the Manchester-Nashua, and from 15 to 21 cents on the Manchester-Derry line of the Manchester Traction, Light & Power Company, Manchester, N. H. The commission said that no complaint had been received, but that it deemed an investigation expedient.

Increase in Wages in Wheeling.—The wages of the trainmen of the Wheeling (W. Va.) Traction Company and affiliated lines were increased on Nov. 1 in accordance with an agreement entered into last May. All of the employees who were receiving 29 cents an hour were granted the advance in salary and others will receive this increase, after working so long. When the men are first taken on they receive 22 cents an hour, and at the end of each year advance until they reach the limit, now 30 cents an hour.

Courtesy in Topeka.—The Topeka (Kan.) Railway, always solicitous to provide special accommodations for visitors to the capital of Kansas, by the instruction of its trainmen in the giving of information and the handling of crowds, made unusual efforts during the recent convention of the State Teachers' Association. The service rendered by conductors in pointing visitors to destinations in the residence district was the subject of much favorable comment. The company took occasion, in its newspaper advertisements addressed to the teachers, to refer to the advantages of its service as compared with the jitneys.

Fare Concession to Steel Workers.—The International Railway, Buffalo, N. Y., has inaugurated a 6-cent service during morning and evening rush hours to and from the plant of the Lackawanna Steel Company in Lackawanna, N. Y. Heretofore it was necessary for passengers to pay a 5-cent fare to the Buffalo city line on either the International Railway or Buffalo & Lake Erie Traction Company cars and then an additional 5-cent fare on the lines of the latter road to the various gates of the steel plant. The line starts at Seneca Street and Bailey Avenue and no transfers are issued to passengers going farther than this point.

New Form of Safety Zone in Kansas City.—A new form of safety zone is designed by Street Commissioner Beggs in Kansas City, Kan., to be painted in black on the pavement now being laid on Minnesota Avenue. These zones will be extensions of the sidewalk lines across the street, and will mark the path to be taken by pedestrians in crossing the street, and serve as warnings to drivers of vehicles as well as motormen as to the exact line where the pavement intersection begins, where pedestrians are likely to be found, and outside of which vehicles and street cars must stop. The zones are intended primarily to encourage square turning of corners by vehicles.

Toronto Running Boards to Go.—The running boards on the cars of the Toronto (Ont.) Railway are to go. A statement to this effect was made by D. L. McCarthy, counsel for the company, before the judges of the Second Division Appellate Court on Nov. 8 during the hearing of the city's appeal from the interim order of the Ontario Railway Board, which relieved the company of the necessity of immediately dispensing with the running board. Mr. McCarthy thought all the cars would be reconstructed by next season. Application will, however, be made by the city to the Legislature for the passing of an act to compel the company to discontinue the use of the running board on all open cars. This decision was reached by the Board of Control on Nov. 10.

Competition on Traffic Question in San Francisco.—At the suggestion of M. M. O'Shaughnessy, city engineer of San Francisco, Cal., a competition was recently held in that city under the direction of the Beaux Arts Society for the handling of traffic at the foot of Market Street. The prize of \$50 offered by the San Francisco Society of Architects was won by Ernest Weihe, whose plans provide for the segregation of traffic into three classes, each to use its own level; street cars would rise by ramps to the level of the upper decks of ferryboats, the street level would be used by vehicles, and subways would be provided for pedestrians. Two large piers for pleasure purposes, cafes, etc., are also included in the plan. They would give an ornamental effect to the scheme.

Temporary Jitney Injunction Denied in Terre Haute, Ind.—In the United States District Court at Indianapolis, Judge Anderson has denied a temporary injunction to the Fidelity Trust Company, Philadelphia, Pa., trustee under the mortgage of the Terre Haute, Indianapolis & Eastern Traction Company, in its suit against the jitney operators in the city of Terre Haute. A hearing in this case was held at the Federal Building, Indianapolis, on Oct. 4, and was reported in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, page 782. At that time Judge Anderson stated he would take the case under advisement, but indicated that he did not think the plaintiff had conclusively proved interference with its business and property rights. The case was dismissed as to forty-two of the sixty defendants, as they were found to have discontinued the business as jitney operators. It is not yet known whether the case will be pushed on a hearing for a permanent injunction against the remaining eighteen defendants.

Westfield Trolley Service Finding.—The Massachusetts Public Service Commission has recommended that twenty-minute service be reinstated on the Mill and Union Streets and the Highland-Franklin Street lines of the Westfield division of the Springfield Street Railway. The former is 2.68 miles in length and the latter 2.79 miles. Early in October the headway was increased to thirty minutes. The board held a public hearing at Boston, at which both the complainants that the old service should be restored and the company conceded that car-mile receipts were insufficient for profitable operation, but the commission held that the twenty-minute service should be restored in view of the fact that it had been in effect more than twenty years, during which time the population of the town has steadily increased. The finding points out that the increase in headway materially discouraged traffic and calls attention to the opinion of the former Railroad Commission that a street railway cannot reasonably expect that all the lines which it operates in any given district will be profitable.

First Brooklyn District Safety Campaign.—The first meeting in the district safety campaigns which, in connection with the public safety instruction in the schools, will be the features of the work of the Brooklyn Institution for Safety during the coming year, was held on the evening of Nov. 17. This campaign covers the district along the South Brooklyn water front from Erie Basin to the neighborhood of Joralemon Street. Coincidentally with these meetings, safety posters are to be displayed throughout the district and thousands of safety leaflets distributed through the congested areas within the district. The preliminary work of organizing the first of the district safety campaigns has consumed several weeks and from now on those

campaigns will follow each other in quick succession. It is expected that about twelve district safety campaigns will be conducted during the next year in co-operation with various public and semi-public agencies and organizations. These twelve campaigns will, in the aggregate, cover all of the congested sections of Brooklyn and will have to do not only with the perils of the street, but with the fire hazard and all of the other elements entering into the question of public safety.

Fare Reduction Complaint Dismissed.—The Railroad Commission of California has decided the case of *J. W. Ray vs. the Pacific Electric Railway*, Los Angeles, Cal. The complainant attacked the rates of the company between Pacific Ocean Avenue Junction and Temple Avenue, both points being within the limits of the city of Long Beach, and petitioned the commission to reduce such rates from 10 cents to 5 cents, contending that the 10-cent rate was a material detriment to the development of the district adjacent to Temple Avenue. The commission held that though territory may be within the incorporated limits of a city it does not necessarily mean that a street railway should operate at a 5-cent fare irrespective of the excessive mileage covered and the light traffic to be obtained. It was shown that the defendant's present line is operated at a loss and was constructed only at the earnest solicitation of property owners who agreed at the time that the present rates would not be questioned. The complaint was dismissed with the understanding that the defendant would establish at an early date the adjustments which it proposed at the hearing.

New Fast Service in Indiana.—Additional and faster limited service between Indianapolis and Terre Haute was inaugurated by the Terre Haute, Indianapolis & Eastern Traction Company on Nov. 7 with the adoption of a limited service to be known as "The Highlander." The two trains will be operated in each direction every day, covering the distance of 72 miles from terminal to terminal in two hours and five minutes, cutting twenty minutes from the regular limited schedule. Stops are made at Plainfield, Greencastle and Brazil. Of the total running time of two hours and five minutes, twelve minutes are required to reach the city limits of Indianapolis, fifteen minutes to pass through the city streets of Brazil, and twelve minutes passing over the city streets of Terre Haute. The standard three-compartment passenger car of the company, with an over-all length of 61 ft. 6 in., equipped with four Westinghouse No. 121 motors, rated at 90 hp. at 500 volts, will be used for the new service. The choice of the name "Highlander" to designate the new service was the result of a prize contest arranged by the company. The name was derived from Terre Haute, meaning high land. The new service was created to permit business men to travel between Indianapolis and Terre Haute, transact their day's business and return home before nightfall.

Overcrowding Held to be a Crime.—In upholding the conviction of the Toronto (Ont.) Railway so far back as February, 1911, the judges of the First Division Court of the Appellate Division at Toronto on Nov. 9 in a lengthy written judgment disposed of the company's appeal and directed that the overcrowding nuisance be abated. Chief Justice Sir William Meredith, who expressed the opinion of the court, said there was no doubt that the company was charged with and convicted of having committed a public nuisance and the evidence showed there had not been an isolated case of overcrowding, but a systematic course of the conduct which affected all who became passengers in the cars. The court at first sight thought that the argument that there could not be an indictment because there had been an abatement of the nuisance was fatal to conviction, but held that a count on the indictment which alleged that the nuisance was continued at the time of the indictment disposed of that argument. One section of the Ontario railway act gave the court power to interfere when there was a contravention of the by-law such as to cause danger or annoyance to the public. The court held that the offence of the company was indictable and punishable as a crime and in concluding the judgment Sir William Meredith expressed the hope that the decision would result in putting a stop to overcrowding.

Personal Mention

Mr. J. T. McMahon has been appointed roadmaster of the East St. Louis, Columbia & Waterloo Railway, East St. Louis, Ill., to succeed Mr. Joseph Genduso.

Mr. William Dods, formerly vice-president of the Carbon Transit Company, Mauch Chunk, Pa., has been elected president of the company to succeed Mr. Val Smith.

Mr. F. B. Van Vorst has been appointed secretary and assistant treasurer of the United Railways Investment Company, New York, N. Y., to succeed Mr. W. J. Duane.

Mr. F. H. Mason has been appointed engineer of maintenance of way of the Waterville, Fairfield & Oakland Railway, Waterville, Me., to succeed Mr. Lester E. Choate.

Mr. D. Penman, formerly assistant traffic manager of the Pittsburgh & Butler Railway, Pittsburgh, Pa., has succeeded Mr. Thomas G. Orr as traffic manager of the company.

Mr. C. H. Latta has been elected vice-president of the Carbon Transit Company, Mauch Chunk, Pa., to succeed Mr. William Dods, who has been elected president of the company.

Mr. Trueman J. Bach has been appointed electrical engineer and master mechanic of the North Kankakee Electric Light & Railway Company, Kankakee, Ill., to succeed Mr. John McFarland.

Mr. Louis P. Baurhenn, who has been superintendent of the Bergen division of the Public Service Railway, Newark, N. J., has been made superintendent of the Hudson division of the company.

Mr. Elmer L. Williams, who has been superintendent of the Hudson division of the Public Service Railway, Newark, N. J., since 1905, has been made superintendent of the Essex division of the company.

Mr. F. H. Chamberlain, general manager of the Alabama Power Company, Anniston, Ala., was elected president of the Alabama Light & Traction Association at the meeting of the association in Montgomery on Oct. 20 and 21.

Mr. Frank A. Bailey, who has been superintendent of the Southern division of the Public Service Railway, Newark, N. J., with headquarters at Camden, N. J., has been made superintendent of the Bergen division of the company.

Mr. James P. Gorman has succeeded Mr. S. E. Jones as claim agent of the Wilkes-Barre & Hazleton Railway, Wilkes-Barre, Pa. Mr. Gorman has also succeeded Mr. Jones as claim agent of the Lehigh Traction Company.

Mr. William B. Graham, who has been superintendent of the Essex division of the Public Service Railway, Newark, N. J., since 1907, has been made superintendent of the Southern division of the company, with headquarters at Camden.

Mr. W. M. Morton has been elected secretary and treasurer and appointed auditor of the Charlottesville & Albemarle Railway, Charlottesville, Va. He succeeds Mr. E. E. Starke, as secretary, Mr. Norman James as treasurer and Mr. J. H. Windsor as auditor.

Mr. H. C. Bushnell has been appointed mechanical assistant to the superintendent of motive power of the United Railways & Electric Company, Baltimore, Md. Mr. Bushnell was formerly employed as an engineer with Mr. H. E. Mole, a consulting engineer with offices in New York City.

Mr. Nathan Rumney, traveling freight and express agent, has been named general freight and express agent of the Detroit (Mich.) United Lines to succeed the late George W. Parker. Mr. Rumney has been connected with the Detroit United Railway in the freight and express department for fourteen years.

Mr. Charles W. Bosworth, a director of the Springfield (Mass.) Street Railway, has been appointed counsel for the company to succeed Ely & Ely, who have resigned, effective June 30, 1916. Mr. Bosworth will handle all the new business from now on and will take over all the unfinished business next June. Mr. Bosworth is widely known among the legal fraternity in Massachusetts. He has built up a lucrative law practice in addition to his duties as referee

in bankruptcy and president of the Union Trust Company. Mr. Bosworth conducted the trial of the company's cases against the three conductors who were discharged early this spring for the alleged mishandling of fares. The elder Mr. Ely, Mr. Henry W., has been counsel for the Springfield Street Railway since June, 1906.

Mr. George H. Binkley has resigned as engineer of maintenance of way and structures of the San Francisco-Oakland Terminal Railways, Oakland, Cal. Mr. Binkley's experience in engineering work has been very broad. He was born in Richmond, Ind., and was educated at De Pauw University. He entered engineering work with the Pennsylvania Railroad, served on the engineering staff of the Chicago exposition, engaged in track elevation work for the Chicago, Rock Island & Pacific Railway in Chicago, served for five years as chief engineer of the Calumet Electric Street Railway, Chicago, and was subsequently connected in turn with Kohler Brothers, Chicago, contracting engineers; the American Engineering Company, Indianapolis, Ind., of which he was vice-president and chief engineer, and the Arnold Company, Chicago.

Mr. Oscar T. Crosby has returned from Brussels, Belgium, where he has been since April in general charge of the distribution of supplies for the Commission for Relief in Belgium. On Nov. 17 he made an address at the Technology Club in New York advocating the establishment of an international court for the settlement of international disputes, with sufficient military and naval force to carry out its decrees. This is a plan in which Mr. Crosby has been interested for several years and which he hopes will be adopted by the United States and other leading countries. Its main principles were embodied in a resolution introduced last spring in the United States Senate by Senator Shafroth, and at about the same time a similar resolution was introduced in the House. These resolutions did not succeed in passing at the last session but it is expected that they will be introduced again at the coming session. Mr. Crosby expects to remain in this country for some time and will reside at Warrenton, Va.

Mr. T. W. Connette, assistant superintendent of transportation of the Buffalo division of the International Railway with headquarters at Buffalo, N. Y., became superintendent of transportation of the Buffalo division of the company on Nov. 15, as previously announced in the *ELECTRIC RAILWAY JOURNAL*. Mr. Connette is not yet twenty-six years old, but has had unusual opportunities to become well versed in the management of street railway properties. As early as 1901 he was employed in the shops of the Syracuse (N. Y.) Rapid Transit Railway, of which his father, Mr. Edward G. Connette, now president of the International Railway, was then general manager. In 1906 he began work during the summer months with the Worcester (Mass.) Consolidated Street Railway, of which his father at that time was general manager, and for several years was in the shops, mechanical department, power house and the track and line departments. He attended Williston Seminary, Easthampton, Mass., and in 1910 he entered Lehigh University and took a course in civil engineering. In 1912 he entered the transportation department of the International Railway at Buffalo. During that year he was made assistant superintendent of equipment in the mechanical department under Mr. G. W. Dunlap, superintendent of equipment. On Aug. 25, 1913, he was made assistant superintendent of transportation, Buffalo division, under Mr. N. H. Brown. He now succeeds Mr. Brown as superintendent of transportation of the Buffalo division, Mr. Brown having been made general superintendent of transportation of the entire system.

T. W. CONNETTE

OBITUARY

Dennis Sullivan, a director of Cities Service Company, New York, N. Y., and a Colorado pioneer in mining, banking and public utilities, is dead. Mr. Sullivan was born in Rensselaer County, New York, in 1837.

Joseph G. Hendrickson died on Nov. 4 after an illness lasting less than a week. Mr. Hendrickson was sixty-nine years of age. He founded the Ajax Metal Company in 1880. He retired as president of the company a little more than a year ago and since then has been chairman of the board, also chairman of the board of the Ajax Metal Company of the South, Birmingham, Ala., and president of the Ajax Lead Coating Company.

William Frederick Allen, president of the National Railway Publication Company, New York, N. Y., which publishes the *Official Railway Guide*, died on Nov. 9 at his home in South Orange, N. J., in his seventieth year. In 1910 Mr. Allen was elected vice-president of the company, and president in 1914. He was appointed general secretary of the American Railway Association when it was founded in 1875 and held that office until his death.

Charles Haglin Rinker, superintendent of the St. Paul lines of the Twin City Rapid Transit Company, Minneapolis, Minn., died of pleurisy at St. Luke's Hospital, St. Paul, on Nov. 9. Mr. Rinker was born in Minneapolis, and after he was graduated from the University of Minnesota he continued to reside there and was identified with Haglin-Stahr, general contractors, Minneapolis. In September, 1912, he became connected with the Twin City Rapid Transit Company. He was thirty-two years of age.

George Whitfield Parker, general freight and express agent of the Detroit (Mich.) United Railway, died on Nov. 11 at Harper Hospital, Detroit, following an operation. He was forty-five years old. Mr. Parker was born in Detroit. He became connected with the Detroit United Railway as general freight and express agent in September, 1901, and his years of service had given him an exceptionally wide acquaintance in traffic circles among both steam and electric railway officials. His preliminary experience in freight business was gained under Mr. J. K. Muir on the Grand Trunk Railway, where he served in the capacities of rate clerk, chief clerk, soliciting freight agent and traveling freight agent with headquarters in Detroit. He is survived by his widow.

E. T. Munger, who was general superintendent of the Hudson & Manhattan Railroad, New York, N. Y., from January, 1909, to January, 1914, died on Nov. 14 at Paterson, N. J. Mr. Munger was born in Menominee, Wis., in 1870. He was graduated with the degree of bachelor of mechanical engineering at the University of Wisconsin in 1892. Previous to his work on the Hudson & Manhattan Railroad Mr. Munger had held a number of responsible engineering positions, such as master mechanic and later superintendent of motive power and equipment of the Metropolitan West Side Elevated Railway, Chicago, and later president and general manager of the Havana (Ill.) Telephone Company. After resigning from the Hudson & Manhattan Railroad Mr. Munger was for a short time general manager of the Cumberland County Power & Light Company, Portland, Me., which position he relinquished on account of ill health. Mr. Munger is survived by his widow and three daughters.

Herbert M. Wheeler, engineer in charge of electrolysis and electrical distribution of the Chicago (Ill.) Surface Lines, died suddenly on Nov. 12, 1915. Mr. Wheeler was born in Shawano, Wis., in 1876, and following his graduation in electrical engineering at the University of Minnesota in 1896, he began work with the Fort Wayne (Ind.) Electric Corporation. His career as electrical engineer in street railway work began in 1899 with the North Chicago Street Railroad, where he served as an assistant engineer. Four years later he resigned to become an instructor in mathematics and engineering at Lewis Institute, Chicago, and in 1907 he again returned to railway work as electrical engineer of the Chicago Railways. In 1909 he was made assistant to Mr. John Z. Murphy, then chief engineer of the company. In February, 1914, he was appointed to the position which he held at the time of his death. Mr. Wheeler is survived by his widow and two children.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Mexico & Santa Fé Railroad, Mexico, Mo.—Incorporated in Missouri to construct and operate an electric railway from a connection with the Chicago & Alton Railroad at Mexico to a point in Monroe County, 16 miles northeast. Capital stock, \$160,000. The Mexico Investment & Construction Company is building the road. Incorporators: J. A. Botts, W. W. Mundy, M. W. Beamer and J. P. Cauthorn of Molino, and T. C. Botts, J. D. Bates and W. W. Botts of Mexico.

FRANCHISES

Berkeley, Cal.—The petition of the San Francisco-Oakland Terminal Railways to discontinue the operation of its line on Dwight Way from College Avenue to Shattuck Avenue has been denied by the Council of Berkeley.

San Pedro, Cal.—The Council of San Pedro has authorized the sale of a franchise through Front, O'Farrell, Newport and Bay Streets to the Pacific Electric Railway.

Decatur, Ill.—The Council of Decatur has revoked the franchise of the Illinois Traction System to use Morgan, William and other east-side streets over which the interurban line from Champaign into Decatur was to have entered the city and which have never been used.

Peoria, Ill.—An ordinance is being prepared by the legal department of the city of Peoria extending the time of the franchise granted the Illinois Traction System in February, 1914, to construct tracks on Jefferson and Hamilton Streets into the new traction terminal building.

Buffalo, N. Y.—The International Railway has received a franchise from the Council to construct a line on Bailey Avenue. It is planned to complete the line between Clinton and Broadway and between East Genesee and East Ferry Streets by Jan. 1, 1917; between Broadway and East Genesee Street by Jan. 1, 1918; between East Delavan Avenue and Kensington Street by Jan. 1, 1919, and between Clinton and Seneca Streets by Jan. 1, 1920.

***Baker, Ore.**—J. L. Soule has asked the Council for a franchise to construct and operate an electric railway in Baker. The Commercial Club of Baker is interested.

Dallas, Tex.—The Northern Texas Traction Company has received a twenty-year interurban franchise from the Board of Commissioners of Dallas on Jefferson Street between Commerce Street and Trinity River. The franchise stipulates that work on the proposed viaduct over the steam lines entering the new Union Terminal, crossing the rails of the Northern Texas Traction Company, must be started within ninety days from the date the ordinance becomes operative, and the work must be completed within fifteen months thereafter. The original petition of the company included local street car service to Oak Cliff, but this was eliminated by the city attorney and must be handled under a separate franchise when the present ordinance expires.

TRACK AND ROADWAY

Pacific Gas & Electric Company, Sacramento, Cal.—Plans are being considered by this company for the construction of an extension of its East Lawn line through Elmhurst to the State Fair grounds.

Municipal Railways of San Francisco, San Francisco, Cal.—At a meeting recently held in San Francisco the Board of Park Commissioners unanimously declined to grant permission for the municipal cars to cross Golden Gate Park from Tenth Avenue to Fourteenth Avenue. While denying the petition, the Board intimated that it might favorably consider a proposition to construct a tunnel line in the vicinity of Nineteenth or Twentieth Avenues.

Hartford, Meriden & New Britain Railway, Hartford, Conn.—This company has been organized to construct a line from Meriden to Hartford via Kensington, New Britain and Newington, 20 miles. Stock to the amount of \$1,000,000 has been subscribed, company officials elected, a

full preliminary survey of the route made and plans completed to begin work next spring. Construction will be begun in Meriden, New Britain and Hartford at the same time. Louis Fiske, Branford, has been elected president of the new company and Robert O. Eaton, North Haven, secretary and treasurer. [May 29, '15.]

Evansville (Ind.) Railways.—This company has placed an order with the Cloverport Boat & Machine Company, Cloverport, for two boats to be used in connection with the interurban service of the company at points along the river. The boats will cost \$8,000.

Iowa & Illinois Railway, Clinton, Iowa.—This company will rebuild 5 miles of overhead structure in the vicinity of Comanche at an estimated cost of from \$7,500 to \$10,000. It is also reported that the company will rebuild much of the overhead work between Davenport and Clinton.

Boston, Mass.—The contract for the construction of Section G of the Dorchester Tunnel, on Dorchester Avenue, between West Fourth Street and Old Colony Avenue, South Boston, has been awarded by the Boston Transit Commission to Coleman Brothers, 1 Marginal Street, Chelsea, Mass., at \$382,364. [Oct. 30, '15.]

Bay State Street Railway, Boston, Mass.—Work has been begun by this company installing double track on Main Street, Haverhill. The line will be constructed from the Pleasant Street turnout to the end of the Haverhill bridge this year, and the remainder of the work of double-tracking the line to the corner of Main and Salem Streets will be done early next year.

New York Municipal Railway Corporation, Brooklyn, N. Y.—Bids will be received until Dec. 7 by the Public Service Commission for the First District of New York for the construction of Section No. 3, Route No. 8, comprising the tunnel section under the East River from Fourteenth Street, Manhattan, to North Seventh Street, Brooklyn, being a part of the Fourteenth Street-Eastern District subway line. This line connects with the Broadway elevated line of the New York Consolidated Railroad, which runs out to East New York.

International Railway, Buffalo, N. Y.—After informal conferences with city officials of North Tonawanda, the objections raised against the elevation of tracks through that city of the fast line to be built between Buffalo and Niagara Falls by the Frontier Electric Railway have been withdrawn. Work has been begun on the line and with the exception of a few very small parcels of property, all the right-of-way has been acquired. The Frontier Electric Railway is owned by the International Railway.

New York, N. Y.—Bids for the installation of tracks on the Queensboro subway extension, the Astoria elevated line and the Corona elevated line, all in the borough of Queens, were received by the Public Service Commission for the First District of New York during the week. The Queensboro subway extension is a part subway and part elevated line, extending from the present terminus of the subway near Jackson and Van Alst Avenues, through Fourth Street, Davis Street and Ely Avenue to the Queensboro Bridge Plaza, where the line connects with the Astoria and Corona railroads, the former extending northerly through Second Avenue to Ditmars Avenue, Astoria, and the latter northeasterly through Queens Boulevard, Greenpoint Avenue, Skillman Avenue and Roosevelt Avenue to Sycamore Avenue, Corona. The contractor must begin work within thirty days from the date of delivery of the contract, and complete the work within six months. According to unofficial figures, submitted by representatives of the contractors present at the bid opening, George S. Bennett, 36 Northern Avenue, was the lowest bidder, at \$204,000, the second bidder being the Thomas Crimmins Contracting Company, of 444 East Sixty-ninth Street, at \$204,900.

Interborough Rapid Transit Company, New York, N. Y.—Bids will be received until Nov. 30 by the Public Service Commission for the First District of New York for the construction of Section No. 2 of Routes Nos. 19 and 22, being the elevated extension of the Southern Boulevard and Westchester Avenue branch of the Lexington Avenue subway, extending over Westchester Avenue, The Bronx, from Whitlock Avenue to Pelham Bay Park.

Bartlesville (Okla.) Interurban Railway.—Plans are under consideration by this company for the construction of extensions from Bartlesville to Pawhuska and from Bartlesville to Nowata.

Toronto (Ont.) Civic Railway.—The Council of Toronto has authorized the construction of the Bloor Street line from Dundas Street to Quebec Avenue at a cost of \$125,000.

Toronto (Ont.) Civic Railway.—The Council of Toronto has approved plans for the extension of this company's lines on Yonge Street from the tracks of the Canadian Pacific Railway to Farnham Avenue.

Hershey (Pa.) Transit Company.—Surveys have been completed and work has been begun by this company on the construction of an extension of its line from Hershey to Fredericksburg. The line will enter East Hanover, north of Hershey, and will extend east to Fredericksburg via Ono and Jonestown. It is estimated that the cost will be about \$300,000.

Philadelphia, Pa.—Bids are desired until Dec. 7 by the Department of City Transit, Bourse Building, for the construction of concrete column foundations on piers for about 4000 ft. of two-track elevated railway in Frankfort Avenue from Unity to Dyre Streets. Bids are also desired until Dec. 14 for the construction of steel superstructure and appurtenant work for the same section. [Sept. 25, '15.]

Eastern Pennsylvania Railways, Pottsville, Pa.—Work has been begun by this company on its extension from Pottsville to St. Clair, 2½ miles. From St. Clair the line will extend on Third Street to Patterson Street, to Second Street, north on Second Street to connect with the line from Frackville. The entire line from Pottsville through to Frackville will be completed by the end of next February. The road is being built by the White Construction Company.

Scranton, Pa.—Rights-of-way are being obtained for a third-rail electric railway system throughout central Pennsylvania. According to J. F. Richard, fiscal agent of the Northumberland County Gas & Electric Company, Sunbury, franchises will be asked for in many towns in that section. Starting at Scranton, the proposed road will follow the west side of the Susquehanna River, touching Kingston, Moca-naqua, Shickshinny, Berwick, Bloomsburg, Danville, Northumberland and Sunbury. Recrossing the river, it is to follow the Susquehanna River to Harrisburg. From Sunbury a line is to be built to Shamokin, Mount Carmel, Tamaqua and Hazleton, where it will connect with the Lackawanna & Wyoming Valley Railroad. Power for the system is to be furnished by the Harwood Electric Company, Hazleton.

Nashville & Eastern Railway, Nashville, Tenn.—It is reported that this company plans to begin construction immediately on its line from Lebanon to Smithville, 35 miles. Myers Construction Company, Chicago, will build the road. C. T. Edwards, Nashville, is interested. [Sept. 4, '15.]

Fort Worth & Denton Interurban Railway, Fort Worth, Tex.—At a meeting of the directors of this company held at Fort Worth on Nov. 11, it was decided to release the Stone & Webster Engineering Corporation from its contract to build the line upon receipt of one-half the losses sustained by the company, provided these do not exceed \$30,000, which, with the \$52,000 now on hand would be returned to the stockholders. The money on hand together with the amount to be received from Stone & Webster will make possible the return of 80 per cent of the money originally paid in as stock. The financial statement presented by President Sam Davidson showed that the company sustained a loss of approximately \$39,000, due to the failure of the Fort Worth Savings Bank & Trust Company. The contract from which Stone & Webster were released bound them to start work on the line within one year, and the promoting company agreed to furnish a bonus of \$75,000 and right-of-way. G. H. Clifford, general manager of the Stone & Webster interests at Fort Worth, told the directors that his company desired to build the Fort Worth & Denton Interurban Railway but had been prevented from doing so because of stringent financial conditions brought about by the European war and the introduction of the jitney into the city traffic. [July 17, '15.]

Houston, Richmond & Western Traction Company, Houston, Tex.—Offices have been opened by this company at 506-507 Moore Building, San Antonio, to take charge of the construction of the first 100 miles of this company's line between San Antonio and Houston. It is expected that engineers will soon be sent out and a decision reached as to which of the two routes under consideration will be adopted. E. Kennedy, Houston, president. [Oct. 16, '15.]

Richmond, Rappahannock & Northern Railway, Richmond, Va.—Bids have been received by this company for the construction of its line from West Point to Urbana, 17 miles, and it is expected that the contract will soon be awarded. C. L. Ruffin, 514 American National Bank Building, Richmond, chief engineer. [Oct. 2, '15.]

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—Operation has been begun by this company on the extension of its Twenty-seventh Street line between Center Street and Hopkins Avenue.

SHOPS AND BUILDINGS

Union Traction Company of Indiana, Anderson, Ind.—This company will build a new freight house on East Washington Street, Alexandria. The building will be of cement blocks or brick. The passenger station will be removed at once from the present site at Harrison and Monroe Streets to a location farther up-town.

Springfield (Mass.) Street Railway.—Plans have been drawn up for this company's new Hooker Street carhouse and shops which will be erected shortly. The buildings and tracks will cover the entire property of the company, which measures 300 ft. on North Main Street and extends the entire front of the property and back 350 ft. It will be of fireproof construction with an office section in front. One-half of the office section will be two stories high and the rest one story. The new carhouse will eliminate that now in use at Carew Street, but the one on the west side of Birnie Avenue will be retained and two more tracks will be extended to the Boston & Maine tracks. The principal building will have a capacity of 120 cars, the yards 190 and the Birnie Avenue carhouse thirty-two. It is estimated that the cost will be about \$175,000.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The contract for the construction of station finish on Section No. 2 of Route No. 39, the New Utrecht Avenue elevated railroad in Brooklyn, has been awarded by the Public Service Commission for the First District of New York to A. L. Guidone & Son, Inc., the lowest bidders, for \$513,656. The steel structure for this section is nearly completed. This line will be operated by the New York Municipal Railway Corporation on a branch of the Fourth Avenue subway. The contract provides for the finishing of the stations between Thirty-eighth and Sixty-second Streets within three months so that the new road may be operated as far south as Sixty-second Street, where transfers can be given to the Sea Beach line to Coney Island.

Toronto (Ont.) Suburban Street Railway.—This company is constructing a carhouse at Lambton Park.

POWER HOUSES AND SUBSTATIONS

Illinois Traction System, Peoria, Ill.—This company has completed the construction of a stack at Danville, Ill. The stack is 250 ft. high and is 18 ft. in diameter. It will take the place of three stacks which have been used in the past.

McComb & Magnolia Railway & Light Company, McComb, Miss.—It is reported that this company, which was recently incorporated in Mississippi to construct a line in McComb and an interurban railway to Summit, Fernwood and Magnolia, contemplates the construction of a power plant. H. W. Bell, Laurel, engineer.

Jersey Central Traction Company, Keyport, N. J.—Plans are being made by this company to erect a new substation at Stone Church to replace the portable one now in use. The new station will supply energy in Highlands and adjacent towns.

Toronto (Ont.) Suburban Street Railway.—Substations are being constructed by this company at Georgetown and Guelph.

Manufactures and Supplies

ROLLING STOCK

Pittsburgh (Pa.) Railways are reported as expecting to purchase at once a large number of cars.

Miami (Fla.) Traction Company advises that it will need construction cars and equipment for extensions, also trailer cars.

Lake Erie & Northern Railroad, Brantford, Ont., has ordered eight electric cars from the Preston Car & Coach Company, Preston, Ont.

American Sugar Refining Company, Brooklyn, N. Y., is considering the possible purchase of one electric freight locomotive, for third-rail, overhead or storage battery operation.

Muscatine & Iowa City Railway, Muscatine, Ia., has ordered four gas-electric motor cars from the General Electric Company and will also purchase some gas-electric locomotives.

United Traction Company, Albany, N. Y., noted in previous issues of the ELECTRIC RAILWAY JOURNAL as expecting to purchase fifteen new cars, has ordered these car bodies from the Wason Manufacturing Company.

Toronto (Ont.) Suburban Railway has ordered six center-entrance interurban cars from the Preston Car & Coach Company, Ltd., Preston, Ont. They will be 61 ft. long over vestibules and will be mounted on Standard Motor Truck Company trucks. They will be equipped for 1500-volt d.c. operation.

General Electric Company, Schenectady, N. Y., has received an order from the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., for eighty General Electric motors, to replace a similar number of motors of its present equipment.

TRADE NOTE

S. K. F. Ball Bearing Company, Hartford, Conn., which is about to erect a factory in Hartford for the purpose of manufacturing the S. K. F. ball bearings in America, as noted in the ELECTRIC RAILWAY JOURNAL of Sept. 18, 1915, has elected Frank A. Vanderlip of the National City Bank as a director. The board of directors will also consist of B. M. W. Hanson, vice-president; Pratt Whitney, Hartford; F. B. Kirkbride, 7 Wall Street, New York; A. Carlander and S. Winquist. B. G. Prytz will act as president.

ADVERTISING LITERATURE

Trolley Supply Company, Canton, Ohio, has issued a catalog describing its headlight for interurban cars.

E. I. du Pont de Nemours & Company, Wilmington, Del., has issued a colored sheet illustrating the uses of its explosives for railroad construction and other purposes.

Ajax Metal Company, Philadelphia, Pa., has issued a catalog describing its various metals, including white metals, ingot metals, journal brasses, plastic bronze and "bull" bab-bitt metals.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a large catalog announcing its Christmas program for 1915, in connection with Electrical Prosperity Week.

Canton Culvert & Silo Company, Canton, Ohio, has just published a set of specifications for corrugated metal culverts. These have been prepared with a view to co-operating with railways and highway engineers, contractors and others, in supplying them, for references at least, if not for adoption, a foundation for a comprehensive specification for culverts. The specifications are not limited to any single type, riveted or nestable, but rather present a choice of all that the company considers fair and good in the production of a first-class culvert. The various sections embody the experience gained by the company in studying metal culverts. One of the sections covers the analytical features which call for a pure iron, but the company explains that this may be omitted and the remaining clauses cover the best type of culvert construction.

Harrison Safety Boiler Works, Philadelphia, Pa., has issued a 68-page booklet entitled, "Finding and Stopping Waste in Modern Boiler Rooms," and devoted to the use and design of Cochrane meters. The value of feed-water and condensate meters as aids in the management of power plants is taken up in detail in the introductory part of the book, covering among other factors, grade of fuel, grates, methods of firing, air leaks, control of draft, condition of gas passages, scale and soot on boiler tubes, radiation, etc. With a feed-water meter installed, it becomes possible to measure the effect of changes in connection with these several factors. As a result, scientific management becomes easy and natural, and standard rules of operation, such as directions for handling fires, regulation of draft, blowing of soot, banking of fires, carrying overloads, etc., can be written out, so that any man following them can obtain good results. The use of records further arouses the ambition and spirit of emulation of the men, and makes it possible to reward special skill or attention to duty by bonuses or promotions. In the subsequent sections of the book, the Cochrane metering heater, a combined open feed-water heater and hot-water meter, with its several modifications, is described in detail, also the Cochrane flow recorder for use in connection with V-notch weirs. In the last pages of the book a new type of meter, working on the volumetric principle by means of which it is possible to obtain an accuracy of within one-third of 1 per cent, is described.

NEW PUBLICATION

Statistics of Railways in United States, 1904-1914.—Consecutive Bulletin No. 81. Bureau of Railway Economics, Washington, D. C. 67 pages.

This bulletin, which supersedes Consecutive Bulletin No. 75, gives tabulations for steam railroads based upon official data published by the Interstate Commerce Commission for the fiscal years ended June 30, 1904, to 1914, the latest year for which such official data are obtainable. Mileage, capitalization, operating, equipment, labor and accident statistics are included.

NEW YORK TRANSIT CONTRACT AWARDS

The Public Service Commission for the First District of New York has adopted the recommendation of its counsel and chief engineer and denied the request of the New York Municipal Railway Corporation for permission to let the contract for the construction of the Coney Island terminal to the George W. McNulty Company without competitive bidding. The New York Municipal Railway had asked permission to do this on the ground that the McNulty Company, which had built the Sea Beach Railroad, was thoroughly familiar with the work required, had given satisfactory service in its previous contract, and had submitted a list of unit prices for the proposed work which were reasonable and compared favorably with prices obtained by the commission under competitive bidding. The commission, however, refused to consent to the award of the contract without competitive bidding.

Alfred Craven, chief engineer of the commission, has approved the award of a contract by the New York Municipal Railway Corporation to the Charles A. Myers Contracting Company, Inc., for grading, removing existing tracks, laying new tracks and special work, installing contact rail and other electrical work, etc., in the improvements now being made by the company in its Fresh Pond Road yard in Queens Borough. The contract amounts to \$17,123.

The commission has given a qualified approval to the award by the New York Municipal Railway Corporation to the American Bridge Company of a contract for furnishing steel to be used on the third-tracking of the Fulton Street elevated line in Brooklyn between Nostrand Avenue and Adams Street, on the Coney Island terminal, on the third-tracking and reconstruction of the elevated railroad at East New York, and for the reconstruction of the Brighton Beach line from Church Avenue to Malbone Street, aggregating \$2,274,700. The company submitted to the commission bids from eight different firms to whom the specifications were submitted, and the American Bridge Company was the lowest of these bidders.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK SATURDAY, NOVEMBER 27, 1915

No. 22

RULE-OF-THUMB VS. RATIONAL METHODS As the electric railway business becomes more highly developed from the technical standpoint the methods used in solving problems naturally tend to become more rational or systematic. This fact has been increasingly evident in the articles published in the *ELECTRIC RAILWAY JOURNAL* from time to time, especially when comparison is made of the practices over an interval of several years. It is illustrated this week particularly in the article by J. R. Brown which appears in the "Equipment and Its Maintenance" section of this paper. The question as to the effect of the welding process on the rail head is answered by appeal to analysis. In the present case this consists in sectioning a rail to which a bond has been welded, and in bringing out the characteristic structure of the steel by etching, from which its properties can be determined with some measure of exactness. Supplementing this, hardness tests are made with simple apparatus. As such methods become more popular progress will be more rapid, for the results of a proposed improvement can be predicted at a nominal cost without waiting for the test of time. With the increasing difficulty of making a fair profit from electric railway operation accurate testing must take the place of "cut and try."

EVIDENCE OF REAL PUBLIC JUSTICE Waiving its right under the franchise agreement to limit rates to a stipulated figure, the authorities of a certain town voluntarily assented to a 30 per cent increase in order to permit successful operation of a private utility. This sounds Utopian, but it actually happened recently in connection with the gas company in West Seneca, N. Y. Some pessimists may assert that selfishness was the leading motive of the town, for the utility easily showed that the franchise provision in question had been for years inimical to its prosperity and with rising costs would mean its dissolution. We wish, however, that there were more of such selfishness. It has been too little recognized that a utility and its customers have a mutual interest in the business and that good service must be properly compensated if the utility is to prove attractive to investors and beneficial to the public. Some day the public will more fully understand that unreasonable demands in regard to service and rates ultimately mean loss and inconvenience to themselves as well as to the utility. The rights of the utility to income and benefits must be conserved fully as much as the rights of the public to rates and service. The two points of view are not antagonistic; they are mutually dependent, even if not always so recognized by the public.

CAN ELECTRICAL MACHINERY RUN HOTTER? The discussion on safe working temperatures for electrical apparatus, which occupied the New York meeting of the A. I. E. E. this month, treated of a subject of the most vital character. Some surprising information was given out, but, thanks to the existence of a great store of practical knowledge of insulation matters, the statement that electric generators had been operating for many years at temperatures frequently above 250 deg. C. in the "hot spots" was received calmly. Insulation of Class B in the A. I. E. E. code was the center of interest. Manufacturers believe that this will safely withstand a higher temperature than that now permitted, without special guarantee by the manufacturer, under the A. I. E. E. rules. The users of machines are conservative as they want to be sure of long life of their equipment. The general tendency, however, is toward more liberal temperature rise allowance. The New York discussion suggests a number of significant facts. First is the influence that the A. I. E. E. rules have in guiding electrical practice. Again, temperature rise limitations for machines insulated with refractory materials have in the past been quite conservative. A third point is that the hotter generators and motors can be operated the cheaper they are in first cost. The relation of maintenance and first costs must determine the limits of economical temperature rise. Unfortunately, the resistance of electric conductors increases with the temperature, so that the same current produces heat faster in a hot machine. This may prove to be a controlling factor.

WEIGH L. C. L. FREIGHT AT POINT OF ORIGIN Although electric interurban railroads have been careful to render their patrons the full measure of service in connection with freight traffic, they have, in some instances, been exceedingly lax in safeguarding their own interests. This applies particularly to checking the weight of all less-than-carload freight shipments. The extent of the losses due to negligence in this particular may vary from a few cents to several dollars on a single shipment. Aside from the possibility of a gain in revenue, the process of checking the weight of a shipment also serves as a check on its condition and the number of packages contained and also frequently reveals illegible marking which would delay or make impossible prompt delivery. In case a claim is filed subsequently, information of this nature is invaluable. Weighing and checking at the point of origin will also eliminate the cause of many claims and increase the number of satisfied patrons. If relief from the former is obtained the

traffic department may devote more of its energies to obtaining new business and less to the most undesirable and unsatisfactory phase of the freight-handling business. As a general proposition the way station agent is not a busy man, so that insistence on weighing and checking at this point does not work a hardship. At terminals or heavy shipping points such a requirement might increase the burden, but the savings effected would warrant employing additional help. As we see it, therefore, insistence upon weighing at the point of origin is a panacea for many freight-department ills.

LOCOMOTIVE MILEAGE AND ELECTRIFICATION

The electrification of 440 miles of the Chicago, Milwaukee & St. Paul Railroad is by no means interesting only because of the immensity of the project, nor is its importance measured alone by the radical nature of the forward step that has been taken by its sponsors. As it stands, the installation will go further than any of its predecessors toward providing a definite answer to one of the most important but mooted questions of the electrical operation of steam railroads, namely, that of the influence on cost of operation of the large mileages of which electric locomotives are capable.

Heretofore everyone of the electrifications that has been undertaken in this country has covered much too short a route mileage to escape the handicap of the terminal detentions which are invited every time an engine arrives at the end of its run, even though it may be perfectly ready to continue in revenue service at the head of a train. On the St. Paul, however, no such condition will obtain, and as pointed out in these columns when the project was first agitated, electrification will permit each locomotive to take its train over the whole 440 miles of route, setting out bad-order or local cars as are required at the various stations and changing crews in accordance with their physical limitations. Obviously this provides an opportunity to increase locomotive mileage to an extent that is unparalleled in previous railroad practice. With the short divisions of, say, 150 miles that are necessary for steam operation, the time lost at the division points and chargeable only to the terminal delay may actually constitute more than half of the time spent between terminals in revenue service, but with the division points eliminated, practically all of the time thus wasted may be utilized by the locomotives in hauling trains. The vastly increased locomotive mileage thus possible may, and probably will, go far to offset the effect of the lesser traffic density which has been cited from time to time as a reason for believing that the St. Paul installation will not equal the record of 20 per cent return on the investment that has been made on the Butte, Anaconda & Pacific electrification in the same territory.

Traffic density is, no doubt, essential in a large degree for the profitable substitution of electricity for steam as a motive power. But the underlying reason for this advantage is, in the end, nothing more than the fact that it is necessary to make frequent and regu-

lar use of the costly contact and transmission system in order to earn interest charges and profit upon the investment. Exactly the same reasoning applies to the electric locomotives, which constitute from one-half to one-third of the total investment in the ordinary electrification project. If the locomotives are not utilized to their fullest extent, or, in other words, if they do not make the maximum revenue mileage of which they are capable, they become just as much of a financial handicap as an expensive contact system that is used by only one or two trains daily. For example, the St. Paul locomotives comprise roughly 40 per cent of the entire investment for electrification, and if the annual mileage per locomotive now expected should be cut in half for some unforeseen reason, the installation would have to carry 40 per cent more interest on account of the necessity for double the number of locomotives, to say nothing of the increased cost of maintenance per mile that invariably follows reduced mileage. Such an increase in interest would offset the major part of the net earnings, but, on the other hand, if the annual mileage per locomotive now expected should be doubled, the interest on the installation would be reduced 20 per cent as soon as a place could be made for the surplus locomotives, and this would be the equivalent of a corresponding increase in profit.

Pending the results of actual operation it is, of course, impossible to say what the St. Paul locomotives will accomplish in the way of yearly revenue-miles, although as outlined above there is every reason to believe that it will be very high. The main point is that this electrification will at last give an opportunity to show what can be done along these lines by electric units, and when the results are known it is quite possible that the ensuing economies will be sufficient to make hesitation in trunk-line electrification seem like criminal negligence.

EFFICIENCY IN EXPORT

For a country which has made such rapid progress in technical matters it is sometimes surprising that the United States has not done more in a scientific development of its export trade. We have the goods, the men to make them, and the money to exploit them, but our export methods have always been characterized by a *laissez faire* policy which has left our manufacturers far behind in the competitive race with the manufacturers of other countries. This policy has affected the small manufacturing companies much more than the large ones. The latter could afford to have their own representatives abroad to develop the field, arrange for bills of exchange, and, if necessary, help to finance the purchase of their products. The result has been, for example, that representatives from the fleet of the Standard Oil Company are seen in practically every important harbor in the world. But with the small manufacturer it has been an entirely different matter. He could not conduct the complicated business of export trade from his home office, which might be perhaps far from the seaboard. As one small manufacturer testified recently before the Federal Trade

Commission: "We have had an exasperating experience with port duties, consular fees, fines for improper wording of bills of lading, improper boxing, and improper net and gross weights, cubic contents and dimensions. For a small concern, business in South America as well as the Orient is an utter impossibility."

The present war in Europe and the change which it has effected in world business conditions, however, have forced a change in our policies in the matter of our business relations with foreign countries. A large part of the world outside of the belligerent countries is looking to us for assistance in the development of its enterprises. The usual channels for the receipt of manufactured and raw materials which these countries absolutely need have been interrupted, and they need money or credit for the development of enterprises already begun. This demand seems bound to continue even after the war is over, because during the reconstruction period in Europe, the manufacturers there will have all that they can do for a long time to come to repair the waste of war. Hence, the general inquiry now being conducted into foreign trade conditions by the Federal Trade Commission and the recent announcement of the formation under the auspices of the National City Bank of a large company to develop the foreign trade of the United States, possesses the greatest significance. It is hoped that through the agency of these two movements a large part of the handicap under which the American manufacturer has labored in seeking foreign business through his lack of training, knowledge and experience in this class of business will be overcome.

It is an especially interesting and significant fact that the board of directors of the American International Corporation, whose organization with a capital stock of \$50,000,000 was announced on Nov. 23, contains the names of a number of men who have been prominent in electrical development in this country. This makes the organization of this company of peculiar interest to manufacturers of electrical apparatus as well as to those who have been interested financially in electrical undertakings in this country and are ready to invest in sound enterprises abroad of a similar character. Tramway undertakings in South America and the Orient have been a favorite form of investment for many years by Belgian, British and German capitalists, but practically no money has gone from this country into enterprises of this kind. This has been due to several causes, one of which has been a lack of knowledge on the part of investors in this country as to the character of these investments and another has been a lack of means by which investments could easily be made in them. Nevertheless, the conditions under which these companies operate are in many respects much more favorable than those governing similar enterprises in this country. With the attention which is now being given to the development of foreign trade and foreign enterprises, it is not too much to expect that the various manufacturers and investors who have built up successful electrical undertakings here will be able to extend their enterprise to countries which

need undertakings of this kind much more at present than our own country.

AVOIDING INACCURACIES IN STEEL CAR BUILDING

Errors in small details of construction occasionally produce more serious consequences with steel than with wooden cars. In building wooden cars a mistake in measurement can often be rectified without disfigurement or without incurring practical objections by the insertion of a small wooden filler. With steel construction, however, this picture-puzzle method is impossible. Exact dimensions are particularly essential in the construction of parts of steel cars exposed to the weather. For example, special ventilators may be easily and snugly attached to the roofs of wooden cars by the use of screws, whereas in steel cars where riveted or bolted construction is used, if the ventilator fit is imperfect serious leakage of rain water or melting snow may occur. In a recent case, the builders of a number of new steel cars for a well-known railway neglected to furnish the necessary insulating gasket between steel sheets where the ventilators were attached. In addition, they carelessly sheared off too large a portion of the inner ventilating duct and thus caused such a poor ventilator fit that after the car was placed in operation rain leaked in at that point and ruined the interior paneling.

One railway company which discovered that a certain shipment of cars delivered to it did not conform strictly to specifications insured satisfactory results on the following car delivery by warning the car builder in advance that it would dismantle one of the cars when delivered; that if the railway company then should discover any hidden errors in measurements of design, method of assembly or quality of material used, it would immediately refuse acceptance of all the other cars. Although the above admonition was quite successful in that case in bringing the car builder to terms, to dismantle a car would, of course, involve much unnecessary labor and expense. Cannot such trouble be forestalled in a milder way by the exertion of a little more circumspection all around? The car builder for the sake of his own reputation should study close adherence not only to the specifications furnished by the railway and specialty manufacturer, but also to requirements of good car-building practice not expressly "written in the bond," and should endeavor to avoid inaccuracies of workmanship. The manufacturer of special apparatus should be sure to give explicit directions on his blueprints for installing his equipment so as to render absolutely intelligible such details which may not be self-evident from the appearance of the drawing alone. The railway company, in its turn, would be more likely to reap fuller satisfaction from its rolling-stock by sending a competent inspector to the car-builder's plant during the period of car construction, providing the company can financially afford such inspector and the number of cars ordered is sufficiently large to warrant his employment. Observance of the above suggestions should result greatly to the advantage of all three parties concerned.

Electrical and Mechanical Details of the Bay State Car

Outside-Hung, Nose-Suspension Motors and a New Form of Control Are Used, and a Description of These Features Is Published Together with Details of the Body Construction—

A Detailed Table of Weights Is Appended

In the *ELECTRIC RAILWAY JOURNAL* of Oct. 23, 1915, was published a general description of the new convertible car of the Bay State Street Railway, which is characterized by many features of striking originality. The motors, control and air-brake equipment of the car also embody numerous points of interest and these are outlined in the following paragraphs together with a description of the semi-steel body construction.

MOTORS

Four General Electric motors of the design known as GE-247-C are provided. These are similar in general internal design to those used on the low-wheeled cars in New York City and Pittsburgh, having internal ventilation to reduce the weight for a given capacity. They are the first in the country, however, to be designed for outside-hung nose suspension. Each motor has a rating of 35 hp. on 600 volts and 30 hp. on 500 volts, according to the manufacturer's standard of 75 deg. C. rise by thermometer on any part of the windings after one hour's run on the stand with all the covers off.

The frame is of the box type, and the weight of the motor without gear and pinion is 1685 lb. or with gear and pinion, 1941 lb. The motor design includes commutating field coils and the usual modern features that are found in standard practice of the General Electric Company.

The nose, which is designed for spring suspension of the motor, is cast integral with the magnet frame, but instead of being located in the center of length it is at the center of weight of the motor. The motor is mounted so that the nose comes on the center line of the truck, giving a larger clearance than usual between the gear

case and the wheel and adding space for the brake hanger. The gear ratio used on the new car is 20:58, at which a maximum speed of 35 m.p.h. is attained on a level track at 600 volts. The length of the motor over all along the shaft is $41\frac{3}{8}$ in., and the depth from the center line of axle to the bottom of the gear case is $11\frac{3}{16}$ in., giving $3\frac{13}{16}$ -in. clearance above the rail on a 30-in. wheel. The motor is also adapted to a gear ratio of 15:63 for purely city service. The use of the nose suspension for outside hanging instead of the ordinary bar and bracket suspension cuts 100 lb. per truck from the weight of the complete car, and there is a minimum of strain on the axle bearings, as in ordinary practice with three-point suspension. Under the motor shell the clearance above the rail is $4\frac{9}{16}$ in.

TRUCKS

The trucks are the Bay State Street Railway 12-B type, and except in minor details they are similar to the company's 12-A truck, which was designed by the equipment department of the railway and fully described in the *ELECTRIC RAILWAY JOURNAL* of Oct. 5, 1912. In front of each truck is a pilot board consisting of $\frac{1}{4}$ -in. x 4-in. steel, bent to shape as shown in the accompanying illustration and bolted to lugs attached to the truck frame.

BRAKES

Both hand and air brakes are provided, the former being of the Peacock type, with a specially designed hand wheel for vestibule service which fits closely into the vestibule but allows ample space for manipulation. The hand-brake lever is divided into two independent

BAY STATE CAR EQUIPMENT—GENERAL VIEW OF CAR

BAY STATE CAR EQUIPMENT—ELECTRO-PNEUMATIC CONTROLLER

sections which work on each side of the fulcrum. This arrangement keeps the chain taut on the side connected with the end away from the point of application, and facilitates free movement of trucks, motors and other rigging which might otherwise be hampered by slack chain. Pulleys are used beneath the car floor to facilitate free movement of chains.

Straight air-brake equipment with an emergency feature has been installed on the car. This equipment was recently developed by the General Electric Company to meet the requirements. Under these conditions the straight air brake with emergency feature possesses the advantage of securing the maximum brake-cylinder pressure in the minimum time in emergency, thereby shortening the distance required to bring the car to a stop, and adding materially to the safety features of the equipment.

The emergency feature consists of a valve which on maximum application opens a passage directly from the main reservoir to the brake cylinder. A CP-27-B compressor, with a Spencer air purifier is used, this being suspended directly by lugs bolted to the framing, thus eliminating the usual cradle. The main reservoir is 16 in. x 60 in., and there is also a control reservoir 10 in. x 30 in. which provides the air supply for the operation of the doors, and control mechanism. By adding the necessary hose and couplings two-car trains can be operated with all the protection of the automatic air brake and without in any way dispensing with the simplicity, reliability and ease of manipulation of standard straight air-brake equipment.

CONTROL EQUIPMENT

The control apparatus is virtually a General Electric K-35 control cylinder development with balanced air-

BAY STATE CAR EQUIPMENT—TRUCK FULLY ASSEMBLED

operated head, pneumatically operated reverser and electromagnetic line breaker. The apparatus provides the features of permitting the use of a small controller on the platform; the installation of all motor current-breaking equipment under the car where any arcing is invisible to the passenger; the use of contactors instead of the controller, to break the main current; the elimination of one piece of main current-carrying apparatus on a double-ended equipment, with resulting simplicity of wiring; the protection obtained by the use of apparatus having a definite time limit for notching up to full parallel position and multiple-unit operation.

The contactors, with an overload relay, are inclosed in a sheet metal box. The overload relay functions to interrupt the control circuit of the equipment if the line current of the car exceeds the value for which the relay is set. Having once tripped and dropped out the line breaker, the relay locks itself open and must be reset before the line breaker can be reclosed. This relay is reset electrically by the control switch in the motor-man's cab.

BODY FRAMING

Owing to the low steps and large side window opening to be provided for, a side girder construction of unusual design was used. With the height of floor from top of rail but 34 in. to 36 in. and the height from floor to top of window stool $16\frac{3}{4}$ in., the side girders had to be extended below the floor 6 in. to provide a pocket deep enough to take the interchangeable window sashes. This gave a $22\frac{3}{4}$ -in. side girder, consisting of a 22-in. x $\frac{3}{16}$ -in. steel plate to which a pressed member at the top and bottom was riveted. The latter member forms a pocket with a bent up flange for floor support; the top member forms the window stool. Inside the hollow

BAY STATE CAR EQUIPMENT—CONSTRUCTION VIEWS SHOWING ROOF AND FLOOR FRAMING

stool an extra stiffener in shape of a 2-in. tire channel is riveted to the plate. The intermediate posts are fastened to the side girders with $4\frac{1}{2}$ -in. bolts spaced equal distances apart from center of window stool and down, and fitted into special castings, riveted to the girder at the lower edge of the window stool and in the pocket. At the bolsters this casting runs the whole height of the girder, and the bolster posts are braced with an angle iron bracket from the top flange of the bolster. In place of the usual truss planks, light steel pressings in the form of square pans are placed between the posts, the side flanges of the pans being tied together through the posts forming a continuous truss. The bottom flange is tied in with the inner flange on the girder pocket, and the top flange, finished off, is used as a seat support. These pans are lined with insulating material and hold the heaters and, in addition to the castings at the window stool, they insure proper spacing of the intermediate posts.

The bolsters are of cast steel; the top and bottom flanges are widened to 12 in. at the ends, and fastened with turned machine bolts between two extra wide gussets riveted to the bottom and the inner flange of the girder pocket. These gussets follow the girder to

BAY STATE CAR EQUIPMENT—VIEW OF UNDERSIDE OF CAR

about 20 in. in front of the bolster, where it receives the extended platform supports which again are tied in at the body corner with the end sill, side girder and corner post with a bracket-shaped steel pressing and a gusset plate extended downwards lapping the side of the platform support. The latter is also suspended from the end sill with a U-shaped angle-iron stirrup, whose ends are flattened and bolted horizontally against the end sill, bent over and bolted vertically to the corner gusset to insure proper clamping of the supports. The end sills consist of a 10-in. x $3/16$ -in. steel plate and two angle-iron stiffeners riveted to the inner edge of the sill at the top, where it receives the body floor supports and the extended threshold plate, and on the outer edge at the bottom where it is tied to the platform supports and receives the platform floor furrings.

The platform supports are channel-shaped $1/4$ -in. steel pressings, $10\frac{1}{2}$ in. deep at the end sill and tapered off to 6 in. at the ends, where they are tied together on top and bottom with steel plates edged with angle iron. In the center between these plates the draft rigging, a combination drawhead and spring-cushioned bumper of special design, are carried. The crown piece and the floor are also bolted to the top flange of the platform sup-

ports and diagonal cross-braces run from the body corners to the platform support, where they are tied in through the web of the latter with pressed-steel brackets supporting the vestibule corner posts and the upward extended anti-climber bumper, which had to be kept a certain height from the rail to insure interlocking in case of colliding with other cars with higher platforms. The bumper is also braced between the platform supports with triangular-shaped steel pressings, tied to the top gusset plate.

The center construction of the bottom framing is made up of two needle beams and diagonal braces tied together at the side members with pressed steel gussets, and in the center of the car the braces are tied in with a channel-iron center beam by a liberal-sized gusset in such a manner as to give the maximum of clearance for brake rigging, pipes and wire conduits carried above the equipment between the needle beams. The latter are constructed as queen-post trusses, reinforced at the top with a floor furring tied to the side member gussets. This lends stability to the side members and is especially adapted for floor support and to resist the load of the equipment which is suspended between the two needle beams.

Floor support over the motors and wheels is made up of three light T-shaped steel pressings, strung from needle beam to end sill and tied to the top flange of the bolster and bridged across with angle irons, backed with floor furrings. On each side of the bolster an additional T-bar extends from the end sill back beyond the bolster the full length of the longitudinal seat framing, the latter being integral with the floor supports. This construction gives practically a flush floor over the motors and wheels, the floor being laid in between and parallel to the web of the T-shaped pressings. The matting consists of strips of $7/8$ -in. maple, carried above the floor instead of flush with it, facilitating cleanliness and solidity of floor construction.

Bulkheads were constructed with unusually large openings and disappearing bulkhead doors, the doors being designed to operate in pairs, with one leaf sliding at double the speed of the other. The door pocket is narrower than the longitudinal seat alongside, thus offering no hindrance whatever to the movement of the passengers, whether in ingress or egress. The skeleton construction of the bulkheads consists of a $1/8$ -in. pressed-steel cornerpost reinforced with a $3/16$ -in. pressed angle riveted to the side girder and laced up with the door post, a light steel pressing, with $1\frac{1}{2}$ -in. x $1/8$ -in. bars and tied across overhead with a pressed-steel pan shaped to suit the curvature of the roof. This pan with the skeleton frame on the outer edge of the corner posts, consisting of pressed-steel flanged angles, forms the usual pocket for the door hanger, the latter being a ball-bearing hanger of special design.

The side posts are $1\frac{1}{2}$ -in. x 4-in. ash, with separate sash runs and facing cap glued and screwed on. The upper sash, which is stationary, is built and runs continuous from corner post to corner post, the rails being halved in with the intermediate posts under the facing. This stiffens the construction as much as would a letterboard 19 in. wide while the actual letterboard is only $6\frac{1}{2}$ in. wide.

There are eleven steel carlines $1\frac{1}{2}$ in. x $1/4$ in. extending from side to side in one piece tied to the monitor and body roof rafters and bolted down to the side of the body plates.

Agasote headlinings are used and the finish is natural cherry.

The trolley base support is constructed as a short bridge, bolted securely to the rafters and steel carlines, instead of the usual trolley planks.

Safety zones have been marked off for three blocks on both the near and far sides of crossings on Main Street in Joplin, Mo. The zones are 60 ft. long, and 7½ ft. wide from the outside rail, and are painted on the pavement in white. Traffic will be allowed to pass these zones at all times, while the previous rule requiring traffic to stop 10 ft. behind a standing street car will be observed elsewhere.

A 1500-Volt Interstate Interurban Railway

Opening of the Brigham-Wellsville Section of the Ogden, Logan & Idaho Railway Marks Completion of Important Interurban Project

The completion of the last link in the system of the Ogden, Logan & Idaho Railway between Brigham and Wellsville, and the inauguration of through service between Ogden, Utah, and Preston, Idaho, was celebrated on Oct. 27, as noted previously in the ELECTRIC RAILWAY JOURNAL. The closing of this gap makes it possible for a passenger to travel by electric railway from Springville, Utah, to Preston, a distance of 186 miles. The trip is over three independent systems, but it is expected that in time through trains will be run.

The interurban lines pass through the center of the richest portions of Utah and serve 80 per cent of its population. They parallel for the greater part of their route the steam railway lines serving the same territory. On the north the Ogden, Logan & Idaho Railway runs between Ogden, Utah and Preston, Idaho, a distance of 96 miles. It passes through the northern end of Salt Lake valley, noted for its apples and peaches, and through the southern end of Cache valley, known as the granary of Utah. Its tracks are on private right-of-way throughout most of the route.

The Salt Lake & Ogden Railway operates between the two cities from which it takes its name, the largest two cities of the State, a distance of 36 miles. It serves the fertile territory lying between the Great Salt Lake and the Wasatch range of mountains, the richest and most intensively developed farming section of the State.

O., L. & I. RAILWAY AND CONNECTING LINES

This line has been completed since 1908, and has been operated by electricity since 1910. Considerably more than half of the line is now double tracked and work is progressing on the remainder.

The company operates out of Salt Lake City from a temporary joint depot with the Salt Lake & Utah Railroad. The two companies now have under way negotiations for a site for a joint terminal depot, and as soon as these can be settled and the necessary rights-of-way secured work will be started on an adequate terminal station.

The Salt Lake & Utah Railroad, the southern end of the interurban chain through Utah, operates between Springville and Salt Lake City, a distance of 54 miles. A 6-mile extension to Payson, which is to be the southern terminus of the line, is under construction. This line was first opened under electric operation on July 24, 1914, between Salt Lake and Provo, a distance of 48.5 miles. The line traverses a rich agricultural section in Salt Lake County lying west of the Jordan River which has not hitherto had convenient transportation facilities.

The new line has been designed for high-speed, heavy

service. The track is on private right-of-way, this right-of-way averaging 65 ft. in width. Seventy-pound rails and catenary overhead construction have been used throughout. New passenger, freight and express depots have been constructed in practically every town along the line.

The company secures its power from the Utah Power & Light Company's system, consisting of hydro-electric plants with an aggregate capacity of 75,000 kva. and a 20,000-kva. steam auxiliary. This power is transmitted at 44,000 volts to one portable and three permanent substations. Each permanent substation contains one Westinghouse 500-kw. three-bearing motor-generator set, each set consisting of a 1500-volt, compound-wound commutating-pole d.c. generator and a 2300-volt, three-phase, 60-cycle synchronous motor, with exciter. Each of the three transformers of a set has a capacity of 235 kva., and in the bank both primary and secondary windings are connected in delta with taps provided for obtaining reduced voltage at starting. The particular capacity and arrangement of the transformers were selected with a view to operation in open delta in case of damage to one of the three units.

Several new all-steel triple-compartment interurban cars were placed in service on the Logan division of the line before the Brigham-Wellsville line was completed. The new cars, which were built by the

and stopping the compressor, but allowing the dynamotor to continue running.

The lighting equipment for the cars consists of two circuits of seven 56-watt tungsten lamps with Alba shades. Headlights and heaters operate direct on the 1500-volt circuit.

To accommodate the local traffic in the city of Logan, the present four-motor, double-truck, forty-passenger cars have been changed over to operate with straight 1500-volt equipment. Each car is equipped with two Westinghouse 543-A-6, 750-1500-volt motors, connected permanently in series and controlled by R-200 double-end equipment.

Three 50-ton Baldwin-Westinghouse locomotives are used for hauling freight. In these the equalized pedestal construction was employed, permitting the use of simply-designed trucks, with half-elliptic springs and rigid bolsters.

The four motors on this locomotive are type 562-A-6, rated at 75 kw. They are built for forced ventilation, but also have fans on the armature shafts of capacity sufficient for operation at three-quarters load with the blower out of commission.

The present electric interurban system has been accomplished by such men as Simon Bamberger, for many years president of the Salt Lake & Ogden Railroad; the late David Eccles, former president of the Ogden, Logan & Idaho Railway, and his successor, M. S. Browning, and W. C. Orem, president of the Salt Lake & Utah Railroad. P. D. Kline of Ogden, Utah, general manager of the Ogden, Logan & Idaho Railway, formerly had charge of the building of the Salt Lake & Ogden interurban lines from Ogden to Salt Lake, and since that time he has had entire charge of the construction of the new interurban lines of the Logan division of the Ogden, Logan & Idaho Railway and has been responsible for the operation of all the lines of the latter company.

Miami to Open Storage-Battery Line

The Miami (Fla.) Traction Company will begin street railway service with four storage-battery cars early in December, adding trailers as the increase of business may demand. An article describing some features of the road, particularly the rolling stock, was printed in the Oct. 30, 1915, issue of the *ELECTRIC RAILWAY JOURNAL*, page 920. The following additional facts have since been received from the company. With the exception of an unsuccessful attempt to furnish such service, made about eight years ago with one car, this is Miami's first electric railway. Up to the present time bicycles and automobiles have been largely used on account of the smooth, hard-surface roads which are characteristic of the city and vicinity. The road will comprise about 3½ miles of track laid with 105-lb. grooved rail in the business section and 80-lb. T-rail elsewhere. The railway will traverse the principal streets of the city and, beginning at the corner of Waddell Street and Avenue C in the northern section, in a thickly-settled residential neighborhood, it will run south on Avenue C, parallel with Biscayne Bay to Twelfth Street, the center of the tourist hotel district. Thence the route will lie along Twelfth Street, the principal business thoroughfare, across the Miami River into Riverside, a residential section, through Lawrence Estate to the baseball park. The Boston National League will make this park its winter training ground for the next five years. The terminus of the line is at Sixth Street, just beyond the ball park in the northwestern section of the city, where the carhouse and power house are located.

50-TON LOCOMOTIVE IN SERVICE ON O., L. & I. RAILWAY

American Car Company, are 62 ft. in length over all, and have a seating capacity of seventy-five passengers. The electrical equipment on the cars consists of four Westinghouse 334-E-6, 750-1500-volt motors, each with a nominal rating of 85 kw. On the higher voltage the motors are operated in series so that there is a potential of but 750 volts across each motor. They are geared for a free running speed of from 47 to 50 m.p.h. on the level, with an average of 1350 volts on the trolley.

The unit switch control apparatus is of the HL type, differing from the standard outfit in the provision of unusually great creepage distances, exceptionally powerful blow-out coils and additional switches connected in series to break the arc.

The air-brake equipment consists of Westinghouse AMM combination straight and automatic air-brake apparatus with M-24-A brake valve. A continuously-running dynamotor furnishes 750 volts for the control and lighting circuits and the air compressor. This compressor is connected mechanically to the dynamotor by means of a multiple-disk clutch, which is normally held by a spring in a closed position. Whenever the air pressure reaches a predetermined value, the governor admits air to a small cylinder, disconnecting the clutch

C. E. R. A. Meeting on November 19

A Joint Folder with Maps and Time-Tables Will Be Issued—There Was an Interesting Discussion on Automatic Substations and the Transportation of Package Freight—Abstracts of Two Papers and the Report on Standard Interchange Rules Follow

Friday's session of the Central Electric Railway Association's two-day meeting at Indianapolis, Ind., held on Nov. 18 and 19, was attended by more than 100 members, and the interest and lively discussions of the first session continued.

E. B. Peck, vice-president Terre Haute, Indianapolis & Eastern Traction Company and chairman of the joint folder committee, submitted the report of that committee. He said that the committee had been at work for more than two years endeavoring to bring the time-tables and maps of all member companies into one folder. For various reasons a number of the companies at first were opposed to this plan, but lately there had been a change of opinion. Active and progressive work and the immediate issuance of a joint folder were now possible. The committee recommended that the folder be issued monthly and that it show all lines and time-tables. As to the demand for the folder, Mr. Peck said that requests had come from all parts of the country for such information. From another standpoint he said the association had taken the lead in many things and should continue so doing by publishing the joint folder. It would induce interline and long-distance travel, and thus afford a means of increasing revenue. Concerning the possibilities of interline travel, he called the association's attention to that at the Indianapolis terminal. One railway company transferred 2714 passengers to two other railways during the month of August. This same road transferred 2272 passengers in September. This, he said, was evidence of the demand for interline travel and the necessity for promulgating information concerning the facilities for transfer at all junction points. To bring about the prompt issuance of a folder, Mr. Peck asked the association for an indorsement of the plan of the committee.

President Henry emphasized the importance of the work of the joint folder committee. At first the committee had met strong opposition, then there was a difference of opinion, and now practically all the railways in the association territory wanted the folder. He said that while the economy feature was attractive, it was the smallest advantage to be secured from the issuance of a joint folder. The advertising of the service, which in turn should induce long-distance passenger travel, was the greatest value of such a folder.

John Benham, International Register Company; F. R. Dunbar, Union Traction Company of Indiana, and S. B. Hutchins, Westinghouse Airbrake Company, also indorsed the recommendation of this committee. Each believed that a joint folder would stimulate traffic. Mr. Dunbar also suggested that this folder should advertise the interchangeable mileage now used by the member companies. At the close of the discussion a motion by E. F. Schneider, Cleveland, Southwestern & Columbus Railway, that the president appoint a committee of five to arrange for and supervise the publication of a joint time-table folder and give the committee full power to act, was unanimously adopted.

At this point W. A. Carson, Evansville Railways, moved that a committee be appointed to take up with experts the matter of general advertising with a view of evolving a plan which the association could adopt. He said he had in mind an advertising campaign such as was being used by the telephone companies, banks

and electric appliance companies. If the electric inter-urban lines were kept before the public, Mr. Carson believed that this would serve as a passenger traffic accelerator. He was of the opinion that such an advertising campaign should be handled by a central committee to reduce the cost. Prepared advertisements and cuts could be used in the local newspapers and on cars. Acting upon this motion, which was approved by the association, the president appointed as members of the committee, W. A. Carson, chairman; A. D. B. Van Zandt, Detroit United Railway; J. H. Drew, Drew Electric & Manufacturing Company; C. J. Laney, Cleveland, Southwestern & Columbus Railway, and R. A. Crume, Dayton & Troy Electric Railway.

AUTOMATIC SUBSTATIONS

Edward Taylor, engineer General Electric Company, then read his paper on "Automatic Substations." In this paper Mr. Taylor defined an automatic substation as one which is operated entirely by the requirements of the system supplied. He pointed out that the determination of the necessity for starting a rotary converter, and the manipulations necessary in starting it, do not require the factor of human judgment. While there are abnormal conditions which arise quickly, each has a physical manifestation which can be utilized in operating suitable relays.

He showed how, under certain circumstances, considerable energy and labor saving can be produced by this type of substation, referring in this connection to the article by C. M. Davis which was abstracted in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 9, page 772. Mr. Taylor estimated that in some cases an automatic substation will pay for itself in about two years, and that a 300-kw. substation may show a yearly saving of \$4,700 after so doing.

In order to make the paper concrete the author discussed the equipment of the Union substation of the Elgin & Belvidere Electric Railway, which was described in detail in the issue of the ELECTRIC RAILWAY JOURNAL for Sept. 18, 1915, page 583. In this substation an important feature is the load-limiting resistance which is automatically inserted to prevent excessive overload. He said that while a similar protection can be accomplished by the use of long feeders this is less economical of power.

Among the points which Mr. Taylor made in favor of the automatic substation and of the application of the same principle to the operation of station units were the following:

The distribution of d.c. power supply from a large number of substations of small capacity, rather than from a small number of large substations, results in a smaller voltage drop in the return system and therefore less danger of electrolysis troubles.

The same distribution results in a smaller line loss or a saving in overhead copper, or both, and may render unnecessary the use of voltages higher than 600 in some cases. The possibility of using automatic substations should, therefore, be considered in the selection of trolley or third-rail voltages.

The load-limiting device used with the automatic substation operates to produce more reliable power supply by eliminating unnecessary opening of circuit-breakers

and by reducing the danger of rotary converter flashing.

The use of a motor-driven drum controller insures the proper sequence of operations and the maximum economy of time in performing these operations.

The system is particularly well adapted to the control of motor-generator sets, which can be automatically connected to the line in six or eight seconds.

The automatic control features are applicable to substations containing several rotary converters, not necessarily to the extent of dispensing with all attendance but rather to permit reduction in the force and increase in the station load factor. A schedule of operations could be decided upon in advance and the apparatus adjusted to carry it out. For example, this schedule might be arranged thus: Up to 2000 amp. rotary No. 1 operates alone. After the load has been 2000 amp. for five minutes, or if it suddenly increases to 3000 amp., No. 2 is to be cut in. If the load goes to 4000 amp. for five minutes, No. 3 is to be cut in, etc. A similar routine would be followed in cutting units out of circuit. Such a schedule would be difficult to maintain with manual operation.

In concluding his paper Mr. Taylor discussed the reliability of the automatic substation. While no device is infallible, this apparatus contains fewer moving parts than a multiple-unit train control, it is simpler and more rugged than an automatic railway signal system, and it is less complicated and has fewer parts than a storage-battery and booster set. It contains standard relays and contactors such as are used in steel-mill service. They are arranged so that the failure of any single device would do no more than make the station inoperative until an inspector could give it his attention. The contact-making voltmeter is the same as the one successfully used for years in the Tirrill regulator where the service is many times more severe.

A lively discussion followed, confined largely to inquiries concerning how the automatic substation would meet operating conditions. A. Schlesinger, superintendent of distribution Terre Haute, Indianapolis & Eastern Traction Company, opened the discussion. He wanted to know how the automatic substation would take care of rotary converter buck-overs which, he said, frequently occurred, even when the utmost care was exercised. He also asked what safeguards were provided when work was being done on the transmission lines, and also, in case the machine became defective, what arrangements were made to cut it out of service.

In response Mr. Taylor replied that the automatic substation had limitations but that the new type of circuit breaker would prevent bucking over. In a station where it had been in operation for over a year the commutator was in perfect condition, and in numerous observations no sparking had been observed. In order to prevent the mechanical defects which might interrupt operation frequent substation inspections were necessary. Inspectors should also be on duty when anyone was working on the transmission lines.

G. H. Kelsay, superintendent of power Union Traction Company of Indiana, objected to the inclusion of resistance between the circuit breaker and the line. He was of the opinion that this would add load to the line which would make it impossible to meet abnormal conditions. He thought the resistance would reduce the capacity of the station and lower the voltage greatly. Mr. Kelsay also suggested that while a closer distribution of substations would help line voltage, the hourly service rendered by most electric interurban lines did not lend itself readily to such an economy. He also believed that the use of feeder taps near a substation was false economy. Concerning the elimination of substation attendants, he said that on his road most of the

substations were located where the attendant also served as a ticket agent, hence the company could not dispense with his services. Mr. Kelsay also observed that lightning protection would be difficult to care for even though an automatic substation would make better provision for it than had been the case heretofore. He also asked how the automatic control installation would operate in case the old rotaries were used.

In response, Mr. Taylor said that the apparatus was designed to be installed in old stations and would prevent flashing over. The objection to the resistance in the outgoing lines, he said, was rather difficult to answer because the resistance was the same as a long feeder, and in his opinion much better. On the other hand, the resistance was in the circuit so short a time that the power losses were insignificant. Mr. Taylor stated that automatic substations were designed to pull capacity loads at all times, hence the resistance was necessary.

Mr. Kelsay then said that he thought that rotary converters for interurban road requirements should be designed more liberally, particularly as regards the size of the commutator. He believed that better results would be obtained where instantaneous high peaks occurred if the commutator was of 1000-kw. capacity on a 500-kw. rotary.

J. E. Cochran, superintendent of distribution Ohio Electric Railway, expressed the belief that electric interurban roads would be forced to adopt automatic substations as an economy measure. He said that during four hours of the night an attendant was unnecessary at substations in ordinary operation. There were, in addition, two or three hours when only freight trains passed over the line. In case the substation could be brought into service only when required, it would represent a considerable saving. He was rather skeptical, however, regarding switchboard maintenance, being of the opinion that it would be high with the additional apparatus necessary for automatic operation.

PACKAGE FREIGHT ON PASSENGER CARS

W. L. Foreman, traffic manager Louisville & Northern Railway & Lighting Company, continuing the program, then read a paper prepared by J. F. Strattan and himself, entitled "Package Freight on Passenger cars." An abstract of this paper is published on page 1078.

In the discussion which followed, F. D. Norviel, general passenger and freight agent Union Traction Company of Indiana, said that he believed it was good practice to handle package freight on passenger cars. Practically all the lines operating out of Indianapolis pursued that policy profitably. It was also desirable, in his opinion, to set some standard fixing the amount or size of package which passengers should be permitted to carry.

E. F. Schneider said that he was endeavoring to eliminate the carrying of package freight on passenger cars. When freight was carried on passenger cars it was impossible to discriminate against the undesirable classes; therefore, he believed the best policy was to eliminate the practice altogether. He also said that his road did not allow large packages in the racks, and in this way eliminated accidents to passengers from that source.

At this point President Henry closed the discussion with the statement that the meeting had been one of the most profitable in the history of the association. Before adjourning and upon motion, the hotel and arrangement committee was authorized to plan a three-day boat trip for the June, 1916, meeting.

Abstracts follow of convention papers and reports not published last week.

THE INTERURBAN

BY HON. J. F. MCCLURE, MEMBER PUBLIC SERVICE
COMMISSION OF INDIANA

The introduction of the interurban as an agency of transportation has tended more than any other factor to unify the neighborhoods of the State into the larger community. Formerly the inhabitants of near-by cities were comparative strangers, and by reason of their segregation and lack of intercourse, frequently entertained feelings of hostility for each other. The change in habits, customs and conventionalities of our social condition have been much greater during the lifetime of the older members of the association than during all the time since the discovery of America by Columbus.

There are, in round numbers, 2200 miles of traction lines in Indiana, including city lines outside of Indianapolis. The properties are operated and under the control of twenty-five different companies. The longest mileage of any one company is 428, and the shortest 10. The lines of practically every electric road parallel a steam road. This competitive condition does not exist between interurbans, except in a very few instances between near-by points. The companies maintain hourly service between the more important points, and a two-hour service for rural and smaller points, during eighteen hours of each day.

For the years 1912, 1913 and 1914, complete reports for all companies have been filed with the commission, which show the number of passengers carried per year to be as follows: 1912, 106,355,292; 1913, 113,621,528; 1914, 123,262,730. For the same years the operating revenues were: 1912, \$10,546,910; 1913, \$11,443,020; 1914, \$12,293,622. During the latter part of this period there was a small increase in mileage operated, but not sufficient to account for increase in volume of travel or in receipts. The net revenues for the same years were: 1912, \$4,130,304; 1913, \$4,564,216; 1914, \$4,748,234, and the percentages of net revenue to operating revenue were: 1912, 39.1; 1913, 39.8; 1914, 38.6. The revenues in most instances have been augmented from the sales of current for light and power to municipalities and individual consumers along the lines, and the net revenue is 7 per cent of the bonded indebtedness.

A recent comparison of the revenues of the principal companies, made by their own accountants, show a reduction in operating revenues for the first eight months of 1915, compared with the same months of 1914, of $7\frac{1}{2}$ per cent.

The annual reports of the companies operating lines in Indiana show that there has been issued stock of the par value of \$86,458,285, and that the bond issues aggregate \$68,417,947. This shows a total average capitalization of more than \$70,000 per mile of line, and an average bonded debt of \$31,000 per mile of line. This would indicate that the par value of the bonds approximates the reproductive cost of the lines, based upon estimates from time given by men engaged in the business of operation. It would appear that the business of the interurban is not only sound, but is reasonably remunerative.

COMPETITION FROM AUTOMOBILES

Within the past year a new element of transportation—somewhat erratic and undependable—has arisen, which introduces a competitive condition in street railway traffic. It is as yet problematic as to what effect the automobile, as a common carrier, will have upon the transportation question. It undoubtedly will be a factor to be considered, both by the State and by the electric railway companies, in the matter of regulation and as a competitive quantity. It would not seem that it would

be a permanent or serious matter; at least, under present conditions. The difficulty of maintaining dependable service at all times of the year is quite out of the question; and, at most, under present-day conditions, it should be limited to a supplemental service to well-equipped and efficient car lines. I take it, however, that it only has an incidental effect upon the interurban, and would not be serious except for the fact that the properties are jointly owned and controlled.

The problem thus presented must be solved by the traction lines by improved service. This is particularly true of city service. The demand for more extended service brought the jitney into the field, and it will remain—under some regulations, perhaps—as long as the demand will justify its use. In fact, it appears that it may be made a useful facility to supplement the street car service.

The interurbans, however, must, we think, meet competitive conditions that arise or are likely to arise with steam roads. The steam lines entering Indianapolis, with one exception, are paralleled by electric roads for distances from 20 miles to more than 100 miles. Some of these steam lines are already double tracked and could be electrified to compete for the local traffic. It is probably true that the steam carriers under-estimated the competition of the interurban in the beginning, or there might have been greater effort made to keep them out of the field by providing local service along their lines. All the while inventions are appearing, intended to improve the methods and cheapen the cost of tractive power, and it is within the range of possibility that keener competition may develop between the different carriers.

POSSIBLE FUTURE IMPROVEMENTS

The public justly demands adequate service at a reasonable cost of every utility. In the matter of adequacy of service, as applied to the electric roads, it involves frequency of trains, speed, comfort, safety and reasonable fares. The passenger is entitled to be provided with comfortable service. The average interurban car does not, under all conditions, do this. It may be said, I think, that the ventilation of the interurban car is crude and inefficient and that the heating methods employed are equally subject to criticism. Very little improvement has been developed in either of these important matters since the lines have been operated. Business has adjusted itself to all the modern time-saving devices, and the interurban railway is one of the most important devices of this character. This feature of the service is to be commended rather than criticised. Shortening of routes through cities and straightening track will aid in the expeditious movement of trains.

During the last five years the companies in this State—and I think it is true generally—have given to the subject of safety more serious consideration than at any previous period. Automatic block signals have been installed on a large amount of the mileage of the lines, and it is exceedingly desirable to have this equipment extended so that all lines operating opposing trains should be so protected.

In the matter of fare, both the public and the carrier are interested. The traveling public is willing to pay a reasonable charge for the service furnished. It should not be required to pay any more. In all the territory in which the members of this association are located passenger fares are fixed on steam roads, at least, by statute. This operates to keep interurban fares within the limitations of the statutes. The law generally declares the rule to be that the fares, tolls and charges of a public utility shall be so adjusted as to enable the owners thereof to receive a reasonable return on the value of the property devoted to the public use. It is

clear that two utilities cannot—operating in the same field under competitive conditions—furnish their service as cheaply as where one company supplies the entire demand, unless it be a telephone utility, which seems to be an exception. With interurban transportation, it is quite apparent that a consolidation of the lines under one management, or, at most, two companies, would be desirable. As between themselves they are not competitive, and therefore no objection to the merging of them could fairly be made. They will continue competitive with steam lines, and they should not be dominated by these interests. The economies capable of being introduced as a result of consolidation would be very great. In the matter of the reduction of power equipment, the increased volume of supplies to be purchased, better financing conditions and other incidental reduction in cost of operation would necessarily reduce the expense of operation and at the same time improve the service.

It is important that the interurban shall be strengthened and extended as a transportation factor. It is essential to the prosperity of the merchant, farmer and laborer. It is best adapted to providing means of transportation locally for the masses and makes the town and country one community, to the advantage of both, and adds, in addition to all these benefits, a large sum to the wealth of the State and aids in bearing public burdens.

PACKAGE FREIGHT ON INTERURBAN CARS

BY J. F. STRATTAN, TREASURER, AND W. L. FOREMAN,
TRAINMASTER, LOUISVILLE & NORTHERN RAILWAY
& LIGHTING COMPANY

Interurban companies generally have been confronted with the problem of what limit should be placed on the size of packages, other than baggage, which passengers expect to carry into the car with them and have transported free. To a certain extent they have felt that they should extend to their patrons all of the privileges granted by their steam road competitors, and allow passengers to carry packages of almost any size, although the electric roads cannot do this as well as the steam roads, because, as a rule, the electric cars are smaller than the steam railroad cars and are generally run in one-car trains.

We believe that the liability to accident is by far the most important item to be taken into consideration. We are all familiar with the dangers connected with the overhead package rack. While racks are almost a necessity, there is no doubt that in their present form they are a menace to public safety, and a rack which would combine both safety and convenience would be welcomed both by the company and the public. If the package racks were made safe and no restrictions placed on the size of the package carried inside of the car, the aisles and unoccupied seats would at times be filled with merchandise of every description, making entrance and exit very difficult and dangerous, and interfering with the quick and safe operation of the car. We shall try to explain what we have done toward solving this problem.

The Louisville & Southern Indiana Traction Company operates a line between Louisville, Jeffersonville and New Albany, via the Louisville and Jeffersonville bridge. It operates a freight car between these three cities, maintaining freight stations at each point, and it operates a passenger service on a thirty-minute headway throughout the day and on a fifteen-minute headway from Louisville to Jeffersonville during rush hours.

When the line started the cars were equipped with package racks, and no restrictions were placed on the

size of any package which a passenger wished to carry free of charge. The cars are equipped with spacious platforms, and passengers were allowed to deposit any kind of package, which they could lift by themselves or with the help of another, onto the platforms. After a few months it developed that some means must be found to regulate this practice, which interfered materially with the operation of the line, increased the accident liability and in many other ways interfered with the transportation of passengers. It was finally decided to abolish the package racks and to make a charge of 10 cents for all packages carried onto the car which could not be conveniently held, provided passengers would place them on the front platform and remove them on arrival at destination. At this time it was not necessary for the package to be way-billed, the amount of the charge being collected by the conductor and turned in at the end of his run with the other remittance.

After this rule had been in effect for some time it was found that there was a demand for a quick express service between the cities served, request having been made by quite a large number of people who did not wish to accompany packages on the car but wanted us to handle them. As there were many teaming companies which operate between Louisville and the other two cities and can cut whatever rates are made at will, it was finally decided that all we could expect to get for packages carried on passenger cars was 10 cents. Packages of this character, it was ruled, must be presented to the freight agent and way-billed in the usual manner. These packages were placed on the front platforms with the motorman, and the freight agents at the different stations met the cars and removed the packages to the freight office, where they were called for by the consignee. By way of further explanation, no passengers were allowed to ride on the front platforms of our cars, and, as stated before, these platforms are spacious, and packages do not in any way interfere with the motorman in the performance of his duties.

We found that this not only increased our revenue without increasing our costs but left more space in the freight car for heavier freight. At the same time it reduced the liability to damage of the lighter packages.

For the convenience of shippers and to meet competition, a collection and delivery system was then inaugurated, and stamps in \$5 and \$10 books were sold at a discount of 10 per cent, provided that the purchaser would deliver the freight to our terminal for transportation. Advantage was taken of this service by a number of the larger stores in Louisville, which maintained a delivery service in New Albany or Jeffersonville, the traffic grew in volume, and we have always felt that it was very beneficial to us.

The system of having the conductor collect for packages accompanied by a passenger was not altogether satisfactory, as we had no check on how many packages were being carried other than what our inspectors could report to us. It was desirable to change this system, but we disliked to do anything which would make it more difficult for a passenger to travel and transport packages over our line. About this time the war tax stamp act went into effect, and we were obliged to make it a rule that all packages should be presented to our freight stations, everything being way-billed so that we then had a complete check on all shipments offered for transportation.

The operations of this company are more in the nature of a suburban road, although the towns which they connect are larger than those reached by most suburban companies, and it is therefore classed as an interurban road. This is not the case, however, with the Louisville & Northern Railway & Lighting Company,

FORM B—NOTIFICATION OF FOREIGN CAR DAMAGE

nominal length of the time required for the execution of such repairs, to be used as a basis of settlement by the companies involved. An agreement as to the cost of repairs and length of time required for them will then be made within ninety-six hours following the owner's receipt of the original notification, after which the report may be executed by either the owner or operator, as may be agreed upon. If a satisfactory basic estimate of damage cannot be agreed upon within ninety-six hours, the cars will be repaired by the owner, and the actual cost of material and labor, plus 15 per cent, together with rental charges, will be invoiced against the operator.

In case of damage to foreign equipment by collision or derailment, the responsibility shall be decided upon between the companies involved, and if a conclusion cannot be reached, the case may be placed before a board of arbitration, as hereinafter provided.

In case of damage to foreign equipment by collision or derailment, the operator shall pay the regular per diem charge as established by the Traffic Association to cover the ninety-six hours allotted to the joint inspection of cars and the estimated length of time required for repairs, when such estimates are agreed upon. In the event of a disagreement, the rental charges will cover the ninety-six hours and the time in days or frac-

FORM C—FRONT AND BACK OF TAG FOR RETURNED MATERIAL

tions exceeding twelve hours actually required for the execution of the repairs, whether executed by the owner or operator. In the event of agreement, the operator may loan to the owner, and the owner should accept, a car for its use in lieu of the rental charges provided above.

On the first of each month the operator will forward promptly to the owner a statement of the individual mileage operated by the owner's cars, for its information in connection with maintaining mileage records of cars and car equipment.

Two clauses then follow in the proposed agreement relating to the methods of settling controversies over the interpretation of the rules and the establishment of a board of arbitration.

The report was signed by S. W. Greenland, H. B. Cavanaugh and S. R. Dunbar, committee, and also bears the approval of the chairman and secretary of the standardization committee.

The Missouri Public Service Commission has issued Vol. I for the period from April 15, 1913, to Dec. 31, 1914, containing the miscellaneous orders, authorizations, investigations of accidents, general inspections and conference rulings made by the commission during this period.

Gasoline Motor Car on Rails in the Pacific Northwest

When the bottom dropped out of the mining boom in the Monte Cristo district in the Cascade Mountains, 90 miles north of Seattle and 50 miles from Hartford, Wash., the railroad system, operating between Hartford and Monte Cristo, built by the Rockefellers at a cost reported to be in excess of \$2,000,000, failed to pay expenses and was virtually abandoned. Some time later the Northern Pacific Railway attempted operation but found the cost prohibitive even for running cars at irregular intervals, and the railroad company turned over the right-of-way, tracks, good will, etc., to Rucker Brothers, timber dealers in Everett, Wash. This concern utilizes the line in logging-off a vast area of timber lands lying adjacent to the tracks.

In the section covered by this line, there are several hundred people who need some sort of transportation service. Rucker Brothers speedily discovered that it would be unprofitable to operate a railway service and

MOTOR CAR ON HARTFORD EASTERN RAILWAY IN THE CASCADE MOUNTAINS

instead are utilizing the motor car shown herewith which uses the rails already laid. The car is a 1½-ton White truck chassis, equipped with steel wheels, accommodating twenty-two passengers. The car is a stock model in all respects, with the exceptions that rubber-tired wheels are replaced by 29-in. steel wheels and the wheelbase is lengthened to 157½ in. Three steel trusses were added to the frame to support the extra wide body, and the steering arms were made stationary. The four-cylinder, 30-hp. motor, the four-speed transmission and the axles are regular in every detail.

The front wheels are disconnected from the steering wheel and made rigid by using a long steering arm from a 3-ton White truck attached to the frame. The driver's duties are to collect fares and signal at grade crossings, the latter being done by a whistle attached to the end of the muffler. The cars have a maximum speed of about 30 m.p.h., which can be maintained with a full load over the maximum grades of 2.9 per cent in fourth speed, which is an over drive, geared 2.91 to 1. It is seldom necessary to travel in third speed or direct drive, which is geared 4 to 1. The motor car makes round trips of approximately 100 miles, and a regular service has been established, during the tourist season, of two cars a day.

Regulation of Public Utilities

Leonard A. Busby, President Chicago Surface Lines, Explains Why Electric Railway Regulation Is a Particularly Difficult Problem and Discusses the Factors Involved in Regulation and in Good Service

At a joint meeting of the Chicago section of the American Institute of Electrical Engineers and of the electrical section of the Western Society of Engineers, held at the Hotel Sherman on Nov. 22, Leonard A. Busby, president Chicago Surface Lines, presented an extended address on the "Regulation of Public Utilities." Mr. Busby said, in part:

"With the exception of steam railroads, electric railways are by far the most important of the public utilities that are now attempting to meet problems of regulation. Railroads have been subject to varying forms of governmental control, through constitutions and statutes, since the early seventies. It is only within the last decade that electric railways in our larger cities, including street railways, elevated roads, and more recently lines operated in subways, have fallen heir to about all the ills with reference to regulation that could affect any utility.

"The companies which supply our cities with gas, electric light and telephones render an invaluable service. This service, however, is neither so universally used nor so vitally necessary to the welfare of the community as transportation, nor does the regulation of these utilities present the difficulties involved in the regulation of street railway service. In this city we do not hear much about the regulation of the gas company or the telephone company, except as to rates, and then the agitation usually precedes a mayoralty campaign. Not so with the companies furnishing transportation in large cities. In nearly every large city in this country the traction question at some time has been made a political football, and in no city to a greater extent than in Chicago. This is a factor to be reckoned with in considering the question of regulation.

"True, the agitation, as a rule, is not so much over the rate which is fixed either by statute or by contract ordinance—almost universally at the flat rate of 5 cents—as over the question of service. This question vitally affects in a direct, personal way almost the entire population of our cities, and daily involves the comfort and convenience of almost every citizen. A car is delayed a few minutes by a breakdown on the tracks or a blockade or from some other cause. This will probably inconvenience several persons. If the weather is bad, the discomfort may be extreme. When the blockade is lifted, the first cars must run by the next group of waiting passengers to adjust the headway—another ground of complaint. Then there are the questions of heating and ventilating the cars. One passenger wants heat, regardless of ventilation; another wants ventilation, regardless of heat—more complaints—calling for expert advice on the question of heating coils, thermostats, the merits of ventilating fans and systems of so-called natural ventilation. Then there is the rush-hour problem. The cars are overcrowded—more inconvenience and discomfort, and more complaints. This same problem exists in every large city in this country. Then there are complaints about the non-rush-hour service, of the failure, at times, of trainmen to observe the service rules and regulations of the company, of running by passengers, starting the car too quickly, and other miscellaneous happenings.

"Now, most of these complaints are perfectly natural. No one likes to wait for a car, much less in the rain or

extremely cold weather. No one likes to be passed up, or crowded, or jostled, or be obliged to stand up for several miles after a hard day's work, or to be treated discourteously by employees of the company. For some of these complaints the company may be charged justly with responsibility—some can be remedied, some cannot be eliminated entirely. The rush-hour problem has been with us for the last twenty-five years, and will be with us as long as the growth and development of this great city continue.

"But enough has been said to make it apparent that the field for the regulation of transportation utilities in large cities is broad enough to cover in principle about every question that can be raised with reference to any utility, and presents an inviting prospect to the sociopolitical agitator or reformer, and a very difficult problem to the utility. And with this promising field in sight the opportunity for experimental regulation has not been overlooked. State utility commissions, city councils, boards of control have all taken a hand, and in at least one instance all have tried their experiments on the same utility at the same time in respect to the same matters."

Mr. Busby then enumerated the various authorities which exercise supervision over the Chicago Surface Lines. They include the City Council, with its local transportation committee and transportation supervisor, the commissioner of health, the commissioner of public works, the commissioner of public service, the aldermen, each of whom has the transportation needs of his particular ward to look after as well as the transportation needs of the city, the Board of Supervising Engineers and the State Public Utilities Commission. Occasionally the orders from these different authorities clash and the companies are threatened with penalties if they do not do two opposite and contradictory things. For instance, at the present time the State board has ordered the company to operate trailers which are forbidden by the city ordinance. In this case the city has filed a bill seeking to enjoin the State board from enforcing this order and the company from complying with it. The matter now awaits the decision of the court.

PRESENT STATUS OF REGULATION

Continuing his discussion of the general subject of regulation Mr. Busby said, in part:

"I shall not attempt to trace the history of utility regulation, but shall assume that the prevalent popular opinion is in favor of the necessity of some system of regulation. It is a legal concept that these utility companies have devoted their properties to a public use—that they are engaged in rendering a public service, and are, therefore, subject to be controlled through some governmental agency representing the public. Hence we have State public utility commissions and various local regulating bodies, such as city councils, boards of trustees, committees and boards created by ordinance.

"The American public is insisting year after year upon higher and higher standards of service. The street railway service which the public would have accepted ten years ago would not be tolerated for a moment today. In fact, all of the energy, resources and inventive ability of those who have developed electric railway service have been directed towards providing an im-

proved service. This improvement has taken the course of furnishing the most modern and efficient power plants, the best possible track, roadway and overhead equipment, the best lighted, the best heated and the most comfortable cars which the development of the industry so far has produced.

"But there is another side to this question. While all these improvements have taken place, the fare upon which the companies have been compelled to supply and develop this service has remained stationary. It was 5 cents in the city of Chicago when the first horse car in 1859 was operated on State Street from Randolph Street to Twelfth Street—a distance of a little more than 1 mile. It is 5 cents to-day for a continuous ride within the city limits, a distance of 30.5 miles.

"This situation has not, as a rule, received fair consideration by those who have had to do with the regulation of these utilities. If there have been instances in the past of unfair treatment of the public by the public utility companies, such a policy is the exception and not the rule to-day, and there can be no question that the unfairness and abuses of which some of these utilities may have been guilty in the past have been more than paralleled by the treatment they have received and are receiving at the hands of their regulators. Year after year they are subject to wholly unnecessary interference with the operation of their properties by over-regulation, with all of the expense and embarrassment connected therewith, and, finally, with a constantly increasing pressure towards decreasing the return upon the investments already made.

"Now it is perfectly evident that while these regulators may control, to a large extent, the fate of the capital already invested, there is one element over which they have no control, and that is the prospective investor whose co-operation is absolutely necessary to the development of this utility. Not only this, but the investor of to-morrow will determine his course of action by reference to the treatment accorded the investor of yesterday.

"The electric railway industry in the United States to-day represents a total capitalization of approximately \$5,000,000,000; it employs approximately 300,000 men; it disburses in salaries and wages each year more than \$225,000,000. In 1912 the business had a gross income of \$585,930,517, and expended in operating expenses the sum of \$332,896,356. During the same year, 41,064 miles of track were operated. Notwithstanding the amazing increase in this industry in former years, and the enormous capital involved, the last few years have shown a startling change with reference to its development.

"During the five-year period from 1902 to 1907, the capital invested in electric railways increased 63.5 per cent, while during the five-year period from 1907 to 1912 the increase in capital was only 24.7 per cent, and the figures so far available covering the period from 1912 to date show a still further decrease in the amount of capital seeking investment in this business. During the five-year period from 1902 to 1907 the gross income of street railway properties in the United States increased 71.6 per cent. During the five-year period from 1907 to 1912 the increase in gross receipts was only about one-half of this amount, or 36.3 per cent. The capital increase from 1902 to 1907 was \$1,466,489,997, or at the rate of \$5,640,346 per week. The capital increase from 1907 to 1912 fell to \$933,796,045, or an average of \$3,591,523 per week—a decrease of more than 36 per cent. While the first period was one of unusual growth, yet the heavy decrease during the last seven or eight years challenges attention and demands an explanation.

"While the rate of fare has remained stationary, almost every factor in the cost of producing the service has increased. In the United States wages of street railway trainmen increased during the period of ten years from 1902 to 1912, inclusive, approximately 20 per cent, and the actual increase in average hourly wage on the Chicago Surface Lines from 1902 to the present time has been approximately 44 per cent. Furthermore, the cost of most items of material and supplies used in construction and operation has increased. The length of haul in Chicago has increased from 13.3 miles in 1907 to 30.5 miles in 1915. The average fare per passenger, taking into account the issuance of transfers for the year ending Jan. 31, 1908, was 3.02 cents per passenger. It was 2.80 cents per passenger for the year ending Jan. 31, 1915. It has only been by the most rigid economy that the companies have been able to make the stationary fare meet the increased operating expenses and higher standards of service. It is also apparent to anyone familiar with operating problems that many of these economies have already been carried as far as they can legitimately go, that the 'irreducible minimum' has about been reached, and that further efforts to reduce operating ratios by decreasing the expenses for maintenance and up-keep of power plants, track and roadway and equipment, afford no real solution of this problem, and only delay the final reckoning.

PURPOSE OF REGULATORY COMMISSIONS

"We now have State public service commissions having jurisdiction over electric railway lines in twenty-six States, exclusive of the District of Columbia or the Philippine Islands. We have State public service commissions having jurisdiction over interurban, but not urban, railway lines in five additional States. We have State public service commissions having no jurisdiction over electric lines but having jurisdiction over steam roads in fourteen other States, leaving but three States, namely, Delaware, Utah and Wyoming, in which there is not a public service commission of some kind.

"An examination of the public utility commission acts now in force shows the following: In thirteen of the States the act requires the charge for the service to be 'just and reasonable'; in five States the requirement is 'reasonable and just'; in two the requirement is 'reasonable'; in one the requirement is 'just and fair'; in one the requirement is 'must be reasonable'; in another the requirement is 'just and reasonable,' with the further qualification that 'no street or interurban railroad is to receive more than 5 cents for one continuous ride within the city limits, excepts when shown that the same is justified,' and another makes no provision as to whether the charge shall be just and reasonable, but says: 'No street railway is to charge more than 5 cents for one continuous ride within the limits of any city or town'; the others make no specific provision on this subject.

"On the question of service, the general provision is that the service shall be 'safe and adequate,' 'reasonably adequate,' 'safe, adequate and sufficient,' 'just, reasonable, safe and adequate,' 'reasonable, efficient and sufficient,' etc.

"The theory of these acts is that a definite relation exists between the service furnished and the charge or price for such service. The theory is economically correct, the unfortunate thing is that it is not applied in practice. The difficulty is that the two factors are not equally considered. There is a definite and a necessary relation between the service standard, or quality of service, and the price which is being paid by the public for the service. This situation results too often in a disregard of the principle that no service can continu-

ously be furnished at less than cost, and that a street railway, or any other utility, in that regard stands in exactly the same situation as any other business.

FACTORS INVOLVED IN GOOD SERVICE

"The people want good service from these utilities. But before we consider how to get good service by regulation, it will be necessary to have a clear understanding as to what factors are involved where the avowed purpose of regulation is to secure good service. There are three controlling factors to be considered in any regulation with respect to service:

"1—*Continuity of Service.* Provision must be made, not only for good service to-day but for good service to-morrow, and thereafter so long as the service is needed.

"2—*Extension of the Service.* Provision must be made not only for the continuance of the service in the territory or community where service is needed to-day, but also for its extension to keep pace with the growth and extension of the community.

"3—*Improvement of the Service.* Provision must be made for constant improvement so as to keep pace with the progress and development of the industry.

"The difficulties which have arisen in attempting to regulate these utilities are largely due, in my judgment, to the failure on the part of the public and its representatives to realize that these three elements are necessarily involved in regulation. The public does not understand, and has not been shown, that no satisfactory regulation or permanent solution can be had otherwise. The fact that the public is not well informed on this subject is partly due to the failure on the part of the utility companies to place these facts fairly and clearly before the public. For that we may assume our share of the blame.

"There is nothing new in this—it seems commonplace—perhaps it is—but it is fundamental. If you think it is not, take the history of any of the bitter disputes concerning regulation that have been waged before commissions, in the courts, in the public forum and in the public press, and see if in the last analysis the disputes did not directly or indirectly involve these factors.

"The main difficulty on both sides has been that each has had too narrow a view of the practical elements involved in this problem of regulation. The question has been viewed from the standpoint of to-day rather than from the standpoint of to-day and to-morrow. A mere order directing compliance with a certain standard of service does not solve the question of regulation nor end the responsibility of the commission or regulating body. Adequate provision for the maintenance of the service in the future must be made. The offer of a utility company to supply service presupposes the existence and operation of a suitable plant and equipment, and this involves the consideration of adequate reserves for maintenance and renewals. Unless these reserves are maintained the service is bound to deteriorate. Efficient and reasonable regulation, therefore, requires that due allowance for these elements be made when any regulation or adjustment of service is being considered.

"Granting that it is necessary to provide for the continuity of the service, why should the extension of the service into new territory in the more or less distant future be considered as a factor in regulation? A little consideration will answer this question.

"Our population is steadily increasing; our cities are expanding. In Chicago, for instance, it is literally true that the cornfield of last year is the site of a new subdivision this year. But before people will move out they want to be assured of the advantages of the service

offered by these utilities. Owing to the limited demand for service in the new territory, the service in nearly every case is, for a considerable time, rendered at an actual loss. In many instances these extensions are not voluntary but compulsory.

"The companies, as a rule, have no other means of raising money except their credit. This means that their ability to extend their service must depend absolutely upon their ability to go into the market and borrow money in competition with every other industry seeking new capital. Unless these utilities are able to offer as good terms and as good security as other enterprises seeking investment, they cannot possibly procure the capital needed.

"Nor is it sufficient to consider only the continuity and extension of service. The public demands the benefit of every invention and every improvement in the industry which will benefit the service. The candle, the kerosene lamp, the gas light, the electric light; the horse car, the cable car, the electric car—these words alone sufficiently indicate the development and progress made in the service furnished by these different utilities. These milestones of progress mean that plant and equipment costing millions of dollars have time after time become obsolete and been replaced by new plant and equipment in order to keep pace with progress. Will anyone say that new plant and equipment could have been acquired had it not been for faith in the future and a confidence that the capital invested in the old plant and in the new would be protected? What has happened may happen again. To-morrow some inventor may say: 'Scrap your present plant and utilize my invention, which has revolutionized the industry.' It may be of vital interest to the public that this be done. But it cannot be accomplished unless the credit of these companies is kept at the highest mark, and all doubts as to the security of the investments made and to be made are dispelled.

"The power to regulate carries with it the power to destroy. No fair-minded person, I take it, claims that the public utility commissions were created to destroy these utilities, and no one, I take it, denies that it is the duty of these commissions, in connection with and as an adjunct to their regulation of these utilities, to provide for their preservation and development.

BASIS OF SOUND REGULATION

"By sound regulation I mean regulation that will stand the test of time. I do not mean mere political experimenting, which promises something for the moment and ultimately ends in disaster. There is no magic in this matter of regulation, nor are commissions or other regulators able to obtain service at less than cost any more than a manufacturer is able to sell his product at less than cost and continue in business. It is obvious that if regulation is to succeed ultimately it must be by the application of sound business principles. Without attempting to enumerate all of the elements which should be considered in sound regulation, I submit these:

"1. *Regulation presumes just, reasonable and adequate service requirements, based upon just and reasonable compensation.*

"In the regulation of street railways where the compensation is practically fixed, a problem of constantly increasing difficulty is presented. These companies are now being called upon to face higher and, in some instances, drastic service requirements, together with a constant increase in operating expenses. There are only two sources from which the increased cost can be taken: maintenance and renewal funds, and the income to the investor. If taken from the first source, it means a

deteriorated service with a heavy bill to foot in the end. If taken from the second source, to the extent of impairing a fair return to the investor, it means the inability of the company to extend its service or provide for its improvement.

"Where a new contract between a street railway company and a municipality is being considered, another situation presents itself. Assuming that a fair valuation has been fixed and a fair rate of return has been agreed upon and assuming that a high standard of service is desired, the first essential is to provide for using the entire fare for transportation purposes, as by relieving it from the obligations to pave and clean that part of the street occupied by the company's tracks. These items are not unimportant. During the eight-year period ended Jan. 31, 1915, the surface lines in Chicago have expended approximately the following amounts for these purposes:

Paving right-of-way.....	\$8,397,796.46
Maintaining paving	1,550,204.39
Cleaning right-of-way.....	2,905,391.53
Total	\$12,853,392.38

"2. Regulation must not be so directed as to destroy the incentive to economy and efficiency.

"A standard of service is prescribed; the utility sets about to meet it. When through additional economies the company has adjusted itself to the new conditions still further burdens are promptly imposed. A utility company is no different from any other corporation. It responds to the same incentives. Its welfare and sound public policy both demand an incentive to further economies and greater efficiency. This incentive must be found in the reasonable hope of some reward for such efforts.

"3. A reasonable standard of service having been prescribed, the method and detail of providing that service should be left to the utility.

"The reports of the utility commissions show many controversies arising out of an attempt on the part of the commissions to regulate the details of operation. It is to be presumed that in the operation and management of their property the owners of the utility will themselves bring to their aid the best talent which they are able to procure for the efficient operation of their property. It is quite obvious that such details are better dealt with by the operators and owners of the property than by these commissions or regulating bodies, who could not possibly, under the present system and tenure of office, be expected to have the experience or familiarity necessary to enable them to deal satisfactorily with such questions.

"4. Unnecessary interference with operation is bad and tends to increase the cost of the service and to increase the cost to the public of maintaining the regulation.

"Commissions have a strong tendency to exercise the powers conferred upon them, regardless of the necessity or the advisability of doing so. The result has been an increasing tendency to interfere with the details of the management of these utilities. About all that has been effected in this way has been to cause considerable irritation on the part of the utility company, owing to loss of time, extra expense and interference with the operation of the property, and to incur a large amount of additional expense for clerical and other work on the part of the commission, which in the end the taxpayer has to meet.

"5. The right to regulate these utilities is neither municipal nor State ownership.

"Our regulators have a tendency to assume many of the prerogatives of ownership but, at the same time, to

avoid carefully any responsibility for the outcome of the enterprise. In this the regulators are fixing the price, or prescribing the quality of service, or both, but they have assumed no responsibility for furnishing necessary capital or working out the problems of furnishing the service for the price fixed. There can be no question that all this is a departure from sound business principles, and must in the end work to the injury of the public. The important points that cannot be too often stressed are: That regulation is not management; that no property is of any real value without the beneficial use thereof, and that ownership and management must abide together."

St. Clair Tunnel Electrification Operating Data

Electric Operation During Six Years Has Resulted in Reduced Cost and Has Proved Otherwise Entirely Satisfactory

The Grand Trunk tunnel under the St. Clair River between Port Huron, Mich., and Sarnia, Ont., was electrified in 1908. The electrification was fully described in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 14, 1908, page 1364.

The system is single-phase, 3300 volts, six 66-ton Westinghouse locomotives being used. Two coupled together haul 1000-ton trains up the 2 per cent grades encountered in the tunnel at 10 m.p.h. Electric operation has made it possible to handle fully one-third more trains than was possible with steam operation and has eliminated danger from gas.

Through Walter D. Hall, superintendent of the tunnel, information regarding the results of six years of electrical operation of the tunnel has been made available. He states that the steam engineers who, after a few weeks of training, were put in charge of the locomotives are still operating them and, with two exceptions the same firemen, now called assistants, are with them. Not a passenger or member of the yard crew has been injured by electric shock and but two casualties have occurred to workmen in the electric bay of the shops.

The average cost per year for maintenance of the six electric locomotives has been \$11,131 as compared with \$21,173 for the four steam locomotives which they replaced. The average cost per car handled through the tunnel, a distance of about 5 miles, was 17.22 cents compared with 26.64 cents with steam locomotives, although the capacity of cars handled to-day is much greater than that of the cars of 1907 and 1908. The electric engines are available for service about 90 per cent of the time. The total yearly locomotive mileage for the six units averaged 208,810, or 34,800 per unit.

The commutators make from 60,000 to 99,480 miles between turnings and the brush mileage is from 40,000 to 60,000. The pinion mileage is from 64,000 to 118,000, and none of the gears has worn out in 254,000 miles of service.

Formerly the greatest mechanical expense was due to flange wear, the average mileage between tire turnings being 25,000. Since the installation of electro-pneumatic flange oilers, the invention of Mr. Hall, some tires have already made 184,000 miles since last turning, and are still in service. Tires which formerly made 12,000 miles now reach 83,000 between turnings.

The few train delays which have occurred were due mostly to insulator failures or flashovers caused by the steam locomotive exhaust. At first some short-circuits were caused by birds which alighted on the arcing tips of lightning arresters, but this cause of trouble was removed by installing porcelain perches over the arcing

tips. Such strain and special insulator failures as occurred were apparently due to expansion under the effect of temperature changes. Strain insulator trouble has been overcome by the use of fiber "shrouds" which protect from rain and steam locomotive gases. The tunnel insulator design was also improved by increasing the amount of insulation between wire and ground and making broken insulators more readily replaceable. A steel contact wire was also placed below the copper wire to reduce the rate of wear.

The wood section breakers gave some trouble due to warping. These have been removed and an overlapping arrangement of the contact wires has been substituted. The wire hangers of $\frac{1}{4}$ -in. pipe proved satisfactory except where subjected to steam locomotive gases in the yard. In such places $\frac{1}{8}$ -in. x 1-in. galvanized or sherardized steel band has been used when hangers needed replacing. A special hanger or universal trolley-wire clamp was devised by Mr. Hall for use in supporting the iron contact wire. This consists of two grooved plates, held together by one carriage bolt with provision for attaching a band-iron hanger by means of which the clamp with attached wires can be supported from messenger wire or insulator.

The average cost of maintenance per mile per year of the 12 miles of overhead construction and rail bonding was \$127 for labor and \$72 for materials and tools. The saving in the cost of track maintenance in the tunnel alone is estimated at \$1,500 per year.

The cost of fuel for the steam locomotives was \$42,729 per year, while that for the electric locomotives was \$17,186, with the electric locomotives handling a greater tonnage. While slack coal is used in the power plant in place of the hard coal formerly used on the locomotives, fewer tons of the former are consumed. The energy cost given also includes energy supplied for operating pumps, for tunnel, terminal, yard and engine-house lighting and for crane and other motors. The average watt-hours per ton-mile at the generator busbars were 37.6.

An interesting indicating device has been installed in the boiler room to supplement the automatic device used to adjust the rate of fuel consumption to the load. The latter consists of a diaphragm valve in the fan engine line, which controls both the fan speed and the engine speed through variation in boiler pressure. There are times when trains follow each other in such quick succession that it is not advisable to wait for the steam pressure to drop in order to bring in the auxiliaries. A coil was therefore placed around the cable feeding the contact wire and the induced current was utilized for ringing a bell and lighting lamps when a train requiring 800 kw. or more moves out of the yard toward the tunnel. This indicates to the fireman that he should prepare to handle a heavy train up the 2 per cent grade in three or four minutes. He can then cause the fan and stokers to speed up and be ready in ample time to care for a heavy load.

Meeting of Public Utilities Association of West Virginia

This association held its first convention at White Sulphur Springs on Nov. 18 and 19. The papers and discussion related largely to electric lighting and power matters, but the interests of electric railways also received some attention. At the Friday afternoon session S. B. Fortenbaugh, engineer General Electric Company, Schenectady, N. Y., discussed the relative merits of 1200-volt and 600-volt d.c. railway systems, and James Fagan, chief engineer Ohio Valley Electric Railway, Huntington, W. Va., described some special concrete track construction.

ASSOCIATION NEWS

The association has issued in pamphlet form "An Analysis of Ordinances Governing the Operation of Jitneys in Various Cities of the United States and Canada." This is a tabular compilation of data arranged under the direction of W. A. House, president United Railways & Electric Company of Baltimore, Md. It is issued as an appendix to the report of the committee on the operation of motor vehicles. The analysis covers ordinances in eighty-four cities, in thirty-four states and two Canadian provinces.

The association has also distributed copies of the full text of the opinion of the New York State Public Service Commission, second district, dated Oct. 20, 1915, on the petition of W. B. Gray for a certificate of convenience and necessity for the operation of a stage route by auto buses in New Rochelle, N. Y.

PUBLIC SERVICE SECTION

The regular meeting of company section No. 2 was held on Nov. 18 in Newark. The meeting was addressed by F. W. Doolittle, director of the bureau of fare research of the association, and Ernest Kopia, chief of the company's mailing department. Nine new members were received, mostly from the claims and welfare departments. R. E. Danforth, general manager of the company and chairman of the program committee, outlined and explained the tentative program for the session. On the list printed on one of the section's standard data sheets these items appear:

Dec. 16, smoker.

Jan. 20, "Construction of Carhouses and Shops," by C. F. Bedwell, assistant engineer, and R. H. Harrison, mechanical department.

Feb. 17, "Problem of Rerouteing for the Newark Terminal," speaker to be announced.

March 16, "Design and Construction of Rolling Stock," by H. A. Benedict, mechanical engineer.

April 22, "Valuation and Appraisal," by Dean M. E. Cooley, University of Michigan, a continuation of the address abstracted in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 30, page 913.

May 18, "Cost of Rush-Hour Operation," by George J. Roberts, vice-president, and H. C. Donecker, assistant general manager.

June, Newark Anniversary Celebration.

September, "Analysis of Operating Costs," speaker to be announced.

It is planned that, beginning with the January meeting, a short entertainment feature will be introduced at each meeting. This will probably take the form of motion pictures, of which advance notice will be given.

In his paper Mr. Kopia explained in detail how inter-department and outside mail is handled, and he gave interesting statistics showing the magnitude of this work.

Mr. Doolittle's topic was "Psychological Aspects of Street Railway Service," and his talk was based upon one of the chapters of the forthcoming "Studies in the Cost of Transportation Service," which is to be issued by the association before the end of this year. Special studies had been made in Cleveland and Milwaukee to determine some of these psychological aspects, considerable numbers of individuals being interrogated in both cities to learn their attitude toward the service. As a result it was found that the average individual is utterly unable to estimate time or distance, or to set forth with any degree of definiteness the facts which determine whether or not service is satisfactory. Mr. Doolittle showed that many of the factors which the patrons consider as having a bearing on their satisfac-

tion with the service are entirely beyond the control of the railways. If the standards of service were laid down in accordance with many opinions expressed by patrons unlimited service complications would result.

A most important point made was that when a question was worded to suggest discomfort or poor service, this suggestion was reflected in the character of the answer. This susceptibility to suggestion is, therefore, an important factor in such investigations as those described. The amount of weight which is assigned by patrons to complaints published in the newspapers was also studied. As a result it was found that these were not considered as important by the public, although in Milwaukee statements of an official character did have a certain weight.

DENVER TRAMWAY SECTION

The thirtieth regular monthly session of the Denver Tramway Company section was held on Nov. 18. W. G. Matthews, who was recently elected president, gave a brief account of his trip to the San Francisco convention. After this there was a general discussion on the work of the section. One hundred persons attended the meeting.

COMMUNICATION

Preparedness in Transportation

BOSTON, MASS., Nov. 22, 1915.

To the Editors:

I am glad to see that the *ELECTRIC RAILWAY JOURNAL* is taking up seriously the possibilities of our great network of electric lines as aids to mobilization. With the truly enormous coast line which the United States possesses no practicable defense can be made without facilities for quickly massing men at points threatened. Our present standing army would provide us with about three men per mile of coast without making, even then, suitable provision for manning the fortifications. Consequently a big and peculiarly mobile army is a necessity to defense. Now our electric railway lines greatly increase the available trackage by which troops can be massed over most of the coast. From Maine to Maryland probably not less than 50 per cent extra trackage, both as respects coastwise lines and cross lines from trunk roads further inland, can be added when the electric service is fully utilized.

Take, for example, the stretch of coast from Boston to Portland, Me.; there are two direct railway connections here, one lying close along the coast, the other a few miles inland. There is also a complete electric railway line with ramifications which from several points tie the trunk lines together. In case we are required to mass men at some point between the termini all this railway trackage could be made extremely serviceable. Twenty-five or thirty cars will transport a regiment at at least five times the speed at which it could march, and by properly utilizing cross lines the transport of troops could be greatly hastened.

One advantage which is particularly conspicuous in electric service is the facility with which men can be entrained and detrained at any convenient point, thus relieving the termini of the transportation system from very great stress. For instance, it would not take more than a single division to tangle up traffic in a somewhat inconvenient space like the North Station in Boston so that it would be likely to take hours to get away the necessary trains through the somewhat cramped yardage. But a procession of electric cars in a well-cleared street could take a regiment aboard in a very few

minutes and could push it out across country to be detrained at the nearest convenient point to the rendezvous. And, as you very properly say, street railway men are experienced in handling crowds. The efficiency with which a Harvard-Yale football audience half as big as our standing army is hustled away from the Stadium is good evidence that at a pinch the electric railways could send out great masses of loaded cars with promptness and carry them rapidly as far as interconnecting tracks reach.

The information necessary for utilizing the existing facilities is not difficult to obtain. It merely needs to be co-ordinated, as could very well be done by a committee of the association, acting in conjunction with officers of the General Staff. It is needful, first, to know for any point on our coast the direct routes by electric railways and the points of intersection of indirect routes with main railway lines from which troops could be transferred. This is a very simple matter to determine. Second, the ultimate power available for operating cars on each of the sections concerned should be ascertained, first considering the available output of the road's own equipment, and, second, the current which could quickly be made available by existing or easily-made connections with contiguous systems. All these facts are at hand within the knowledge of our skilled electric railway men. Every road superintendent knows how many cars he could swing on a given line with power which is available, also what he could do by borrowing all the power of his neighbor not involved in the scheme of mobilization, for in case of necessity all traffic would be suspended pending the transportation of troops to danger points. Third, it is necessary to know how many open, closed, and freight cars and of what capacity each road concerned in the mobilization at a given point has available, and how many more are available on interconnecting lines not concerned in that particular movement, for, of course, all these would be instantly commandeered for temporary service. Finally, it is important to know in how far the roadbeds, rails and clearances of each electric line considered permit, first, of hauling freight or passenger cars directly switched from the railroads and what effective power is available for drawing them, and, second, in how far the conditions of roadbed, bridges and clearances would permit of temporary use of locomotives drawing trains switched direct from the regular railways.

These last-mentioned matters of interchange of rolling stock may in certain instances be important, although no general interchange is to be expected. Still, at certain points and under certain conditions, the establishment of switching connections between railroads and existing electric railways might prove to be desirable enough to justify carrying out the work, or at least making all the preparations for its execution rapidly in case of emergency. Electric railway curves and grades are often forbidding in the matter of carrying ordinary railroad traffic, but in some instances this is not so, and points of advantage should not be dropped out of sight.

LOUIS BELL.

S. S. Bush, Louisville, Ky., who manages traction properties at Vincennes, Ind., Jackson, Tenn., and Rome, Ga., has adopted a profit-sharing plan to enlist the interest of employees in safety first work that has been very successful. Credits are given for freedom from accidents, and charges made when accidents occur. A man who goes through the year without an accident gets an extra cent an hour on Dec. 15 for the whole time he has worked, while the charges made against this account depend on the character and seriousness of the accident.

Gas-Weld Rail Bonding*

BY J. ROWLAND BROWN, ELECTRICAL ENGINEER OHIO BRASS COMPANY, MANSFIELD, OHIO

Rail bonds have been welded to rails by the use of the oxy-acetylene flame for years, but only recently have the obstacles to the general use of the process been removed. These obstacles consisted in the lack of an easily procurable supply of pure gases at a reasonable price and of readily portable tanks, in the use of torches not adapted to the particular job, and of copper wire, with its great power of absorbing gases when melted, for the welding material, and in the absence of a properly designed bond. These obstacles have now been overcome, and in the accompanying view is shown a modern welding equipment at work installing a bond.

The gases required for welding are pure, dry oxygen and acetylene, compressed or dissolved. These can be easily and safely handled in cylinders.

The oxygen is obtained either by the electrolytic decomposition of water or by

a pressure gage, a reducing valve and a gage for indicating the pressure in the hose and at the torch. There is a great variety of torches on the market, but they all consist of a tip having an orifice that controls the size of the flame and the rate of consumption of gas, and a mixing chamber with a shut-off valve for each gas. The best torches are simple and light in construction. The tip used for bonding consumes gas at the rate of about 30 cu. ft. per hour of each, with the pressure in each hose from 12 lb. to 15 lb. per square inch. Regulation to the correct flame is done by adjusting the shut-off valves on the torch and not by adjusting the reducing valves. The regulation of the flame is illustrated at A, B and C in the accompanying diagram. The acetylene is ignited first and then the oxygen is turned on. As the oxygen is gradually turned on the flame will appear first as in A, which shows an excess of acetylene. This is a reducing flame. Increasing the oxygen will soon produce the distinctly lined bead shown in B. This is the neutral flame of approximately equal parts of the gases, and is the flame desired for bonding. Increasing the oxygen reduces the size of the

OXY-ACETYLENE WELDING—BONDING OUTFIT IN OPERATION—DIAGRAMS OF GAS FLAMES—CROSS-SECTION OF BOND TERMINAL WELDED TO RAIL

liquefying air and removing the oxygen by fractional distillation. It is compressed in cylinders to about 1800 lb. per square inch pressure. A tank containing 100 cu. ft. of free air is generally used in bonding work as it weighs only between 100 lb. and 125 lb.

Acetylene gas compressed in a tank above 30 lb. per square inch pressure is highly explosive, and between 15 lb. and 30 lb. its action is doubtful. To prevent any possibility of explosion the tanks are packed with asbestos fiber having a porosity not greater than about 75 per cent. The asbestos-filled tank is then charged with liquid acetone to about 40 per cent of the volume of the tank. Acetone has the property of dissolving twenty-five times its own volume of acetylene for each atmosphere of pressure, and as the tanks are charged to 225 lb., or 15 atmospheres pressure, the tank contains about 150 times its own volume of acetylene gas under perfectly safe conditions. A tank of 100 cu. ft. capacity, weighing about 85 lb., is generally used.

A fitting is connected to each gas tank consisting of

bead slightly as in C, and produces an undesirable oxidizing flame which consumes an excess of oxygen.

The proper design of bond for use with this process has only recently received the necessary consideration. In the first place, the weld should be made either to the head or the base of the rail. On account of the intense heat of the flame it is necessary to have a sufficient body of copper in the terminal to conduct the heat and to prevent burning or melting away of the terminal while the rail is being brought to the welding point. It is impracticable to weld the rail and the surface of the original terminal which is adjacent to it because the surfaces cannot be properly heated to the welding point. Therefore the welding wire is built up on top of the initial terminal, forming a new tapered bond terminal. This is clearly shown in an accompanying halftone. The bond now has a tapered terminal which prevents traffic from exerting a destructive shearing action, but causes all wheels or other destructive forces to glance off. Another feature of design is the provision of means for keeping the initial terminal about 1/16 in. away from the rail to allow the gases of the flame to escape and not form a pocket when welding into the

*A paper delivered before the Illinois Electric Railway Association, Oct. 29, 1915. For discussion see issue of ELECTRIC RAILWAY JOURNAL, Nov. 6, 1915, page 953.

corner. The cable or ribbons of the flexible portion of the bond must also be protected for a sufficient distance by a sleeve to prevent burning by the flame.

Until recently annealed copper wire has been used for the welding wire or filling-in material, but as copper oxidizes and absorbs gases rapidly when melted it is impossible to produce even a fairly non-porous structure for the built-on part of the terminal with pure copper. A flux wire of non-oxidizing alloy containing a high percentage of copper has, therefore, been developed. This produces a more perfect weld free from porous spots, and is much easier to manipulate than copper.

It is not necessary to prepare the surface of the rail for the weld, but by some operators it is considered best to grind the surface. Grinding is an extra precaution to insure a uniform contact with the rail and does not demand as careful work on the part of the operator. On exposed rail, one end of the bond is clamped in position while the other end is being welded, and then the clamp is removed while the other end is welded.

In bonding in paved streets one or two paving blocks are removed and the bond is located by embedding the strand in some loose sand. When the rail is not to be ground the operator first coats the surface of the rail with flux metal, as by this method it is easy to see, from the manner in which the metal spreads over the rail, whether or not the oxide has been burned off. The flux metal is then built in between this coating and the initial bond terminal, producing the beveled terminal

ing does not injure the bond in any way, as the mass of cold metal in the rail acts as a chill and anneals the copper. A series of vibration tests, comparing new bonds with welded bonds that had been cut from the rail, showed that in no case did the welded bonds break down before the unwelded ones.

A study of the effect of heat on the structure of the steel rail has proved very interesting, and after very careful tests and investigations it can be safely stated that the welding process does not have any detrimental effect. An etched section of the welded portion of a rail is reproduced herewith. The dark area adjacent the welded surface shows that the welding has changed the structure of the steel to a depth of $\frac{3}{8}$ in. The affected zone does not extend longitudinally beyond the welded terminal of the bond. Another illustration shows a microphotograph of the etched section on the dividing line between the fine structure produced by the welding process and the normal structure of the rail. On the lower side of the line the normal structure consists of large pearlitic areas and patches of ferrite characteristic of open-hearth steel. On the upper side of the line the grain is finer, showing a fine pearlitic structure, which is the average structure of the area affected by the welding process.

The rail in the samples was open hearth with carbon 0.74 per cent, silicon 0.174 per cent, sulphur 0.025 per cent, phosphorus 0.020 per cent and manganese 1.07 per cent, hence the effect of the heating would show up more prominently than in a steel of lower carbon content. Scleroscope readings for hardness checked by

OXY-ACETYLENE WELDING—BOND WELDED TO RAIL HEAD—ETCHING OF RAIL SECTION SHOWING AREA AFFECTED BY WELDING—MICROPHOTOGRAPH OF ETCHED SECTION IN AFFECTED AREA

shown in the accompanying figures. A little practice will enable an average track man to control the flame and make a good weld by this method.

It is customary for a man doing welding of this kind to wear a pair of blue glasses, but there is no danger to a spectator and no such eye trouble develops as that experienced when working with or looking at the electric arc.

The connection between the terminal and the rail is very strong mechanically and will resist the shearing strains produced by traffic. In fact, it is impossible to tear the terminal from the rail contact and failure only occurs by fracture through the copper structure. The electrical resistance of the terminal contact is approximately 2.5 microhms, which is slightly more than has been attained by other terminals. This difference is due to the resistivity of the flux metal forming the terminal, which is greater than that of pure copper. This difference, however, is negligible and, as there is no depreciation of the contact, it is electrically very efficient.

During welding the terminals of the bond are heated to a bright red and sometimes the strand becomes a dull red for a short distance from the sleeve. This heat-

tests with a Brinnell machine show the affected areas to be slightly harder than the rest of the rail.

The investigation showed that the areas affected and having a fine pearlitic structure have been heated to the critical point and were rapidly cooled by the mass of surrounding cold metal. The welding had refined the structure for $\frac{3}{8}$ in. from the corner and had increased the hardness, but it had not detrimentally affected the steel. It is inconceivable that it could have affected the wearing properties of the rail or caused fractures or flaking.

A complete welding outfit, exclusive of the truck, which can be home-made, can be purchased for from \$50 to \$125, depending on the make of the torch and the extra accessories required for shop welding. The oxygen and acetylene consumed per bond cost approximately 10 cents, which cost varies with the distance to gas-charging stations. The flux wire used per bond will cost approximately 8 cents, the price varying with the copper market. The cost of labor with grinding of rail will average 6½ cents per bond on straight work and 4½ cents when no grinding is done.

Where rail grinding is done with an electric grinder,

three men are required in a gang, while without grinding only two men are necessary. A gang should average ten to twelve bonds per hour on straight work under average traffic conditions. An average cost of installation, therefore, exclusive of cost of bond but including depreciation and interest on investment, is 25 $\frac{3}{4}$ cents per bond with grinding and 23 $\frac{1}{2}$ cents without grinding.

The advantages of this process of welding are as follows:

The investment in apparatus is small, resulting in low interest and depreciation charges. The utility of the apparatus in shop repair work makes it a 365-day-in-the-year machine. The entire equipment is compact and easy to handle and does not necessitate interference with traffic. No electric current is required, a matter of considerable importance in construction work and in a.c., or high-voltage d.c. installations. The welded contact has a high electrical efficiency and is permanent. The bonded joint is moderate in cost and easily inspected. When a length of rail is to be replaced one end of the bond can be cut loose from the old rail and rewelded to the new rail, thus saving the bonds.

Steel vs. Wood Ties in City Track Construction

BY J. A. NESTER, SUPERINTENDENT CLEVELAND, SOUTHWESTERN & COLUMBUS RAILWAY, ELYRIA, OHIO

On account of the scarcity of white-oak ties railway officials have for several years been looking around for something to take their place. As far as getting ties for city track construction is concerned, it seems that the problem has been solved.

TWIN-STEEL TIE INSTALLATION UNDER WAY

About four years ago the Cleveland, Southwestern & Columbus Railway decided to try steel ties in pavement work, and after careful investigation placed an order for International steel twin ties. These ties proved to be very much of a success and during the period since that time we have used them entirely in 6 miles of track in paved streets.

These ties are made of two channel irons, either 3 in. or 4 in. in depth and 6 ft. 4 in. long, connected by a plate 5/16 in. x 13 in. x 3 ft. At each end the plates

are riveted to the channel irons, and a bar 5/16 in. x 1 $\frac{1}{2}$ in. x 3 ft. also connects the channels underneath at each end. The rails rest on the plates and are fastened by means of clips which clamp under the plates and over the base of rail. The clips are securely fastened by iron wedges driven in behind them. Ties with 3-in. channel weigh 140 lb., and those with 4-in. channel weigh 160 lb. The clip holes are punched in plates so as to fit the section of rail being used. We space these ties 3 ft. apart and as the ties are 3 ft. wide this gives us 6-ft. centers. Consequently one tie, which costs about \$4, takes the place of three and one-half wood ties. The initial cost is, therefore, not much more than that of wood ties.

The rail joints are placed in the center of the tie plates and concrete is tamped flush under the plates, making a proper support at the joints. The joints in the track that we installed four years ago are still in perfect condition.

The channel irons reinforce the concrete and we have been convinced, as have also the municipalities, that it is not necessary to have as much depth to the concrete base as would be needed with wood ties. We have, therefore, saved more than enough in the concreting and excavating to offset the difference in the initial cost. In addition to the saving in construction, my judgment is that the track will last a great deal longer than that with wood-tie construction. We are using 100-lb. A. R. A., 6-in., T-rail with nose brick.

While the track is in process of concreting it is blocked up to grade with old paving brick, placed under alternate ties, and wooden wedges are used to bring the track exactly to grade. Wooden braces are used to hold the track in proper alignment. The blocking and braces are allowed to remain and the concrete is placed around them, insuring perfect grade and alignment.

Below are given the construction costs of a piece of track 3825 ft. in length. These figures cover 9 in. of concrete below the rail.

640 steel ties, at \$4.....	\$2,560.00
1,856 cu. yd. grading, at 45 cents.....	835.20
779 cu. yd. concrete, at \$3.50.....	2,726.50
Total	\$6,121.70

The cost of construction of the same piece of track with wood ties on 20-in. centers, figuring 12 in. of concrete below the rail, would be as follows:

2,295 white-oak ties, at 75 cents.....	\$1,721.25
2,280 cu. yd. grading, at 45 cents.....	1,026.00
974 cu. yd. concrete, at \$3.50.....	3,409.00
Total	\$6,156.25

The labor cost in both cases would be about the same.

Protecting Armature Coils from Cutting on Band Wire

BY W. A. ERNST, ARMATURE WINDER, ST. JOSEPH (MO.) RAILWAY, LIGHT, HEAT & POWER COMPANY

On a number of GE-210 motors in service on the cars of the St. Joseph (Mo.) Railway, Light, Heat & Power Company, a great deal of trouble was experienced because of the fact that the armature coils frequently became loose in the slots and worked against the banding until the coils grounded. As a rule, such armature coils would be damaged beyond repair because of the subsequent high temperature, and to remedy this difficulty it was decided to introduce strips of Peerless paper between the coils and the band wires as a protection to the coil insulation. These strips of paper were 0.062 in. thick and they had a width of

9/16 in. or $\frac{1}{4}$ in. more than the band slots in the laminated core of the armature.

When these strips are applied the armature is heated, after it is completely rewound and is all ready for banding, until the insulation of the coils has become materially softened. The armature is then placed in a banding machine, and the paper strips are wound around the armature, being pulled down by the band wire until the coil is even with the bottom of the band slot. The paper thus forms a thorough protection to the insulation of the coils underneath the banding and it is of interest to note that in none of the rewound armatures that have been treated in this manner has there been any recurrence of the original trouble.

Dubuque Remodels Cars for One-Man Operation

In remodeling eight cars for one-man operation, the Union Electric Company, Dubuque, Iowa, recognized the fact that if the cars were to be an operating and popular success they would have to be equipped with modern devices for the accommodation of the car operator and the public.

The cars are of St. Louis manufacture, 31 ft. long over all with 20-ft. body. In remodeling the interior the bulkheads were removed, circular seating was installed at the rear end and slat seats on turned legs replaced the original boxed-in rattan seating. While the monitor roof was retained, ventilation was improved by fitting each car with four sets of E-4 Automatic intake and exhaust ventilators. These ventilators were installed in the ordinary monitor sash framing without defacing the car in any way.

Easy operation of doors and steps was assured by the use of the National Pneumatic Company's standard manual control of the double-shaft type. In this equipment all doors fold outwardly and extend upward above the header board and below the platform floor for 1 in. to $1\frac{1}{4}$ in. Therefore, when the doors are closed there is a perfect weather joint to prevent the entrance of cold air. The door shafts are made of rolled steel shafting with die-pressed master panel clips machined fast.

DUBUQUE ONE-MAN CAR—GENERAL PLAN

At the bottom, these shafts are fitted with thrust collars to hold the doors in proper vertical position on the ball bearings, and they are machine-tapered and fitted to operate in unison with the folding step. The use of ball bearings at all frictional points makes this equipment exceptionally easy to operate.

Other means for reducing the operator's duties as a motorman are the provision of the General Electric Company's C-P 25 straight air equipment and the staffless brake of the National Brake Company. The latter is exceptionally compact and light in weight.

To simplify the operator's duties as a conductor, the International Register Company's C-16 fare box is used. The special advantage of this fare box for one-man operation is that it relieves the conductor in large part in making fare collections, that it is accurate in count, and that it permits the passenger to pay the fare and pass into the car quicker than where the fare has to be handed to the conductor.

Other additions to these cars are Golden Glow headlights and Railway Utility thermostatic control.

Expanded Metal Poles Replace Two Wooden Pole Lines

At a point on the right-of-way of the Elgin, Joliet & Eastern Railway near East Chicago, Ind., two wooden pole lines carried the 11,000-volt, three-phase transmission lines of the Northern Indiana Gas & Electric Company, and the telephone and telegraph lines of the Chicago Telephone Company and the railway company. To reduce the cost of maintenance and distribute the ex-

DUBUQUE ONE-MAN CAR—FRONT END INTERIOR SHOWING CONTROL DETAILS; VIEW SHOWING VENTILATORS AND OTHER DETAILS

pense of installation, these three companies installed approximately 1 mile of 35-ft. Bates Expanded Steel Truss Company's poles. The features of these poles were described on page 370 of the *ELECTRIC RAILWAY JOURNAL* of Aug. 28, 1915. The transmission line is carried at the top of the pole on cantilever arms made of steel angles, and the telephone and telegraph lines on a single cross-arm placed below these. The poles are set in the ground with portable concrete breast blocks,

EXPANDED METAL POLES INSTALLED ON ELGIN, JOLIET & EASTERN RAILWAY RIGHT-OF-WAY

which make concrete mixing on the ground unnecessary. These blocks are keyed and bolted to the pole at the ground line and at the base, and make as substantial construction as if the poles were set in concrete mixed on the site.

Features of Electric Railway in Alsace

In an article in *La Lumière Electrique*, J. Reyval has recently described the electric railway in Alsace, running from Münster to the Schlucht Pass in the Vosges, a district now in the hands of the Germans. An unusual feature of the line is the fact that some of the grades are operated on the ordinary adhesion principle and some by means of a rack-rail. The rack portion is about $1\frac{3}{4}$ miles long with grades varying from 18 per cent to 22 per cent. Grades as great as 6 per cent are, however, encountered on the other parts of the line. Rolling stock consists of motor cars and trailers. The motor cars sometimes run alone and sometimes draw a trailer; they carry forty passengers and the trailers carry thirty-two passengers.

The speed is at least $10\frac{1}{2}$ m.p.h. on the adhesion section and 4.7 m.p.h. on the rack-rail. The motor coaches are mounted on double trucks, each of which has a motor driving one pair of wheels through single reduction gearings and another driving a spur wheel for the rack through double gearings. There is a band brake on the axle of the rack-driving motor and also block brakes on the four wheels acting at the same time. Another brake acts automatically on the rack-driving mechanism when the speed exceeds the safe limit, and provision is further made for electric braking by short-circuiting the motors. Each motor is of 85 hp. continuous rating or 100 hp. maximum capacity. On the

rack-rail sections all four motors are in action and on the other parts only the two driving the ordinary wheels. The four motors are operated from one controller, by which series-parallel arrangements can be made as well as reversing and braking. The current is collected by a flexible bow trolley.

Report on Tramway Company in India

At a recent meeting of the Delhi Electric Tramway & Lighting Company, Delhi, India, it was stated that the net revenue for 1914 was \$39,795 compared with \$30,479 in 1913, but that both branches of the company had been affected by the war. The gross revenue of the tramways had increased by 10 per cent and that of the electric supply department by 19 per cent. The present unsuitable type of tramcar with its single motor equipment was said to be responsible for heavy annual maintenance charges and abnormal current consumption. Recommendations were made to install on the system cars more suited to the climate and particular local conditions, which would probably increase the receipts per car-mile.

New Double-Ear Overhead Switch

The overhead switch illustrated in the accompanying view has been tried out on a number of railways during the past two years and has given such good satisfaction that the maker, the Drew Electric & Manufacturing Company of Indianapolis, Ind., has decided to put it on the market regularly.

As shown in the illustration, the switch has a double ear or clevis on each side, with a cotter bolt for attachment to the supporting span. When it is necessary to renew either switch or trolley wire the bolts can be removed without cutting the wire and putting in a new "make-up."

The straight and curved runners are high and of heavy cross-section. The runners extend nearly into the

NEW DOUBLE-EAR OVERHEAD SWITCH

center of the pan and take the wear of the wheel, stop "dragging" and tend to produce long life.

The Drew tapered, renewable approaches extend 6 in. each way from the frog, giving further protection to the wire and insuring smooth "take" and "leave." The switch pan proper is 20 in. long, the two approaches making the complete switch 32 in. long over all. The cross-bar between runners prevents the trolley harp from fouling.

A number of operating tests of Diesel oil-electric cars were recently conducted in Germany by the State Railways of Saxony, over the line between Dresden, Neustadt and Leipzig. Tests were made on grades up to 11.1 per cent. On one grade of 5 per cent a self-propelled car was able to haul a 47-ton trailer at 25 m.p.h. The greatest speed reached on level stretches was 47 m.p.h. without a trailer and 31 m.p.h. with a 47-ton trailer.

News of Electric Railways

SPECIFIC CHARGES IN McCALL CASE

Twenty Charges on Which Legislative Committee Bases Its Recommendation for Dismissal of New York Commissioner

The specific charges filed with Governor Whitman by the Thompson legislative committee on Nov. 22 against Chairman Edward E. McCall of the Public Service Commission of the First District of New York, and on which the recommendation for his dismissal is based, are as follows:

1. That Chairman McCall's acceptance of his appointment was in violation of law.

2. That he was at the time the owner of stock in a corporation subject to the supervision of the commission.

3. That thereafter he attempted to transfer such stock to his wife.

4. That such attempt was a mere subterfuge and a clumsy effort to evade the statute.

5. That he has participated in the consideration of matters pending before the commission affecting the value of such stock, whether owned by him or by his wife.

6. In various matters pending before the commission from time to time in which one or another of these companies was a party, Chairman McCall has improperly participated in the consideration and determination of questions affecting the value of the stock and has employed his influence for that purpose.

7. That he has neglected and failed to attend scheduled meetings and hearings on important matters pending before the commission.

8. That he has accepted in at least one instance a retainer from and rendered legal services to a corporation seeking to evade in the courts the payment of taxes claimed by the State to be owing by such corporation to the State. The chief owner of the stock of such corporation is also commonly reputed to be a controlling factor in the management of the Interborough Rapid Transit Company, one of the corporations subject to the supervision of the commission, of which he is chairman.

9. That in another case he has accepted a retainer in an action now pending in the Supreme Court, in which action the engineers in the employ of the Public Service Commission will be necessary and material witnesses.

10. That he has favored the public service corporations and that his official actions have been consistently prejudicial to the interests of the people of the city and State.

11. That he has appropriated to his own use an automobile belonging to the city of New York, that he has removed the Public Service Commission plate therefrom, has neglected and refused to make and return a record of the uses to which it has been put, and has monopolized the services of a chauffeur whose salary has been paid by the city, and that the expense of the operation of such automobile for the convenience of himself and his family has been charged to and paid by the city of New York, all in violation of the rules of the Public Service Commission.

12. That he has used his power as chairman to interfere with hearings pending before other commissioners, in order to prevent the conclusion of such hearings, and in the case of the Edison Electric Illuminating Company of Brooklyn he permitted an adjournment of a hearing pending before Commissioner Maltbie to a date subsequent to the expiration of Commissioner Maltbie's term of office.

13. Thereafter, and in the same rate case, before Commissioner Hayward, he exercised his power to permit the introduction by the said Edison Electric Illuminating Company of improper evidence which Commissioner Hayward, the hearing commissioner, was unwilling to admit.

14. That in the matter of the Third Avenue Railway and the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway Chairman McCall has not only neglected to enforce the commission's orders, but has used his influence to prevent the commencement of legal proceedings for the enforcement of such orders, and for the collection of the penalties which the law imposes for the violation of

such orders, in violation of the mandatory provisions of the law.

15. That as to a competing company, the Manhattan & Queens Traction Company, he issued an order the effect of which in the event of a failure to comply therewith within the time specified, forty-eight hours, would have operated to cancel and annul the franchise of such competing company, thereby destroying competition beneficial to the city and its inhabitants.

16. In the matter of the certificate issued to the Manhattan Railway, dated March 19, 1913, he failed and neglected to reserve to the Public Service Commission and surrendered the power to supervise the award of the contract for the construction of the additional tracks of the Second, Third and Ninth Avenue elevated lines, and that as a result of such failure the lessees of the Manhattan Railway have entered into extravagant and improvident contracts under which its stockholders and the people of the city of New York have suffered and will suffer large losses.

17. That in the matter of the approval of the contract for the construction of the connecting lines under a certificate issued to the Interborough Rapid Transit Company, he authorized and approved a contract for such construction at an extravagant and exorbitant price and without competition, to the disadvantage of the city of New York and its inhabitants.

18. That in the execution of the dual contracts and certificates he permitted the inclusion of a provision under which the New York Municipal Railway Corporation will be permitted unwarrantably to deduct from the earnings of that company before the division of the net earnings between the company and the city can be accomplished a sum aggregating more than \$10,000,000.

19. That in the negotiation and execution of the so-called dual contracts and certificates he surrendered and failed to exercise his powers and duties as a Public Service Commissioner of the State of New York.

20. That by his administration of the office which he holds, by his failure properly to supervise the expenditures of the Public Service Commission, by the extravagance of expenditure which he has permitted and by his failures and neglects as aforesaid, he has demonstrated his entire lack of sympathy with the purposes of the public service commissions law.

ARBITRATION HEARING HELD IN ALBANY

The committee selected to arbitrate the dispute between the United Traction Company, Albany, N. Y., and its employees, which caused a strike last September, heard the testimony of both sides on Nov. 19 and then took the case under advisement. The questions involved are whether it is fair to suspend an employee without giving him a hearing before the sentencing official, and whether the new procedure in discipline is in violation of Sec. 6 of the agreement between the company and the men.

The hearing lasted four hours. It was opened by Lynn J. Arnold, chairman of the arbitration committee. Sitting with him on the committee were William E. Woollard and Mayor Cornelius F. Burns of Troy. The company was represented by Harry B. Weatherwax, vice-president; John E. MacLean, counsel for the company; C. A. Coons, general superintendent, and N. R. Cass, assistant to Mr. Weatherwax. The case for the men was conducted by W. B. Fitzgerald, representative of the international president of the association, and with him were Joseph S. Droogan, president of the Albany local; Joseph H. McLaughlin, president of the Troy local, and Stephen Dwyer of the Albany local.

Chairman Arnold said he thought Sec. 6 was obscure in that it did not fix definitely whether the preliminary hearing should be before the general or division superintendent, and suggested that Mr. Fitzgerald and Mr. Weatherwax fix up the section so that it would be clear. Mr. Fitzgerald reiterated that this could not be done legally until next July, when the present contract expires. The section will accordingly be passed upon in the light of its present wording.

OPPOSITION TO MOON BILL ORGANIZING—OTHER PROPOSED RAILWAY LEGISLATION

The committee on railway mail pay, representing railroads operating 90 per cent of the mileage of this country, has announced that these 264 railroads, with a total of 218,000 miles, have joined in a protest to Congress and to the public against renewal of the efforts to effect the passage of the Moon railway mail pay bill.

This measure was introduced in the last Congress and failed to pass, and the Postmaster General has announced that it will be reintroduced when Congress opens in December. Under the Moon plan the Postmaster General would be authorized to establish the "space plan" of payment, whereby a railroad would be paid no more for hauling a whole carload of mail than for a partial carload. In their protest the railroads say that the Moon bill would empower the Postmaster General to make the rates for carrying the mails, with the only limitation that he could not exceed certain sums. On the other hand, he could reduce the rates with no restraint but his personal discretion.

The railroads contend that the highest rates which are permitted by the bill would be unjustly low, because they would be less than the receipts from passenger carrying, which the Interstate Commerce Commission has decided are unremunerative. They also say that the Moon bill delegates legislative power to the Postmaster General, and would bring the railway mail pay problem into politics. They say that the problem ought to be settled on a business basis, and direct attention to the fact that Chairman Moon of the post-office committee of the House of Representatives in asking support for his bill declared it to be a proposal of the Post-office Department.

The bill to regulate the issuance of railroad securities is another measure which the prophets of railroad legislation regard as sure to come before Congress. This bill is an item of "unfinished business," left over from the Wilson trust program. It has long been advocated by the Interstate Commerce Commission. When the bill was brought before the House on June 2, 1914, for debate and passage, Mr. Rayburn of Texas, its nominal author, declared that it contained three provisions deemed necessary by a majority of the committee. The first of these was greater publicity in the financial transactions of railroad corporations; the second, making it illegal for corporations to issue stocks and bonds "or other evidence of indebtedness" except for certain specified purposes to be approved in advance by the Interstate Commerce Commission; and the third, that within two years after the passage of the act, it should be illegal for one man to hold a directorship or official position in more than one railroad, and for any official to "appropriate, pay or receive as salary or dividends any money resulting from the sale of stocks and bonds." On June 5, 1914, the Rayburn bill passed in the form in which the committee on interstate and foreign commerce had prepared it. The vote was 325 in favor, twelve against, two answering "present," and ninety-four not voting. Going up to the Senate, the bill found its way to the committee on commerce, which reported it on July 23, cutting out, however, the interlocking directorate provision and making several amendments to the text. The session closed with the bill still on the Senate calendar. It was not revived at the winter session.

LITTLE PROSPECT FOR PEACE IN WILKES-BARRE STRIKE

James W. Steese and Patrick Gildea, mediators for the Pennsylvania State Bureau of Labor, continue their efforts to settle the strike of the trainmen on the lines of the Wilkes-Barre (Pa.) Railway. Mr. Steese would not discuss the plans that are being considered. Company officials declare that there can be no settlement which will involve concessions on its part, while strike leaders assert that there can be no peace on a plan which does not bring them a flat wage rate instead of the sliding scale.

Shopmen in the employ of the company ordered out on a sympathy strike refused to obey the order.

One of the most serious attempts at violence occurred

when an effort was made to burn the company's bridge over the Susquehanna River between Wilkes-Barre and Plymouth. Mounted men of the State Constabulary extinguished the fire before it had done more than burn several spots in the bridge flooring, which had been saturated with gasoline. While using the northbound tracks to continue on their way when it was found that the southbound tracks were blocked by fallen overhead wires, several men who have replaced the strikers were hurt in a head-on collision on the Nanticoke line. Considerable violence was reported on Thanksgiving Day and service was abandoned in Plymouth.

The company expects to start running on a night schedule on Dec. 1. It is having a second story built under the roof of the Wood Street carhouse for the purpose of providing sleeping quarters for the convenience of the men who are now living there.

DES MOINES FRANCHISE ELECTION POSTPONED TO NOV. 29

Light registration indicates slight public interest in the election of Nov. 29 on the granting of a new franchise to the Des Moines (Iowa) City Railway. The Des Moines Chamber of Commerce, which was instrumental in drawing up the new franchise to the satisfaction of the company and the City Council, is working to overcome the public apathy on the question by sending out letters to voters. These letters explain the franchise draft and relate that it has the approval of every member of the City Council, including the Mayor.

The lack of interest shown by the voters in the election is partially explained by the fact that practically no opposition to the grant is in evidence. A few spasmodic expressions of disapproval have come from scattered and generally uninfluential quarters. Only one of the local newspapers opposes the franchise. Its opposition is of a minimum effect because organized labor favors the franchise. The local street car men's union has approved the franchise and is particularly enthusiastic about the clause which provides for the settlement of labor disputes by arbitration. It was intended originally to hold the election on Nov. 20.

Emil G. Schmidt, president of the company, was explaining the franchise at a recent public meeting when he was questioned as to the effect of the jitneys on the company. He said that the jitneys had cost the company about \$25,000 to date, but that he believed they soon would be a thing of the past in Des Moines if the present rate of disappearance continues.

The Chamber of Commerce letter to voters is in part as follows:

"The street car franchise is a Chamber of Commerce measure, drafted by a committee of the organization and recommended by it for submission to the voters. It received the unanimous vote of the City Council after several other measures had been defeated by it.

"It provides for placing service in the hands of a commission, and when the commission cannot agree, arbitration is provided for. It places the capital for service at \$4,110,000, which is \$390,000 less than the capital offered originally by the City Council for all purposes. Service follows interest on bonds, taxes and depreciation and comes ahead of dividends. The capital is fixed at \$5,000,000 for purchase by the city. The State Legislature has not yet given the city authority to purchase or determine a method for acquisition of street car systems by cities. The grant provides for the sale of six tickets for 25 cents, half fare for school children, etc. It also provides for new rolling stock, 8 miles of extensions in three years and \$1,500,000 in three years for rehabilitation, etc.

"By the arbitration proviso in the service clause it is sought to take the question of service away from political and speculative influences. It is defined that 'service shall be as good as the best service in cities of the same size and class as Des Moines.'

"Salaries are limited to a per cent of earnings. It provides that stock can be issued only at par and when paid for in cash and that bonds must be sold in the open market. All proceeds from stock and bond sales must be invested in the property."

INTERURBANS ACCEPT KANSAS CITY PLAN

The five interurban electric railways entering Kansas City, Mo., have signed the agreement to accept the terms of the new franchise to the Kansas City Railways, as far as it affects their interests. These companies include the following: Kansas City, Clay County & St. Joseph Railway; Kansas City, Kaw Valley & Western Railway; Missouri & Kansas Interurban Railway; Kansas City Western Railway, and Kansas City, Lawrence & Topeka Electric Railroad.

Section 16 of the new franchise provides that interurban cars shall be under control of and be operated by the Kansas City Railways and its board of control from the time they enter the city limits. The city company shall pay to the interurban companies 15 per cent of passenger revenue on the interurban cars within the city limits. In the event that a central interurban station is built, this 15 per cent is to be paid by the interurban companies to the owner of the station.

Several franchises are pending in the City Council for building interurban electric railway stations. The interurban companies will have thirty days from the time when the new franchise finally goes into effect to agree on a location for such station. Such agreement is to constitute a recommendation to the board of control, which in turn has the privilege of recommending a site to the City Council for establishment by ordinance.

MELLEN RESPONSIBLE FOR NEW HAVEN TROLLEY PURCHASES

Charles S. Mellen, former president of the New York, New Haven & Hartford Railroad, took upon himself on Nov. 15 the responsibility for the New Haven's policy of acquiring electric railways in New England, which the Government in the trial of the eleven former directors of the road charges was a part of the New Haven's alleged plan to monopolize commerce. Mr. Mellen said:

"I told my directors time and again that the road ought to supply the public with its needs, and that meant electric railways, steamship and railroad lines. It was my policy, and I always put it forward, that the public should be supplied with all classes of transportation it demanded."

Sixty-five electric railways went into the New Haven system in pursuance of the Mellen policy, it was brought out, the acquisition of which the prosecution began to establish one by one. The evidence was admitted only conditionally, however, as Judge Hunt said that where the electric railways were shown to have operated within the borders of a single State, as in the case of many of the Connecticut lines, there was doubt in his mind that their acquisition was necessarily a violation of the Sherman law, which applies to interstate commerce.

CINCINNATI TRANSIT COMMISSION APPOINTED

In compliance with the law enacted by the Legislature last spring, Mayor Spiegle of Cincinnati, Ohio, has appointed the members of the commission to prepare plans for the proposed municipal rapid transit railway in that city. This step was taken on Nov. 16 when he announced the following appointments: William Cooper Proctor, president Proctor & Gamble Company; E. W. Edwards, president Edwards Manufacturing Company; William A. Hopkins, former city treasurer and for years connected with the public schools and city library; Edward H. Dornette, well-known architect, and Christian Schott, president Cincinnati Galvanizing Company. Both Mr. Proctor and Mr. Edwards were members of the old commission. The terms of the members range from one to five years, in the order in which their names are given.

City Engineer Frank Krug will be the engineer-in-chief of the commission. It is rumored that Mayor Spiegle, whose term expires at the end of the year, will be selected as attorney. City Solicitor Walter M. Schoenle and former City Solicitor Alfred Bettman will both have certain legal work in connection with the commission's activities.

The first work of the commission will be a careful study of the plans of that commission. Until this work is out of the way Council will not issue any part of the \$150,000 of bonds authorized for the preliminary work. The members of the commission are to serve without salaries.

What is known as modification H of scheme No. 4 of the old commission's plan, described at some length recently in the *ELECTRIC RAILWAY JOURNAL*, will probably receive attention first. The cost of the rapid transit line provided for in this plan was estimated at \$5,717,849, or if it is made a subway for the entire length, the cost would be about \$12,000,000. Conferences will be held with officials of the various interurban roads to learn just what will be necessary to bring them to the business district.

The Cincinnati, Lawrenceburg & Aurora Electric Street Railway is working out a plan of entry of its own in connection with the West End Rapid Transit Company, which was incorporated some weeks ago. Edward H. Dornette said after his appointment as a member of the commission that an effort should be made to bring the Cincinnati & Indianapolis Traction Company into the heart of the city.

ELECTRICAL PROSPERITY WEEK NOV. 29 TO DEC. 4

On Nov. 20 the Society for Electrical Development sent out the last of the general publicity literature to be issued during the great Electrical Prosperity Week campaign, with the exception of the advance issue of *Collier's Weekly* Electrical Prosperity Week number of Nov. 27. The advance issue was for electrical men only. Of it 25,000 copies were mailed later. The special number of *Collier's Weekly* contains all of the "ads" shown in the advance issue and in addition thereto important articles on electricity—news pictures of what electricity will do and a vast amount of other interesting reading matter. It will have a circulation of nearly 1,000,000. The *Saturday Evening Post* of Nov. 27 also contains a number of Electrical Prosperity Week advertisements of leading electrical manufacturers. *Scientific American* of Dec. 4 and *National Food Magazine*, November issue, are electrical numbers. These magazines will reach fully 10,000,000 people.

With the assistance of leading sales and advertising experts last spring the society planned a large amount of co-operative material to be furnished—much of it free to everyone. The campaign soon became so big that the society reordered material many times—but still the avalanche of requests grew, many coming in at the last minute. For example, based upon every fact of past sales campaigns 5000 window lithographs should have covered the country. Up to Nov. 20 the society had already sent out 30,000. Of the 58,000 street cars in this country, more than 24,000 cars carry the society's Electrical Prosperity Week car cards. More than 5000 billboards are covered with the big eight sheet society design. Electric vehicles, wagons, etc., will carry 10,000 muslin signs. The 5,000,000 poster stamps have been distributed. It is said that never before in trade history has such a tremendous amount of dealer co-operative matter been distributed.

The Society for Electrical Development has been unable to fill orders for last-minute material, so great has been the demand on it. The society has now in preparation a booklet which is to recite the work done for Electrical Prosperity Week. Wishing to make the records complete, it asks that the chairmen of committees in charge of local celebrations send the society photographs, newspaper clippings and stories of the week.

AMENDED BUS PROPOSAL IN NEW YORK

The Fifth Avenue Coach Company placed a new proposal for an extension of its motor bus lines before the Board of Estimate of New York on Nov. 18 in opposition to the application of the New York Motor Bus Company. The Fifth Avenue company now suggests a profit-sharing arrangement, whereby the city shall obtain one-half the net profits after a certain preferential has been set aside, calculated on the cost of operation, the charges for amortization, 6 per cent on the capital invested, and an amount equal to the company's average profits for the last two years. The company is willing to guarantee that the annual payment to the city shall never fall below \$75,000, and it asserts that in all probability, under this plan, the city's share would be at present \$107,500 a year and in seven years not much under \$225,000. The company proposes to charge for all its buses 10 cents, but to have a system of universal transfers. It has adopted many of the lines which the New York

Motor Bus Company has proposed, but has omitted some, to which opposition has developed.

Rhode Island Arbitration Award Postponed.—By agreement of the Rhode Island Company and its union employees the finding of the board of arbitration sitting in the wage case pending at Providence has been postponed an additional thirty days. The decision will probably be announced about Christmas.

Girardville Strike Settled.—The strike of the electrical workers of the Schuylkill Railway at the Girardville, Pa., shops has been settled as the result of a conference between W. S. Leib, general manager of the company, and a committee of employees. All of the latter will get an increase of wages ranging from 25 cents to 50 cents a day.

Strike on Buffalo & Depew Railway.—Demanding an increase in wages of 5 cents an hour, eight motormen and conductors, employed on the 7-mile line of the Buffalo & Depew Railway between Pine Hill and Lancaster have gone on strike. No effort has been made to operate cars, nor to fill the places of the eight strikers. William B. Cutter, Buffalo, president of the company, says the line has never paid expenses and that the company cannot increase the pay of the men.

Strader Finally Obtains His Liberty.—Alfred M. Strader, after having once been denied a pardon from the penitentiary, was finally granted his liberty by Governor Willis of Ohio on Nov. 16. Strader was convicted of having dynamite in his possession for unlawful purposes and placing dynamite on the street railway tracks in Columbus during the strike in 1910. For the first offense he had served five years and he had also served sixteen months of a five-year sentence for the second offense.

Report on Cleveland Bridge Approaches.—Frederick Law Olmsted, Boston, architect employed by the City Plan Commission at Cleveland, Ohio, has filed a report with Director of Public Service Sidlo, in which he objects to the approaches to the new bridge across the Cuyahoga River, as planned by the county engineers. He insists that the vehicle traffic should not cross car tracks at grade at either end of the bridge and this would be necessary under the present plans of the county engineer. Mr. Olmsted favors the subway approach for cars on the east side and is studying a new plan for the west side.

Matters in Status Quo in Detroit.—No question affecting the municipalization of the lines of the Detroit (Mich.) United Railway within the one-fare zone of Detroit may be submitted to the electors before July, 1916, according to the corporation counsel's interpretation of the city charter which prohibits more than two special elections in any one year. Because of this ruling the Board of Street Railway Commissioners has accepted the resignation of its secretary and will close its offices on Dec. 1. All three of the commissioners have indicated that they do not intend to resign from the board, but in a letter to the Common Council they point out that for the next eight months at least their activities will be governed more or less by the Council's requests.

PROGRAM OF ASSOCIATION MEETING

Pan-American Scientific Congress

The preliminary program of the coming Pan-American Scientific Congress, to be held in Washington at the Pan-American Building, Dec. 27 to Jan. 6, is just available. The congress will be divided into nine sections, of which one is devoted to "Transportation, Commerce, Finance and Taxation." L. S. Rowe, president American Academy of Social and Political Science, is the president of this section. Professor Rowe was chairman of the United States delegation to the first Pan-American Scientific Congress, which was held in Santiago in 1908. This section is divided into four sub-sections, namely, (1) Transportation, (2) Commerce, (3) Finance and (4) Taxation. The chairman of the committee in charge of sub-section (1) Transportation, is James S. Harlan, commissioner, Interstate Commerce Commission. The other two members of the committee are B. H. Meyer, commissioner, Interstate Commerce Commission, and Prof. Emory R. Johnson, of the University of Pennsylvania, Philadelphia.

Financial and Corporate

NEW YORK EARNINGS IMPROVE

Current Earnings of All Lines in Metropolis Show Substantial Increases—Outlook Now More Gratifying

According to current reports the elevated, subway and surface lines of New York City are practically all enjoying a marked boom in traffic. This came without warning, starting in October, and the current month is said to be showing capacity traffic. July, August and September, the first three months of the current fiscal year, were normal traffic months. The lines about held their own with last year, and in some cases reported smaller earnings. October was better, but in November the traffic began to show marked increases.

Earnings of the subway and elevated lines of the Interborough Rapid Transit Company are reported to be averaging \$7,000 a day ahead of last year at this time. That means that about 140,000 more passengers, daily, are using the overhead and underground lines. The New York Railways is averaging \$3,500 a day more than last year, so that the lines owned by the Interborough Consolidated Corporation are doing a daily business \$10,500 more than last November.

In the first eighteen days of November, the Brooklyn Rapid Transit System reported total earnings that were \$105,642 or 8.9 per cent in excess of the same period of 1914. Surface traffic increased \$50,406 or 6.6 per cent, and elevated traffic \$55,236 or 13.1 per cent. Frederick W. Whitridge, president Third Avenue Railway, is reported to have said recently that since the beginning of the current year in July there has been a distinct betterment in revenues and the outlook is more gratifying than for some time. The employment department of the company has lately noticed a large falling-off in applications for positions, which fact may be accepted as evidence of a general improvement in business conditions.

Harvey Fisk & Sons, New York, state that the Hudson & Manhattan Railroad is reporting substantial increases in the number of passengers carried. The number of passengers in October was 5,287,429, an increase of 4.48 per cent over October, 1914, while in the first half of November the number was 2,614,706, an increase of 11.3 per cent. Every station in the current month showed an increase except two, and here the traffic remained the same.

Officials of the traction lines unite in attributing the increase in traffic to generally improved business conditions in and around New York. They point to the capacity business of the big hotels as additional evidence, and also assert that the shopping and pleasure traffic, as well as strictly business traffic, is on a decided upgrade.

KANSAS COMPANIES MERGED

The Kansas Public Utilities Commission after an adjourned hearing on Nov. 9 gave its approval to a merger of the street railway and electric light plants in Lawrence, Emporia and Parsons with the Kansas Electric Utilities Company, a Lawrence corporation recently chartered. The plants in the three localities were inspected by commission engineers, and it was decided that the proposed amalgamation would be of general advantage.

In expressing its approval the commission issued three orders. One authorized the Parsons Railway & Light Company, the Emporia Railway & Light Company and the Lawrence Railway & Light Company to sell their franchises to the Kansas Electric Utilities Company. Another granted permission to the new company to operate as a common carrier in Kansas. The third authorized the new company to issue \$400,000 of capital stock and \$1,500,000 of first mortgage ten-year 5 per cent bonds, the sale of which is to provide funds for taking over the three old companies.

An unusual feature of the arrangement is that the capitalization of the new company will be less than the combined capitalization of the three companies which it supplants. The order issued by the commission provides that the new company will have \$871,000 less in securities than the three old ones had outstanding. The commission, however, allowed exactly what the incorporators asked.

ANNUAL REPORT

Spokane & Inland Empire Railroad

The comparative statement of income, profit and loss of the Spokane & Inland Empire Railroad, Spokane, Wash., for the years ended June 30, 1914 and 1915, follows:

	1915	1914	Change in Per Cent
Railway operating revenues:			
Freight	\$270,126	\$310,930	-13.1
Passenger	401,644	483,191	-16.9
Street railway system.....	498,977	541,618	-7.9
Other revenue	72,577	68,728	+ 5.6
Total railway operating revenues	\$1,243,325	\$1,404,469	-11.5
Railway operating expenses:			
Way and structures.....	\$239,443	\$254,400	- 5.9
Equipment	195,378	127,400	+53.4
Power	119,015	119,468	- 0.4
Conducting transportation ...	368,140	388,461	- 5.2
Traffic	18,936	21,759	-13.0
General and miscellaneous ..	126,384	150,588	-16.1
Transportation for investment—credit	14
Total railway operating expenses	\$1,067,284	\$1,062,080	+ 0.5
Net revenue, railway operations	\$176,040	\$342,388	-48.6
Auxiliary operations—revenue.	\$162,914	\$136,840	+19.1
Auxiliary operations—expenses	10,634	10,282	+ 3.4
Net revenue—auxiliary operations	\$152,280	\$126,557	+20.3
Net operating revenue.....	\$328,321	\$468,946	-29.9
Taxes accrued	150,000	150,000
Operating income	\$178,321	\$318,946	-44.1
Other income	2,456	3,840	-36.0
Gross income	\$180,777	\$322,786	-44.0
Deductions:			
Interest on funded debt ...	\$235,238	\$238,910	- 1.5
Interest on unfunded debt..	231,224	214,427	+ 7.8
Miscellaneous	2,108	27
Total deductions	\$468,571	\$453,365	+ 3.4
Deficit	\$287,794	\$130,578

The interurban freight business during the year, in common with other business in the territory, especially the lumber business, suffered from the general depression. It showed a decrease in revenue received of \$40,803, or 13.1 per cent, as compared with last year's figures. The interurban passenger business shows a decrease of \$81,547, or 16.9 per cent, as compared with preceding year. This decrease was caused in some measure by the auto-bus and privately owned automobile competition, but largely by the prevailing depression.

The revenue received from the street railway system of the city of Spokane showed a decrease of \$42,640, or 7.9 per cent, as compared with last year. This decrease was principally caused by the jitney-bus competition in the city. The revenue received from other sources shows an increase of 5.6 per cent over last year's figures. The revenue received from auxiliary operations—sale of power—increased \$26,514, or 19.1 per cent.

The charges for operation showed a decrease in every department except equipment. The increase in the equipment department was brought about by depreciation being charged this year on all equipment under the new ruling of the Interstate Commerce Commission. Such charges during the current year amounted to \$78,315. In addition to this, there were a number of wooden bridges on the Inland Division which were replaced by embankments, and it was necessary, under the rulings of the commission, to dispose of the depreciation on these wooden structures through operating expenses. The charges on that account amounted to \$18,418, making a total charge for depreciation during the year of \$96,733. As there were no corresponding items in the previous year's report, a comparison of the actual expenses for operation shows a decrease of \$91,530.

The taxes of the company in the State of Washington for the years 1911 and 1912 were paid during the last year, a compromise being effected with the County and State officials in which all penalties and interest on account of taxes unpaid were cancelled. The funds necessary to pay these taxes were secured at 5 per cent. The current taxes were also paid.

The total expenditures for additions and betterments for the fiscal year amounted to \$32,829. This amount covered payments of land contracts, municipal assessments, paving in the city of Spokane, bridges filled on the Inland Division, new depots at Kiesling and Steptoe and a new substation and equipment at McGuire, Idaho.

ACTUAL COST AND CAPITALIZATION

Judge Stuart in the Circuit Court of Honolulu is hearing an injunction suit brought by the Territory of Hawaii to restrain the Honolulu Rapid Transit & Land Company from making certain increases in its capital stock. The company's franchise provides that it shall not be lawful to increase the capital stock above the actual cost of the property plus 25 per cent thereof. The Territory, however, contends that this franchise provision constitutes merely a limitation, and the capitalization can be based only on the present value of the company's property, plus 25 per cent.

The choice of a valuation basis, therefore, forms the vital issue of this case. Judge Stuart, it is reported, has tentatively ruled in favor of the cost basis. He admitted some evidence regarding value, but indicated that it might be ruled out later. The actual cost of the company, as far as shown, is said to be approximately \$2,171,000. On this basis the company might contend that it can issue stock up to \$2,171,000 plus 25 per cent, but the present suit is confined to its right to issue stock up to \$1,600,000. C. R. Forbes, superintendent of public works, and W. H. Barringer recently completed an investigation as to the company's present value, although their findings have not yet been offered to the court. W. A. Cattell, consulting engineer, San Francisco, Cal., has been retained by the company to investigate its plant and testify as to its proper valuation.

C. G. Ballentyne, general manager, has been testifying before the court in regard to the company's valuation and earnings. Of the sum paid for the franchise of the old Honolulu tramway system, approximately \$300,150, Mr. Ballentyne stated that \$150,000 was in bonds, \$91,000 in preferred stock at par value and the balance in cash. This purchase price, it is asserted, should be included in the cost of the company. The total income from Aug. 31, 1901, to April 30, 1915, was approximately \$5,693,032, of which sum \$5,563,376 was taken in fares. The expenditures for the same period were \$2,171,976.

\$50,000,000 CORPORATION TO PROMOTE TRADE

Frank A. Vanderlip, president of the National City Bank of New York, announced on Nov. 23 the details of organization and the objects to be achieved by a new corporation for the promotion of American enterprises, industry and commerce in foreign lands. The name of the new corporation is the American International Corporation. It is incorporated in New York State with a capital of \$50,000,000, of which \$49,000,000 will be common and \$1,000,000 will be managers' shares. The managers' shares will be paid for at par, the same as the common stock, and will have no advantage over the common until the latter pays 7 per cent. Any amount higher than this figure will be divided one-fifth among the holders of the managers' shares and four-fifths among the common shareholders. The managers' shares can be held only by those actively engaged in the management of the corporation. There will be no public offering of any of the stock.

The president of the new corporation will be Charles A. Stone, of Stone & Webster, Boston. Mr. Stone will come to New York to live. R. P. Tinsley, treasurer of the Standard Oil Company, will be secretary and treasurer. Mr. Vanderlip will be the chairman of the board of directors, which will be made up as follows:

J. Ogden Armour, Armour & Company; Charles A. Coffin, General Electric Company; W. E. Corey, Midvale Steel & Ordnance Company; J. P. Grace, W. R. Grace & Company; James J. Hill, Great Northern Railway; Otto H. Kuhn, Kuhn, Loeb & Company; Robert S. Lovett, Union Pacific Railroad; Ambrose Monell, International Nickel Company; Henry S. Pritchett, Carnegie Foundation; Percy A. Rockefeller, Standard Oil Company; John D. Ryan, Anaconda Copper Company; Charles H. Sabin, Guaranty Trust Company; William L. Saunders, Ingersoll-Rand Com-

pany; James A. Stillman, National City Bank; Charles A. Stone, Stone & Webster; Theodore N. Vail, American Telephone & Telegraph Company; Frank A. Vanderlip, National City Bank; Edwin S. Webster, Stone & Webster; Albert H. Wiggin, Chase National Bank; Beekman Winthrop, Robert Winthrop & Company, and Guy E. Tripp, Westinghouse Electric & Manufacturing Company.

The purposes of the new company were outlined by Mr. Stone as follows:

"It is organized for the purpose of doing an international business and promoting trade relations with the different countries which will help make a world market for our products; for financing and promoting the development in foreign countries by American engineers and manufacturers of great public and private undertakings; for assisting in financing the rehabilitation of industries in foreign countries; and for undertaking such domestic business as seems advantageous in connection therewith."

American Railways, Philadelphia, Pa.—The board of directors of the American Railways has issued to its stockholders a formal announcement of the details of its merger with the National Properties Company, New York, as described in the *ELECTRIC RAILWAY JOURNAL* of Nov. 6. In particular the announcement calls for the deposit of the American Railways outstanding common stock at the Continental-Equitable Title & Trust Company, Philadelphia, on or before Nov. 30, in order to be exchanged for new thirty-year collateral trust bonds of the National Properties Company. The depositors will receive negotiable receipts exchangeable for bonds after Jan. 3, 1916, if the agreement becomes operative by the deposit of the 75 per cent of the stock required. All depositors of stock will be entitled to receive the dividend upon the common stock now declared and payable Dec. 15, 1915, whether the agreement of purchase becomes operative or not.

Boston (Mass.) Elevated Railway.—The authorized \$3,286,000 issue of 5 per cent gold bonds of the Boston Elevated Railway, noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13 and 20, has been sold at 97 and interest, to yield 5.2 per cent, by a syndicate headed by R. L. Day & Company, Boston. The bonds, dated 1912, are due in 1942.

Buffalo & Williamsville Electric Railway, Williamsville, N. Y.—The Buffalo & Williamsville Electric Railway, as noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, has been authorized to issue \$49,000 of 5 per cent forty-year first mortgage bonds at 95, to net \$46,550. All of this sum, it is now learned, is to be devoted to the payment of notes and bills payable. An examination of the affairs of the company revealed that while the assets have been less than the liabilities since the sale of its Batavia property, its present properties are being operated profitably. The permission for the present issue of securities is made on the condition that the company not pay dividends until this difference has been completely amortized, meanwhile maintaining a corporate surplus account of at least \$10,000.

Cities Service Company, New York, N. Y.—Henry L. Doherty & Company, New York, is offering at 101 and interest five-year 7 per cent convertible coupon gold notes of the Cities Service Company. The notes are due on May 15, 1918, but are callable at 102 and convertible into preferred stock at par. Of the \$10,000,000 of notes authorized in this issue, \$7,000,000 are outstanding. It is also announced that John C. Mitchell, president Denver National Bank, has been elected a director of this company to succeed the late Dennis Sullivan.

Fort Wayne & Springfield Railway, Decatur, Ind.—I. A. Kalver, Decatur; A. Bornstein, Indianapolis, and A. Fernberg, Muncie, have filed with French Quinn, receiver Fort Wayne & Springfield Railway, a certified check for \$5,000, accompanying their bid of \$51,647 for the property of the company. It is said that their plan will be to wreck the road, sell the material and hold the real estate. It is not generally believed that the road will go to them, as their bid is much lower than the receiver's certificates and the court costs. The latest preceding item regarding this company's condition was published in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23.

International Traction Company, Buffalo, N. Y.—Under the plan outlined in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, holders of more than 85 per cent of the \$5,000,000 of 4 per cent cumulative preferred stock of the International Traction Company have retired their holdings, together with all accrued and unpaid dividends thereon, by the acceptance in exchange on a share for share basis of new 7 per cent cumulative first preferred stock. The company now offers to the holders of the remaining 4 per cent preferred issue the privilege of a like exchange at any time prior to Jan. 1, 1916. The new 7 per cent issue will bear dividends from Nov. 15.

Jamestown, Westfield & Northwestern Railroad, Jamestown, N. Y.—The Public Service Commission for the Second District of New York has approved the lease of the Jamestown, Westfield & Northwestern Railroad line between Mayville and the Chautauqua assembly grounds to the Western New York & Pennsylvania Railroad and the Pennsylvania Railroad. The leased line is a 2.6-mile section along the shore of the lake that is not connected or capable of profitable connection with any of the other lines of the lessor. The lease was made last March, but through inadvertence the approval of the commission was only recently applied for.

Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.—The syndicate composed of Lee, Higginson & Company, Boston, and Reilly, Brock & Company, Drexel & Company and Graham & Company, Philadelphia, which recently purchased \$7,000,000 of first and consolidated mortgage five-year 5 per cent gold bonds of the Mahoning & Shenango Railway & Light Company, dated Nov. 1, 1915, as noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, has disposed of all the issue at 97.75 and interest to yield about 5.5 per cent. The proceeds of these bonds will be used to retire \$4,844,000 of first consolidated refunding bonds maturing on Jan. 1, 1916, and in addition pay a part of the cost of new construction, additions and improvements made during the last few years by the controlling company, the Republic Railway & Light Company.

Middle West Utilities Company, Chicago, Ill.—The Illinois Trust & Savings Bank, Russell, Brewster & Company and McCoy & Company, all of Chicago, are offering at 94.8, to yield more than 6.75 per cent, the remainder of a present authorized issue of \$2,000,000 of 6 per cent ten-year collateral gold notes of the Middle West Utilities Company, dated Jan. 1, 1915. A large part of this has already been placed by the three foregoing firms and by W. P. Bonbright & Company and A. H. Bickmore & Company, New York. On June 30, an amount of \$1,000,000 was outstanding.

Public Service Corporation of New Jersey, Newark, N. J.—The financial statement issued by Public Service Corporation of New Jersey for October shows an increase in gross business of nearly \$160,000. For the ten month period ended with October the gross increase totaled more than \$1,100,000. The actual gross increase in total business for October was \$159,129, an increase of 5 per cent. The balance available, after payment of operating expenses, fixed charges, sinking fund requirement, etc., for amortization, dividends and surplus was \$488,741. The decrease in surplus available for dividends over the corresponding month of 1914 was \$32,697. For the ten months ended Oct. 31, 1915, the gross increase in total business was \$1,127,841, an increase of 3.83 per cent. The balance available for amortization, dividends and surplus was \$2,995,133, while the increase in surplus available for dividends amounted to \$161,505.

Sandpoint & Interurban Railway, Ltd., Sandpoint, Idaho.—The stockholders of the Sandpoint & Interurban Railway, Ltd., have decided to issue \$20,000 of bonds to take up notes in the sum of \$15,000 and to make improvements.

Springfield (Mass.) Street Railway.—The Massachusetts Public Service Commission has authorized the Springfield Street Railway to issue 9472 shares of stock at 110. The proceeds, amounting with the premium to \$1,041,920, are to be used to pay off floating indebtedness. The application for this issue was reported in the *ELECTRIC RAILWAY JOURNAL* of Dec. 12, 1914.

Toledo-Detroit Railroad, Toledo, Ohio.—The Toledo-Detroit Railroad, the successor to the Toledo, Ann Arbor & Jackson Railroad, is now operated by steam. The latter line, which took over the Toledo, Ann Arbor & Detroit Railroad, foreclosed, was organized to operate a 50-mile electric system, and 18 miles of line were constructed before it was sought to change to steam power.

Utah Securities Corporation, New York, N. Y.—All offers to sell Utah Securities Corporation 6 per cent ten-year notes of 1912 up to 89.99 were accepted on Nov. 18 by the Guaranty Trust Company, New York, as trustee. The amount deposited with the bank for the retirement of the notes was \$1,000,000. It is now announced that the bank has on deposit an additional \$1,000,000, in exchange for which offers of notes at not more than 101 and interest will be received up to Dec. 2.

Worcester (Mass.) Consolidated Street Railway.—The Worcester Consolidated Street Railway has received permission from the Massachusetts Public Service Commission to issue 18,140 shares of stock, par \$100, to pay off floating indebtedness. As noted in the ELECTRIC RAILWAY JOURNAL of Dec. 12, 1914, the company had asked approval of an additional \$1,880,000 of stock.

DIVIDENDS DECLARED

Manhattan Bridge Three-Cent Line, Brooklyn, N. Y., quarterly, 1½ per cent.

Norfolk Railway & Light Company, Norfolk, Va., 3 per cent.

Northern Ohio Traction & Light Company, Akron, Ohio, quarterly, 1½ per cent, common.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis., quarterly, 1¼ per cent, preferred.

Traffic and Transportation

ATLANTIC CITY COMMISSION REVERSES ITSELF

Political Expediency Said to Have Governed Jitney Legislation at Coast Resort—Independence Measure Upheld—Ordinances Passed in St. Louis and Logansport

In direct contradiction to an article published in *Commission Government*, the organ of the city officials of Atlantic City, N. J., the City Commissioners absolutely and finally refused to pass proper and reasonable regulation of the jitney traffic. The article in question stated in part as follows:

"For the first time with the authorization of the City Commissioners, jitneys are to be brought under at least a pretense of regulation. An ordinance will be introduced requiring jitney operators to cover specified routes instead of running as they please; to prohibit smoking in the cars; to stop at the far sides of all street intersections, and to pay a license fee of \$50 each, instead of \$25, the former charge being the amount assessed upon the trolley cars."

After asserting that trolleys are essential to the further development of the resort and maintaining at the same time that the expulsion of jitneys from Atlantic Avenue is out of the question, the official statement says:

"It must be patent to every mind that the Board of Commissioners cannot be called upon to solve the problem of competition. The commissioners cannot be expected nor called upon to protect either the dividends of the electric railway or the profits of the individual jitneys. Both are lawful enterprises, and it is for them to work out the problems of competition. There has been a demand for the bonding of jitneys, but the law department of the city has decided that this cannot be legally done. That it has been done in other cities does not make the act legal."

All matters taken up with reference to the electric railway and the jitneys in Atlantic City seem to have been decided from the standpoint of political expediency on account of the fact that all of the present City Commissioners will be candidates for re-election next May. At the present time the 400 or more jitney operators and their friends evidently loom up as holding the balance of elective power.

The *Ohio Law Reporter* for Nov. 15 contains the text of the decision by Judge Foran in the case of Mike Kaczmarek vs. the Village of Independence et al., decided on July 28 in the Common Pleas Court of Cuyahoga County. The village of Independence last April passed a jitney regulatory ordinance requiring, among other things, a \$10,000 bond for jitney owners, and the plaintiff, who was arrested in violation of the ordinance, brought suit claiming that the restrictions were excessive and that the Village Council did not have power to pass the ordinance. Judge Foran held that an irresponsible jitney driver "is as dangerous a menace to the community as a truck load of dynamite in the custody of a drunken driver." He upheld the validity of the ordinance as well as the reasonableness of its provisions.

A bill providing stringent regulations for jitney automobiles was passed by the Board of Aldermen of St. Louis, Mo., on Nov. 19, by a vote of twenty-one to six. The measure requires owners of jitneys to pay a license fee of \$25 a year and to give bond of \$10,000 to indemnify pedestrians and other persons, excepting passengers and chauffeurs, for injuries to themselves or property in jitney accidents. Jitneys must display signs showing their destination and the fare charged, and are prohibited from being overloaded. No person may ride on the running board or body of the auto, and no higher fare than that specified shall be charged, under penalty of a fine of from \$5 to \$500. When the top is up after dark the jitney must be lighted.

An ordinance has been passed by the city of Logansport, Ind., to regulate the jitney. The conditions imposed are quite severe. Among other things the measure prescribes a license of \$100 a year for each automobile with a capacity of five persons or less, including the driver, \$150 a year for a machine of seven passengers, including the driver, and \$250 for a machine of more than seven passengers, including the driver; a \$10,000 bond; a charge of not more than 5 cents per passenger, and operation subject to regulations as to routes, etc., by the Board of Work.

MILWAUKEE COMPANY WANTS FARE INCREASE

Brief to Commission Shows Burdens of Regulation—For First Half of 1915 City and Suburban Lines Earn Only 1.075 Per Cent on Cash Investment

After a campaign of advertising for several weeks, as previously described in this paper, for the purpose of putting its side of the case before the public, The Milwaukee Electric Railway & Light Company for the city lines in Milwaukee, Wis., and the operated Milwaukee Light, Heat & Traction Company for the suburban lines have petitioned the Wisconsin Railroad Commission for increased fares. A brief filed with the commission cites various reasons why such an increase would now be justified.

In the first place it is stated that under commission orders the rates of fare charges have been repeatedly reduced in various ways—by requiring in August, 1912, the sale of thirteen tickets for 50 cents, by extending the single fare limits, and by forcing the issuance of two transfers for a single fare in spite of franchise provisions. In January, 1914, the commission extended the single-fare limits materially beyond the points provided for in the franchises and established suburban 2-cent zones in connection with certain minimum fares. In October, 1914, the commission ordered the sale of thirty zone tickets for 50 cents, or 1.66 cents per zone, and extended the city fare zone so as to eliminate certain outlying zones. In January, 1915, the commission rescinded the thirteen-tickets-for-50-cents order but left the single fare limits unchanged. In November, 1913, the commission fixed certain standards which are said to have required service in excess of that needed and to have imposed expenditures for construction and maintenance exceeding any possible revenue derived from the change.

In addition to the foregoing burdens, the companies have been required by the municipalities to make large capital and maintenance expenditures for building new lines into outlying districts and making unprofitable extensions, paving streets, sprinkling the streets and removing snow. The building and maintaining of pavements alone cost the city lines \$166,856 a year. Furthermore, The Milwaukee Electric Railway & Light Company is being subjected to large unremunerative expenditures for separating grades at steam railroad crossings, and proceedings are now contemplated to require the company to clean the streets in Milwaukee. On the suburban lines the Milwaukee Light, Heat & Traction Company has been similarly burdened with heavy paving obligations, and further impositions are sought in requirements to clean, sprinkle and oil the tracks and roadbed. In general, too, taxes and operating costs for material and labor have increased.

On the basis of commission figures the increase in capital expenditures on the city system in the five years from Jan. 1, 1910, to Jan. 1, 1915, was \$5,403,237, while the gross revenues in this period increased only \$323,394 or less than 6.2 per cent of the capital increase. This sum is less than one-sixth of the amount necessary to cover operating expenses, depreciation and a 7½ per cent return on the capital invested. Moreover, irrespective of the capital expenditures required, the operating expenses during the five years have increased on the average 218 per cent faster than the gross revenues.

The brief mentions the inequalities shown in jitney and railway regulation, and sums up with the statement that the present rate of return is prohibitory of further development. For the first half of 1915 the return secured by the petitioners on the basis of merely the earning value set by the commission was 1.388 per cent. On the basis of the cash investment for the city lines based on the United States Circuit Court decision as of Jan. 1, 1897, with cash additions to date, and the cash cost of the outside lines as stated by the commission with the actual cost of additions since, the return for this half year was 1.075 per cent. On the valuation as determined by the Wisconsin Tax Commission, however, the return was 1.056 per cent.

During the four years ended June 30, 1915, the companies secured returns on the different valuations as shown by the accompanying table. The lines inside and outside the city were forced by too low rates, high taxes and long hauls to earn \$1,408,865 less than they were entitled to on

the Wisconsin Railroad Commission's rate valuations; \$3,124,068 less than the 7½ per cent fare return on the actual admitted cash investments in physical property, and \$3,145,148 less than a 7½ per cent return on the tax valuations. These results are held to be confiscatory, and fares and zone limits sufficient to yield a reasonable return are demanded.

RAILWAY ESTABLISHES INTERURBAN BUS SERVICE

The Washington Auto-Bus Company, a subsidiary of the Puget Sound Traction, Light & Power Company, Seattle, Wash., on Nov. 15, inaugurated an auto bus service between Seattle and Bothell, a distance of approximately 15 miles. The Seattle-Bothell line is similar to those which have been operated by the company at Bellingham, Auburn, Edmonds and other points as auxiliaries or feeders to the various electric railways. On the Seattle-Bothell line, transfers are issued and accepted between the buses and the Cowen Park Railway, or at the Seattle terminus of the line, which is located at the Seattle-Everett Station, Fifth Avenue and Pine Street. The first auto-bus leaves Bothell at 6.40 a. m. and arrives at the Seattle terminus at 7.45 a. m. Three cars are in service morning and evening and two during the remainder of the day. The bodies of the cars are glass inclosed and are mounted on Mack trucks. The forward wheels are equipped with pneumatic tires and the rear wheels with block non-skid solid rubber tires. Each car seats twenty passengers, exclusive of the driver. The cars are lighted with electricity and are heated from the engine exhaust.

PACIFIC ELECTRIC CURTAILS PASADENA SERVICE

Paul Shoup, president of the Pacific Electric Railway, Los Angeles, Cal., and J. McMillan, D. W. Pontius and F. K. Hawkins, of the company, have sent a letter to Chairman Hamilton of the City Commission of Pasadena, Cal., setting forth the fact that owing to decreased revenues the company has found it necessary to change its running schedule in Pasadena. The letter follows:

"The Pacific Electric Company has found it necessary because of decreases in its passenger revenues during the last fifteen months to economize in its transportation service, and its new time card will become effective on Nov. 14. The principal point is that the public and railway can get along best without that service which is least patronized.

"Notwithstanding the decrease in revenue between Los Angeles and Pasadena, so far, fortunately, we have been able to get along without increasing the intervals between trains, which we are very loath to do, so it may be said that your most important service is not affected.

"Some changes have been made in your local street car service, about which you have been advised locally, which is only taking off some cars which we voluntarily put on some time ago. Conditions on our local city lines in Pasadena are expressed by comparing September, 1915, with September, 1912. During the former month we operated 130,000 car-miles and took in \$19,939, while three years ago we operated 118,000 car-miles and took in \$24,700.

"We regret the necessity for these economies and trust that normal conditions in all lines of business, which of course includes ours, will return before long."

One-Man Cars in Everett.—The Puget Sound International Railway & Power Company is operating cars on the North Colby-Rucker extension in Everett, Wash., except between the hours of 4 p. m. and 6 p. m., at which time traffic is the heaviest.

Car Seat Vandals in Buffalo.—Because of the number of car seats damaged by passengers and others cutting them with knives and other sharp instruments, officials of the International Railway, Buffalo, N. Y., have offered a reward of \$25 for the apprehension of such individuals. Notices to this effect have been posted in all cars.

"Trolley Topics" a Year Old.—The November issue of *Trolley Topics*, the house organ of the Louisville (Ky.) Railway, is a special number, being the anniversary and Thanksgiving number of the publication and the thirteenth issue, which was published for the first time in November a year ago. The special number contains, with covers, thirty-four pages, printed on a book paper and illustrated. Samuel Riddle, superintendent of transportation, is editor of the publication.

Question of Jurisdiction Settled.—The Appellate Division at Toronto, Ont., has dismissed the appeal of the Hamilton, Grimsby & Beamsville Electric Railway from the judgment in favor of Rev. J. S. Ross and others, Hamilton, Ont. The company contended that the Ontario Railway Board had no jurisdiction to order sanitary conveniences in the company's cars, since the railway had been declared for the general advantage of Canada. It is held by the court that the board has jurisdiction.

Skip-Stop Vote in St. Louis.—It was proposed by the United Railways, St. Louis, Mo., to permit its patrons to vote on Nov. 22 on the question of the continuation of the skip stop there. It is stated unofficially that the stops already eliminated have resulted in a saving of six minutes in the regular schedule of the Broadway line in each direction, making a saving of $7\frac{1}{2}$ per cent, and that three minutes have been clipped from the time in each direction of the Delmar and University lines, making a saving of 7 per cent to the passengers.

Chicago Surface Lines Introduce Fresh-Air Cars.—The popularity of the twelve fresh-air cars being operated on the Elevated Railroads of Chicago, Ill., has led to the inauguration of a similar service, with sixty cars, on the Chicago Surface Lines. These cars are operated five each on twelve different lines and bear conspicuous signs stating that they are fresh-air cars. Like the cars operated on the elevated lines, those on the surface have all the windows and doors open. The cars were placed in service at the request of John Dill Robertson, health commissioner of the city. They will be continued in service indefinitely.

Something New in Railway Bowling.—A series of games between picked teams of the Public Service Railway, Newark, N. J., and the Denver (Col.) Tramway bowling leagues is now in progress. The first three games were rolled by both teams on Saturday, Oct. 23. In order that the play might be made simultaneously, the contest was arranged to begin in Denver at 7 p. m., mountain time, and, in Newark, at 9 p. m. Eastern time. Returns of each game were telegraphed by the teams immediately after the finish. The first series resulted in a victory for Denver, with a total gain of 171 pins. After the games are finished, the losing team will prepare an engrossed copy of the scores, suitable for framing, and will present it to the winner.

Toronto Running Board Ruling.—Judge Winchester, in his judgment in the charge of criminal negligence against the Toronto (Ont.) Railway for operating cars with running boards, delivered on Nov. 19, says: "On the evidence I find the Toronto Railway has been guilty of criminal negligence, and that the charge has been proved. Since the hearing herein an interim order relieving the company from the obligation imposed by Sec. 107 (1) of Chap. 185, R. S. O., 1914, as to all the routes in the city until the application has been finally disposed of, has been made by the Railway Board, that only affects the rights of the parties since its date. While finding the railway guilty of the charge I do not impose any sentence at present, and will wait a reasonable time to permit the company to carry out the provisions of the statute. I will, therefore, defer sentence until the General Sessions of the Peace, to be held in May, 1916. In

the meantime, if a reserved case be desired to the Court of Appeal on the above I shall grant it."

Detroit Skip-Stop Campaign.—Some form of skip-stop plan will be tried by the Detroit (Mich.) United Railway within a short time, provided the necessary permission is forthcoming from the city authorities. The company's idea is to conduct the first experiment on the Woodward line, the heaviest passenger line in the city, and if satisfactory to the riders to make the plan effective on other lines. For the last three weeks the company, through its weekly publication, *Electric Railway Service*, has been seeking the opinions of its riders on the skip-stop plan. The response in favor of the idea has been so large and so unanimous that it is believed the time is opportune for the experiment. Congestion in some of Detroit's main thoroughfares has been increasing at such a pace recently that in the rush hour many of the cars cannot average more than $7\frac{1}{2}$ m.p.h. Half trips on some of the lines which are scheduled to be made in thirty minutes are taking from thirty-eight to forty-one minutes. The company's plan, generally speaking, is to have the cars going in one direction stop at every other block and on the return trip stop at the blocks which have been missed in going in the opposite direction.

Campaign in Brooklyn Against Reckless Vehicle Driving.—According to the Brooklyn (N. Y.) Rapid Transit Company there were 434 accidents to vehicles on its lines in September. In 60 per cent of these mishaps the company held the drivers of motor and horse conveyances were to blame. In a statement which it has issued the company says: "We commend these figures to all those who are responsible for the operation of commercial or pleasure vehicles in the streets of Brooklyn. In common with other street railroads we are spending thousands of dollars each year in instructing our operating employees in safety and in following up this safety education by a comprehensive system of inspection and report. Where operating employees are found deficient in their knowledge of safety duties through the occurrence of accidents or other means of disclosure, we see to it that they are promptly and effectively reinstructed and the man who cannot or will not understand such instruction does not remain long in the service." The company announces that hereafter it will have its car crews report the numbers or owners' names of vehicles recklessly operated which may be involved in accidents, and, if such reports are substantiated after investigation, notices will be sent to the owners, advising them of the circumstances.

New Traffic Rules in Louisville.—Traffic regulations which are revolutionary for Louisville have been ordered put into effect by the Board of Public Safety, of that city, and promise to be very effective in remedying traffic conditions on Fourth Street, the principal retail street in that city. From Main Street to Broadway, six blocks, there is always a large amount of traffic, and this stretch of street has been most troublesome for the Louisville Railway. The Fourth Street line is the principal line of the company and, in addition to the through travel, it carries a large number of transfer passengers in the central part of the city. Blockading of traffic here has often seriously interrupted schedules and discommoded passengers transferring from these cars to cross-town cars. The rule promulgated now provides: That no vehicle shall be left standing at the curb on Fourth Street between Main Street and Broadway, or on Walnut and Chestnut Streets between Third and Fifth Streets; that traffic in or out Fourth Street between Main Street and Broadway may not turn across the street to pass into cross streets, i.e., to the left, although traffic from cross streets may turn into Fourth Street; that no vehicle in any of the described squares shall stand within 15 ft. of a fire hydrant and that an additional safety zone shall be established on Fourth Street between Green and Walnut Streets. Authority is given to the police to enforce these regulations and to prosecute offenders in the ordinance court. Another improvement is being installed in the form of a semaphore tower at Third Street and Broadway, the arms to be operated by the officer seated in a signal tower at the corner. This is a very busy corner and it has been selected to make an experiment. If the plan proves desirable here the city will probably make similar installations at other corners.

Personal Mention

Mr. R. E. L. Kolb has succeeded Mr. F. M. Bright as roadmaster of the York (Pa.) Railways.

Mr. Warren Dougherty has succeeded Mr. T. Carman as master mechanic of the Atlantic & Suburban Railway, Pleasantville, N. J.

Mr. H. A. Robson, commissioner of Public Utilities for Manitoba, has resigned to become general counsel for the Union Bank of Canada.

Mr. O. E. McCormick has succeeded Mr. George Otis Spencer as assistant secretary of the Middle West Utilities Company, Chicago, Ill.

Mr. Irving E. Forbes has succeeded Mr. W. W. Forbes as president of the Unanounuc Incline Railway & Development Company, Manchester, N. H.

Mr. George Grove has been appointed engineer of maintenance of way of the Montoursville (Pa.) Passenger Railway to succeed Mr. P. Hettler.

Mr. W. H. Chesebrough has been elected vice-president of the United Railways Investment Company, New York, N. Y., to succeed Mr. Moritz Rosenthal.

Mr. Henry Malloch has been elected secretary and treasurer of the Nevada County Traction Company, Grass Valley, Cal., to succeed Mr. L. W. Pryor.

Mr. L. C. Fritch has been appointed general manager of the Chatham, Wallaceburg & Lake Erie Railway, Chatham, Ont. Mr. Fritch is general manager of the Canadian Northern Railway, Eastern Lines, and will now occupy the dual position.

Mr. E. J. Peartree has been appointed superintendent of transportation of the Trenton & Mercer County Traction Corporation, Trenton, N. J., to succeed Mr. C. E. Hart, who resigned some time ago. Mr. Peartree was previously connected with the United Traction Company at Troy, N. Y., for twenty years.

Mr. David M. Bunn, superintendent of the engineering and construction department of the Appalachian Power Company, Bluefield, W. Va., has also been appointed manager of the Bluefield division of the company. The property of the company includes 6.25 miles of electric railway, connecting Graham, Va., and Bluefield, W. Va.

Mr. E. M. Willis, secretary to President Howard W. Elliott of the New York, New Haven & Hartford Railroad at Boston and a director of the Berkshire Street Railway, the Vermont Company, the Hoosick Falls Company, and the Old Colony Railroad, has been appointed assistant to the president, with offices in the south station, Boston. Mr. Willis was assistant chief clerk to Mr. Elliott when the latter was president of the Northern Pacific Railway.

Mr. W. Norris, formerly general manager, chief engineer and purchasing agent of the Chatham, Wallaceburg & Lake Erie Railway, Chatham, Ont., has been appointed general superintendent of that road. Mr. A. C. Johnstone has been appointed accountant, and Mr. L. W. Mitchell, Toronto, treasurer and purchasing agent of the Canadian Northern Railway, has also been appointed purchasing agent of the Chatham, Wallaceburg & Lake Erie Railway.

Mr. George W. Burke, who has succeeded Mr. T. R. Crumley as master mechanic of the Evansville (Ind.) Railways, entered electric railway work with the Evansville Suburban and Newburg Railway as a motorman. At the beginning of construction of the Evansville Railway's lines he accepted a position running a locomotive on construction work for the company. On the completion of the line he continued with the company and ran a locomotive in freight service for a period of three years. He was then appointed shop foreman of the company, in which capacity he served four years.

Mr. William B. Graham, for the last nine years superintendent of the Essex division of the Public Service Railway, Newark, N. J., who has been transferred to take charge of the Southern division, with headquarters at Camden, was waited upon by 400 employees of the company at the Roseville carhouse on the night of Nov. 15 and was presented with a diamond ring, the gift of the conductors and motor-

men of the division. The supervisors of the division gave him a pair of diamond-set cuff buttons. Mr. Graham thanked the men and expressed his regret at leaving the division. He was followed by General Superintendent Newton W. Bolen, who, during the course of his remarks, introduced Mr. Williams, the successor to Mr. Graham on the Essex division. There was an informal program of songs and stories, participated in by representatives of the various carhouses in the division.

Mr. Charles A. Stone & Webster, Boston, Mass., is to be elected president of the American International Corporation, organized with a capital of \$50,000,000, to promote American enterprise, industry and commerce in foreign lands. It is announced that Mr. Stone will remove his residence from Boston to New York. He was born at Newton, Mass., on Jan. 16, 1867, and was graduated from the Massachusetts Institute of Technology in 1888 with the degree S. B. He is a member of the firm of Stone & Webster and is a director of the Stone & Webster Construction Company, Stone & Webster Engineering Corporation, Stone & Webster Management Association and many other corporations, including the Blue Hill Street Railway, Brockton & Plymouth Street Railway, Dallas Electric Corporation, El Paso Electric Company, First National Bank of Boston, Houston Electric Company, Jacksonville Electric Company, Massachusetts Gas Company, Minneapolis General Electric Company, Old Colony Trust Company, Railway & Light Securities Company, and the Whatcom County Railway & Light Company.

Mr. James Forgie, consulting engineer of New York, is awaiting the receipt of a Telford gold medal which was awarded to him by the Institution of Civil Engineers of Great Britain in recognition of his paper on "The Laxaxalpam Aqueduct Tunnels in Mexico" and of his achievement in engineering, the subject of the paper. The award was formally announced at the meeting of the institution on Nov. 2. Among the very few men in this country who have received this honor are Col. W. H. Harts, Mr. William Barclay Parsons, Mr. W. J. Wilgus and Mr. J. V. Davies. Mr. Forgie has for many years been prominently identified with the solution of rapid transit problems in cities; notably in New York the Pennsylvania Railroad tunnels and the Hudson & Manhattan Railroad tunnels under the Hudson River, and is an authority on tunnelling and construction works of a subaqueous character. Twenty years ago he helped to solve the difficulties connected with the growing density of traffic in the first underground electric railroad in London. The experimental train as recommended by Mr. Forgie was a success, and at the annual meeting of the City & South London Railway on Feb. 1, 1915, it was adopted as a remedy to alleviate the crowded conditions at the rush hours.

OBITUARY

Lieut. Cecil G. Weitzmann, traffic manager of the Para (Brazil) Electric Tramways, was killed in action with the Allies in France on Sept. 25.

S. W. Divine, a pioneer in electric railway work in Chattanooga, Tenn., died in that city on Nov. 16. He was sixty-seven years old. Mr. Divine was for many years a director of the Chattanooga & Lookout Mountain Railway and also was vice-president and a director of the Rapid Transit Company of Chattanooga, both of which are now included in the system of the Chattanooga Railway & Light Company.

E. M. Van Frank, president of the Petaluma & Santa Rosa Electric Railway, Petaluma, Cal., died at his home in Santa Rosa on Nov. 13. Mr. Van Frank was born at Quincy, Ill., on Jan. 15, 1866. After graduating from the high school at Quincy, Ill., Mr. Van Frank when a mere boy made a trip to South America. On his return he settled in San Francisco and assumed a position with the General Electric Company. Later he superintended the construction of the Sutro Street railway in San Francisco, also of the power houses of the system and after the completion of the road he became its general manager. When this road was absorbed by the United Railroads, Mr. Van Frank entered the employ of that company. He resigned from the United Railroads in May, 1906, to assume the management of the Petaluma & Santa Rosa Electric Railway. He is survived by his widow.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Summers Street Realty Company, Charleston, W. Va.—Chartered in West Virginia to construct an electric railway in Charleston. Capital stock, \$25,000. Incorporators: J. S. Hill, R. G. Hubbard, Guy A. Porter, R. E. Eskins and G. C. Porter, all of Charleston.

FRANCHISES

Rhodes, Iowa.—The Iowa Railway & Light Company has asked the Council for a twenty-five year franchise to supply electricity in Rhodes. The proposal will be submitted to the voters on Dec. 9.

Methuen, Mass.—The Bay State Street Railway has received a franchise from the Council to construct double tracks on the new river boulevard from Lowell Street to the Lawrence line.

Trenton, N. J.—The New Jersey & Pennsylvania Traction Company will ask the Council for a franchise to double-track West Hanover Street from Green's Place to Calhoun Street.

Portland, Ore.—The Portland Railway, Light & Power Company has asked the Council for a one-year's extension of time from February, 1916, on its franchise to construct a line on Morrison Street from Chapman to Washington Streets. The franchise was granted nearly two years ago and the track should be laid and in operation by February.

Chattanooga, Tenn.—The Central Power Company, recently incorporated, has asked the Council for a franchise to build an interurban railway from Chattanooga to Cleveland, about 25 miles. G. B. Adams, Chattanooga, is interested. [Oct. 23, '15.]

TRACK AND ROADWAY

Fort Smith Light & Traction Company, Fort Smith, Ark.—A tentative agreement has been reached between the Fort Smith-Van Buren Bridge Commission and officials of the Fort Smith Light & Traction Company which is expected to result in the company's early use of the Fort Smith-Van Buren bridge, abandoned last December after the Supreme Court annulled its forty-five-year franchise.

Connecticut Company, New Haven, Conn.—Work has been begun by this company on the construction of an extension of its line on East Grand Avenue to Lenox Street, New Haven.

Sandpoint & Interurban Railway, Ltd., Sandpoint, Idaho.—The stockholders of this company have decided to issue \$20,000 of bonds to take up notes in the sum of \$15,000, and to make improvements. Among the improvements is a spur track to the Great Northern Railway depot.

Bloomington & Normal Railway & Light Company, Bloomington, Ill.—Cars are now being operated on the new track on Franklin Avenue between Bloomington and Normal. The track was removed from the west side to the center of the street when a new pavement was laid.

*Chicago, Ill.—A proposed line, about 8¼ miles long, to connect various suburban towns in the southern part of Chicago and villages and cities adjacent to the southern city limits, is meeting with wide favor. A joint committee, representing various commercial and civic organizations in this suburban territory, has gone over the proposed route from Calumet Park to State Line Street, West Hammond. The various organizations interested are the Blue Island Commercial Club, Riverdale Improvement Association, Dolton Civic Club, West Hammond City Club and the Hammond Chamber of Commerce.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—This company is constructing a bridge over the tracks of the Chicago, Milwaukee & St. Paul Railway just south of Milwaukee. The bridge consists of a 185-ft. skew through girder span, a 140-ft. truss span and a 55-ft. skew deck

girder span. The company has built the concrete abutments and piers and the contract for the steel work has been let to the Wisconsin Bridge & Iron Company.

Kankakee (Ill.) Electric Railway.—This company has been repairing its track in the commercial subdivision and cars will soon be running into that part of the city. This plan follows an agreement between the railway and the Kankakee Commercial Club for the opening of the subdivision. The company agreed to operate cars when enough families had moved into the district to cover operating expenses, the entire plan being one designed to enlarge the growth of the city. The ultimate plan will be to construct a loop to connect with the East Court Street line at one terminal and with the Electric Park line at the other.

Indiana Railways & Light Company, Kokomo, Ind.—This company is erecting 12 miles of 6600-volt transmission line connecting its present lines with Hillisburg, Circleville and Kempton, and is installing a distributing system in each of the three towns.

Lafayette & Northwestern Traction Company, Lafayette, Ind.—This company is being reorganized in Lafayette and plans to proceed with the enterprise undertaken by O. L. Brown. Mr. Brown will not be connected with the new company. W. L. Moyer, Rensselaer, is interested. [Oct. 23, '15.]

Fort Madison Street Railway, Fort Madison, Iowa.—Announcement has been made that this company, which is owned and operated by the Mississippi Valley Electric Company, will spend about \$50,000 to rehabilitate its line.

Lawrence Railway & Light Company, Lawrence, Kan.—It is reported that this company has offered to pay \$1,000 toward the expense of equipment of an ornamental lighting system in Lawrence. About \$3,000 will be raised by a special tax.

Wichita Railroad & Light Company, Wichita, Kan.—This company plans to construct a line to the race track to be built on East Thirteenth Street. A bridge will be built across the canal at Twelfth Street, at which point the tracks will extend north alongside the site of the grandstand.

Cumberland & Manchester Railroad, Barbourville, Ky.—Work has been begun on the construction of this company's line from Barbourville to Manchester, 24 miles. It is expected that the road will be completed next spring. M. E. S. Posey, Barbourville, chief engineer. [July 10, '15.]

Holyoke (Mass.) Street Railway.—Plans are being considered by this company to construct an extension in South Hadley Falls on West Main Street to Canal Street, on Canal Street to Taylor Street and on Taylor Street to North Main Street, with a possible loop down North Main Street to the end of the present line.

Gulfport & Mississippi Coast Traction Company, Gulfport, Miss.—Operation has been resumed on this company's beach route from Gulfport to Dubuys.

Lincoln (Neb.) Traction Company.—Work has been begun by this company on the construction of track from the present terminus of the North Sixteenth Street line to the intersection of Sixteenth and W Streets.

*American Sugar Refining Company, Brooklyn, N. Y.—This manufacturing company is preparing estimates for possible electric operation over the track connecting its plant with freight floaters. Third-rail, overhead and storage battery operation are all being considered, the freight cars to be hauled by one electric freight locomotive. Energy could be supplied from the company's own powerhouse.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The commission has approved the award by the New York Municipal Railway Corporation of a contract to Connors Brothers Company, Inc., for the construction of the second section of the new elevated railroad in Jamaica Avenue, for \$726,168. The work will include the erection of the steel work between Walnut Street and Cliffside Avenue. The railway submitted the contract for competitive bidding and received seven bids, of which that of the Connors Brothers Company was the lowest.

Otsego & Herkimer Railroad, Cooperstown, N. Y.—It is reported that this company proposes an expenditure of about \$250,000 for betterments.

New York, N. Y.—The contract for track laying on the new rapid transit lines in Queens Borough has been awarded by the Public Service Commission for the First District of New York to the Thomas Crimmins Contracting Company, the lowest bidders, for \$204,898.

Interborough Rapid Transit Company, New York, N. Y.—Bids for the supply of special work for the Lexington Avenue subway from its junction with the existing subway at the Grand Central Station to 138th Street, The Bronx, where the east side and west side branches diverge, will be received by the Public Service Commission for the First District of New York on Dec. 7. The special work called for includes all frogs, switches and cross-overs for the line, comprising nineteen separate pieces. Delivery of the articles must begin within two months and must be completed within eleven months after the delivery of the contract. The contractor will be required to furnish a bond in the sum of \$5,000.

Manhattan & Queens Traction Corporation, New York, N. Y.—The Manhattan & Queens Traction Corporation, which has a franchise to operate from the Queensboro Bridge through Queens to the city line of Greater New York has succeeded in obtaining an extension of the time in which it agreed in its franchise to complete its lines from Jamaica, where they now terminate, through St. Albans to the city line.

Ohio Service Company, Cambridge, Ohio.—This company has just completed the construction of its transmission lines from Newcomerstown to Dennison and from Dennison to Tippecanoe. Its entire transmission line system from Coshocton to Cambridge and to New Philadelphia has been placed in operation.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—It is reported that this company is considering the construction of an interurban line from Bartlesville to Nowata, 28 miles. Bartlesville proposes to raise a \$50,000 bonus, give the company a free right-of-way of practically half the distance to Nowata and a franchise to come in over its streets. If Pawhuska citizens will raise a like bonus and furnish a free right-of-way it is proposed to extend the line to that city, 28 miles from Bartlesville. This company proposes to build a chain of interurban lines that will connect towns in southeastern Kansas, southwestern Missouri and northeastern Oklahoma. John R. Rose, Oklahoma City, president. [Nov. 13, '15.]

Chatham, Ont.—Plans are being considered to construct a hydro-radial line between Petrolia and Chatham.

London & Lake Erie Railway & Transportation Company, London, Ont.—Plans are being made by this company to extend its line from Lambeth to Delaware.

Toronto (Ont.) Civic Railway.—A report is being prepared by R. C. Harris, commissioner of works, on the extension of the St. Clair Avenue line to Avoca Avenue, Toronto.

Toronto (Ont.) Suburban Street Railway.—Track has been laid by this company on its extension from Lambton to Guelph, 46 miles, over the Humber River bridge to the junction with the line on Dundas Street at Lambton Park. Ballasting work is now under way. Contracts for the catenary line equipment will be let in the near future.

Galveston-Houston Electric Company, Galveston, Tex.—This company, with the other lines leasing the causeway across Galveston Bay, consisting of all steam roads entering Galveston, has agreed to bear its pro rata of three-fourths of the cost of constructing a temporary wagon bridge to connect the two ends of the arch bridge with the mainland. Construction work will be started immediately by the engineers of the railroads.

Salt Lake & Ogden Railway, Salt Lake City, Utah.—The work of double-tracking its extension from Orchard to Clinton, 3 miles, has been begun by this company. This extension is only a preliminary step toward connecting up the double track out of Ogden and out of Salt Lake City, thereby giving the road double track all of the way. It is reported that the double track work over the remainder of the route will be pushed as rapidly as possible. Contracts have been let by the company for the erection of two bridges, one at Hunter's cut and the other near Roy. The construction of a viaduct at Lagoon to carry the public

highway over the tracks is contemplated but the plans are being held in abeyance until an agreement can be reached with the town of Farmington as to the division of expenses.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—A contract has been awarded to the Wasatch Construction Company, Provo, for grading this company's extension from Spanish Fork to Payson.

SHOPS AND BUILDINGS

Lincoln (Neb.) Traction Company.—The Lincoln Terminal Company has recently been organized with W. E. Sharp, president of the Lincoln Traction Company, as president, for the purpose of erecting a building on a corner of the principal business street in Lincoln, to be known as the Terminal Building. The structure will be 85 ft. x 142 ft., ten stories, and will be of steel, terra cotta and granite. A large room on the main floor of the building will be used as a display room for the Lincoln Traction Company's electric appliances and fixtures. The basement, which will be finished off in marble and tile, will be equipped for the convenience and entertainment of the trainmen when off duty. The third floor will be used as the general offices of the railway company. It is expected that the building will be ready for occupancy by next summer.

International Railway, Buffalo, N. Y.—H. C. Young, superintendent of bridges and buildings International Railway, and Edward E. Franchot, of counsel for the company, presented plans for improving the freight and passenger terminal of that line in Lockport at a hearing before the Public Service Commission on the complaint of certain residents of West Lockport to have the International Railway and the Buffalo, Lockport & Rochester Railway construct a new passenger terminal in the city. The plans of the company call for the addition of a second story to the existing structure and complete remodeling and improvement of the waiting rooms, etc. The Lockport offices of the company will be on the second floor according to plans submitted, and this will increase the size of the waiting room and ticket offices. It is expected the company's plans will be accepted.

Interborough Rapid Transit Company, New York, N. Y.—The Public Service Commission for the First District of New York has ordered this company to construct and maintain a new local station on the Sixth Avenue and Ninth Avenue elevated line in the neighborhood of 150th Street. Residents and property owners in the vicinity of 150th Street recently petitioned the commission to order a station at that point. The exact location of the station was left open, with instructions to the chief engineer of the commission to report upon the most suitable site. As soon as he makes his report the company will be ordered to begin the construction of the new station.

New Midland Power & Traction Company, Cambridge, Ohio.—This company reports that it is building a new \$4,000 carhouse at Dennison.

Toronto (Ont.) Civic Railway.—In compliance with a request of the Board of Control of Toronto for a report on the cost and advisability of building municipal car shops in Toronto, R. C. Harris, commissioner of works, reports that he considers it inadvisable at the present time.

POWER HOUSES AND SUBSTATIONS

Richmond Light & Railroad Company, New York, N. Y.—A report from this company states that it is installing a 7500-kw. Westinghouse turbo-generator in its power plant at Livingston.

Ohio Service Company, Cambridge, Ohio.—This company's power house which was begun two years ago has been completed. A new water wheel and a new head-race are being installed at the hydroelectric plant and the old dam has been repaired. The company's substation at Dennison has been completed. A new 500-hp. boiler is being installed at Coshocton and a new engine and 400-kw. d.c.-a.c. generator will be installed at Hanover.

Mitchell Street & Interurban Railway, Mitchell, S. D.—This recently organized company is investigating the water-power at Great Bend, about 78 miles north of Mitchell, with a view to installing a power plant to supply electricity to the proposed railway and to furnish electrical service to surrounding towns.

Manufactures and Supplies

ROLLING STOCK

Visalia (Cal.) Electric Railroad recently lost by fire one of its passenger cars.

City Light & Traction Company, Sedalia, Mo., expects to purchase eight single-truck, light-weight, one-man cars.

Lake Erie & Northern Railroad, Galt, Ont., has ordered three Westinghouse electric locomotives.

Long Island Railroad, New York, N. Y., has issued inquiries for twenty-five trailer cars for use in its electric zone.

Mississippi Valley Electric Company, Iowa City, Iowa, will order within a week four 28-ft. one-man passenger cars.

Durham (N. C.) Traction Company has ordered three 26-ft. and three 31-ft. semi-steel city one-man car bodies from the Southern Car Company.

New Midland Power & Traction Company, Cambridge, Ohio, has converted its single-truck cars into pay-as-you-enter near-side one-man cars.

Des Moines (Ia.) City Railway is reported as having placed an order for forty front-entrance, center-exit motor cars equipped with multiple-unit control.

Springfield (Mass.) Street Railway is having ten of its fourteen-bench open cars rebuilt by the Wason Manufacturing Company into prepayment semi-convertible cars.

New York (N. Y.) Municipal Railway will soon place orders for 100 additional subway cars for the Sea Beach Line, which will make a total of 400 cars ordered by this company.

Menominee & Marinette Light & Traction Company, Menominee, Mich., has rebuilt twenty single-truck cars and equipped them with door and step operating mechanism for one-man near-side stop operation, with front entrance and exit only.

Interborough Rapid Transit Company, New York, N. Y., noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13, 1915, as having issued requests for bids on 311 new subway cars, including 234 motor and seventy-seven trailer cars, has placed an order for these car-bodies with the Pullman company.

Boston (Mass.) Elevated Railway lost by fire seven automobiles at the company's Harrison Avenue garage on the night of Nov. 23, at a loss of \$12,000. The blaze was caused by an explosion of gasoline which occurred while a tank was being filled. The company's purchasing bureau will shortly be in the market for new machines.

Pittsburgh (Pa.) Railways, reported in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, 1915, as expecting to purchase a large number of cars, have ordered 125 motor cars and fifty trail cars. An order for seventy-five cars was placed with the Cincinnati Car Company and an order for the remaining 100 was placed with the St. Louis Car Company. These cars are all to be of the low-floor type, as described in the *ELECTRIC RAILWAY JOURNAL* of April 11, 1914.

TRADE NOTES

Baldwin Locomotive Works, Philadelphia, Pa., has equipped three cars of the Ironwood & Bessemer Railway & Light Company, Ironwood, Mich., with Baldwin L-type trucks.

Simmen Automatic Railway Signal Company, Buffalo, N. Y., has appointed W. H. Crawford as Pacific Coast representative. Mr. Crawford will maintain headquarters at 609 Spalding Building, Portland, Ore.

Curtain Supply Company, Chicago, Ill., has received orders to equip with ring No. 88 curtain fixtures and Rex all-metal rollers the three cars recently ordered by the Laredo Railway & Electric Company, Laredo, Tex., and one car ordered by the Walnut Ridge & Hoxie Light, Power & Transit Company, Walnut Ridge, Ark., from the Southern Car Company.

Standard Paint Company, New York, N. Y., manufacturer of P & B insulating tape, has just placed upon the market a rubber friction tape, under its IMP brand. The

IMP friction tape will not compete with or in any way displace the P & B tape, which is especially adapted for work in mines and weather-exposed locations. The IMP tape is treated with rubber compound and finished by the friction process. It is suitable for all kinds of wiring work.

Russian Society for Electrical Enterprises, Ltd., Petrograd, Russia, address, No. 5, Marsowo, which controls electric lighting stations in Pawlowsk, Uman, Kamenetz-Podolsk and tramways in Elizabethgrad and Uman, has opened at the present time a branch for resale of electrical machines and apparatus and insulating materials, and also of steam and naphtha engines as well as of water turbines, and desires to enter into relations with first-class factories in the United States producing these goods with the view of becoming their agents in Russia. The company refers to the Russian & French Bank as to its responsibility.

ADVERTISING LITERATURE

A. L. Drum & Company, consulting engineers, Chicago, Ill., have recently published a pamphlet discussing the construction features and advertising advantages of underground plazas to relieve traffic congestion at subway stations in important traffic districts. They show diagrams and sections of such proposed underground plazas at Herald Square and Times Square in New York, at the junctions of the subway systems at those points. These plazas would be constructed about 12½ ft. below the surface of the street, directly over the train platforms of the subways to which they would furnish access. When built simultaneously with the passenger subway station the additional cost would be very slight, while the increased earning capacity of the basement shops facing on the plaza and of shops on city property in the underground plaza will be very large. Thus it is estimated that the additional cost of the underground plaza at Herald Square would be less than \$400,000, while the rental value of the shops on the plaza should exceed \$100,000 per year, and the additional show-window space to the retail dry goods stores fronting on the plaza would be worth \$300,000 per year. Similarly, the additional cost of the underground plaza for Times Square would be less than \$200,000, while the rental space would amount to \$60,000 per year and the value of the show-window space to the present stores would be at least \$250,000 a year.

WORK OF NEW YORK LEGISLATIVE TAX COMMITTEE

The legislative committee on taxation, of which Senator Ogden L. Mills is chairman, has completed its work in New York City and will hold several sessions in cities up-State. The committee expects to return to New York City in December, examine more witnesses and then prepare its report for submission to the New York Legislature next January. On Oct. 16 Senator Mills was quoted as follows:

"If we can work out and solve the personal tax problem, and the Legislature is willing to treat with our suggestion, we can go on, but if what we propose is thrown out of the window by the public and the Legislature, it would be idle to continue. Yesterday's test question seems to have been misunderstood, partly through a suggestion made by me to the effect that it would be possible by means of an income tax running from 1 to 3 per cent to raise some \$45,000,000.

"The estimate was not made by me, nor was it in any sense accurate or final, in so far as the income tax proper is concerned. The committee is not committed to the plan either tentatively or finally. As a matter of fact, at the last executive session of the committee the chairman was authorized to prepare two or three substitutes for the personal property tax.

"In view of the misunderstanding which seems to have arisen about an income tax, I desire to state that public service corporations are a separate and distinct class. They enjoy special privileges from the State, and should pay higher taxes. The subject of taxing public service corporations is, however, so vast and intricate that the committee has been and is unable to consider it in the short time at its disposal. A Connecticut commission took some two years to complete this task, while this committee has but six months at its disposal. I hope that the committee at some future date may be able to take up this question, but any discussion at this time on taxation must be understood not to include public service corporations."

No. 23

A NOVEL TYPE OF PROTECTED THIRD-RAIL

Through the courtesy of H. M. Hobart we are able to give our readers some interesting details of the novel third-rail installation described in the issue of this paper for July 24, 1915, page 154. This electrification is about ready for operation. Drawings of the rail and contact shoe are printed elsewhere in this issue. In examining these drawings and the pictures given in the earlier article one is inclined to believe that under climatic conditions existing in this country there would be difficulty at times with this scheme due to the collection of ice in the slot. It would also appear to be troublesome to maintain a good contact area between the shoe and the rail with the side-contact scheme owing to sidewise motion of the trucks. On the other hand, it must be remembered that the designer of this novel rail is an experienced steam railroad operating man, and its novel features have been adopted in the light of his expert knowledge of existing electrifications. In this country the tendency has been to use rail sections of a girder shape and often standard sections for the contact rail. A form as unusual as that adopted for the Manchester-Bury section of the Lancashire & Yorkshire Railway would be considered quite radical here from the rolling mill standpoint. All of which goes to prove, as we have contended before, that heavy electrification is in process of flux and experimentation, and each new project involves elements of novelty.

THE ATLANTIC CITY RECEIVERSHIP

The expected has happened in Atlantic City, and the Atlantic City & Shore Railroad Company, which operates the local electric railway system in that city as well as the interurban line to Ocean City, has passed into the hands of a receiver as a result of unregulated jitney competition in that city. Atlantic City is under the commission form of government, but if the purpose of this form of government is to bring greater intelligence to bear upon the problems of city government or administration, it has lamentably failed in this case. We cannot imagine any more specious form of reasoning than that put forth by the commissioners to excuse their failure to adopt a proposed regulatory ordinance covering jitneys, indorsed by a committee representing the Chamber of Commerce, the Hotel Men's Association and the Rotary Club of Atlantic City. The explanation is so unique that we cannot refrain from quoting from it. It says, in part: "That the trolley company has been losing money heavily since the advent of the jitney there can be no doubt, but the company is

simply facing a condition that has confronted every means of transportation since history began. * * * The commissioners cannot be expected nor called upon to protect the dividends of the trolley company any more than the profits of the individual jitneys. Both are lawful enterprises, and it is for them to work out the problem of competition." The commission then goes on to compare the competition between the newer jitney and the older electric car with that of modern means of transportation and the oxcart, that between the transcontinental steam lines and the Rocky Mountain stage coach, and that between the sail boat and the steam boat. "And so," the commission continues, "this present problem of competition between the jitneys and the trolleys will work out in time, although it may seem a hard one just now."

THE JITNEY NO IMPROVEMENT

If the jitney represented a real improvement in methods of transportation there would be an excuse for the action of the commissioners. But the jitneys are not doing the work of the electric cars in Atlantic City, and they never can. At present they are giving in the heart of the territory a service which is practically subsidized at the expense of the electric railway company. Until the jitneys have demonstrated that they can supplant the electric car in all of its service, or in the greater part of it, on the same basis of operation as regards schedules, continuity of service, responsibility, the comfort and safety of passengers and taxation, they cannot be considered a substitute for it. That the city could do without the trolley line entirely, the commissioners admit, is inconceivable. Incidentally it develops that last year the Atlantic City & Shore Railroad paid \$38,000 taxes to the city, made up of a license fee of \$50 per car and about \$34,000 as a real estate and personal tax. In addition, when Atlantic Avenue, the principal street of the city, was paved, the railway company, besides paving between its rails and for 2 ft. outside at a cost of about \$300,000, paid to the city \$150,000 toward paving the balance of the street, and since then it has paid \$5,000 annually for the use of the street. The proposed license fee of \$50 per jitney would certainly not equalize the taxation burden, and the request of the citizens' committee, rejected by the commissioners, that every jitney owner should file a bond of \$2,500 for the proper performance of the obligations and to indemnify the public in case of injury, is certainly a very moderate requirement when compared with the responsibility to which the trolley company is held.

THE AUTOMATIC RAILWAY SUBSTATION

While the automatic substation was fully described in a paper presented before the A. I. E. E. at the San Francisco meeting held in September, the crowded condition of the program of that meeting and the relatively small attendance of electric railway men precluded adequate discussion. In order that the interesting proposition, which had had a commercial trial on a small scale, might be brought to the attention of the electric railways, the *ELECTRIC RAILWAY JOURNAL* abstracted the paper fully in the issue for Sept. 18 and interested itself in bringing out some discussion. This undoubtedly contributed in a measure to the reception that the presentation of a somewhat similar paper enjoyed at the recent C. E. R. A. meeting, at which real interest on the part of railway operating men was manifested. The general attitude toward the plan was naturally and properly critical while at the same time hospitable. Objections were of two kinds, technical and economic. As far as the former are concerned we have no doubt that they can be overcome as they materialize. The vital question is economic: Under what conditions, if any, will automatic substations yield a substantial profit? The claims made for them along this line are such as to command attention, but railway men have done so much pioneering that they are necessarily more wary of innovations than they were when money was more plentiful. We believe that most companies will wait until there are more data from actual installations of this kind before changing over their own distribution systems.

THE CHICAGO REPORT ON ELECTRIFICATION

If the recommendations of the committee on smoke abatement and terminal electrification of the Chicago Association of Commerce are followed there will be no general electrification of the steam railway terminals there in the near future. The complete report was not available at the time of going to press with this issue, and the official abstracts given out were presumably prepared primarily for the daily press and so rather fragmentary and quite incomplete so far as many of the matters of engineering interest are concerned. But sufficient data are contained in them to indicate that, while the engineering difficulties of electrification are considered surmountable the conclusion is otherwise with regard to the financial ones. No comment on the technical features of the report is possible until fuller data come to hand, but the following points are clear: First, justification for a general enforced terminal electrification cannot be found on the basis of the smoke nuisance, because there are worse offenders than steam locomotives in this regard. Second, the individual requirements and possibilities of the different roads are so great that the enforcement of a general scheme would work many hardships. Third, there is no reason why individual roads should not electrify as congestion and economy dictate, and the selection of a general electrification system which would be acceptable to all roads which might at some time voluntarily electrify is highly desirable. We admit that

the amount estimated by the committee as the cost of the entire work, namely, \$274,440,620, is a large sum for the roads to raise at this time, but until the complete report is available to explain the basis for the figure comment is idle. It will also be interesting to learn from the report itself the reasons which induced the committee to decide that the single-phase system is best.

SINGLE-PHASE MAINTENANCE COSTS

The seven years' experience of the Chicago, Lake Shore & South Bend Railway with single-phase equipment in eliminating the inherent weaknesses in a new system illustrates the benefit of co-operation between user and manufacturer. In an article published in the issue of the *ELECTRIC RAILWAY JOURNAL* for Nov. 6, 1915, page 940, data were given to show that maintenance costs have now been brought down to about 2½ cents per car-mile, a very creditable figure, especially when the weight of the cars is considered. How this was done is described in the present issue.

When it was built this road was said to be the heaviest and highest-speed interurban electric railway in the country, if not in the world. A very substantial type of construction was employed with a view to giving reliable service under severe operating conditions, including a liberal use of trailers. A quality of performance was therefore expected of the novel a.c. equipment under conditions that would have been severe for the standard d.c. equipment of 1908. In justice to the a.c. motor it is well to remember that the a.c. motor designed years ago now finds itself in competition with a type of d.c. motor which did not then exist, the high-voltage, commutating-pole motor. The single-phase motor was one solution of the problem of reducing power transmission cost while maintaining high transmission efficiency. It was a radical solution involving the speedy commercialization of a theoretically simple but practically complicated design. The difficulties were transferred from the transmission system to the motor. These difficulties have been gradually brought under control, as is reflected in the maintenance costs, until, as in the C., L. S. & S. B. Railway, the costs are comparable with similar ones for d.c. equipment. In motors of later design, such as are used on the New York, Westchester & Boston Railway, the maintenance cost is still lower.

In the meantime, however, another solution of the same problem has been found in the beaten path of d.c. progress, and at present this one seems to be considered the more general solution for interurban lines, offering, as it does, a much simpler control when the interurban car passes upon the lower voltage d.c. circuit in the terminal cities. However the single-phase system must receive credit for a share in the commercializing of the commutating-pole principle which has made d.c. high voltage practicable. Because it was necessary to have compensating windings to neutralize the armature ampere-turns in the a.c. motor such windings were taken as a matter of course. The d.c. commutating pole, different in construction and for a somewhat different

purpose but similar in principle, became popular soon after.

To sum up the single-phase situation the following appear to be the salient features: In ten years the structural weaknesses have been eliminated from the compensated series motor; there is now substantial confidence in its reliability; the maintenance costs are reasonable; it finds itself under competitive conditions more difficult than those of a few years ago. The next step, as indicated in the Philadelphia-Paoli electrification, will be in the direction of weight and cost reduction.

ELECTRIC LOCOMOTIVE CAPACITY

The two most recent electric locomotives to be placed in service have been characterized by maximum tractive efforts, or drawbar pulls available for starting, that approximate 125,000 lb., exceeding by some 50 per cent all previously existing figures except for the largely experimental "triplex" type of steam locomotive. That this remarkable advance has been made in a single step makes pertinent the question as to whether electric locomotive hauling capacities are to continue to increase beyond this in accordance with the tendency displayed in the history of steam railroads, and if so, where the limit in locomotive size will be reached in case any such limit exists.

Apparently there is nothing that could hamper the electric locomotive designer in the production of larger and more powerful units should the demand for them exist. With the establishment of the principle of extending the locomotive along the track in a series of short, articulated units, all that is required for greater tractive effort is the addition of a few more pairs of driving wheels, the clearance limitations of height and width being no longer important since the way has been found to get motors of the requisite power for each articulated unit, or truck, within the vertical and transverse space that is allotted to it. The added weight of greater locomotive length would have, of course, an influence upon the bridges, but as regards the track there seems to be no need for special consideration, because past experience tends to show that it is only the long, rigid wheelbase, such as does not appear in the modern locomotive, that is productive of damage. The existing wheel loads are, perhaps, somewhat higher than desirable, but at that they are generally less than those of steam locomotives, and in any event they do not directly affect the possibility of lengthening the locomotive to get more power.

Beyond the question of physical dimensions, however, are limitations in connection with operation that can hardly fail to be felt in case the growth of electric locomotive capacity should continue. Foremost of these, perhaps, is the matter of drawbar strength. With a drawbar pull of 125,000 lb. the elastic limit (or point at which permanent set takes place) of even the new standard M. C. B. coupler is rather closely approached. This design, which was brought out in experimental form by the Master Car Builders' Association only three years ago, was intended to serve as a real universal

standard, presumably for many years to come. Its yield point was set by the designers at 175,000 lb. owing to the fact that a limit had to be placed somewhere upon the great size and weight of the parts, and it was considered that this figure should be ample for all normal conditions. It should be said, perhaps, that the coupler does not actually fail under the drawbar pull above mentioned, as the ultimate strength is some three times greater, but permanent set may always be expected to take place under pulls of more than 175,000 lb., and, of course, this is only the preliminary of a failure to operate or to hold properly.

A locomotive drawbar pull of 125,000 lb. matched against a physical strength of drawbar of 175,000 lb. is by no means unreasonable under static load, and under ordinary circumstances the "suddenly applied" load of theoretical mechanics due to uncushioned shocks is hardly a probability in a freight train, although it is a possibility that might occasionally produce the effect of an increase of, say, 50 per cent in the static drawbar pull. Therefore, in a train equipped throughout with couplers of the new standard type there should be no difficulty with locomotives even larger than the latest machines. This, however, is dependent upon a condition that can hardly obtain for years to come. The vast majority of couplers in use to-day are neither so heavy nor so scientifically designed as the new standard, and their strengths range downward at various figures materially less than the maximum herein mentioned. The cars thus equipped obviously cannot be changed over *en bloc*, and until the lighter couplers disappear (a matter practically dependent upon the life of the cars) there are bound to be some couplers in every train which will be hardly able to withstand even the static pull from the largest electric locomotives that are now operating. The possibility of trouble with still larger locomotives than these would be obvious.

It would seem, therefore, that there is at least one serious obstacle in the way of materially larger electric locomotives except, perhaps, under conditions such as on a coal or ore road where special equipment was used and where the number of interchange cars was at a minimum. In addition, there is the matter of train lengths on level divisions, where ordinary modern steam locomotives are able to haul loads of 5000 tons at high speed, and where the advantages of an electric locomotive of greatly increased power would be offset by difficulties in making up and handling the tonnage suitable for its full capacity.

To say that these obstacles are insurmountable would be somewhat daring in the present age of rapid change. Nevertheless they are sufficiently serious in the light of existing conditions to make a further material increase in electric locomotive capacity exceedingly doubtful. In fact, it is safe to say that, according to present experience, the limit of size for the individual unit may be set at a point but little, if any, beyond the figures that have already been established by the remarkable locomotives that have been designed for the electric installations on the Norfolk & Western and on the Chicago, Milwaukee & St. Paul Railway.

Reducing Maintenance Costs on a Single-Phase Railway

The Chicago, Lake Shore & South Bend Railway Has, by Close Study of Operating Conditions, Greatly Reduced Maintenance Costs—Details of Economies Developed Are Given in This Article

The Chicago, Lake Shore & South Bend Railway has had more than seven years of experience with the single-phase system. During this period the defects of the equipment, which were minor in character, have been eliminated. A general description of the road, with maintenance and operating data, was given in the issue of the *ELECTRIC RAILWAY JOURNAL* for Nov. 6, 1915, page 940. The present article takes up in detail the methods by which economies were achieved, with special reference to the collecting devices and to the results of a change in gear ratio.

PANTOGRAPH DEFECTS AND REMEDIES

Pantograph troubles have been more or less insignificant in their effect upon maintaining schedules. After five years of service, however, the No. 0000 copper contact wire became so badly worn that breaks occurred quite frequently, and these largely accounted for the damaged pantographs. During the year ended Dec. 31, 1913, seventy-four cases of pantograph trouble were recorded, but in the year following this the number was reduced to thirty-five. The reduction was largely due to the installation of the steel contact wire. About twenty-three breaks occurred in 1913, whereas in 1914 the substitution of the No. 0000 auxiliary steel contact wire entirely removed the cause of troubles arising from this source.

Following the change from a copper to a steel contact wire, excessive wear developed on the No. 12 gage galvanized-iron pantograph shoes, so that a life of only 2500 miles was obtained from them. To increase the mileage two sections of half-oval mild steel, $\frac{3}{8}$ in. x $\frac{1}{2}$ in., were substituted for the galvanized-iron pan. The cost of this type of shoe, including material and labor, was 45 cents. As the mileage was increased to 9000,

the cost with the new shoes was 5 cents per 1000 miles. One of these shoes, riveted and clinched to the 1-in. angle horns, is shown in an accompanying illustration.

Prior to adopting the $\frac{3}{8}$ -in. half-oval shoe $\frac{1}{4}$ -in x $1\frac{1}{4}$ -in. half-oval mild steel was used for the horns. These horns were too light, for, as wear occurred, the edges tended to turn up and in some cases caught the trolley wire and damaged the pantographs. The trouble occurred particularly at section insulators, where the turned-up knife edges cut the composition runners. With the $\frac{3}{8}$ -in. shoe this difficulty was relieved, but excessive wear on the composition runners in the section insulators resulted and they became the weakest points in the line. A recent change to a composition known as "Micarta" has materially reduced the rate of wear and entirely eliminated the tendency to deteriorate and split. Deflectors of $\frac{1}{2}$ -in. round iron placed at the points where the contact wire branches to sidings, also prevented the pantographs from catching at these points.

Lubricated shoes have been tested to increase the life of pantograph shoes and reduce wear on the trolley wire, but were found to be of little value because grease would not remain on the contact strips sufficiently long to produce results. Tests were made with the galvanized-iron pan, and a groove was made in the pan to serve as a grease reservoir. At high temperatures during the summer months the grease melted and ran down on the car roof, marring its appearance and shortening the period during which the lubricant was of value.

Except at railroad crossings, the standard clearance between the top rail and trolley wire is 21 ft. This allows 9 ft. 5 in. between the car roof and the trolley wire, or the normal height of the pantograph in the raised position. The average pantograph pressure against the trolley wire is 10 lb., sufficient to provide good contact

SINGLE-PHASE MAINTENANCE—CAR ROOF WITH TROLLEY POLE AND PANTOGRAPH

at railroad crossings where the maximum contact-wire height obtains. At each inspection the contact shoe pressure at the standard height is tested with a spring balance.

All things considered pantograph mechanism defects have been relatively few and largely confined to the supporting porcelain insulators at the roof. Breakage of these insulators was attributed to various causes, the principal one being that insufficient creepage surface caused undue heating of the insulator and its ultimate deterioration. Hair-line cracks in these insulators were the first indication that deterioration had begun, and as a general rule the insulators failed under the surge created when the pantograph was raised to make contact with the trolley wire.

In the illustration on the preceding page the old and new types of insulators are shown. The small spool type was the original one used and the larger insulator with greater creepage surface was substituted for it. Changes in these insulators are being made as defects develop. In connection with the mounting of the pantograph, it is interesting to note that the car roof is covered with 16-oz. sheet copper grounded to the car-body bolster by copper cables. Under this an 8-oz. duck covering thoroughly painted was applied.

RESULTS OF REDUCING THE GEAR RATIO

Undoubtedly the discovery of a gear and a pinion of sufficient strength to withstand the enormous torques of 6600-volt, single-phase motors, as well as the adoption of the correct gear ratio has been of great importance in making this equipment a success. Unusually high speeds were required to meet competition and to furnish the character of service which would obtain the passenger business as well as develop the territory traversed. For a number of years it was deemed inadvisable to attempt to lower the gear ratio below 25:66, because it would entail a reduction in the scheduled speed. The inauguration of the Gary-Chicago service, however, necessitated a reduction in the gear ratio to 21:70 to permit the 500-hp. standard motor cars to pull two trailers. This change also required a reduction in the maximum scheduled speed from 58½ to 48 m.p.h. By a careful balancing of the schedules on the different sections of the line, the reduction in gear ratio has made changes in the time of only two trains.

This reduction in the gear ratio and the change from a standard tooth to a stub-tooth, bull-nose gear with a 16:53 ratio, the equivalent of 21:70, eliminated broken gears. This change largely accounted for the improved results obtained from the electrical equipment, which is quite clearly shown in the reduction in equipment failures from 282 in 1911 to 187 in 1915. During the year 1911 ten gear breaks were recorded, whereas during the year ended June 30, 1915, no breaks occurred. While the breaking of gears and pinions has never been such a serious factor as to diminish the reliability of the service, the result of the changes mentioned has been a profitable one.

The changes made in the types of gears used since the beginning of operation on this road were as follows: At first, standard cast-steel gears with spokes were employed, but the heavy duty required of them and the limited clearances with these large motors and trucks, made the use of heavier gears of this material impossible. A solid-web, cast-steel gear was then substituted, but it failed principally from broken teeth. To eliminate the breaking of teeth a special gear having a cast-steel center and a tool-steel tire with stub-teeth was employed. However, the unusual temperature rise incident to single-phase motor operation and the difference in the coefficients of expansion of the two metals resulted in numerous tire breaks. Flexible gears with

SINGLE-PHASE MAINTENANCE—PANTOGRAPH SHOE WITH HALF-OVAL CONTACT STRIPS

spring cushions were then tried, but the composite design with the limited clearances would not permit them to be made sufficiently strong. The next to the last step in solving the gear problem was the adoption of a gear and a pinion manufactured by the Tool Steel Gear & Pinion Company with standard teeth and a 25:66 ratio at 2½ pitch. While these gears and pinions stood the service without excessive breakage, the temperature rises in the single-phase motor due to rapid acceleration continued to cause some failures in the electrical equipment. To eliminate these and to obviate any chance of failure in the gear teeth, the gear ratio was reduced and a stub-tooth, bull-nose gear was adopted with the excellent results stated.

ELECTRICAL EQUIPMENT EXPERIENCE

One of the benefits derived from the reduction in gear ratio which lowered maximum temperatures was a constant diminution in number of motor failures, and of preventative coil and switch-group defects. Relatively few failures in the high-tension wiring on the cars were recorded before the change in gear ratio was made, and none have occurred since. The failures that did occur in the wiring were due to insufficient insulation of the lead-covered cables. This was overcome during 1913 and 1914 when the cars were entirely rewired with cable having a heavier insulation and no lead covering.

Commutator flashovers are exceptionally rare, only one commutator having been lost due to a ground in the eight years of operation. This result was largely attributed to the fact that all commutators were turned and slotted 3/32 in. deep whenever the armatures were brought into the shop. Some mechanical weaknesses developed in the original resistance coils which, when subjected to the severe vibration incident to service on this road, broke in the bend on the coil rest where the leads are brazed. Trouble at this point has been obviated by

SINGLE-PHASE MAINTENANCE—STUB-TOOTH GEAR AND PINION

SINGLE-PHASE MAINTENANCE—TIN CHANNELS AND END OF ARMATURE COIL WITH ASBESTOS TAPE

applying Monel metal tips as a substitute for the original German silver tips.

High temperatures in the resistance coils, combined with the sand-blast action caused insulation failures particularly at the points where the coils cross the air vents. This difficulty has been overcome by the use of a reinforcement between the coil rest and the spider, consisting of a tin trough and molded-mica insulation as a substitute for the fish paper originally used. The use of a tin trough across the air vent has not created any difficulties from eddy currents. Another improvement has been the substitution of $\frac{3}{4}$ -in. asbestos tape in place of linen tape. Whenever an armature is brought into the shop for new coils, the coils are reinsulated from the connection at the commutator to the bend on the coil rest.

In the original construction of the armatures the coils on the pinion end were covered with a brass flanged end bell, and those on the commutator end were covered with an asbestos hood. Under this hood the ends of the coils were covered with Bakelite cement. This cement also filled the openings between the coils and was intended to keep the coils from vibrating. A great deal of trouble was experienced with the loosening of the cement and the forcing out of the asbestos hood, which in turn caught on the brush-holders and was torn loose. On the pinion end, trouble with grounding of the coils on the end bells was also experienced. During the period of reconstruction of these armatures by the Westinghouse Electric & Manufacturing Company, the flanges were machined off of the end bells, the asbestos hoods were discarded and the ends of the coils were covered with $\frac{1}{8}$ in. of Bakelite cement, which was finally baked. This practice did not prove satisfactory because it resulted in the retention of the heat in the armature. Also when the armature was in service and extremely warm, the cement cracked and left openings between the coils, back of the neck of the commutator and at the end bell. Carbon dust from the brushes collected in this crevice where it could not be blown out. In course of time so much carbon dust would accumulate that it would cause short-circuits between the windings and result in an armature failure.

To overcome trouble from this source all of the cement was removed from both ends of the windings and from the crevice between the German silver and the copper windings. This lowered the temperatures of the armatures, at the same time permitting the ready detection of poor connections in the windings. However, the mechanical department was not entirely satisfied with the result, as the Bakelite cement between the German-silver leads would chip off and be thrown out by vibration and by the force due to the high armature speed. Small asbestos hoods were then placed between the leads

of the German-silver windings on the commutator end, and between the copper winding and the bell on the pinion end of the armature. All openings or crevices were again filled with Bakelite cement and baked thoroughly. Some of the armatures treated in this manner have been in service for the past year and are still in a perfect condition. Judging from the condition of these armatures it is the opinion of the master mechanic of the road that the hoods will last until the armatures need to be rewound. An armature fitted with these hoods is shown in the illustration below.

Other purely mechanical defects that developed under the service conditions included occasional breaks in the rigid connections on the brush-holder yokes. In the original motors this yoke was made of strap copper which frequently became annealed and broke under vibration. The substitution, two years ago, of standard motor cables with soldered terminals which clamped to the brush-holder supports eliminated this difficulty. Vibration also accounted for a number of broken brush-holder castings in the original motors. As shown in one of the accompanying illustrations, the break in holder usually occurred in the body casting which was improperly designed. Originally these brush-holders were of brass and made in one piece. In the new design the brush-holder proper was made with a cast-steel body and a detachable brass box which was bolted to the body casting with four stud bolts. When one of these holders becomes worn it is only necessary to renew the box, thereby saving practically one-third of the cost of replacement. Moreover, the detachable box, in many instances, is removed and restored to the correct dimensions in a press. The old and new brush-holders and the detachable box are shown in the illustration on page 1111.

Transformer difficulties have been exceedingly rare; in fact, only three transformers have failed in the last six years. These became defective when the support bolts loosened under vibration, allowing the case to open and permitting snow and water to enter. Since the roadbed has become seasoned and more thorough and regular inspections have been made, failures of this nature have entirely ceased.

BEARINGS

Thorough inspection followed by careful lubrication has made hot journal bearings a rare occurrence. The

SINGLE PHASE MAINTENANCE—COMMUTATOR END OF ARMATURE FITTED WITH ASBESTOS HOOD

M. C. B. brass is standard, and a tendency to tilt due to braking and rapid acceleration has not been experienced. About four years ago the bronze motor-axle bearings were replaced by cast-steel babbitted shells and considerable saving was thus effected. The bronze bearings, which were not babbit-lined, cost at that time \$6.85 a pair. The steel bearings cost \$3.60 new, and during the four years have been rebabbitted twelve times. The cost of rebabbitting was 75 cents per pair, which reduced the cost per shell to \$1.05.

Other recent minor improvements to increase the life of equipment parts include the introduction of case-hardened, $\frac{1}{8}$ -in. chafing plates in the journal-box yokes. As these are renewable, wear on the truck frame proper at these points is eliminated. Similarly, $\frac{1}{8}$ -in. renewable plates in the brake-lever guides on the circle bars take all the wear and the life of the truck frame at these points is thus prolonged.

LIGHTING

Recent changes in the car-illumination scheme, which was described in the issue of the *ELECTRIC RAILWAY JOURNAL* for Dec. 12, 1914, page 1308, has materially reduced energy consumption. Seven 60-watt and five 25-watt Mazda lamps were substituted for fifty-two 23-watt lamps. Along this same line the mechanical department has just adopted the Esterline type TR-128 headlamps fitted with Mogul bases, and designed for 6-volt, 18-amp., 108-watt, concentrated-filament Mazda lamps. Until recently all cars were equipped with arc headlamps designed for 25-cycle alternating current. The cost of operation was 18 cents per night for power alone. Tests have demonstrated that the Esterline headlamp will cost but 0.56 cent per night, and it is also assumed that the cost of maintaining lamps will be practically eliminated. Whereas one man was required to keep the arc headlamps in good condition, none will be required exclusively to maintain the new headlamps.

In connection with these new incandescent headlamps small compensators, or transformers, designed particularly for this service have been adopted in the place of resistors to step down the voltage. These are provided with taps so that the motormen, by simply operating a switch, may dim the headlamps when operating in city streets. The dimming effect is obtained by reducing the pressure from 6 volts to 3 volts. A view

showing this headlamp installed, as well as the trolley and pantograph mounting on the car roof, is reproduced on page 1108.

POWER GENERATION AND DISTRIBUTION

The power plant of the system is situated at Michigan City, Ind., at the upper end of the harbor about 1 mile from Lake Michigan proper. The plant is supplied with fuel by transfer tracks which connect two steam railroads. Eight 500-hp. Stirling boilers, normally rated at 200 lb. per square inch and equipped with superheaters supplying steam at 90-deg. superheat, are contained in the boiler plant. Draft for these is supplied by a 225-ft. stack with a 12-ft. flue. Six of the boilers are equipped with chain-grate stokers and flat ignition arches, while the remaining two boilers are equipped with Murphy stokers. As an economy measure in the boiler plant, all stokers are controlled by a McDonough automatic damper regulator which maintains a uniform steam pressure and at the same time regulates stoker speed to conform to any load demand. This has been found to be a very economical piece of apparatus, particularly where there is considerable fluctuation in the load, and in this plant it has effected a 10-per cent saving.

Three Westinghouse, single-flow, 2250-kw. turbines driving 25-cycle, three-phase, 6600-volt, a.c. generators at 1500 r.p.m., and one double-flow, Westinghouse, 3750-kva. turbine driving a 60-cycle, three-phase, 6600-volt a.c. generator at 3600 r.p.m., compose the generating equipment. Power is generated at 6600 volts and the voltage is stepped up by transformers to 33,000 for transmission. Power is supplied for the line between Michigan City and Pullman over the 33,000-volt transmission line to a substation situated at Calumet, 32 miles from the power house, and for the line between Michigan City and South Bend to Terre Coupee substation, located 21 miles from the power house. A 6600-volt feeder direct from the power-house busbars also connects to the line at Michigan City. In connection with these feeder lines two sets of reactance coils, built for a 10-per cent drop from the normal load, have been installed. These coils are a necessary protection against the severe surges coming in on the generators due to a grounded or short-circuited contact wire.

During a normal year 60 per cent of the station output is 60-cycle, three-phase current, which is wholesaled for commercial purposes, and 40 per cent is 25-cycle, single-phase which supplies the railway. An average power factor of 90 per cent is obtained for the 60-cycle commercial load, and one of 72 per cent for the 25-cycle railway load. Approximately a 55 per cent load factor obtains for the 60-cycle load and one of 45 per cent for the 25-cycle load. Due to the large size of the train units in operation between Gary and Pullman, the

maximum momentary peaks on the railway load approximate three times the average load, thus necessitating a large reserve generating capacity in order adequately to care for the maximum demands. In the accompanying illustration is shown the load chart for the kilowatt output and boiler horsepower in service for the month of August, 1915. These are representative of the average conditions prevailing at this plant. In this connection it is also interesting to note that the

SINGLE-PHASE MAINTENANCE—LOAD CHART FOR THE MONTH OF AUGUST, 1915

power load for 1915 for the railway totaled 7,546,000 kw.-hr., while the commercial load was 7,690,200 kw.-hr. Owing to the general business depression the commercial load has not been up to normal during the past year, but it will be seen that it is a large factor in the economy obtained at this plant. Unit results obtained in 1914 were as follows: Total cost per kilowatt-hour, 0.594 cent; kilowatt-hours per car-mile, 6.16.

MAINTENANCE OF OVERHEAD AND SIGNAL SYSTEM

The line between Gary and South Bend, 59 miles long, is equipped with Union Switch & Signal Company's type TDB., a.c. track-return semaphore block signals. Power for the signal system is supplied at 60 cycles and 2300 volts, the voltage being stepped down through transformers located in each block to the value necessary for operating the signals. Maintenance and inspection of the signal equipment is done by two men. They proceed over the road in a gasoline motor car of light weight and regularly inspect the signals, overhead, lighting arresters, telephone, switch lamps, bonds and the Egry registering machines used in connection with train dispatching. They make all repairs except those of breaks in the trolley wire or changes of high-tension insulators which is done by the line crew consisting of three men and a line car. These inspectors keep in constant touch with the dispatcher by reporting to him at each siding for emergency assignments.

Owing to the combining of these maintenance duties the average cost per car-mile for labor and material in maintaining the signal system is 0.196 cent. The average cost per car-mile for labor and material in maintaining the pole line is 0.084 cent. The average cost per car-mile for labor and material in maintaining the trolley line is 0.574 cent. These together make a total cost per car-mile for labor and material in maintaining the signal system and the overhead lines of 0.854 cent.

One-Man Cars in Australia

In an article written for the *Electric Railway and Tramway Journal* by P. J. Pringle, general manager Electric Supply Company of Victoria, Australia, it was stated that in the city of Ballarat there are seven tramway routes radiating from the business center and that all of the cars on four of the routes and on the extremities of the three other routes have been operated under the one-man system since October, 1913. In the city of Bendigo also, one-man cars have been in operation since September, 1913, on two of the four electric railway lines in the city.

The motormen on these one-man cars receive a somewhat higher rate than those on standard cars, but where the extremities of the line are operated on the one-man system the motorman is paid a higher rate only for the hours he is actually working on these sections. California type cars are used, the open section being inclosed with chain so that passengers must enter and leave by the front door, and each car is equipped with one fare box, which is temporarily fixed by the motorman at the side of the door in the front bulkhead.

When cars are traveling from the suburbs into the city passengers pay as they enter, when traveling from the city to the outskirts they pay as they leave. The average speed is approximately 8 m.p.h., and the company reports no difficulty in keeping the cars on time. In the beginning a few cases occurred where passengers climbed over the rear gates and left the cars without paying, but a few prosecutions in the courts rectified this difficulty, and since March, 1914, no trouble whatever has been experienced on this score. On the routes run entirely with one-man cars loads of from forty to fifty passengers are very frequently carried without any difficulty.

Variable fares are in force. On one route operated partly on this one-man principle there are several fare values reaching a maximum of 8 cents, and in this case all fares ranging from 3 cents up to 6 cents are paid into the fare box. In the case of 8-cent and 7-cent fares to the city, passengers are given special tickets by the motorman which are collected by the conductor, who joins the car at the boundary of the 6-cent fare zone. Those who are on the car at the time of his entering pay him according to the ticket that they produce and they are then given an ordinary passenger's receipt check. Paper tickets are stated to have been dispensed with and celluloid tokens are used in their stead, these making a very considerable saving in cost, as they are used over and over again.

Fare Increase Conference in Edinburgh, Scotland

The Edinburgh (Scotland) Tramways and the tramways committee of the Council recently held a conference on the proposed increase in fares of the tramway company. On behalf of the company it was pointed out that they had been forced to increase the tramway fares in consequence of the rise in the price of coal, cables and wages owing to the war; that this increased expenditure, which amounted to about \$121,750, did not include allowances which the company was making to dependents of employees engaged at the front. The company could not see its way to postpone the increase of fares or to consider any modifications thereof, except on the basis of a reduction in the rent, or of a guarantee by the corporation of profits similar to those of the past three years. The directors expressed their willingness at the end of three months to reconsider the matter if the increased fares were producing more money than was needed for additional expenditure.

In Chicago air, the products of combustion constitute only two-thirds the total pollution, the other third being due to avoidable and unavoidable dirt from the general activities of the city and from poor municipal house-keeping.

The appointment of a permanent pure air commission with sweeping powers was recommended by the committee as the most feasible plan for reducing smoke, to the production of which the steam railroads are not the heaviest contributors.

GENERAL FINANCIAL PHASES OF THE PROBLEM

As regards the financial practicability of electrification the committee submits these findings:

1. The complete electrification of the railroad terminals as a betterment to be brought about by the railroads through the investment of free capital is, under present-day conditions, financially impracticable.

MAP OF CHICAGO DIVIDED INTO DISTRICTS ON THE BASIS OF COAL CONSUMPTION

2. Any procedure designed to bring about complete electrification which is based upon a financial program involving municipal co-operation is, under present-day conditions, impracticable.

3. Any procedure designed to bring about complete electrification which is based upon the application of an "arbitrary" tax to traffic of Chicago will constitute a tax which must be borne by the business interests of the city. The practicability of such a tax is a matter which has not been studied by the committee.

4. The preceding conclusions apply to the complete electrification of Chicago's railroad terminals. The financial practicability, under present-day conditions, of electrification as it might be applied to individual roads or to a single service of individual roads, is a matter which has not been investigated by the committee and concerning which no opinion is expressed.

5. The credit of the individual railroads, the properties of which make up the Chicago railroad terminals, differs greatly. This fact cannot be overlooked in estimating what portion of the potential credit of the railroads is available for the purpose of electrification.

6. Certain railroads making up the Chicago terminals operate entirely within the prescribed zone, while for others the great predominance of traffic lies outside the terminal limits. Complete electrification, from a financial point of view, would affect but a relatively small part of the fixed investments of some roads, while for others it would require practically the rebuilding of the property.

7. Electrification is a matter which may present greater advantages in connection with certain classes of service than with other classes of service; for example, the electrification of a railroad having a large suburban business would be more effective in developing opinion favorable to the railroad concerned than the electrification of a road the activities of which are wholly those of freight switching yards. A few only depend upon passenger traffic within the city limits for any considerable amount of their revenue. A larger number derive passenger revenue within the terminals from the movement of through passengers only, while other roads perform little passenger service or no passenger service at all.

8. The extent to which individual railroads have recently made large capital expenditures for terminal improvements, track elevation and enlargement of facilities in Chicago, and the extent to which they are committed to further expenditure for these purposes, must have a material bearing on their ability to make expenditures for new projects.

UNIQUE FEATURES OF THE CHICAGO ELECTRIFICATION PROBLEM

The committee, realizing that many public-spirited citizens will not understand its decision, in the light of reports of electrifications in New York and elsewhere, points out the essential differences between electrification here and those installations that have so far taken place. Nowhere in the world, it finds, as a result of its investigations, has a steam railroad been electrified to avoid the pollution of a city's atmosphere. Nowhere has a terminal been electrified when that terminal from an operating standpoint has been satisfactory. No electrification in existence, either in America or abroad, is comparable, in scope and diversity of service, with that involved in the electrification of the Chicago terminals. A wide gap exists, the committee reports, between that which has been accomplished and that which would have to be done before local electrification would become a success.

Some of the electrifications that have been most widely heralded as such were in fact only a subordinate, though necessary, part of a greater scheme for terminal enlargement. The New York Central, the New York, New Haven & Hartford, and the Pennsylvania electrifications are not alone projects of electrification; primarily they are an essential detail of a new tunnel entry into the heart of New York City. These projects must necessarily stand upon a different basis than the Chicago proposal, where physical conditions absolutely requiring electrification are lacking and where physical conditions and the nature of the traffic would make electrification extremely difficult.

The committee finds that elsewhere steam roads have been electrified for these reasons:

1. Electrification has most frequently been employed in operating suburban passenger service.

2. It has been used for all passenger service in connection with the intensive development of great passenger terminals where underground operation has been involved.

3. It has been used for both freight and passenger operation in tunnels.

4. It has been applied to sections of through lines of route to improve operation of both freight and passenger service on difficult grades.

5. It has been applied to sections of through route lines in anticipation of operating economies through the utilization of water or other relatively inexpensive centralized power.

6. It has been employed by a single railroad in this country in the operation of three switching yards, the work of which must still be regarded as being in an experimental stage.

After studying all electrifications now in existence or planned, both in this country and abroad, the committee finds that of the total of fifteen American installations nine were undertaken because of operation in subways or tunnels, one as an experiment to test out economy in long distance passenger service, two to hold suburban business, one was equipped for initial electric operation because of charter requirements, and two for the purpose of utilizing water power instead of coal.

Of the foreign electrifications all English lines are classed as suburban. None conducts heavy electric locomotive service and none freight service except in a very minor degree. Practically all electric service is confined to suburban and interurban traffic handled by motor cars. In France the Orleans Railway confines its electric locomotive operation to passenger trains through a subway entrance into an underground terminal. It also operates electrically a suburban motor car train service on a line connected with this terminal. The Midi electrification is, in its present stage, experimental only, and for heavy grade lines where hydro-electric power may be substituted for steam.

In Germany no considerable heavy electric main line traction is as yet in operation. The Dessau-Bitterfeld is a short line and has been operated only in experimental service to test out apparatus and methods. The Magdeburg-Leipzig-Halle line, an important extension of which the Dessau-Bitterfeld line will form a part, when completed will represent the first German trunk line electrification, and the Lauban-Königszell line will represent a second such electrification. Both are predicated upon the production of cheap centralized power either from very low grade coal or from hydro-electric plants. While both of these lines will conduct a heavy electric locomotive passenger and freight service, neither of them will conduct a freight switching service comparable with that which exists in the Chicago terminals. In Switzerland the Loetschberg line and the Simplon tunnel line were electrified primarily because of tunnel operation; other Swiss electrifications are for light multiple unit train service only. All Swiss electrifications utilize cheap water power instead of the more expensive coal fuel. In Italy the Giovi with its branches is the only road which operates heavy electric service. The secondary lines in foreign countries operate a service which is entirely different from American operation, and resembles our interurban.

Thirty-eight steam railroads would be involved in the Chicago project, as against thirty-seven for the rest of the world. Of the Chicago roads twenty-five maintain passenger and freight service and twenty-three are classed as trunk lines, while thirteen perform transfer or switching service only. Eight of the trunk lines have no main tracks within the city limits but operate trains into the Chicago terminals over the tracks of other companies. Twelve railroads operate wholly within the area of investigation.

It was found that the Chicago mileage would be nearly twice that of all other electrically-operated mileage in America, and, exclusive of foreign light service lines, would be about 15 per cent greater than all existing

electrifications in the world. The committee's plan involves several times as much yard track mileage as do all existing American electrifications. The number of electric locomotives required would be approximately four times that of all which are now in service in America and two and a half times the number in service in the whole world.

Of switching service, which constitutes 59 per cent of the total locomotive mileage and presents a grave problem in that it has never been attempted electrically on a large scale, it has been ascertained that yard freight switching services, on the basis of car-miles, is more than sixty-five times as great as that on all existing electrified steam roads in America.

No similar service elsewhere, says the report, is handled electrically in any considerable volume except that on the Giovi Railroad of the Italian State Railways and on the New York, New Haven & Hartford Railroad in America. The latter operates, in part electrically and in part by steam locomotives, three freight yards having in the aggregate 72.7 miles of track, requiring about 90,000 electric locomotive-hours per year and handling about 2,500,000 car-miles per year in switching and transfer service. The freight yard traffic of the Chicago terminals aggregates approximately 3,430,000 locomotive-hours per annum and approximately 164,400,000 car-miles per annum in switching and transfer service.

NO SELF-PROPELLED VEHICLE AVAILABLE

As a preliminary to its study of electrification for Chicago steam roads the committee made an investigation into other methods of conducting transportation. It had been hoped that some type of self-propelling motor might be found, and the danger, engineering difficulty and expense of electrification be avoided. But this hope was not justified. The following systems were studied:

Internal combustion motor with mechanical drive, electric drive, compressed air drive, hydraulic drive, direct-connected motor.

Compressed-air motor.

Hot-water motor.

Electric storage-battery motor.

While it was found that progress had been made in adapting the gasoline engine to the requirements of light or special railroad service, the power requirements of heavy and diversified traffic, it is stated, are still beyond the gasoline driven unit. The Diesel oil-burning marine engine has the power, but neither type is self-starting, an imperative requirement for switching work. A new Diesel experimental locomotive was examined in Switzerland. Much had been hoped from it, but the inventor was found doubtful of its success in such heavy yard switching work as would be required here, and limited its future to light express work with constant speeds and infrequent stops.

Much, also, had been hoped from the storage battery, but it was found to lack power, to be too expensive and to share, with electrification, the disadvantage of producing power house smoke. The internal combustion motors are also smoke producing and are regarded as adding a new hazard of operation through their fuel tanks.

Compressed air and hot water motors, also, were found to be impracticable but their use is suggested on those sections of Chicago track that cannot be electrified.

There is available at this time, says the report, no form of locomotive carrying its own power capable of handling the traffic of the Chicago railroad terminals which could be substituted for the steam locomotive,

and there is no prospect of the immediate development of any such locomotive.

DETAILS OF THE COMMITTEE'S ELECTRIFICATION PLAN

While the committee does not find electrification feasible, it has prepared a plan which is covered in detail in the report.

The committee believes that the highest degree of efficiency in electrification can only be secured by joint procedure by all the roads. It is inconceivable, says the report, that the different railroads will undertake such a work independently. It may be argued that a course necessary in the case of one railroad may prove quite unnecessary in the case of another, and yet the fullest measure of technical success in the electrification can only be secured when individual interests and preference are subordinated to the requirements of a general plan.

The committee's plan contemplates the electrification of all track within the city limits and the conclusion of electrified trackage on each railroad as close outside the city limits as is practical. The mileage involved by this conception may be summarized as follows:

	Miles
1. Main track	1,475.59
2. Yard track	1,456.64
3. Industrial track owned by railroads	277.19
4. Miles of industrial track owned by industries	229.72
5. Industrial track, railroad repair track and shop track so located in streets at grade, in buildings or under structures employed in industrial processes as to require some type of self-propelling motor.....	37.26
Total ..	3,476.40

While in general the committee decided to terminate electrification at the first convenient point outside the city limits, this could not be accomplished on certain roads which conduct a suburban passenger service. It would be impracticable, according to the findings of the committee, to operate these frequent suburban trains part way by electricity and part way by steam. It has hence been decided that certain lines must be partially electrified beyond the limit of complete electrification to the terminals of the suburban service. Through passenger and all freight trains are to be operated by steam on the partially electrified extensions, which will be for use only by multiple-unit suburban trains, resembling "L" trains, but of heavier construction.

As yet no system of electric traction has been developed, the committee finds, which can be accepted as standard for all conditions on all railroads. If it were decided to proceed at once with the electrification of the Chicago terminals, it would be difficult for any group of men, the committee believes, to choose a system which would not be criticised by other men as able as those upon whom the choice of the system developed.

The system selected for Chicago, it is pointed out, must be suitable not only for passenger terminals and through line work, but also for yard switching and transfer work. It must be applicable to the requirements of railroads having a heavy suburban traffic, and also to those roads conducting freight yard and switching service. It must not only be satisfactory in its application to the terminal portion of a trunk line railroad, but it must lend itself to an indefinite extension of the limits of electrification over other and adjoining portions of the road.

Obviously, the report adds, the project must be regarded as too important to permit of the introduction of methods in any way questionable, or of a type of construction of untried value. Furthermore, it is not permissible to consider any methods which might serve to tide over a temporary condition anticipating the later selection of a permanent and stable system.

The committee, after obtaining complete engineering

data on these three systems selected the third as cheapest and most desirable:

1. Third-rail contact, direct current at 600 volts.
2. Overhead contact, direct current at 2400 volts.
3. Overhead contact, single-phase current at 11,000 volts.

The third-rail system was given up as the least practical of the three because of the difficulties to be met. Not only would the presence of the third-rail be a danger to employees in the yards and make necessary a large amount of reconstruction, but there would be trouble in operating trains, owing to the large number of gaps in the third-rail due to switches, street intersection and other such obstructions. After ascertaining the extent of this difficulty on six railroads, the committee found that:

Under present methods the six railroads examined would have 3834 gaps more than 25 ft. in length in the third-rail conductor aggregating 56.42 miles. Of these gaps 2216, aggregating 24.06 miles, would be unimportant since they would be short or would occur in places where trains could coast over them. Another class, numbering 881 gaps and aggregating 16.13 miles, could be reduced so that proper operation could be maintained; some of them could be eliminated by rearranging track or, assuming that municipal grant could be obtained, by closing some streets and reducing the width of other streets and roads. The expense of making these changes has not been determined, but it would be large. The remaining 737 gaps, averaging more than 115 ft. in length and aggregating 16.23 miles, or about 1 per cent of the total mileage examined, would require the use of an overhead third-rail conductor, a device that is cumbersome, difficult to install, inefficient, expensive and an obstacle to operation.

It is estimated by the committee that a total of about 75 miles of track in Chicago could not be equipped by the third-rail system.

Another objection to the third-rail is the fact that except in very unusual sleet storms, service through the trolley wire would not be interrupted, whereas both sleet and drifting snow furnish a serious problem with the third-rail. The rail is also a danger to property and life in case of wreck.

The difficulties of trolley installation would also be great, but less, it is believed, than those attending the use of the third-rail. The great trouble found is with low bridges and other structures over the tracks.

Within the area of investigation there are 492 permanent structures which fail to have sufficient clearance over tracks to allow the installation of the overhead conductor at the desired height of 24 ft. 2 in. Of these obstructions, 221 cannot be changed without great inconvenience and expense both to the city and to the railroads. There are 385 structures which have clearances of less than 25 ft.; 163 of these interferences can be changed to provide the desired clearance, but not without material expense, and 222 cannot be changed without great inconvenience and expense. There are seventy of these structures which have less than the minimum clearance of 16 ft. 6 in. permissible where trainmen are excluded from tops of cars. The conclusion follows that a sufficient clearance to permit employees to ride on tops of cars cannot be obtained throughout the Chicago terminals.

The adoption of the overhead contact system would permit the use of either a high voltage direct current or an alternating current of much higher voltage. The use of the first would result in damage to property by electrolysis. The use of the second would "kill" telephone and telegraph wires adjacent to the tracks, through inductive interference. Both conditions could

be remedied, though with difficulty and at considerable expense.

The committee finds that it would make no practical difference whether the roads manufactured their own electric power or purchased it from public service corporations.

Electricity would, it is concluded, neither increase nor decrease the dangers of operation. Added dangers would be introduced but compensating safety in other directions would offset these.

INCIDENTAL ADVANTAGES OF ELECTRIFICATION

The committee has made an effort to arrive at the incidental advantages that would accrue to the railroads through electrification. The change would give some increased capacity in existing trackage and terminals. In locations where operation under present-day conditions is congested it would give relief, and in locations where there is at present no congestion, electrification would constitute in effect an enlargement of existing facilities and hence would postpone the day when additional facilities would be required.

Electrification, it is concluded, would contribute to increased celerity and reliability in train movement. It would open the way to more intensive use of railroad property, both in this manner and by making double-decked freight and passenger terminal stations possible. It would also make possible the erection of buildings over tracks, but this value is regarded as speculative and, as a present-day asset, small.

Electrification, it is pointed out, would give the roads an asset in the use of electric service beyond that required for trains. It would benefit the roads through the increased convenience and comfort of passengers and it would also give the roads whatever advantage accrued, entirely indeterminate, through the lessening of smoke.

ELECTRIFICATION COSTS

In arriving at the cost of electrification the committee based its work on 1912 operation, extended to meet conditions if electrification were to begin in 1916 and be completed in 1922. The following accounting statement shows why the committee holds that electrification is financially impossible. The deficit on the minimum outlay of \$178,127,230 would be too great:

I—ANNUAL CHARGES	
1. Interest	\$8,906,362
2. Depreciation	7,808,278
3. Replacement of dissipated assets	231,796
4. Indeterminate charges	
Total charges	\$16,946,436
II—ANNUAL REVENUES	
1. Increase in net revenues	\$2,336,693
2. Indeterminate benefits	
Total credits	\$2,336,693
Balance, annual deficit on investment	\$14,609,743

The investigations show that electrified operation for all the railroads taken together and disregarding depreciation and interest would result in a decrease in operating expenses. Under steam operation, those accounts that would be affected one way or the other by electrification show a total of \$10,934,064. Under operation by the 600-volt direct-current third-rail system, the total would be \$8,442,298, with the 2400-volt direct-current system it would be \$7,355,771 and with the 11,000-volt alternating-current system it would be \$7,140,495. The installation of these three systems would result in a saving in operating expenses respectively of \$2,491,766, \$3,578,293 and \$3,793,569.

This saving, however, is in part nullified by new expenses, due to the operation of stations that would have to be established at the end of electrified tracks to

provide for a transfer of trains from electric to steam locomotives, and also by the waste and consequent loss due to operating over shortened steam railroad divisions, which have surrendered part of their mileage to make the new terminal electric divisions. The engineers' estimates place the added expense under the first item at \$1,546,113 and the added expense under the second at \$450,000. This would leave the net saving in operating expenses, to follow electrification, at \$495,653 for the third-rail system, \$1,582,180 for the direct-current trolley system, and \$1,797,456 for the alternating-current trolley system.

Following the work of the committee, a number of the Chicago railroads have made a study of the cost which would be imposed upon them in excess of those set forth by the committee. Eight of these railroads have filed with the committee the results of their investigations. The reports thus submitted have been analyzed with results which are set forth as follows:

ESTIMATES OF INTERMEDIATE COSTS OF EIGHT RAILROADS	
1. Costs due to an extension of the mileage of electrification over that provided by the committee's estimates	\$20,872,500
2. Precipitated costs principally for track elevated	\$29,198,400
3. Total cost to the eight railroad corporations in excess of that necessary to electrification under the plan of the committee	\$50,070,900
4. The committee's estimate of the cost of electrification for the eight railroads	\$92,599,908
5. The excess costs, including costs due to extension of the plan and precipitated costs, in per cent of those which are covered by the committee's estimates	54.07

The committee's estimates of the net cost of electrification for all the roads of Chicago totals \$178,127,230. Therefore, carrying forward the same ratio, the committee finds that the total added and precipitated costs for all the railroads would amount to \$96,313,400.

Upon this basis, the total capital requirement imposed by electrification would be:

That incident to the development of a minimum plan as estimated by the committee	\$178,127,230
That required to cover precipitated costs and costs due to extension of plan	96,313,400
Total	\$274,440,630

Individual electrification by various roads, which refuse to join in the committee's plan of common installation and common operation, is also expected to raise the cost above the committee's minimum. One illustration makes this plain:

The committee assigns to the Chicago & Northwestern Railway a proportionate share in the cost of the common power station. The railroad itself, however, assumes at once that it would prefer an individual power station, and its estimates of the cost of the individual facility is \$3,894,767. This is \$1,683,936 in excess of the committee's estimates.

By far the most important factor in this list of indeterminate costs is that of terminal rearrangement and improvement. The city's terminals have grown up without preconceived plan, additional facilities being added now and then at points further out as the expansion of business and of the city dictated. Many of these changes might not become imperative for a decade, but under electrification would have to be made at once. Track elevations would be extensive in order to avoid grade crossings with trolley lines. Signal systems that are now somewhat out of date but might be continued in operation for a number of years, will have to be altered and it is probable many roads will decide to put in entirely new systems.

SYNOPSIS OF AMERICAN ELECTRIFICATIONS

In its work the committee had occasion to study all existing electrifications, and included in the report the following summary:

The Long Island represents the first complete electrification of a steam railroad on a large scale and is the most extensive example of multiple-unit passenger service in operation. This line is essentially a passenger line serving suburbs of New York City, and at certain seasons operating a heavy excursion business to the seashore. Practically the entire network of lines within a radius of 25 miles of the city, 88 miles of route, has been electrified. The purpose of this electrification was to fulfill the requirements of smokeless operation made necessary by the new tunnel entry into Brooklyn and New York City to the new Pennsylvania terminals. Freight service is conducted by steam locomotives exclusively and on some portions of the electrified system steam locomotives are also used to operate through passenger service.

The New York Central & Hudson River Railroad electrified to eliminate smoke and gases in the long tunnel entrance into the Grand Central Station in New York City. Operation was hampered and accidents made liable by this smoke. The electrification embraces the station yards and 53 miles of route serving a suburban territory. This was necessitated in order to secure continuous electric operation for the suburban trains. The route totals 244.60 miles of track.

The New York, New Haven & Hartford began electrifying because it used the New York Central station and had to follow the change of that road. It has extended this method of operation so as to conform to the Pennsylvania electrification on Long Island. Freight trains are handled by electric locomotives from New Haven to terminal yards located at four points on the Harlem River division. There are, counting switches and other secondary track, 531.68 miles of track involved in this electrification.

The Pennsylvania was forced to electrify in order to go under the rivers and Manhattan Island to its new New York City terminal. The electrification involves 9 miles of main line incidental to the terminal electrification, and 97.49 miles of track.

The West Jersey & Seashore operates 64.6 miles of main line for suburban traffic, the installation having been experimental, the object being to ascertain what main line operating economies would result.

The Spokane & Inland Empire was built for electrical operation because of the high cost of coal and the availability of water power. Total trackage involved is 131 miles. The road is partly an interurban, but also does freight work.

The Butte, Anaconda & Pacific is a copper line with 90.5 miles of track operated by hydro-electric power.

The Erie has 38 miles of experimental hydro-electric main line for suburban passenger use, but through passenger and freight trains operate over this section by steam.

The Southern Pacific has 114.81 miles of suburban track in California under electrical operation. Much of this is in city streets. A large suburban business is handled.

The New York, Westchester & Boston does an exclusively suburban passenger business over 53.56 miles of electrically-equipped track.

The Baltimore & Ohio has 8.4 miles of track under electric operation in Baltimore, made necessary by heavy grades and a long tunnel. This was the first electrification in America for heavy freight and passenger trains.

The Grand Trunk operates electrically through the tunnel under the St. Clair River to Port Huron, Mich. Twelve miles of single track are involved.

The Great Northern has electrically equipped the tracks in its 2.6 miles of tunnel at the Cascade summit. Power is generated by a hydro-electric plant.

The Michigan Central has 20 miles of electrically-operated track through the tunnel approach to Detroit under the Detroit River.

The Boston & Maine uses electricity in the Hoosac tunnel, which is nearly 5 miles in length. Twenty-one miles of track have been electrified.

The Norfolk & Western has electrified 25 miles of its main line which has heavy grades and a tunnel. Electric operation will be confined to coal trains, fast freight and passenger trains continuing under steam power.

The Pennsylvania has equipped for electric operation 20 miles of main line from Broad Street Station, Philadelphia. This change was forced to relieve congestion at the terminal, which cannot be enlarged. Through trains will continue to operate by steam.

The Canadian Northern has electrified 10 miles of double track through the tunnel into its new Montreal terminal.

The Chicago, Milwaukee & St. Paul is electrifying a portion of its main line over the Rocky Mountains, embracing a stretch of about 440 miles. The object is increased speed and track capacity over heavy grades reducing operating costs by the use of water power.

Boston Elevated Library

The Methods of Developing and Indexing the Library and the Duties of the Librarian Are Described

To facilitate the work of officials and their assistants, the Boston Elevated Railway established a company library on Sept. 1 of this year at its main offices, 101 Milk Street, Boston, Mass. The library is designed to be a general clearing house of information for all departments, and is managed not with the idea of amassing a great collection of books and other printed matter, but with the intention of maintaining the most important material, from the company's standpoint, within comparatively small quarters for the present and to keep in close touch with every other available source of information of interest to a transportation organization. The carrying out of this policy is reflected in the sectionalizing of the library and in the development of its general card index.

The library adjoins the executive offices on the fifth floor of the building and is under the general direction of M. C. Brush, second vice-president. There are now about 100 sections classified under such heads as "Investigations and Reports on Transportation Problems in Boston"; "Reports of Boston City Departments," including fire, police, public works, port directors, parks, finance commission, wire department and others; "Massachusetts commissions," including reports of the Public Service Commission, Gas & Electric Light Commission (which has jurisdiction over smoke abatement in Boston); Metropolitan Water & Sewerage Board, opinions of the attorney-general, acts and resolutions of the legislature, reports of the bank commissioner, industrial accident board, Massachusetts Highway Commission, Metropolitan Park Commission, etc. Other sections cover transportation problems in other cities, with special reports of consulting engineers and boards of investigation; the annual reports of electric railways in large cities; reports of public service commissions in New England; reports, pamphlets, etc., on municipal ownership; welfare work; maps of various cities, mounted on pulpboard; labor matters; atlases of metropolitan Boston; current periodicals in bound volumes; proceedings of the American Electric Railway Association, etc.

The card index capacity is 60,000 cards, all within reach of the librarian when seated at his desk. The

index is of the so-called "dictionary" type, with alphabetical subject entries and cross-references. The compactness of this arrangement enables inquiries by telephone or otherwise to be answered in the minimum time. Close relations are maintained with about twenty special libraries in Boston, including, besides the great libraries of Harvard University (in particular the business administration library), the Massachusetts Institute of Technology and the Boston Public Library, the libraries of Stone & Webster; Kidder, Peabody & Company; Arthur D. Little, Inc.; Insurance Library Association; C. H. Tenney & Company, and others. By telephone and messenger service material available is made quickly accessible through interchange facilities of the greatest value. In the broader sense, the Boston Elevated library is an intensive index of information, or a clearing house of data and references in which mere duplication is avoided in the interests of efficient service in connecting the seeker and the information desired in the shortest possible time.

The librarian is charged with the duty of caring for and indexing all scientific books, catalogs, pamphlets, essays, trade magazines, commission reports and findings and papers of the company, and of acquainting officials of the company with articles in these which may be of interest to them. So far as he can, he is required to know about new publications of a nature likely to be of interest to officials and to acquaint them with these. The office libraries of company officials are indexed in the library card catalog—a plan which avoids breaking up specialized collections of great local value within departments and bureaus and still preserves first-class accessibility. Thus, the typewritten stenographic records of various street railway arbitration cases are filed in the library of the second vice-president, indexed in the company library, and so made immediately available without encumbering the shelves of the latter, or withdrawal for more than a temporary period from their most useful location.

By use of cards issued by the Library of Congress pertaining to copyrighted books on railway and electrical matters, references to these volumes are deposited in the index automatically within two or three weeks after publication. The library subscribes to a number of journals, including the *New York Times Book Review* and the *Annals of the American Academy of Political and Social Science*, to the Bureau of Railway Economics, to engineering periodicals, to the United States Catalog of Books in Print, etc. The librarian is in a position to state the name and title of every municipal officer within the Boston Elevated territory, with the dates of municipal meetings. This information is of special value to department heads interested in construction and traffic matters. In every branch of its service the library seeks to act as a most efficient intermediary between the person seeking information and the repository of the desired data. The usual arrangements for circulation of books and periodicals are in vogue.

The questions referred to the library are most varied and include such points as the compilation of references to organization charts on railways, the comparison of different types of third-rail shoes, investigation of the cost of printing transfers, and numerous other topics. Following a recent fire in the company garage, information was sought on the behavior of gasoline when being strained through a chamois cloth into an automobile tank. Co-operative inquiry through the Insurance Library brought forth helpful information upon the possibilities of gasoline ignition through the creating of static charges in straining this liquid in the above way.

Lewis A. Armistead, a member of the company's staff with a varied experience in routine work and special research in different departments on behalf of executive interests, has been appointed librarian of the Boston Elevated Railway. Mr. Armistead is a member of the Special Libraries Association and has a broad acquaintance within the electric railway field. Comprehensive plans for widening the usefulness of the library are being steadily developed, and since its inception early in the fall it has become a valuable adjunct to the company's organization.

The Lesson of the Jitney*

Successful Experience with One-Man Cars Described—Other Suggestions on Economical Operation

BY RAYMOND H. SMITH, GENERAL MANAGER JACKSON LIGHT & TRACTION COMPANY

During the last eighteen months most street railway companies have suffered losses of revenue, the extent of these losses depending largely upon the industrial diversification of the localities served. This condition emphasizes the importance of activity in securing diversification of industries. In times of stress and extraordinary conditions the locality which is dependent upon a single line of industries is just as much affected as is the farmer who is staking his year's work on the success of a single crop.

The falling off of street railway earnings is in general due to one or more of the three following factors: The unusual conditions which have had a depressing effect upon business in general; the ever-increasing number of automobiles used by individuals for pleasure purposes, and the presence of jitney competition. After the war the electric railways will undoubtedly participate in the new era of prosperity which is to follow, but the street railways must look upon future losses of revenue from the privately-owned automobile as a certainty. While the losses sustained through the ordinary use of these machines by the owners and their families is a considerable item, this loss is greatly increased by the very natural desire to give friends a lift. This natural inclination has been greatly stimulated by the advent of the jitney. The effect is destined to grow very much in proportion to the number of cars sold, and the constantly decreasing cost of the automobile is also a factor.

The jitney has cut deeply into the earnings of the street railway, and this in many cases where it has ultimately withdrawn from the field. When operating under laws which have placed upon the jitney even approximately the same responsibilities as are upon the street railway, the tendency of this competition seems to be in the direction of failure, but when the last jitney has been withdrawn from service the community which has passed through the period of jitney craze emerges the loser. It has been such merely because the jitney has been of no lasting benefit to the place, and the street railway, which plays such an important part in the prosperity of a community, has suffered a loss which is bound to hamper it in its efforts properly to perform its duties as a common carrier.

That the jitney has its advantages cannot be well denied. Many who were at first strong in their protest against the unfairness of the competition have succumbed to the allurements that the rapid transit afforded, still, however, maintaining their former position on the equity of the situation. This cannot but bring forcibly home to the street railway operator the fact that patron-

*Abstract of a paper delivered before the Mississippi Electric Association on Nov. 12, 1915, at the Hattiesburg meeting.

age is naturally inclined toward the service which offers the greatest advantages, regardless of where the sympathies lie. It therefore behooves street railway operators to adopt any practical means of securing for their systems the good points of their competitor's service.

Transportation facilities which before the advent of the jitney seemed satisfactory will, with its passing, be deemed inadequate. It is coming to pass that street railway service is regarded as good or bad, depending upon whether or not there is a car in sight. Apparently the jitney is not now a success, but the question arises whether or not it can "come back." This must be settled between the automobile manufacturer and the street railway, as it seems to be a question of future first cost and operating cost of automobiles versus service and cost of street railway operation. The question of how much cheaper automobiles will become in the next five years is problematical, but this question does not rank in importance with that as to whether automobile operating expenses will increase or decrease. It is difficult to predict the future trend of these operating costs. The tire expense is now approximately 18 per cent of the total cost of machine operation, and it is not venturesome to predict that some genius will devise a tire which will do away with much of the expense and trouble now experienced from this source. Just what the gasoline or other fuel situation will be in a few years it is also difficult to foretell.

The jitney of the future cannot expect to be relieved of many of the obligations and burdens which many have escaped in the past. New legal restrictions and regulations have been applied to it with caution, and in some cases with reluctance, owing to its infancy, its popularity, and the possible political effect. If the indications point toward the successful and continuous operation of jitneys, many of the burdens of the street railway will be also assessed against it.

There is too much talent and engineering ability in the electric railway industry to permit serious interference with the electric road. But jitney competition has emphasized that quick acceleration, high speed and frequency of service are the demands of the public. It is not enough that large cars, sufficient in capacity to properly handle the traffic, be run. The demand is for more frequent cars and faster operation, and this immediately suggests more and lighter cars, so inexpensive to operate that the railways can afford to reduce the headway.

The Jackson Light & Traction Company has recently purchased and put into operation five single-truck, all-steel cars having a seating capacity of twenty-four passengers each. These are 25 ft. long over all and have special trucks equipped with 24-in. wheels. The cars weigh about 12,500 lb., and they are equipped with 30 to 35-hp. motors, the new 17½-hp. motors not being available for service at the time the cars were purchased. These cars are arranged for one-man operation. They have been very satisfactory, and the writer is convinced that cars of this design will gradually replace the larger and heavier rolling stock of to-day.

The writer cannot agree with those who are of the opinion that one-man operation is not adapted to cities of from 50,000 to 100,000 population. Local conditions, of course, determine what is best in any particular case, but the feasibility of one-man operation with the future light-weight car, controlled with the ease of an automobile, will not depend upon population. The ability of one man to look after the business of his car is dependent upon having frequent enough service to reduce the riding per car to a point where one man can conveniently handle it.

In the line of reducing expenses there seems to be no reason why cars should be operated through the streets

with a finish like that of a piano. Why should a street car require a highly-polished surface any more than a house? Again, many of us, especially those living in the southern section of the country, may find it possible to do without the extensive carhouses which we now think necessary. Similar cases may be cited in other lines where, if the railway industry is driven to it, economies can be effected. The writer has no fear that the jitney will replace the street railway, and anticipates that a few years hence small electric cars, quite different in design from the present street cars, will be operated over the street railway tracks with the speed, acceleration, control and comfort to passengers of the best automobile of to-day.

Kansas City Advertising Car

The Metropolitan Street Railway, Kansas City, Mo., operated on its tracks this past summer, for the Kansas City Electric Light Company, an illuminated advertising car exploiting the special installation offer of the light company, especially its electric fan feature. The car bore on each side and on the rear end painted signs presenting the offers, the words being lighted by globes concealed at top and bottom and operated by a flasher that caused illumination for about a minute, then darkness for a shorter time. During the period of darkness the flasher caused a small sign, inserted in each side, to revolve exposing alternately

KANSAS CITY ADVERTISING CAR

opposite sides. On the one side was a picture of a man drenched in perspiration. On the reverse, the same man was enjoying the draft from an electric fan. A small motor operated the flasher and also a hurdy-gurdy.

The car was manned by a motorman, a conductor, and an extra man, usually, for the hurdy-gurdy. It traveled 30 miles each clear night, successively on eight routes, which eventually covered the city tracks. It was on the streets two hours, not interfering with the early or late evening traffic. Among the children of Kansas City it was known as "the music car." The wording of the larger signs was changed with the offers of the different months, while the fan cartoons remained.

According to a paper issued by the United States Geological Survey, the value of the production of mica in the United States totalled \$328,746 in 1914. The chief mines are in North Carolina.

Bay State Street Railway Valuation

Methods and Results of Eighteen Months' Investigation of Massachusetts Property in Connection with Fare Case Now Being Heard by Public Service Commission

In support of its proposed fare increase, the Bay State Street Railway, Boston, Mass., recently filed with the Massachusetts Public Service Commission a valuation report prepared by Sloan, Huddle, Feustel & Freeman, Madison, Wis. The general preparation of the report involved the determination of the value of the physical property of the company within the State, and the ascertainment of the revenues necessary to meet present operating expenses, provide for depreciation and furnish a fair return. The principal problems concerned the valuation and the depreciation allowance. The actual operating expenses as shown by the books were used, and the fair rate of return, or cost of obtaining money, was put at 7 per cent. No attention was paid to development costs or other intangible values.

INVESTMENT COST BASIS OF VALUATION

As nearly as possible the investment cost of the property as it existed on Nov. 1, 1914, was obtained, this cost being defined as the money actually spent to build up the physical property then in existence. The cost of reproduction of the entire physical property was also ascertained. Before either value had been found, however, it was decided that the one to be used to show the total revenue needed was the investment cost. The only exception was in the case of land, for which item the present market value was used.

The determination of the investment cost of the property was difficult. Present construction cost regulations have been in effect for only a small part of the life of the system, which is composed of properties originally held by more than sixty separate companies, some organized as far back as 1862. Much of the property dates from 1899, when the main portion of the properties was gathered into two large systems, but not until 1907, when the company began doing its own construction work, were detailed construction records obtainable. In general, material purchase records have been reasonably complete since 1904. For ties, rails, poles and copper wire supplementary data for the earlier years were obtained from manufacturers, supply companies and other sources. Actual costs were found for practically all the track special work, and the greater portion of the rolling stock, car equipment and power station equipment. The records for labor were less extensive, being complete only since 1909. Analyses were made to ascertain the average costs of track laying and of installing the overhead distribution system, and these costs were adjusted to comply with the different conditions of earlier years. Grading prices were obtained from a study of the reports of the Massachusetts Highway Commission and a comparison with available contract prices. Actual grading costs were at hand for some large recent jobs.

The unit prices for investment cost included only the cost of labor, materials and immediate supervision. The overhead charges, which were based on the I. C. C. classification, were kept separate. These charges, including engineering and supervision, interest, taxes, fire and liability insurance, organization and legal expenses, and contingencies of inventory and construction, were considered only when incurred during or incident to the construction period. They were not applied to each individual item but were computed as an average cost to be applied to the total material and labor cost.

In spite of the careful taking of the physical inven-

tory, it was certain from past experience that some items were omitted, and that much work was done during the construction period which an examination of the present property would not disclose. Moreover, in examining the construction work orders to arrive at unit prices, there were a number of cases where the analysis showed costs beyond the normal, owing to unusual conditions. To allow for these a small and varying allowance for contingencies was added to the different accounts.

In following the investment theory for overhead charges, the fact that the company is a going concern reduced the allowance necessary for certain of the items. Engineering and organization expenses were less than would be required for a company just beginning construction. The company's credit also made it possible for money to be obtained on favorable terms for construction purposes. The engineers considered only the interest on the money actually needed for construction and did not include commissions or discounts usually paid for the obtaining of construction funds. All the above conditions resulted in the allowance of a weighted average of 12.74 per cent on the cost of labor and materials. The monetary allowance for overhead charges was \$4,769,717, and the investment cost including overhead charges amounted to \$42,211,810.

COST OF REPRODUCTION OF PHYSICAL PROPERTY

In establishing the cost of reproduction the same inventory of physical property was used as in the case of the investment cost. It was considered that any company starting out to build the system anew would be obliged to do in a few years substantially the same work which was done over a period of many years by the component companies of the system. Four years was deemed the time required. For unit prices the actual costs as of Nov. 1, 1914, were not taken. In their stead an average of prices obtaining for a short term of years preceding this date was used. The units employed did not contain any late prices, which might be abnormal owing to the European war.

The principal changes in overhead charges under the reproduction theory were in the items of engineering, organization and interest during construction. All three of these items are less for an operating company, building its property slowly in the form of extensions, than they would be for a company constructing the property as a whole. The weighted average for overhead charges in this case was 15.80 per cent.

After the values for the entire accounts were determined, it was necessary for later use in rate calculations to apportion the total value to the various operating routes. As previously stated, the value chosen was the investment cost with the one modification in that land was included at the present market price. The actual use of the property by the different routes formed the basis of apportionment. All lines in any one city used exclusively for local service were taken together as one route, but all other lines were considered separately and values found for each route.

DETERMINATION OF ANNUAL DEPRECIATION

In the investigation of depreciation, the engineers computed for each account the annual amount necessary to be set aside so that at the end of the normal life of the

depreciable property in that account a fund would be on hand equal to the original investment. The computation was made by dividing the cost new of the property minus its scrap value by the estimated life in years, it being understood that at no time would the fund actually equal the investment cost of the property in any account, as some portion of the items must be renewed constantly. Every effort was made to have the lives used reflect the company's actual experience. No use was made of life data from outside sources, for other than comparative purposes, except for those items whose normal lives could not be determined from the history of the company. Notes on the present condition of the property were made at the time of the field inventory. The number of years that a piece of property had been in use, taken in conjunction with its condition per cent, was the basis for a close approximation as to its probable remaining years of usefulness and thus of its total normal life.

For much of the property the history of renewals for items subjected to varying operating conditions formed the basis for the lives adopted. In the matter of ties, *e.g.*, it was found that for those laid under pavement the life depended largely on the life of the rail being carried. For ties in unpaved track the practice of covering them by back-filling has considerable effect in lengthening the actual years of service. Hence, to account for local conditions, a range of lives was sometimes assigned to items in the same group. For rail, the lives varied from ten to thirty-five years depending on traffic and other conditions. Certain of the property accounts were classified as non-depreciable. Table I shows the lives used in calculating depreciation on the various items.

In the computation of each account the various items were grouped to obtain the total amounts wearing out in the different life periods of ten, twelve or fifteen years, etc., and to these several totals were added the overhead allowances to determine the gross investment. The scrap value, if any, and the non-depreciable overhead were subtracted from the gross investment to determine the depreciable investment. This latter value for a group, divided by the life for that group, gave the annual depreciation, and the sum of all such group totals gave the total annual depreciation for the account. The composite life was finally determined by dividing the net depreciable investment by the annual depreciation

TABLE II—STATEMENT OF ANNUAL DEPRECIATION NECESSARY FOR EACH PROPERTY ACCOUNT

	Investment	Depreciable Investment	Annual Depreciation, Per Cent†
504—Grading	\$165,374*	\$161,078	2.0
506—Ties	1,421,665	1,384,739	5.6

†Very little near twenty-five years.

*Twice life of rail.

separate from the 1914 maintenance charges the amount, which under the engineers' theory, would have been so charged. The maintenance accounts, which involved both labor and materials, were examined for the last three years available. The material sheets from all storehouses were scrutinized to determine whether or not the material would have been paid for out of the depreciation fund. If the labor charges for the materials so assigned could not be found directly, they were estimated on the same unit basis as in the investment valuation. In this way a comparison of these charges was made for three years and a reasonable deduction made for the year in question. As the actual operating expenses were to be apportioned for the fiscal year 1914, the deduction was made from the depreciation requirements as computed.

WORKING CAPITAL AND REVENUE REQUIRED

Working capital was considered in addition to the investment cost, the amount used being \$1,423,555. This was somewhat less than the net average actually required for the last five years. The routes were assigned working capital in proportion to their respective investments in physical property. The total value of all property in Massachusetts having been determined, the revenue requirements were figured, as shown in Table III. To the variable expenses for the fiscal year 1914,

TABLE III.—STATEMENT OF GROSS EARNINGS NECESSARY TO MEET THE PRESENT OPERATING EXPENSES AND PROVIDE FOR DEPRECIATION AND A 7 PER CENT RETURN ON THE INVESTMENT COST

Investment cost, total Massachusetts property.....	\$42,211,810
Working capital assignable to Massachusetts property.....	1,423,555
Total	\$43,635,365
Revenue Requirements for Massachusetts Property	
Variable expenses year ended June 30, 1914:	
Maintenance of way and structure.....	\$783,906
Maintenance of equipment.....	768,887
Traffic	58,353
Conducting transportation	3,381,835
General and miscellaneous.....	1,000,524
	\$5,993,505
Taxes	604,875
Amount needed for depreciation in addition to present maintenance charges	1,054,386
Interest on \$43,635,365 at 7 per cent.....	3,054,476
Total revenue needed.....	\$10,707,242
Total revenue year ended June 30, 1914.....	9,092,077
Additional revenue needed.....	\$1,615,165
Amount needed as per cent of passenger revenue....	18.73

including taxes, there were added the amount needed for depreciation and an amount equal to 7 per cent return on the investment cost. The results showed revenue requirements of \$10,707,242, or \$1,615,165 more revenue than was actually received.

DETERMINING THE COST OF SERVICE

A study of the routes operated indicated that the average cost of the service as a whole, per car-mile, or on any other basis, could not be applied to any city, town or section and fairly be considered as representing the cost of service in that city, town or section. The necessity of ascertaining as accurately as possible the cost of service on each route was therefore apparent. This requires localizing the variable expenses to the several routes, or, if this is impossible, apportioning them upon an equitable basis.

The books and records of the company showed that it was possible, by reference to the detailed records of labor, material and other expenses from which the general accounts were compiled, to localize practically all of the expenses except general, miscellaneous and other overhead items to the sixteen operating divisions. The revenues and variable expenses in the fiscal year 1914 were selected as representing present conditions, although these conditions have been modified by the recent

wage arbitration, which has materially increased the cost of operation.

The rule generally followed in selecting the unit of apportionment was to choose for expenses varying with the volume of traffic, a traffic unit such as the car-mile or car-hour; for expenses not affected by the volume of traffic, a stationary unit such as the track-mile. It was therefore necessary to consider each account separately and select the unit having the closest relation to the expense included. The track-mile and the car-mile were selected for the apportionment of maintenance of way and structures expenses. In apportioning the expenses for rails, rail fastenings, ballast, ties, special work and track labor, the influence of traffic volume, weather conditions, length of line and other factors were taken into account according to the best available judgment. The line-mile was selected as the unit for the apportionment of electric line expense for all accounts except track bonding, overhead trolley and those included in power cost. The expense of track bonding and overhead trolley varying more closely with the volume of traffic, the car-mile was used.

The expenses in connection with buildings and structures not included in power cost or pro-rated to other accounts were apportioned as follows: Carhouses, stations, waiting rooms and platforms on the basis of revenue passengers carried. Maintenance of equipment was in general figured on the car-mile basis, with the exception of expense of miscellaneous equipment, which was considered as an overhead charge. Traffic accounts were apportioned on the revenue passenger basis. For apportionment of power expenses two units, designated weighted feeder car-mile and weighted car-mile, were made up, considering the cost of power in districts and principal factors bearing upon it. Transportation expenses were apportioned in part on a car-hour and in part on a car-mile basis, the latter mainly covering supplies. Injuries and damages were apportioned on the revenue passenger basis. All overhead costs, such as superintendence and miscellaneous expense, were duly apportioned and pro-rated. The revenue was also apportioned by routes.

It is believed that these methods enabled the fair cost of service on each route to be determined, including depreciation, maintenance and operating expenses as variable costs, taxes and interest and working capital. The total of these items less the revenue gave the surplus or deficit shown by routes among the exhibits filed with the report. The total charges for the territory north and south of Boston were \$10,250,571, and the revenues \$8,623,783, leaving a total deficit of \$1,626,788. By the scheme of localization worked out, however, each division bore the cost of its own service and was not affected by conditions that might tend to increase or diminish the cost in other divisions or localities.

Parcel Carrying on Street Railways in Lancashire, England

The receipts recorded by the parcel-handling department of the street railways of Lancaster, England, during the past year were \$67,500, yielding a net profit of \$18,000. The average number of parcels handled each week approximated 24,000. The expense of delivery by horse and wagon approximated \$4,500 with a maintenance and depreciation charge of \$900, and in consequence, an experiment is under consideration whereby electric battery trucks are to be used in place of the horse-drawn vehicles. Street railway fares of messengers connected with the service amounted to about \$200, while general salaries and wages of the department amounted to \$35,000 for the year.

1200-Volt Steam Railway Electrification in Lancashire, England

Five-Car Units are Expected to Be in Operation Between Manchester and Bury by the End of December

It is expected that by the end of December the 1200-volt electrification between Manchester and Bury on the Lancashire & Yorkshire Railway will be in operation. Some of the general features of this important project were described in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 24, 1915, page 154. Additional details have since become available and some of these are given herewith. The accompanying drawings, which are self-explanatory, show the construction of the contact shoe and the method of mounting and electrically connecting it with the wiring system. The method of mounting and inclosing the contact rail was fully described in the article referred to.

The rolling stock for use on this section is under construction in the company's shops. Each unit will be a five-car train consisting of three motor cars and two trailers. The cars are of all-steel construction, and the motor cars are being equipped with four 200-hp. motors each.

While the line now being equipped comprises only about 20 miles of single track it is the first stage in a general electrification scheme for the Manchester district, and the power house is being built with capacity for the future. Two 5000-kw. turbo-alternator sets have been installed to generate three-phase current at 6600 volts. There is also an auxiliary 500-kw. three-phase set.

An interesting feature of the station is the provision for coal supply by gravity, the difference of 35 ft. in level between the neighboring railroad track and the boiler-room floor being utilized to the best possible advantage. The boiler house has been laid out on the unit system, two boilers, two economizers placed directly over the boilers, one induced draft fan, and one chimney forming a unit. Two substations will be used at present, each of these containing three 1000-kw. rotary converters.

As previously stated this electrification has been carried out under the direction of J. A. F. Aspinall, general manager of the Lancashire & Yorkshire Railway. George Hughes is chief mechanical engineer of the road and A. Lund has acted as resident engineer.

Concrete Waiting Platforms in Los Angeles

The Los Angeles Railway has recently installed about fifty waiting platforms similar to that shown in the accompanying illustration. These are located on Santa Barbara Avenue, Los Angeles, on the "near" side of street intersections, and they are about 25 ft. long, 4 ft. wide and 8 in. thick. The concrete platforms, which are virtually short stretches of sidewalk, are inexpensive, and they serve to keep the pedestrians off the roadway

CONCRETE WAITING PLATFORM IN LOS ANGELES

on either side of the track. The platforms are located about 3 ft. from the tracks, so that it is impossible for those waiting upon them to be struck by the car steps.

The residents in this section desired waiting stations of some kind, but it was not found practicable to build waiting rooms on account of lack of space, aside from the expense.

The *Journal-Gazette* of Fort Wayne, Ind., conducts a traction column, in which the news items of the Fort Wayne & Northern Indiana Traction Company, the Ohio Electric Railway and other interurban lines entering the city are summarized in an attractive manner. Special attention is paid to the personalities in charge of the work of the companies.

LANCASHIRE & YORKSHIRE RAILWAY ELECTRIFICATION—DETAILS OF CONTACT DEVICE; CABLE MOUNTING, SHOE AND PROTECTED CONTACT RAIL

COMMUNICATIONS

Major-General Bancroft Thinks Electric Lines Along Shore Useful in Moving Troops and Supplies

BOSTON ELEVATED RAILWAY

BOSTON, MASS., Nov. 24, 1915.

To the Editors:

I have read the article on "Preparedness in Transportation," in the JOURNAL of Nov. 22, and I agree with you that all methods of transportation should be ascertained by the Government and plans laid to utilize them. This would include, of course, electric railways.

I suppose that on our eastern coast from Maine to Virginia there are lines which could be utilized to move troops and supplies for comparatively short distances, yet far enough for the purpose, up and down the coast. For comparatively short distances also, there are, of course, lines running a few miles distant from the coast, which might be utilized to some extent. I suppose, too, that in some parts of the country there are interurban lines which could move troops for a considerable distance.

I am not informed that if it were desired to move troops from the Middle West to the coast, east, south or west, it would be feasible so to do by trolley. That is, the lines are comparatively short, and the accommodations, if for anything more than a few hours' ride, with exceptional cases, are unsuitable. In other words, while advantage should be taken of all the country's resources, it seems to me, without making a thorough study, that the resources of the trolley for any considerable movement of troops would either be unimportant or inadequate. This, of course, is only first blush opinion and I should be glad if wrong.

I should suppose that one of the things the Government would do would be to make a careful study of the street railways of the country, and assign to them such tasks as were feasible of performance. The Government ought to recognize your public spirited suggestion, and I have no doubt will. I should think that in some way, perhaps through the American Electric Railway Association, your suggestion ought to be brought to the attention of the War Department.

WILLIAM A. BANCROFT, President.

Irresponsible Railway Training Schools

SIOUX FALLS TRACTION SYSTEM

SIOUX FALLS, S. D., Nov. 27, 1915.

To the Editors:

Within the last few months we have repeatedly had our attention called to a form of imposition which is being practised on prospective railway employees, and although operating companies are not directly concerned an effort should be made to remedy the evil. We refer to correspondence schools of railway training, which for sums varying from \$18 to \$25 send a course of instruction. Upon the completion of the courses, which require from two to six weeks, these schools issue attractive diplomas embossed with a gold seal and then refer the graduates to the nearest electric road with the assurance of employment.

During the past six months we have had a number of applicants from different portions of the State who were equipped with diplomas, some coming here in person and others forwarding written applications accompanied by photograph. Within the past two days we have had two personal applications, one from a training school at Kansas City and the other from St. Louis. One

man paid \$25 and completed the course in two weeks, the other paid \$18 and finished in six weeks. Neither of these men had personalities to recommend them as street car operators. Neither had ever had any street car experience, and they were not the class of men we want. I doubt if there is a road in the country that would have considered them for a minute. Both men had been guaranteed employment by the school upon completing its course.

It is apparent that these so-called schools are very keen for business. They buy advertising space in certain magazines regularly and evidently they find plenty of suckers. The legitimate correspondence school may be all right, but the schools that take every Tom, Dick and Harry, get their money, send a diploma and guarantee a job are certainly working a fraud on the public, and their methods should be exposed.

R. C. MILLS, Superintendent.

The Automobile and Hard Times

DENVER, COL., Nov. 22, 1915.

To the Editors:

I have read with interest the editorial entitled "Competition from Private Automobiles" in your issue of Nov. 6. In some communities the competition is felt more severely than in others. Good roads and mild climate are great factors. The smaller cities and towns have felt the competition more keenly than the larger cities.

At present the country districts of the United States afford the greatest field for the increased use of the auto, and here will be the scene of greatest development during the next few years.

Street and interurban railways have not been the only sufferers from the increased sale and use of the automobile. Steam railways have felt it, but in a broader sense. Nearly every industry or enterprise not directly or indirectly connected with the automobile industry has suffered, and I believe that the tremendously rapid growth of this great business has had more to do in bringing hard times to the United States than the European war.

According to estimates made by the *Scientific American* in June, 1915, there were in use in the United States 2,000,000 automobiles. Their annual cost of operation was placed at \$730,000,000. Add to this the selling price of the year's output of new cars, viz: \$450,000,000, and the sum of \$1,180,000,000 results. This tremendous sum is not a permanent investment. On the contrary, it represents wealth put into one of the most rapidly depreciating devices that transportation has ever developed. Rubber tires, gasoline, machine and all are gone or worn out within a comparatively short time. If the cost of building and maintaining garages, the cost of damages resulting from accidents and the expense due to the wear and tear of roads and pavement were added to the above expenditure, the grand total would look like a war debt.

According to the last census there were in the United States proper 92,000,000 people. This, divided into \$1,180,000,000, shows a present annual expense of approximately \$13 per capita, and this amount is increasing rapidly.

A very large percentage of the families owning and using automobiles have certain fixed incomes within which they must live. The auto has proved a new and additional source of expense, and to offset this economies and curtailments have been necessary in other directions. Men buy caps or cheaper hats and inferior clothes, as a good suit gets ruined more quickly apparently in an auto than a cheaper one. Likewise the

women wear auto veils and cloaks and get along without so many good hats or dresses. The members of the family cut out the porterhouse steak and eat deviled-ham sandwiches out under a tree or bean soup at home. They spend their vacations on near-by country roads instead of taking a trip on the train. Evenings are spent riding around instead of going to the theater. We might go all along the line, and practically every business man will tell you that he has felt the pinch of hard times, and almost invariably this pinch can be traced to the use of the automobile.

The automobile has come to stay. It will be cheapened and continually perfected. Its life and service will be lengthened and its use will become well-nigh universal. To fail to recognize this is most shortsighted, as it takes no prophet to foretell these conditions, which are virtually upon us now.

The burning question is, what is it going to do to the railway? My firm belief is that in most communities the railway will be as necessary as ever. The volume of business and conditions of traffic may change. These conditions must be met, how, no one at present can say; probably in different ways under various circumstances in different places.

Taxation must be equalized. One form of transportation must not be required to build and maintain its own substantial roadbed and also an additional roadway for its competitor to use practically free. I mean that the street railway that lays its rails for its own use and then paves the street around them for the use of the auto, must be relieved, and that the auto must bear its just share of such taxation.

JOHN A. BEELER.

Pavement Sand Cushion Becoming Obsolete

MINNEAPOLIS STREET RAILWAY COMPANY

MINNEAPOLIS, MINN., Nov. 24, 1915.

To the Editors:

Replying to your editorial on the use of a mortar cushion instead of sand for paving, the writer has not experienced any difficulty with a sand foundation under granite blocks or brick laid in or between street railway tracks. It has been our custom to grout both these types of paving, but we do not think a mortar cushion is necessary with these pavements. In the case of wooden blocks, however, it is desirable. We have used a mortar cushion to some extent with this type of construction and we have obtained better results than with a sand cushion.

There is a small additional expense in using the mortar cushion but, if it preserves the surface of the pavement, the money will be well spent. Pavements, to hold up under heavy traffic, must be built as permanently as practical, and the use of mortar for a cushion will be a help in this direction.

GEORGE L. WILSON,

Engineer Maintenance of Way.

PHILADELPHIA, PA., Nov. 10, 1915.

To the Editors:

Referring to your editorial in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30 entitled "Pavement Sand Cushion Becoming Obsolete," there has been laid in Philadelphia during the past ten years a considerable amount of both granite block and brick pavement on a dry mixture of sand and cement. This mixture was usually in the proportion of four parts sand to one part cement, spread to a depth of from 2 in. to 4 in. The former depth in case of granite block supported by a sub-base of concrete. After the blocks or bricks had been rammed or rolled the pavement was thoroughly flushed

with a hose and protected from travel for a period of from three to four days. The joints between the bricks were then filled with fine dry sand.

Before trying this experiment it was thought that while this construction would permit of the removal of the bricks or blocks without breaking them, the sand-cement base would hold them firmly enough to prevent displacement by traffic. It was also believed that the sand joint would, to a great extent, prevent upheaval of brick pavement by expansion. Results during the last ten years seem to have abundantly demonstrated the efficiency of this type of foundation. The sand-cement concrete, particularly in the case of brick pavement, prevents access of water to the earth sub-base and when bricks have been removed for any purpose they can easily be replaced to the level of adjoining pavement. Brick pavement laid in this manner—that is, on an earth or gravel sub-base, was tried only on streets where travel was comparatively light. On heavily-traveled streets in the business section a concrete sub-base was provided. The cost for maintenance of this type of paving has been very small, and it is perhaps unnecessary to say that it can be laid quite cheaply and very rapidly.

H. B. NICHOLS.

Standardization of Railway Substations

SAN FRANCISCO, CAL., Nov. 26, 1915.

To the Editors:

Recent communications in your columns under the subject of "Cars at Less Than Cost" will serve to introduce another subject, that of railway substations. Having been concerned in the design and construction of this class of structure, I wish to draw attention to a profitable field for discussion in connection therewith.

The letters referred to bring out the idea that there is insufficient standardization in electric railway car manufacture because of the great variety in the demands made on the car builders by the railway companies, comparing unfavorably with the automobile industry, in which one design of automobile will serve for several thousand different customers. If this line of analysis be applied to the subject of railway substations, we will find the conditions still worse. In spite of my general approval of the policy of standardization, I must admit that the difficulties in getting a standard design of substation adopted appear greater than in the case of a standard passenger car. The latter must always run on two rails nearly the same distance apart, but the building may be located in an endless variety of conditions.

Why do we want a standard substation? Is it to save the railway companies the cost of preparing designs and specifications every time they want a new station or a number of them? Such a saving is well and good, but I believe a much greater one can be effected if a standard, or a series of standards, can be agreed upon, as I will explain directly.

Why a series? For this reason: A standard, inflexible design for a substation is something like a standard design for a residence. To build up a town of a lot of residences all exactly alike is, in general, not at all desirable, and absolute uniformity in substations is not practicable. We must compromise.

At the recent convention of the A. E. R. E. A. there was presented for the consideration of the convention a "Study for Standard Fireproof Substation Buildings of About 1000-kw. Capacity," the sub-committee stating "it is their earnest desire that a full discussion be given same on the floor of the convention in order that suggestions may be made for the guidance of future committees, as your committee recommends that this sub-

ject be considered again next year." Unfortunately there was not time for the full discussion which the subject deserved, and it appears to me that the columns of the *ELECTRIC RAILWAY JOURNAL* offer a suitable medium for bringing out further suggestions. I will, therefore, offer some remarks to start the matter.

A large saving to the railway companies could be made if the association should carefully draw up, say, two or three alternative standards, each of which should be carefully designed in connection with the standard sizes of metal forms for concrete now on the market. Then by having sets of these forms placed at convenient centers of distribution, a company desiring to build substations need only go to the nearest distribution point, procure a set of forms for itself or its contractor, and return them after using. By doing so it would at once eliminate all the cost of form lumber and days and days of sawing and nailing in producing an elaborate wooden structure which will be ruthlessly destroyed the minute the concrete has set and seasoned sufficiently. The design submitted shows brick walls, but I believe concrete, under the conditions just described, will be found preferable in a great many cases. I express this opinion as an independent engineer having no connection with cement interests.

Now to the difficulties of fixing upon a uniform design:

1. The degree of spaciousness which is economically permissible is a function of real estate values. The maximum desirable is a matter of judgment. The minimum possible can be found in portable substations, having a few inches around the machine, and walls and roof which are lifted off by a crane when extensive repairs to the machine are necessary. But neither generating stations on cars nor generating stations on ships should be taken as a guide in designing stations on terra firma. Because it is possible to exist under extremely irksome conditions is no reason for imposing them when they are avoidable.

The design submitted to the convention is quite a way above the minimum possible, but in my opinion not quite far enough.

Again, the design shows a residence and station in the same building. Now such a combination would commonly be constructed in a country town or village where real estate is relatively cheap, but where the operators would scarcely be in position to own their homes, for various reasons. In such a case we could afford to put some of the saving in real estate cost into a little more cubical capacity, affording space for disassembled parts on the floor and for working around in making repairs without knocking against apparatus on the switchboard, etc.; also providing a bathroom in the residence part, which should always be done if possible. It is possible for people to live in cramped, inconvenient quarters, but they do it at the expense of greater loss of energy and irritation of temper, reducing their general efficiency.

A cramped design may be necessitated by high real estate values in a city, but I think in this case the residence combination will usually not be required. Therefore in each case, city and village, the design submitted is not suitable.

2. The design assumes certain conditions. But there are other conditions which may be held to just as tenaciously. In some places, with some companies, motor-generator sets will be used instead of the rotary converters shown and will take up greater length on the floor. In some places provision for extension on the unit system must be made, not to speak of having floor space for installing a third machine without having to extend the building. In some places concrete walls will be preferable, in others brick. In slum districts the

plainest possible structure will suffice; in wealthy residential quarters the cultivation of a favorable public opinion demands a building harmonizing with the surrounding mansions in architectural merit. In some places no residence will be wanted in the building.

To meet these various conditions, why should not the association get up two or three alternative designs (which should themselves be susceptible of ready modification when necessary), making them to suit standard metal forms and standard form lumber, making the window and door frames to suit accepted mill standards, or metal frame standards; work up complete working drawings, with bills of material, tabulation of concrete reinforcement required, list of standard forms and drawings showing how the forms should be put together, and place all this matter at the disposal of the railway companies at a cost sufficient to cover the expense? Before again presenting the matter, let them make a thorough canvass of existing substations, learning the local conditions and obtaining opinions regarding the suitability of the adopted designs as regards convenience and degree of spaciousness, etc.

This is the kind of work which helps to make the association appreciated.

H. J. KENNEDY,

Electrical, Mechanical and Construction Engineer.

What Is the Rail Head ?

ROBERT W. HUNT & COMPANY, ENGINEERS

CHICAGO, ILL., Nov. 23, 1915.

To the Editors:

Mr. Haas is to be commended for his excellent analysis of the practice of making rail renewals, published in your issue of July 31, 1915. The subject is a broad one, but the problem is constantly arising and requires careful study, for the reasons so admirably pointed out. There are, however, some phases of the subject which should be firmly fixed at the outset and even prior to a too general adoption of any precise practice. A very important matter in this connection is the determination of what actually constitutes the head of a rail, and this was commented upon in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13, 1915.

There seems to be no good reason why the same definition for the rail head should not apply to rails of all sections and be that which has been used for years by the users of all types of standard section rails. As already pointed out, practice has always defined the rail head as being that area lying above the intersection of extensions drawn from the top angle-bar lines. While objections to this may be offered from the standpoint of grooved girder rails, it seems best to the writer to let this time-honored definition stand but to subdivide, by further definition, the head into, say, the lip and the bearing. This is, no doubt, work for the way committee of the American Electric Railway Engineering Association.

The best time to make renewals in general is, after all, perhaps largely a matter of individual opinion. While certain conclusions may be reached by calculation, the old question of the engineer's prerogative will probably still enter and be the deciding vote in any case. With so simple a thing as a steam railroad standard section rail, the limits of wear have never been fixed with anything resembling certainty, or even consensus of opinion. One has but to look at the profile of rails on curves and in yards to realize this fact. But, of course, with electric railway track in paved streets an entirely different problem is presented, and one for which, no doubt, some formula may be devised to indicate closely the desired facts.

C. W. GENNET, JR., Engineer.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

A., E. & C. Semicircular Brass Experience

BY W. J. BOWMAN, MASTER MECHANIC AURORA, ELGIN & CHICAGO RAILROAD, WHEATON, ILL.

The use of high rates of acceleration and excessive braking pressures on the Aurora, Elgin & Chicago Railroad caused unequal wear on the babbitt linings of M. C. B. brasses. This inequality of wear was directly due to the tilting of the brasses which rolled the babbitt from the bearings and reduced the average life to 12,000 miles. To meet this condition a semicircular brass, the design of which is shown in the accompanying illustration, was adopted. This provided a bearing area when the brakes were set, twice as large as the standard M. C. B. brass for a 5-in. x 9-in. axle. These new brasses have now been in service for one and one-half years and average approximately 95,000 miles between babbitting periods. Prior to their use it was customary to rebabbitt every other day from fifteen to twenty-five M. C. B. brasses for the fifty-nine cars. Rebabbitting is now done once a month, at which time from twenty-five to thirty bearings are handled. Babbitt metal costing 45 cents per pound was used with the original M. C. B. brasses in an effort to produce good results, but it failed. With the semicircular brasses an

SEMICIRCULAR JOURNAL BRASS

antimony and lead base metal costing 13 cents per pound is used and the extraordinary results are obtained.

Aside from the practical elimination of hot bearings, journal oil cost has been reduced from 29 cents per 1000 car-miles to 16 cents per 1000 car-miles. The M. C. B. brass for 5 1/2-in. x 10-in. axles weighed 25 lb., whereas the semicircular brass for the same axle weighed 29 lb. At the time the change was made to the semicircular brass it cost \$5.49 per bearing as compared with \$4.70 for the M. C. B. brass. As the present service records indicate, however, the increased first cost was more than offset by the increased mileage and the decreased cost of labor and material. The total number of hot bearings during twelve months in 1913 was 191. During the same period in 1914 the number of hot bearings

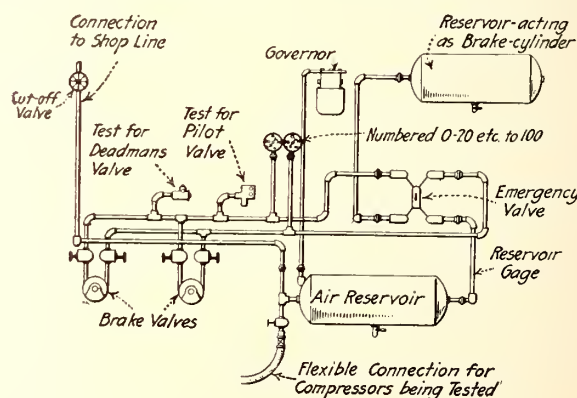

was reduced to seventy-six, and for ten months of 1915 the records show only four. The majority of the hot bearings in 1914 occurred during the months of January, February, March and April, when the change was in progress. With the present system of inspection and repacking on a mileage basis, and the reclaiming of oil and waste, hot bearings of all kinds have practically been eliminated.

Outfit for Testing Air-Brake Apparatus

BY R. H. PARSONS, ELECTRICAL FOREMAN

The following description covers a practical and simple equipment for testing all parts of straight and automatic air-brake equipment which are ordinarily taken care of in one place. Repairs to compressors, cylinders, brake valves, reservoirs, emergency valves, "dead-man's valves," etc., are usually done together, and this testing outfit was built to take care of such repairs. Gages, governors, etc., are repaired in other departments and must be tested locally after repair.

Referring to the accompanying illustrations the following points will be noted. The testing equipment is mounted on or near a bench, which is 10 ft. long, 2 1/2 ft. wide and of convenient height. The bench consists of an angle-iron frame on which is a plank top covered with No. 16 galvanized iron. This makes a substantial

BRAKE-TESTING APPARATUS—PIPE LAYOUT FOR AIR-BRAKE TESTING BENCH

foundation for the apparatus and provides room for making light repairs shown by tests to be necessary.

Under the bench is hung a reservoir similar to those used on the cars, and at one end are attached strap iron hangers to support the piping and connections for two brake valves. Two connections are provided because frequently two types of valves are used, each of which requires its own pipe connection. Cut-off cocks are provided, as only one valve is in use at a time.

At the left-hand end, on top of the bench, connections are provided for the dead-man's valve and these may also be used for the conductor's emergency valve. Near this connection is another tap in the line which is used in testing the pilot valves for leakage only. The functioning test of the pilot valve is made in connection with the testing of the emergency valve by another means in

order to facilitate connections. For this purpose a $\frac{1}{8}$ -in. pet-cock is coupled to the dead-man's valve at the point where the pilot valve is regularly connected. This can be easily opened and closed and the same results as would occur in practice can be obtained.

Above the bench, within easy reach of the operator, is placed a connection board on which the following pieces of apparatus are located: An electrical switch for controlling the test circuit; a governor; an electrical switch for the compressor circuit; a small ammeter, and two gages. The first switch mentioned is an ordinary 600-volt, quick-break switch. To it is connected a set

until the governor cuts it out of circuit, and the governor action is repeatedly tested by reducing the reservoir pressure by means of the bleeding cock beneath the reservoir or by reducing the air pressure by using air for testing purposes elsewhere in the outfit.

In the same manner the functioning of all other parts of equipment may be tested under normal conditions. The brake-valve test is particularly effective as the use of a reservoir in place of the brake cylinder provides a perfectly tight receptacle and the gage connected to the brake line quickly shows leakiness of a valve. The emergency valve test is also effective, as its operation

of test wires in series with which are a number of heaters furnishing resistance sufficient to hold the current to a few amperes. This circuit is used to test the compressor fields and armatures for grounds, and the leads are long enough to reach any reasonable distance to the compressor. The air-compressor switch, governor and ammeter are used for testing the compressor after repairs by putting upon it a load approximating operating conditions as nearly as possible. The governor is connected in series with this circuit, which also contains a low-range ammeter. The reading of the ammeter shows the operator whether or not the compressor is running freely or is handicapped by tight bearings or improper connections in the armature or field circuits. The operator is informed as to the proper current for each type of compressor and therefore knows at a glance when it is operating properly.

The gages on the instrument board are connected respectively in the brake line and the reservoir line.

At some convenient point is placed a small reservoir which is used as a substitute for a brake cylinder. The use of this prevents the banging and pounding which would otherwise follow the throwing of a valve into emergency position. At the same time a result equivalent to the making of a brake application is obtained.

At one end of the main reservoir there is a T-connection, one leg of which is attached to a hose running to the compressor under test. The other leg is connected to the shop air line so that pressure can be maintained for testing if no individual compressor is available.

The piping layout is shown in an accompanying illustration.

In testing a compressor the air and electrical connections are made to the testing outfit and the compressor is timed for speed and examined for commutation under load, the reading of the ammeter being noted at the same time. The compressor is allowed to pump air

can be shown as well under test conditions as if it were actually on the car.

The testing outfit can be further used for testing repaired reservoirs or brake cylinders by connecting the compressor hose to the reservoir or brake cylinder and letting in air from the shop line. A slight modification would provide for the testing of safety valves.

The need for some such testing equipment as has been described above is almost self-evident. The ordinary, original straight air-brake equipment required a certain amount of attention and its share of overhauling. After repairs were made a few simple but necessary tests were in order. Repairs for such equipment were oftener made on the car than at the bench. After the work was completed the car was tested to determine the effectiveness of the repairs. This method of procedure, while passable, was not entirely satisfactory.

As the air-brake equipment was improved the number of parts increased and the number of functions performed by the equipment grew. It thus became impracticable to make satisfactory repairs without removing the equipment from the car. While straight-air equipment is nearly standard for surface cars, the semi-automatic is supplanting it to a great extent on account of its flexibility and simplicity, even where single cars only are used. The maintenance of this equipment demands more care and attention than the straight-air equipment, and repairs and overhauling should be attended to at a bench where the parts can be placed and held in easily accessible positions, and repaired, cleaned, lubricated and tested.

The Orleans, Toulouse, Lyons Railway, formerly a high tension a.c. suburban electric line at Lyons, France, has decided to abandon this system and return to the d.c. system. One of the lines from Miribel to Lyons has already been converted.

Rail Bond Testing—I—Methods Used in Testing

BY H. H. FEBREY, ENGINEER AMERICAN STEEL & WIRE COMPANY, FORMERLY ASSISTANT ENGINEER PENNSYLVANIA TUNNEL & TERMINAL RAILWAY

Bond testing falls short of its proper function when it is conducted only for the purpose of locating high-resistance joints so that repairs can be made. It is frequently argued that the expense of testing is unwarranted, but when conducted in a thoroughly analytical way testing can be made to lead to economies quite commensurate with its cost. Without systematic bond testing there is sure to be lack of knowledge of true conditions and this results in a continuation of wrong practices in matters of selection and installation of the bonds. More real attention to testing would reduce the number of poor installations. This may be seen on lines where extensions are made from time to time. Certain practices become more or less standardized and are used for years, and each year it may be found that a large quantity of bonds are required for general maintenance. Instead of regarding this as a matter of course, the rate of depreciation should be established by testing, and the percentage of failures noted. When it is considered that there are installations where the failures amount to a very small fraction of 1 per cent per year it is obvious that there is room for investigation where the annual replacements amount to much more than that, as is frequently the case. The reasons for bond failures are easily determined, and it can be ascertained by testing whether the installation or the design is faulty.

Suppose that a line is bonded so that a majority of the bonds, a few months after installation, are of low efficiency, i.e., the resistance of a perfect bond to the actual resistance is low. It may be so although it is not necessarily of prohibitive resistance. For the sake of argument, assume that it is not known that the

It cannot be claimed that more attention to tests would make the poorly-installed bonds good, but if it were known that they were deteriorating before the voltage was seriously affected the same errors on subsequent work could be corrected. Or it would be quite practical with certain types of bonds to improve their contacts without removing them, if this was done before corrosion had set in.

It is not necessary to wait for high resistance to develop. Observation by periodical and systematic testing will enable one to determine the quality of workmanship at the time of installation and the rate of depreciation thereafter. Knowing that the resistance of the bonds is increasing from year to year, the causes will be sought and determined and the incorrect practices discontinued.

A rail joint may be tested by reading the drop across the joint and calculating the resistance from the drop. This is practicable only when the current producing the drop is known. The other, and usual method, is to compare the drop across the joint with that in a certain length of solid rail adjacent to it. This comparison is made by means of portable testing sets, which operate on the principal of the Wheatstone bridge. Where the bond testing car is used the method is also comparative, as will be explained.

The total resistance of the bonds in a section of track can be ascertained by making the drop test of the entire section between selected points. The total resistance is calculated from this drop and the total bond resistance can be found by deducting the resistance of the total length of uncut rail. It can be determined then whether or not the resistance of the bonds is higher than it should be. The method of procedure in making a test of this kind is to use a telephone wire or spare feeder as one voltmeter lead, and to connect one end of it to the track at the distant point. It is connected to all bonded rails that are cross-bonded, and the other end is connected to either voltmeter terminal. The other voltmeter terminal is connected to the negative bus in the station or to the tracks. By reading the drop and the current flowing in the section under test, at the same time, the total resistance of the negative circuit can be ascertained. To the calculated resistance of the solid rail should be added the resistance of the negative feeders which lead to the station, and parallel negative

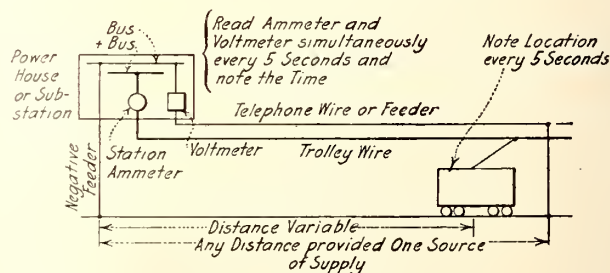

BOND TESTING—MEASURING RESISTANCE OF A SECTION OF TRACK

BOND TESTING—MEASURING RESISTANCE OF TRACK FROM POWER HOUSE OR SUBSTATION

efficiency is low. The bonds, being improperly installed or of incorrect design, will deteriorate and will later reach a point where their resistance becomes detrimental to the service. It may be three or four years before they reach a point where they are noticeably bad without testing and in that time additions to the line may have been made. Through ignorance of conditions the same bonding practice is adhered to and trouble develops on many parts of the system. This may happen, although a test of the system has been conducted shortly after installation, because the joints may have tested to within a certain limit arbitrarily chosen.

BOND TESTING—CONNECTIONS FOR USE OF BOND TESTING CAR

feeders should be taken into account. To determine the resistance of the solid rail the number of rail joints should be ascertained and the total length of rail which is cut out by the bonds should be deducted from the total length of rail in the track. If the rails are 30 ft. long and the distance between the bond terminals is 3 ft., there will remain 27 ft. of solid rail in each rail length.

This is a quick means of determining the approximate total resistance of the bonds, but it will not locate the defective bonds, which must be done by testing each joint. The method here described does not give an ac-

curate measurement of the track resistance, on account of the leakage of current to the earth. This results in a smaller drop than would be read during test if there was no current leakage to earth, and therefore indicates that the track resistance is lower than it actually is. On the other hand, such a test is of value if it shows a relatively high resistance. It is best to conduct a test of this kind on short sections, such as a mile or less.

The bond-testing car is equipped with a low-voltage generator with brush contacts on the rails through

This is a very flexible method and by the use of properly calibrated resistances the measurements on the solid rail can be multiplied as desired, thus eliminating the necessity of awkwardly long measurements.

There are other testers which have three contact points at fixed distances apart. By varying resistances in the instrument the drop across the joint is made to equal the drop in the solid rail. The resistances are calibrated to read directly in rail feet. These do not read as close as the movable-point testers but are suffi-

BOND TESTING—CONNECTIONS FOR TWO-MILLIVOLTMETER METHOD; CONNECTIONS FOR A. S. & W. CO. TESTER; CONNECTIONS FOR WESTON TESTER

which current can be sent through the rails at all times for the test. There are two additional brush contacts for each rail, generally spaced 4 ft. apart, which are connected to the terminals of two millivoltmeters. The millivoltmeters record the drop in the 4 ft. of rail on a special paper roll which moves with the car. The drop in the 4 ft. of solid rail is practically constant and makes a straight line on the paper. When the contacts span the rail joint the drop at the joint is recorded and compared with the drop in the solid rail. The paper is graduated with horizontal lines which represent the number of millivolts deflection of the meter needle. The drop around the joint being generally higher than in the same length of solid rail, is shown, in general, on the chart above the line indicating the drop in the solid rail.

The portable bond testers are mostly arranged so as to read the number of feet of solid rail to which the joint is equivalent. They give very accurate results. Their principle can be explained best by reference to the two-millivoltmeter method. Two points are selected which include the bond terminals between them, and these are connected to the terminals of a millivoltmeter, which shows the drop across the joint. A second millivoltmeter is connected to two points on the rail adjacent to the joint which will register the same drop as that across the joint. The two drops being equal with the same current flowing the resistances must be equal, and all that is necessary is to measure the distance between the points on the uncut rail. This designates the number of feet of rail equivalent to the joint resistance. The two-millivoltmeter method is not used to any great extent because it is cumbersome, and the chances of error in reading both meters at the same time, especially when the current is variable, are considerable.

Another method which is essentially like the two-millivoltmeter scheme involves the use of a differential millivoltmeter. By using two fixed points which span the rail joint and moving a third point until a balance is obtained the resistance of the joint is determined by measuring the length of uncut rail required to make the balance. The drop in the circuit including the rail joint is reduced by the drop in the circuit, including the solid rail adjacent to the joint. When all three points are in contact the indication of the meter needle is the difference between the two drops. It is obvious that when the drops are equal the deflection is zero. This is the most accurate method to use because the resistance can be measured in terms of a fraction of an inch of the rail. By raising and lowering the movable point the correctness of the balance is well established.

ciently accurate for average use. They have the advantage of being readily handled by a single operator and are consequently more popular.

It can be seen from the foregoing descriptions that all bond testers obtain the resistance of the joints in terms of rail feet. Testing is necessarily comparative under average conditions. After obtaining the reading in feet of rail it is an easy matter to determine the ohmic resistance from data pertaining to the resistances of various rails.

Detroit Center-Entrance Trailers

BY C. L. KELLER, ASSISTANT MASTER MECHANIC,
DETROIT (MICH.) UNITED RAILWAY

Detroit (Mich.) United Railway patrons are now being given an opportunity to judge the merits of center-entrance trail cars, as the first cars shipped on an order of fifty equipments of this type were delivered recently by the G. C. Kuhlman Car Company, Cleveland, Ohio, and were immediately placed in service.

While it is not possible, at this early date, to gage the general sentiment of the public concerning this innovation, it is anticipated that the increased efficiency of service will bring public approval and that this will repay the company for its thorough study of existing types of trail cars, and the conditions governing their operation, which was made prior to placing the order for the new cars.

The general dimensions of the trail cars are as follows:

Length over all.....	46 ft. 8 3/4 in.
Width.....	8 ft. 2 in.
Car floor above rail.....	27 1/2 in.
Side sill to top of monitor.....	8 ft. 11 1/2 in.
Truck centers.....	28 ft. 0 in.
Wheelbase of trucks.....	4 ft. 4 in.
Weight, without passengers.....	27,275 lb.

All-steel construction was adopted for the new cars. The outside sills are formed of 5-in. x 3 1/2-in. x 3/8-in. angles with the 3 1/2-in. leg in the vertical position. Entrance and exit facilities were provided in one center opening with two sliding doors, and the sill was bent downward to form a support for the step. All sills are continuous from end to end of the car and are riveted to angle buffers of the same size, bent to a radius equal to one-half the car width, the ends of the underframe being further protected by 5-in. anti-climbers. The cross-bearers are of several different sections, depend-

EXTERIOR AND INTERIOR VIEWS OF DETROIT ALL-STEEL TRAIL CAR

ing on load requirements, and a suitable drawbar anchorage is provided at the front end of the car by the two cross-bearers at that point which are made of 3-in. channels spaced 11 in. back to back and covered top and bottom with $\frac{1}{4}$ -in. plates.

The corner posts are composed of two $1\frac{1}{2}$ -in. x 2-in. tees spaced 6 in. apart and covered with a $\frac{3}{32}$ -in. plate from the sill to the roof. Door posts are of similar construction but with a spacing of $10\frac{3}{8}$ -in. between members. The window posts are placed at $29\frac{1}{4}$ in. centers, and are also formed of $1\frac{1}{2}$ -in. x 2-in. tees, slightly offset at the bottom to frame flush with sill angles. Below the belt rail these posts are sheathed with a $\frac{3}{32}$ -in. plate. The belt rail is formed of a Kuhlman standard pressed shape. The top plate is formed of a $3\frac{1}{2}$ -in. x 3-in. x $\frac{5}{16}$ -in. angle and a $1\frac{3}{4}$ -in. x $1\frac{3}{4}$ -in. x $\frac{3}{16}$ -in. angle which are reinforced over the center entrance by the addition of a 2-in. x 2-in. x $\frac{3}{16}$ -in. angle. The roof is of the monitor type, but the monitor extends toward the car ends to afford better ventilation at these points. The hoods are built as units and can be easily removed for repairs.

From the rail to the first step is 13 in. and the step is 5 ft. 8 in. long and 15 in. wide. A post in the center divides the step into an entrance and an exit, each 30 in. wide. The second step is $10\frac{3}{4}$ in. high and is on a level with the loading space, which is of the same width as the entrance. The loading space is $3\frac{3}{4}$ in. below the level of the car floor proper, and this difference in height is taken up by a ramp leading each way from the entrance well. The aisles are 3 ft. 5 in. wide, and the ramps are 6 ft. $9\frac{3}{4}$ in. long. The distance between the longitudinal seats is 4 ft. 5 in.

The entrance and exit doors slide into pockets on each side of the center opening and are operated by the National Pneumatic Company's door engines. Sheet-metal longitudinal seats with $\frac{1}{2}$ -in. felt padding covered with rattan provide for about fifty-six seated passengers, and fifty-six Rico sanitary hand straps have also been provided for the standing load. Natural, quarter-sawn white oak with no headlining was adopted for the interior finish, the absence of a headlining saving weight and reducing first cost as well as maintenance cost. An interior view of the car in one of the accompanying illustrations shows the effect of this kind of a finish. Tomlinson, spearhead, air and electric connecting, radial drawbars are mounted on the front ends of the cars, and other equipment of interest includes Westinghouse semi-automatic air brakes and Peter Smith forced-ventilation hot-air heaters. The car is mounted on Brill trailer trucks of the arch-bar type equipped with 22-in. wheels.

Sioux City Tracks Paved with Concrete

Comparatively few cities or few railway companies have used concrete pavements on so extended a scale as has been done in Sioux City, Iowa. Ten years of service under varying traffic conditions such as would obtain in a city of 50,000 inhabitants, have been so satisfactory as to warrant a more extended use of this type of pavement. In one of the accompanying illustrations is shown 6-in. 72-lb. T-rail track on wooden ties laid in a residential street with a concrete pavement which has been in service more than ten years. Experience with this particular piece of construction has led to some improvements which, it is believed, will increase the serviceability of the concrete pavement. To separate the track allowance from the street pavement, a longitudinal joint extending from the pavement surface to the bottom of the foundation was provided. This was filled with asphaltum and no transverse expansion joints were used.

An examination of this pavement shows that steel wagon wheels following this wide longitudinal joint, have ground off the edges tending to make the joint wider. This damage has been repaired by refilling the joint occasionally with asphaltum. The occurrence of infrequent transverse cracks in the concrete, particularly over the wooden ties, has led to the adoption of transverse expansion joints. In some cases these transverse cracks show considerable wear under vehicular traffic. To retard this form of wear, these cracks and worn spots have been filled with asphaltum. Other defects developed where there was movement in the me-

CONCRETE-PAVED STREET IN SIOUX CITY, IOWA

chanical rail joints. Defects of this kind were not particularly serious and any of several measures could be adopted to overcome them. The welding of the joints offers a solution, as well as the provision of an asphaltum-filled pocket around each joint.

In the transverse and longitudinal track section the construction details are shown. The 6-in. x 7-in. wooden ties are laid at 3-ft. intervals on a 5-in. x 14-in. concrete bearing. These bearings are made integral with a longitudinal prismatic concrete beam, 12 in. wide

TRACK CONSTRUCTION IN CEMENT-PAVED STREET

under the rail and 8 in. wide at the base of the tie. The rails are fitted with $\frac{3}{4}$ -in. tie rods spaced at 5-ft. intervals. The pavement is 6 in. deep and formed of a mixture of 1:2½:4 of cement, sand and crushed Sioux Falls quartzite. Along the gage line of the T-rail the pavement surface is beveled about 30 deg. from the horizontal to meet the under side of the rail head and to form the flangeways. This class of construction requires approximately 315 cu. ft. of concrete per 100 ft. of track.

Rapid Crossing Installation in Cleveland

The accompanying halftone shows a crossing at the intersection of the tracks of the Cleveland Railway on Ninety-third Street with the tracks of the Wheeling & Lake Erie Railroad. The crossing rests upon an International Steel Tie Company's crossing foundation. The crossing was installed recently in one night, between midnight and morning. Neither the steam or the electric tracks were cut until 1 o'clock and both trains and street cars were going over the crossing before 4 o'clock. The whole foundation was well tamped with unscreened

CROSSING INSTALLATION IN CLEVELAND, OHIO

broken stone and a concrete paving base was put in about flush with the rail base. The street surrounding the crossing was then paved with Medina stone block.

Lantern Which Casts No Downward Shadows

There have been many attempts to make a practical electrical lantern that would be useful in railway service, but an obstacle in the way of its development has been the securing of sufficient battery capacity to give reasonable life. The Federal Sign System (Electric), Chicago, Ill., claims to have overcome this difficulty in its latest type of electric lantern, illustrated herewith, which was invented by F. T. Baird of the Chicago, Rock Island & Pacific Railway. By the use of a high-efficiency, special dry battery and a high-efficiency tungsten lamp, it has been possible to make a lantern which weighs complete but about 2½ lb. and has a battery life of more than sixty hours. By the mounting of the lamp under the battery container, the light is thrown downward without producing any downward shadow, an impossibility with the oil lantern.

ELECTRIC LANTERN

The lantern consists of nickel-plated brass and steel parts; a container for the battery with the lamp base on the under side; a protecting guard and stand, and a bail which also acts as a switch. The battery contains four cells, producing 6 volts by connection in series, and it is supplied in one or two four-cell units. The two-unit, or duplex arrangement, permits the carrying of a reserve battery. The construction of the battery unit is such that it automatically connects itself in the circuit when placed in the container. The wire stand acts as a base for the lamp without interference with the radiation of light, and also protects the lamp. The latter is further protected by a small wire guard. The bail is so constructed that lowering it to one side connects the lamp in circuit while a reverse movement disconnects it. The lamp used is of 1¾ cp. capacity.

The intensity of the light from this lantern at a quarter-mile distance is said to be 30 per cent greater than that of the regular oil lantern, at a half mile 50 per cent greater, at three quarters of a mile 70 per cent greater, and at 1 mile 85 per cent greater. According to tests made by the Chicago & Alton Railroad, and affirmed by the general superintendent, this lantern will give an average service of two or three months on each battery. The lantern is said to be in satisfactory use by train crews in both passenger and freight service. The cost of operating the lantern appears to be about 1 cent per hour.

The State of Michigan has issued a 396-page compilation of the State laws relating to railroads, compiled under the supervision of Frederick C. Martindale, secretary of state. Laws relating to street railways are included in the list, and the various excerpts contain citations of court decisions and bits of legislative history that aid in the interpretation of the law.

Electric Railway Legal Decisions

CHARTERS, ORDINANCES, FRANCHISES

Federal Courts.—Compensation for Property Taken for Elevated Railway.

The property rights of an abutting owner are not taken without compensation, contrary to the due process of law clause of United States Constitution, Fourteenth Amendment, because, in a suit by him to recover for the loss in market value consequent upon the erection and operation of an elevated railway in the street, the trial judge directed a verdict in favor of the railway company, refusing to submit questions of damage to the jury under positive instruction to exclude from market value subsequent to the construction of the railway such enhancement, if any, as resulted from facilities furnished by the improvement itself, where the only testimony relating to market value either before or just after the road was built shows that no change in such value occurred, and there was no evidence as to what enhancement, if any, resulted from the improvement. (*E. L. Brand, Jr., and E. Belle Brand v. Union Elevated Railroad, Lake Street Elevated Railroad and South Side Elevated Railroad*, 35 Supreme Court Rep., 846.)

Federal Courts.—Gas Rates—Reasonableness—Valuation—Going Value—Reproduction Cost.

The "going value" of a long established and successful gas company was sufficiently taken into account in determining the value of the company's property for the purpose of testing the reasonableness of gas rates fixed by municipal ordinance, where the valuation was based upon a plant in actual and successful operation and overhead charges were allowed for promotion, organization and development expenses.

The expenses of taking up and replacing pavements on streets which were unpaved when the gas mains were laid need not be included when valuing the property of a gas company on the basis of reproduction new, less depreciation, for the purpose of testing the reasonableness of rates fixed by municipal ordinance.

The refusal of a court to enjoin the enforcement of gas rates fixed by municipal ordinance upon the conclusion reached that a return of 6 per cent per annum on the valuation of the gas company's property would not be confiscatory will not be disturbed on appeal, especially where the ordinance was attacked before an opportunity was afforded to test its results by actual experience. (*Des Moines Gas Co. v. City of Des Moines et al.*, 35 Supreme Court Rep., 811.)

Federal Courts.—Contract Exemption from Taxation.

The Federal Supreme Court will not disturb a decision of the highest New York court that the contract exemption from taxation conferred by New York Laws 1894, chap. 752, sec. 35, Laws 1896, chap. 729, sec. 4, Laws 1900, chap. 616, sec. 4, upon any person, firm, or corporation operating the New York city subway, in respect to his, their, or its interest therein under the construction contract, and in respect to the rolling stock and other equipment, does not exempt a corporation formed to operate the subway from a tax measured by capital stock and gross earnings, imposed under the New York tax law, secs. 182, 184 (Consol. Laws, chap. 60) upon the right to be a corporation and to operate as such. (*People of the State of New York ex rel. Interborough Rapid Transit Co. v. William Sohmer*, 35 Supreme Court Rep., 549.)

New York.—Fares Within City Limits—Connecting Carrier.

The prohibition against charging more than 5 cents for 5 miles or less, contained in one of the grants of the New York & Long Island Traction Company, which operated three different lines, is limited to the services of the defendant as a connecting carrier, and does not apply to the carriage of passengers over its several lines. (*Raynor v. New York & Long Island Traction Co.*, 151 New York Sup., 417.)

Maryland.—Public Service Commission Has No Power to Require Unprofitable Extension.

The public service commission may not compel an electric railway company to construct and operate an extension of its line, where the construction and equipment of the extension in the manner directed by the commission would in

the honest judgment of the directors of the company, result in annual loss to it, for the commission cannot so control the discretion of the directors. (*Towers et al., Public Service Commission v. United Railways & Electric Co.*, 95 Atlantic Rep., 170.)

New York.—Reasonableness of Regulations of Public Service Commissions to Order Transfers, Changes in Types of Cars and Installation of Underground Feeders.

An order of the Public Service Commission, Second District, requiring an Albany street railway company to arrange with the Schenectady Railway Company for the giving of transfers within the city to passengers entering the cars within the city, was reasonable.

While the Public Service Commission would not be justified in ordering a street railway to provide larger cars simply for the purpose of conforming to the style of an aristocratic city, if there was evidence before the commission that the smaller cars were not convenient or comfortable and not adapted to the large traffic of a large city, a question of fact was presented for the commission's determination.

Where, after the close of a hearing before the Public Service Commission resulting in an order requiring an Albany street railway company to make certain changes in its equipment and method of operation, and among other changes to purchase forty-two additional cars, the foreign war broke out and the company applied for a rehearing, claiming that it was impossible to raise the necessary money and that the expense of procuring such cars would be great, the portion of the order relative to purchase such cars should not be enforced until a rehearing was had.

Where a city had by ordinance the power to compel a street railway to put its wires underground, and pursuant to such power the company had at considerable expense put certain of its wires underground, the work requiring the tearing up of the streets, which could only be done by permission of the city, the Public Service Commission should not have ordered the company to make material yearly extensions of its underground conduit and feeder system but should have left it to the city to order the wires to be put underground and conduits to be built, as telephone and electric light wires could also be placed in the conduits, thus requiring but a single tearing up of the streets. (*People ex rel. United Traction Co. v. Public Service Commission of New York*, Second District, 153 New York Sup., 542.)

New York.—Rights of Abutting Owner Against Annoyance from Switchyard.

Abutting property owners are without remedy for annoyance caused by the operation of a street railway upon tracks lawfully laid within the street, but a company cannot operate a Y on its private property in such a way as to be a private nuisance to residents of adjoining property. (*Davis et al. v. International Railway*, 152 New York Sup., 88.)

LIABILITY FOR NEGLIGENCE

Alabama.—Injuries on Car Step—Burden of Proof.

A passenger suing for an injury received while alighting from a street car does not have the burden of proving that the step of the car was in an unsafe condition when she attempted to alight and that the unsafe condition was caused by the negligence of the street railway company or its employees. (*Birmingham, Ensley & Bessemer Railway v. Hoskins*, 69 Southern Rep., 339.)

Alabama.—Injuries to Persons on Track Between Crossings.

Car tracks in a locality far removed from the business section of a city are not presumptively imbedded in and a part of the street outside of a street crossing, and, in the absence of evidence to show that fact, motormen are not required to look out for persons on the track outside of street crossings, or give warning signals of approach to persons who may by chance intend to cross elsewhere than at a street crossing. (*Birmingham Railway, Light & Power Co. v. Strickland*, 68 Southern Rep., 912.)

Indiana.—Rights of Fire Department.

Where a municipal ordinance gave fire wagons the right-of-way and required street cars, upon signal of any fire apparatus, to stop immediately and remain standing until it had passed, those in charge of a street car may be found negligent where they did not stop upon the giving of the signal, though they did not have actual notice of the signal,

for while the violation of the ordinance shows them guilty of negligence, when by ordinary care they could have discovered the fire wagon, the rules applicable to a criminal prosecution do not apply. (*Indianapolis Traction & Terminal So. v. Beck*, 108 *Northeastern Rep.*, 153.)

Maryland.—Assistance to Passenger in Car.

It is not negligence for a conductor, after inviting and assisting a passenger from one car to another to enable her to get a seat, to fail to assist her down the aisle to a seat, she not being weak or sick, the speed of the train not being excessive or unusual, and the curve in the road, reached while she was walking, not being sharp. (*Plummer v. Washington, Baltimore & Annapolis Electric Railroad*, 92 *Atlantic Rep.*, 536.)

Massachusetts.—Defective Push-Button System.

The company is responsible where a passenger is injured after using a defective push-button system and believed that her signal had been recognized, the car starting suddenly while she was attempting to alight. (*Weil v. Boston Elevated Ry.* (two cases), 105 *Northeastern Rep.*, 984.)

Michigan.—Liability to Express Messengers.

To exempt a carrier from liability or to limit its liability for injury to an express messenger for injury caused by its own negligence, the contract or release must expressly and plainly so provide. (*Cottrell v. Michigan United Traction Co.*, 150 *Northwestern Rep.*, 857.)

New Jersey.—Injuries to Boy Boarding Car.

Where a boy nine years old attempted to board a moving trolley car on the invitation of the motorman, the act of the motorman in suddenly accelerating the speed of the car before the child reached a place of safety justified a finding of actionable negligence of the street railway company. (*Solomon et al. v. Public Service Railway*, 92 *Atlantic Rep.*, 942.)

New York.—Employers' Liability Act—Employee Hit by Train.

The guard on an elevated train went upon the tracks at the direction of the conductor to assist the motorman to raise the shoe of a disabled car from the third-rail. The train was between stations. No precautions were taken to flag on-coming trains, and one struck the guard. Held, that the company was liable under the employers' liability act (*Consol. Laws*, chap. 31, secs. 200-204) it not appearing that the guard was guilty of contributory negligence. (*Fay v. Interborough Rapid Transit Co.*, 154 *New York Sup.*, 154.)

New York.—Failure to Remove Center Poles in Street.

A city which grants to a street railway company authority to electrify a street railway operated under a franchise for horse cars but does not designate the location of the poles, may compel the removal of poles erected in the center of the street, when the poles have become dangerous by change in the conditions and use of the street, and the negligent failure so to do renders the company liable for damages sustained in consequence of the obstructions by persons lawfully using the street. (*Stern v. International Railway, et al.*, 153 *New York Sup.*, 520.)

New York.—Accident to Automobile Covered by Insurance.

Where defendant in an action for damages to plaintiff's automobile, sustained in a collision with defendant's street car, ascertains on cross-examination of plaintiff that the damages were covered by insurance which had been paid, it may, under *Laws 1914*, Chap. 368, Sec. 166, providing that amendments of pleadings may be allowed at any time to promote substantial justice, amend its answer and enter a plea in abatement. (*Allen & Arnink Auto Renting Co. v. United Traction Co.*, 154 *New York Sup.*, 934.)

New York.—Workmen's Compensation Law—Amount of Compensation.

The workmen's compensation act provides for a compensation amounting to two-thirds of the average weekly wages for all disabilities, total or partial, though for longer or shorter periods. An employee sustained injuries resulting in the amputation of one foot and other injuries not shown to be permanent, which in themselves would have disabled him from the time of his injury to the date of an award by the Compensation Commission. The commission awarded two-thirds of his weekly wages for 205 weeks for

the loss of the foot. Held, that the commission could not, in addition to such award, make a further award, running concurrently with the first award, for other injuries than the loss of the foot, though at the expiration of the 205 weeks, if disability still existed by reason of other injuries, the employee might be entitled to a further award, it being the plain purpose of the statute that awards shall take effect consecutively, rather than concurrently. (*Fredenburg v. Empire United Railways*, 154 *New York Sup.*, 351.)

Oregon.—When Person Boarding Car Becomes Passenger.

Where, in an action for injuries to a street car passenger, the evidence was conflicting on the issues whether the passenger attempted to board the car while standing and was thrown off by a sudden jerk of the car, or whether she attempted to board it while in motion, the court should charge that before the passenger could recover, she must show that she intended to board the car and gave notice thereof to the carmen, or that, in the exercise of reasonable care, they knew that she intended to board it, and that if the carmen did not know that she intended to board it, there could be no recovery. (*Tompkins v. Portland Railway, Light & Power Co.*, 150 *Pacific Rep.*, 758.)

Oregon.—Master and Servant—Employers' Liability Act—Trial by Jury.

The general manager and the superintendent of an electric company, both representing it in repair work, were bound to exercise reasonable care to prevent injury to a lineman, and, under the employers' liability act, it was the duty of each to use every care practicable for his safety, and they were liable for their failure to warn him of the fact that a current had been turned on near-by drop wires, as to which he was ignorant, and which, together with their failure to warn, was the proximate cause of his injury.

The Legislature cannot enact a law abolishing jury trials in law actions, nor can a law court arbitrarily refuse to allow a jury to be called in such cases. (*Hoag v. Washington-Oregon Corporation et al.*, 147 *Pacific Rep.*, 756.)

Pennsylvania.—Imputed Negligence—Automobile Passengers—Care Required.

The rule that an automobile passenger is not chargeable with the carrier's negligence does not relieve him from the duty of exercising reasonable care to avoid danger. (*Dunlap v. Philadelphia Rapid Transit Co.*, 93 *Atlantic Rep.*, 873.)

Pennsylvania.—Injury to Infant—Contributory Negligence of Parents.

Where a mother, though seeing a car standing not more than 100 ft. away and likely to start at any moment, sent an unattended child of tender years across a street traversed by a double line of fast-moving electric cars, she was guilty of contributory negligence and the parents cannot recover for injuries to the child from being struck by the car. (*Rapaport et al v. Pittsburgh Railways*, 93 *Atlantic Rep.*, 493.)

Washington.—Master and Servant—Industrial Insurance—"Extrahazardous Work."

A workman for a city contractor, engaged in constructing a manhole in the street near a railroad track, is not employed in an "extrahazardous work," so as to come within the scope of the state industrial insurance act. (*Puget Sound Traction, Light & Power Co. v. Schleif*, 220 *Federal Rep.*, 48.)

West Virginia.—Horse Receives "Shock" from Rails—Res Ipsa Loquitur.

Where, as in this case, the evidence tends to show that plaintiff's injuries resulted from the fall of his horse caused by a shock received from one of the rails of defendant's railway, overcharged with electricity and dangerous to persons and animals traveling on the street, and the character of the fall and the injuries to horse and rider and the electrical manifestation on the track at the instant of the fall are not inconsistent with other facts proved and the known and proved nature of electricity so employed when there are defects in the rails or in the bonds binding them, the jury may properly infer, in the absence of evidence showing that the bonds were not broken and that the track was in good repair and condition, that the injury resulted from a defective and dangerous track, and the rule *res ipsa loquitur* applies. (*Macy v. Charleston Interurban Railroad*, 84 *Southeastern Rep.*, 893.)

LONDON LETTER

City & South London Railway in Operation Twenty-five Years—Lancashire & Yorkshire Railway Nearing Completion

(From Our Regular Correspondent)

It is twenty-five years this month since the late King Edward, then Prince of Wales, formally opened the City & South London Railway, the first electric railway of note in England, and the immediate forerunner of the tubes that now pierce the subsoil of Greater London in all directions. Although electricity was employed as the motive power from the first, it was originally intended to operate the line by cable. Between the inception of the undertaking and its completion developments in electric traction enabled Greathead to apply it to his scheme with success. The original City & South London Railway between the Monument and the Swan, Stockwell, was a little more than 3 miles long and cost, approximately, £220,000 per mile. The South London line itself extended its southern limit to Clapham Common, while its northern end has pushed on through the heart of the city to Islington, where it has been linked up with the larger system at King's Cross and Euston. After the war it is proposed to enlarge the present tunnels to the size of the other tubes.

The new electrified line of the Lancashire & Yorkshire Railway from Manchester to Bury is now almost ready to be put into service. It is to be operated at 1200 volts, which is a novel pressure for England. On the success of this line will depend a very large conversion scheme of electric traction in the Manchester area, and the power plant at Clifton Junction has been designed to provide power when needed for a large mileage of electric railway. The power station is situated on a lower level than the railway, so that the delivery of coal is extremely easy. Babcock & Wilcox boilers have been installed to furnish steam to 5000-kw. turbo-alternator sets supplied by Dick, Kerr & Company. The turbines are designed to generate three-phase current at 6600 volts, which will be delivered to the various substations which are equipped with 1000-kw. Dick-Kerr rotary converters for transforming the 6600-volt current to direct current at 1200 volts. The switch gear in the power house, much of which includes special features, has been furnished by the British Thomson-Houston Company. The feeders to the substations are, wherever possible, in the form of overhead bare copper conductors carried alongside the railway, but where the conductors pass under bridges or through congested areas three-core Henley cables are employed. The collector rail is of a channel form with a head of such section as to provide a wide contact surface. The rail is fixed upon insulators provided with lugs to prevent lateral movement, and is inclosed with boards of Jarrah timber, the fire-resisting properties of which are well known. The only opening round the rail is a slot at one side of the cover for the accommodation of the current collector, but drainage holes are provided to prevent the accumulation of water in the groove formed between the guard and the collector rail.

The new electric service on the London & South-Western Railway between Wimbledon and Waterloo, via East Putney, has been established. The new trains make the journey between Waterloo and Wimbledon in twenty-four minutes, as compared with thirty minutes under the old conditions. The electric service will enable trains drawn by locomotives to be run express between Waterloo and the boundary of the electrified area. The electric trains run every twenty minutes. The company expects soon to open electric service on the Kingston circular route.

The London County Council is recommended by the highways committee to authorize the employment of women conductors on the tramcars during the period of the war and thereafter so long as conditions are abnormal. It is proposed that they be paid proportionately to the time worked, at 5s. a day, a rate equivalent to the present minimum daily rate of pay of male conductors, with the usual increments according to length of service and the war grant of 6d. a day. It is also proposed to employ women on unskilled work at the central car repair depot, and as porters in the Council's stores department.

The London United Tramways has decided to employ a number of women as conductors. Preference will be given to the relatives of men already in the company's service or who have joined the forces. Each woman will be paid 4s. 6d. a day, working six days a week, with an extra war wage of 2s., making a total wage of 29s. a week. She will wear a dark blue costume, with the skirt bound in leather, a specially designed pair of gaiters, and a waterproof cap. Many women are also qualifying at the company's school of instruction to become conductors. They must be at least 5 ft. 5 in. in height and between twenty-five and thirty-five years of age.

The omnibus and the tramway employees have agreed to accept women as conductors in the London area as an expedient during the war period. Recently the subject was discussed for several hours at the annual delegate conference of the Licensed Vehicle Workers' Union. Ultimately a resolution was agreed to on the terms stated previously. The resolution added that this was only subject to the licenses being issued from Scotland Yard under the same conditions as the licenses which are issued to male conductors, and also subject to the same wages being paid. An additional condition was that the women are to do the same kind of work as the men.

The Glasgow Corporation Tramway Department, it is understood, is considering the possibility of employing women to run the cars. The supply of motormen has run so short in consequence of the many enlistments that sufficient male labor cannot be obtained for the work. The fitness of women for the work has first to be demonstrated. The department has not yet made any experiments which would justify a reference of the question to the tramways committee. It is stated, however, that the women now employed as conductors are being asked if they are prepared to undertake the work of the motormen if such a development is found feasible. It may be recalled that Mr. Dalrymple, the tramway manager, stated in the address which he made in London about two months ago to the Municipal Tramways Association that the most difficult problem which the Glasgow department had to face was the shortage of motormen. He then presented statistics of the number of men who had enlisted, and said that throughout the greater part of the past twelve months the men who had remained in the service had had to work seven days a week, and that despite this the service had to be curtailed considerably last winter.

The Dundee tramways committee has decided to reconstruct the service on account of the depletion of the staff through enlistment. A scheme has been worked out to meet the men's demand for an increase of 3s. a week on the ground that the cost of living has increased. The working week is to be increased from fifty-four to sixty hours, and men now earning 27s. and over will get 5s. extra, and men earning under 27s. will get 3s. extra, with the war bonus of 1s. This proposal has been agreed to on the understanding that the former conditions shall be reverted to on the return of a sufficient number of employees from military duty. It has also been agreed to curtail the evening car service by having the last car leave the center of the city at 10.30 p. m.

Bradford is one of the cities that has not as yet employed any female labor on the tramways. In a report recently issued by Mr. Spencer, the general manager, it is evident, however, that there is a shortage of labor and that immediate action is necessary to avoid serious consequences. The present staff of 1281 employees is considered necessary, and as 818 are of military age, it is reasonable to suppose that under Lord Derby's recruiting scheme many of the men will have to leave the service of the corporation for the time being. Mr. Spencer considers that men more than forty years of age do not undertake with satisfactory results the duties of a conductor, and that the alternative appears to be female labor. In looking into the peculiar conditions of Bradford, however, Mr. Spencer considers the employment of women for driving the cars to be out of the question, and impossible under any circumstances in Bradford. The subject is to be considered by the tramways committee, which will also have to pass upon the question of increased wages for the men.

News of Electric Railways

VOTERS APPROVE DES MOINES FRANCHISE

Negotiations Extending Over a Period of Ten Years Concluded by Vote Taken on Nov. 29

The people of Des Moines, Iowa, at the special election in that city on Nov. 29, approved the franchise by the Des Moines City Railway. With returns in from all of the forty-eight city precincts, and with all but six of these official, the vote stood 7787 for the franchise and 1883 against the grant. This represented more than 50 per cent of the normal vote. It is expected that acceptance of the franchise will be filed Jan. 1 by the company, and with its filing several of the clauses of the franchise, including the six fares for a quarter rule, will go into effect.

The vote on Nov. 29 terminates negotiations between the company and the city of Des Moines, extending over a period of ten years. A little more than two years ago the Supreme Court decided the company's franchise had expired and it received two years in which to secure a new grant or remove its tracks from the streets. During this time the company, because it had no franchise, could not properly finance itself, and the principal stockholders personally advanced upward of \$1,200,000 to protect the situation and give the city adequate service, pending such time as the company could re-establish its right to operate, either by a decision from the court upholding its claim to a perpetual franchise, or by securing a new franchise from the city.

In spite of all the company could do, however, it was impossible to prevent the company from going into the hands of a receiver. Now that a franchise has been granted, all that remains to be done is to dissolve the receivership, made necessary to protect the interests of the bondholders, and raise the money to rehabilitate the property. According to A. W. Harris, president of the Harris Trust & Savings Bank, Chicago, which has been protecting the interest of the bondholders, this should not be difficult to do, in view of the excellent showing the company will be able to make as to earnings and equity.

Since September, 1913, Emil G. Schmidt has been in direct charge of the affairs of the company as president, with offices in Des Moines. It is generally accepted that it was largely through his efforts that the passage of a workable franchise was secured and that sentiment favorable to the company was created which is regarded as a most valuable asset to the company in the future. That this is so is attested by an editorial in the *Des Moines Tribune* which was concluded as follows:

"The vote was more than an expression of weariness and more than an appreciation of changed conditions. It was a testimonial to the urbanity, perseverance and intelligent generalship of Mr. Schmidt, who ought to look upon it as a vote of personal confidence. The city believed that if given his head Mr. Schmidt would make a street railway system everybody would be proud of and glad to pay a nickel to ride on. Mr. Schmidt should look upon this vote as a very urgent invitation to him to give up all notions of Ohio or Michigan and make Iowa and Des Moines his permanent home. The city and the State need men of his energy, confidence, enterprise, and persistence. Des Moines really voted for Schmidt yesterday."

President Emil G. Schmidt of the company said:

"I want to prove to the people that they have not made a mistake in voting for the new franchise. Formal acceptance of the new ordinance will be made on Jan. 1 and the provisions of the new measure will then be in effect. Our fiscal year begins at that time. All old litigation will be disposed of before then. We will pay off the bonds and issue a new mortgage to borrow the money which we need for the rehabilitation of the system. The receivership will be disposed of by Jan. 1, and the new fare rate of six rides for a quarter will then go into effect. We shall contract this winter for work to begin next spring and we plan to spend \$750,000 in improvements during the spring and summer. Forty new cars, to be ordered at once, will be in service early in the spring."

Mr. Schmidt estimates that ten years of litigation over the franchise has cost the city and company more than \$250,000. He thanks the Chamber of Commerce, the Federation of Labor, and the employees of the company for their loyal efforts in bringing about the adoption of the new franchise.

A summary of the principal provisions of the ordinance was published in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11, page 461. It is proposed to review the terms of the grant at greater length in a subsequent issue of this paper.

ST. PAUL TO BEGIN ELECTRIC OPERATION DEC. 8

A. J. Earling, president of the Chicago, Milwaukee & St. Paul Railway, Chicago, Ill., has announced that everything will be in readiness by Dec. 8 to make a trial run over the electrified division between Three Forks and Deer Lodge, Mont. Following the run over this 113-mile division, complete electric operation will be started. President Earling and C. A. Goodnow, assistant to the president in direct charge of electrification, accompanied by a staff of railroad officials and representatives of the General Electric Company, expect to be present at the beginning of electric operation.

DECISION FAVORABLE TO COVINGTON FRANCHISE

Federal Judge A. M. J. Cochran on Nov. 17 granted a perpetual injunction against the city of Covington, Ky., to prevent it from carrying out the terms of an ordinance passed on July 13, 1914, which provided for the sale of a street railway franchise through public bids. At the same time he decreed that the South Covington & Cincinnati Street Railway has a perpetual franchise from the city of Covington on certain streets.

The petition and evidence in the case included a history of the franchise from the time it was granted in 1869 down to the present time. The franchise contained no provision as to its duration and it was claimed that all actions of the Common Council and all approvals of the changes that have taken place by which the franchise and rights were acquired by the present company tacitly assumed that it is perpetual. In 1913 an ordinance similar to that of July 13, 1914, was enacted by Council, but the company secured an injunction to prevent the city from receiving bids.

In the trial of the case City Solicitor Blakely contended that the charter of the city gave it power to grant a perpetual franchise, but it did not grant any expressly and it could not be said by implication that a perpetual grant was made. He argued further that when a franchise is silent as to the term of years the length of the period is to be construed in favor of the public.

Judge Cochran held that the granting of a franchise under the ordinance of July 13, 1914, and the construction of a railway in accordance with its terms would be a material interference with the franchise and contract rights of the plaintiff on the streets mentioned and a violation of the terms of the franchise and an impairment of the rights. The passage of the franchise ordinance, the advertisements for bids and the threatened acceptance of bids constitute a cloud on the franchise and rights of the company. Further proceedings would result in a multiplicity of suits and an interruption of the public service of the plaintiff, as well as irreparable damage to the property. The court said:

"The defendant is perpetually enjoined from carrying out the terms of the ordinance of July 13, 1914; from advertising for any further bids thereunder; from accepting any bids for making a grant thereunder; from interfering or attempting to interfere with the plaintiff in the maintenance or operation of the street railway lines upon defendant's streets, and from acting in any such form or manner as would alter, impair, limit, infringe or destroy the title of the plaintiff in its grant, rights and franchises above described, and the plaintiff's title in or to same and all of them is forever settled and quieted hereby."

City Solicitor Fred W. Schmitz has announced that the case will be appealed to the Supreme Court.

CHICAGO ELECTRIFICATION REPORT PRESENTED

The formal report of the committee on smoke abatement and railway terminal electrification of the Chicago Association of Commerce, abstracted on pages 1113 to 1118 of this issue, was formally presented by the committee to the association on Dec. 1. The event was celebrated by a dinner in the Gold Room of the Congress Hotel, Chicago, last Wednesday evening. Charles L. Dering presided, and after explaining the purpose of the gathering, presented Harry A. Wheeler, vice-president of the Union Trust Company, and a member of the committee, who briefly told the history of the report and described the smoke abatement problem and sources of air pollution as found by the committee's engineers. Harrison B. Riley, president of the Chicago Title & Trust Company, the next speaker, then discussed the necessity for electrification as the means of smoke abatement and its engineering and financial practicability. Judge Jesse Holdom, of the Illinois Appellate Court, chairman of the smoke abatement committee, then formally presented the report to the association.

The points especially emphasized by the speakers were that the report was primarily a smoke abatement report, and that the question of the electrification of the steam railroad terminals in Chicago was considered as the only means of relieving air pollution from that source. For this reason complete electrification of all of the steam railroad trackage in Chicago only was considered, and the estimates were based upon thoroughly tested electrical equipment as it existed in the state of the art in 1912. Hence, the estimates should not be considered as applying to recently developed and more efficient, though untried, equipment. The speakers also brought out the point that where electrification afforded an operating economy it should be adopted. Nothing in the report was intended to indicate that the electrification of certain roads was not feasible and financially warranted.

OBJECTION TO TOLEDO PAVING CHARGES

At a meeting of a sub-committee of the committee on railways and telegraph of the Council of Toledo, Ohio, on Nov. 24 Councilman Hein's resolution, calling for a settlement of the city's claim against the Toledo Railways & Light Company for paving between its tracks on certain streets was discussed. Henry L. Doherty, chairman of the board of the company, asserted that the fare paid by the people now is just about sufficient for maintenance. The Heine resolution provided that the company should not be allowed to operate cars on the streets concerned until it had paid the paving bill. Mr. Doherty said that the people of Toledo seemed to think that a franchise was valuable only to the company.

A second meeting was held on Nov. 26 when the matter was again discussed. Mr. Doherty said the company objected to paying the full cost of the paving, which will last about twenty years, without assurance that it will be allowed to use the streets for a portion of that time, but had no objection to paying its pro-rata share of the cost of paving in accordance with the time it is allowed to use the streets in question. Mr. Doherty said he would endeavor to have his views embodied in a letter to be presented to the City Council at its next meeting.

WILKES-BARRE STRIKE UNCHANGED

With the exception of intermittent riots of small proportions, the strike situation at Wilkes-Barre, Pa., has undergone no material change.

In an attempt to end the strike Martin Freeman and Louis Frank, representing the Chamber of Commerce of Wilkes-Barre, discussed the strike situation with Governor Brumbaugh, Attorney General Francis Shunk Brown and Commissioner of Labor William Price Jackson at Harrisburg and mapped out a peace program in which the Governor and the Attorney General have offered themselves as conciliators to hear both sides.

In connection with these efforts, P. J. Shea, the strike leader, said: "We will confer with anybody on earth on this strike situation."

T. A. Wright, general manager of the Wilkes-Barre Railway, said: "Although it would of necessity be a matter that I would have to submit to the board of directors, I should

not think of refusing an invitation to a conference from the Governor."

The company also reiterated that it has always stood ready to submit to the courts the legality of the board of arbitration reversing its original decision.

CINCINNATI TRANSIT COMMISSION ORGANIZED

At an informal meeting at Cincinnati, Ohio, on Nov. 24 E. W. Edwards, Christian Schott, William A. Hopkins and E. H. Dornette were sworn in as members of the Rapid Transit Commission by City Solicitor Schoenle. William Cooper Proctor was unable to be present. It was decided to have City Engineer Frank Krug, who is also the commission's engineer, arrange conferences with each of the nine interurban roads which will use the rapid transit belt, discuss plans and the cost of making connections with the proposed line, and then report to the commission.

Some of the roads were built to broad gage to correspond with the tracks of the Cincinnati Traction Company. Since the rapid transit road will be constructed with standard gage tracks, it will probably be necessary to standardize all the roads.

The City Council will be asked to issue \$100,000 of bonds to provide funds for the initial expense of the commission.

ORDINANCE AUTHORIZING CHICAGO TRACTION COMMISSION SUBMITTED

The creation of a commission to report on the operating, engineering and financial problems involved in the proposal to consolidate the Chicago surface and elevated lines and construct a subway has advanced to the point where an ordinance authorizing the employment of the commission has been approved by the local transportation committee and submitted to the City Council. The terms of the ordinance authorizing the employment of three engineers to serve on this commission, were mentioned in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, page 1050. As stated at that time, one of the engineers selected must be from Chicago and be familiar with its local transportation problems, and the other two must be familiar with the efforts made to solve the transportation problems in New York, Philadelphia and Boston. The ordinance requires that the commission report by April 1, 1916, so that an ordinance authorizing the consolidation and a general scheme of improved transportation can be submitted at the June election. The ordinance also gives the committee authority to compensate these engineers with money taken from the traction fund.

TOLEDO PLANT FORCED TO SUSPEND

The Water Street power plant of the Toledo Railways & Light Company, Toledo, Ohio, was forced to suspend on the evening of Nov. 26 and for an hour almost every car in the city stood still. In explaining the accident, William Richards, superintendent of the electrical department of the company, said:

"The short-circuit at the manhole, caused by a defective feed cable, produced a surge in the power station which caused one of the largest generators to short-circuit. This resulted in a blow-out. There is no way of determining the cause, as all the evidence was destroyed in the accident. Almost the entire system was at a standstill for a time as the result of the accident. It was the most complete shutdown since the construction of the plant in 1896."

SPRINGFIELD ELECTROLYSIS REPORT

C. V. Wood, president Springfield (Mass.) Street Railway, has received a report on the electrolysis situation at Springfield from the Stone & Webster Engineering Corporation, Boston, Mass., following a study of local conditions requested by the company. Earlier in the year the United States Bureau of Standards investigated the electrolysis problem at Springfield, recommending the conversion of the Margaret Street generating plant into an alternating-current station, with the inauguration of direct-current distribution from substations. President Wood stated that the plans proposed by Stone & Webster for the improvement of conditions were substantially the same as those discussed in the government report. The various interests concerned and a bureau representative will confer on the matter.

WESTCHESTER BARRED IN NEW HAVEN SUIT

All the testimony relative to the purchase of the New York, Westchester & Boston Railroad by the New Haven system was stricken from the record on Dec. 1 by Judge Hunt in United States District Court in the trial of eleven former directors of the New York, New Haven & Hartford Railroad on the misdemeanor charge of conspiring to monopolize transportation in New England. Judge Hunt said:

"The Government has thus far failed to show that there was intent on the part of any of these defendants to conspire to monopolize the interstate traffic of New England in so far as the purchase of the Westchester road was concerned. Although the original projectors of the Westchester line may have had in mind a road to do an interstate business, the Government has failed to show that the Westchester was used by the New Haven in interstate traffic."

The New York, Westchester & Boston Railway is a high-speed single-phase line operated out of New York from a connection with the subway as far east as New Rochelle and as far north as White Plains.

CHAIRMAN McCALL BEFORE GOVERNOR ON DEC. 3

Chairman Edward E. McCall of the Public Service Commission for the First District of New York obtained a postponement from Nov. 30 to Dec. 3 of the hearing before Governor Whitman on the charges filed against him with the Governor by the Thompson legislative committee. Mr. McCall in a letter to the commission refused to present before the committee his account with the Bankers Trust Company, but said that he would permit the Governor to examine all records, official or otherwise.

On Nov. 29 the committee questioned Commissioner Wood with respect to his connection with both the American Sanitary Towel Company and the Northwestern Construction Company and went over the transfer of title to \$5,000 of stock in the former company to John A. Maher for a consideration of \$1 and in the latter to his brother. On Dec. 1 the committee inquired of Mr. Wood about the contracts for signals for the Fourth Avenue subway. On the same day Commissioner Williams was questioned regarding his accounts in various banks and trust companies.

GIVING RAILWAY LINES AWAY

Press dispatches report that J. D. Sugg, president of the San Angelo Power & Street Railway Company, San Angelo, Tex., has offered the 3.5-mile railway system in that city to the City of San Angelo as a gift.

Gilbert F. Myer, president of the Realty Company, McKeesport, and general manager of the Port Vue Street Railway, McKeesport, has offered to the Borough of Port Vue the 1-mile line of the railway with all equipment if the borough will agree to operate the railway for five years.

Trackless Trolley Line Abandoned.—The Merrill Railway & Lighting Company of Merrill, Wis., has sold its trackless trolley bus. The company reports insufficient patronage to warrant its operation.

Chicago Can Build Subway by Assessment.—An opinion rendered by the city law department states that the Chicago board of local improvements has the power to obtain funds for subway construction by levying assessments against the property owners which would be benefited by the subway.

Valuation of Toledo Properties Proposed.—Councilman John Mulholland introduced an ordinance in the City Council of Toledo, Ohio, on Nov. 22 which provides that a valuation of the property of the Toledo Railways & Light Company be made by three experts to be chosen by a committee consisting of the president of the Council and the city solicitor, a third city official to be chosen by these two.

I. C. C. Grants Extension of Time.—An order has been entered by the Interstate Commerce Commission extending, for a period of twelve months from July 1, 1916, the order commanding the railroads to equip all cars in service in accordance with specific regulations laid down by the commission in an order issued March 13, 1911. These regulations provided for the equipment of freight cars as to their physical safety.

Penalty Action Begun in New York.—The Public Service Commission for the First District of New York has instructed its counsel to begin an action against the Third Avenue Railway and the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway to recover the statutory penalty for failure to obey the commission's order of May 21, 1915, requiring the companies to make certain repairs to their tracks.

Decision in Alien Labor Law Case.—The Supreme Court of the United States on Nov. 29 sustained an opinion of the New York Court of Appeals and a verdict of the Court of Special Sessions of New York City, both of which upheld the validity of the New York law against the employment of aliens on public works. The law led to far-reaching disturbances in connection with work on the New York subways. Afterward it was amended to permit employment of aliens when Americans were unavailable, but the cases settled on Nov. 29 already had been instituted.

American Employers' Profit-Sharing Plans.—The National Civic Federation, New York, N. Y., will have ready for distribution about Jan. 1 the results of its investigation of the subject of profit sharing between employer and employee, referred to in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, page 1052. It was originally expected that the report would be ready by Dec. 1. The report will contain an analysis of more than 100 plans now in operation in this country, as well as a description of many abandoned ones and the causes of their failure. The views of employees and the attitude of labor unions will be set forth.

Seeking to Make Seattle Municipal Line Profitable.—Councilman Oliver T. Erickson of Seattle, Wash., has introduced a resolution in the Council calling upon Corporation Counsel Bradford to prepare the necessary papers and outline a method of procedure to obtain common user trackage privileges for the Seattle Municipal Railway over the tracks of the Seattle, Renton & Southern Railway on Fourth Avenue and Fourth Avenue South, to a terminus at Second Avenue South and Washington Street, in the business districts. It is hoped that by this means the business of the line, which is now operated at a loss, may be increased.

Objection to Clay County Bond.—It is said that the Interstate Railway, which secured a verdict of \$1,500,000 against the Kansas City, Clay County & St. Joseph Railway for alleged usurpation of right-of-way, will file a motion in the Supreme Court for the increase of the appeal bond of the defendant. This bond for \$3,400,000 was approved by the court. It is understood the plaintiff considers the bond insufficient. If such a motion is filed, it is expected that opportunity will arise for presenting the interests of the public, as protected by the Public Service Commission, in any burdens placed upon the utility. If the case takes the ordinary course, it will not be heard for perhaps three or four years.

Vestibules and Changes in Fenders Recommended.—In a report submitted to the Public Service Commission of Maryland by Transportation Expert Duer and Chief Engineer Phelps recommendations are submitted advocating the vestibuling of all cars in Baltimore and such changes in the construction of the fenders and wheel guards as will, it is claimed, afford more protection to the general public. The point is made that while there is no serious criticism of the present fenders being used, they could be so constructed to make them more effective. It is recommended that the United Railways & Electric Company be ordered to close 560 cars at once, the work to be done in eighteen months by vestibuling thirty-one cars a month.

Final Argument on New York Bus Franchise.—Final pleas against granting a franchise to the New York Motor Bus Company, which seeks to operate buses on new routes, were heard on Nov. 29 by the franchise committee of the Board of Estimate of the City of New York. The chief plea against granting the franchise was by William H. Page, counsel for the Fifth Avenue Coach Company, which operates the present bus lines. Briefs were put in on behalf of the Interborough Rapid Transit Company and the New York Railways Company, in which the argument that the buses would cut down the profits of the new subways was put forward. The Third Avenue Railway Company also put in a brief opposing granting the franchise.

Basis of Renewal of Bridge Operating Contract.—In a report to the transit committee of the Board of Estimate of New York City, Bridge Commissioner F. J. H. Kracke suggests that in place of the old contract for operation on the Williamsburg Bridge, which expired on Aug. 31, a new contract be entered into with the Brooklyn Rapid Transit Company and the New York Railways with increased rental for operating cars over the bridge. Mr. Kracke says: "I would advise the making of new contracts with the companies now providing through service on the Williamsburg Bridge, as being in the best public interest in view of the large mileage they control in Brooklyn and Manhattan, provided that suitable terms of such nature as to leave no doubt of their adequate protection of the city's rights, be agreed to by the said companies." The companies have been operating since Aug. 31 under a permit which expired on Nov. 30.

Seattle Needs Appraisal Expert.—Ralph S. Pierce, assistant corporation counsel of Seattle, Wash., recently advised the finance committee of the Council that the legal department of the city must have expert help in the preparation of its case against the Puget Sound Traction, Light & Power Company in which the company is seeking to be relieved of certain franchise requirements. At the hearing before the Public Service Commission, at which the company's application will be considered, a valuation of the properties will be introduced. Mr. Pierce states that it is important that the city have an expert engineer to testify, as the valuation fixed at the hearing will be the basis of any action that the company may bring to discontinue transfer privileges or increase fares. The company is seeking to be relieved of provisions in its franchises compelling it to pave between tracks, pay 2 per cent of its gross revenues to the city, etc.

Seattle Heating Franchise Rejected.—The Puget Sound Traction, Light & Power Company, Seattle, Wash., has informed the franchise committee of the Council that the company cannot agree to carry passengers on its lines on transfers issued from the Seattle Municipal Railway upon payment by the city of Seattle of 1 cent for each passenger so transferred, in exchange for a steam heating franchise. The company is willing to accept the franchise requirements imposed by the city with this and one other exception. The company asks that the life of the franchise extend to 1934, instead of 1925. Last February the company applied to the city for a renewal of its steam heating franchise, and at this time Councilman Erickson suggested that the grant be made contingent upon the willingness of the company to transfer passengers between Division A and Division C on payment by the city to the company of 1 cent for each passenger transferred.

Toronto Engineers Not in Favor of Subway.—The commission of engineers which has been engaged in the preparation of a scheme for the solution of the traffic problem in Toronto, Ont., has completed its labors and, as stated previously in the *ELECTRIC RAILWAY JOURNAL*, will make its report to the city within the next week. It is known that the engineers are not in favor of the construction of a subway system. The proposals of the engineers will have a direct bearing on the hydro-radial system, of which Toronto must be the center. The question of submitting the scheme to a vote of the people at the forthcoming municipal elections is considered out of the question. The same applies to the suggestion that a by-law be submitted to the people for their sanction to the raising of \$2,000,000 or \$3,000,000 for the purpose of enabling the city to start preliminary work on the project. Sir Adam Beck has admitted that the Hydro-Electric Power Commission had for a year been negotiating for the purchase of all the radial railways now entering the city.

Changes in Engineering Personnel of District Commission.—As the work of valuing the properties of the public utilities in the District of Columbia nears completion it becomes evident that it will be necessary for the Public Utilities Commission of the District of Columbia to have on its permanent staff a man who has had considerable experience in this class of work and one who is thoroughly familiar with the details of these particular valuations. On account of the limited funds available for the employment of a force

under the commission it will be necessary to combine this position with that of engineer of the commission. J. Kappeyne of the valuation bureau has been selected to fill this position, and his promotion will take place this month. H. C. Eddy, who since the creation of the commission has occupied the position of engineer, will be employed by the electrical department of the District of Columbia, if his services can be procured, for the purpose of working in conjunction with the commission on an electrolysis survey of the District of Columbia.

Salary of Chicago Surface Lines' President Approved.—At a recent meeting of the Chicago City Council an order was introduced to the effect that the salary of L. A. Busby, president of the Chicago Surface Lines, should be reduced from \$60,000 a year to \$18,000 a year, the same as that received by the Mayor. Under the contract ordinance between the surface railways and the city, the latter has the right to regulate the salaries of the officers. This question was submitted to the Board of Supervising Engineers, Chicago Traction, which reported that under the terms of the ordinance the president's salary was not excessive. The ordinance provided that in arriving at the permissible salary which could be paid a railway officer, the compensation paid for like service in other industries must be taken into consideration. Upon this basis the Board of Supervising Engineers found that the salaries of the presidents of eleven railways, not named for publication, were larger in terms of per cent of the gross receipts than that paid the president of the Chicago Surface Lines. These salaries varied from 0.147 per cent of the gross income to 0.54 per cent, Mr. Busby's salary of \$60,000 represents 0.18 per cent of the gross income. The local transportation committee, acting upon the recommendation of the board, dismissed the order.

PROGRAMS OF ASSOCIATION MEETINGS

American Association of Engineers

Engineering welfare and the advancement of engineering opportunities will be discussed at the first convention of the American Association of Engineers to be held at the Hotel La Salle, Chicago, on Dec. 10 and 11. The program includes addresses by F. H. Newell, professor of civil engineering at the University of Illinois; T. B. Lambert, power engineer of the Chicago Telephone Company; Richard Yates, ex-governor of Illinois, and J. H. Prior, chief engineer of the Illinois State Public Utility Commission. The association has 260 members. Through the association's clearing house service 100 engineers have been put in touch with positions in the last two months.

American Society of Mechanical Engineers

Among the papers of direct interest to electric railway operatives to be presented at the annual meeting of the American Society of Mechanical Engineers in New York, Dec. 7-10, are the following:

"A Novel Method of Handling Boilers to Prevent Corrosion and Scale," by Allen H. Babcock.

"Turbines vs. Engines in Units of Small Capacities," by J. S. Barstow.

"Proportioning Chimneys on a Gas Basis," by A. L. Menzin.

"Operation of Parallel and Radial Axles of a Locomotive by a Single Set of Cylinders," by Anatole Mallet.

"Four-Wheel Trucks for Passenger Cars," by Roy V. Wright.

A report will also be presented on a code for abrasive wheels.

The entertainments will include a reception and tea to the ladies, members and guests on the afternoon of Dec. 8, a smoker on the evening of Dec. 8, and a dinner and dance on the evening of Dec. 9. The plan this year will be to have a few excursions of exceptional interest, rather than a multiplicity of less important trips. It is proposed to visit the power and elevator plants of the Municipal and Woolworth Buildings and the Seventy-fourth Street station of the Interborough Rapid Transit Company, in which turbines of 40,000 hp. capacity, the largest units running at the present time in a railway plant, have been installed.

Financial and Corporate

ANNUAL REPORTS

Chicago Elevated Railways

The combined statement of income, profit and loss of the Metropolitan West Side Elevated Railway, the South Side Elevated Railroad and the Northwestern Elevated Railroad, which are controlled by the Chicago (Ill.) Elevated Railways, is as follows for the year ended June 30, 1915:

Gross operating revenue.....	\$8,045,265
Way and structures	\$163,679
Equipment	334,928
Power	911,094
Conducting transportation	2,042,383
Traffic	6,479
General and miscellaneous	411,738
Total operating expenses	\$3,870,306
Net operating revenue	\$4,174,959
Taxes, city compensations and other items.....	700,243
Operating income	\$3,474,716
Non-operating income	*117,906
Gross income	\$3,592,620
Interest and rents	*2,188,409
Net income	\$1,404,211
Dividends	1,105,373
Surplus	\$298,838

*Inter-company rentals deducted.

On account of the new classification of accounts issued by the Illinois Public Utilities Commission for the first year to end on June 30, 1915, the figures for the year ended June 30, 1914, are not generally comparative with the foregoing figures. An exception, however, is the gross operating revenue, which for the preceding fiscal year amounted to \$8,182,861. Hence the gross operating revenue for the last fiscal year decreased \$137,596 or 1.7 per cent.

United Railways Investment Company

The statement of net income applicable to the common stock of the United Railways Investment Company, San Francisco, Cal., based on the assumption that this company and its controlled companies are one, is as follows for the year ended June 30, 1915:

Gross earnings	\$32,574,111
Operating expenses and taxes:	
Operating expenses	\$17,166,109
Taxes	1,482,416
Total operating expenses and taxes.....	\$18,648,525
Net earnings	\$13,925,586
Other income	474,821
Gross income	\$14,400,407
Deductions from income (rents, miscellaneous interest, etc.)	3,691,471
Net income before deducting fixed charges.....	\$10,708,936
Fixed charges—interest on bonds, notes, etc., held by the public.....	*6,240,101
Net income after deducting fixed charges.....	\$4,468,835
Dividends on preferred stock held by public.....	†1,536,977
Balance available for improvements, etc., and dividends on common stock.....	**\$2,931,858
Improvements, etc., charged against income by the several companies	860,434
Balance available for dividends on common stock....	†\$2,071,423

*Includes \$358,771 interest on series "B" second mortgage 5 per cent bonds of Sierra & San Francisco Power Company, payable in like bonds up to and including Jan. 1, 1916.

†Includes \$799,130 for dividend on United Railways Investment Company preferred stock, although none was declared during the year.

**Proportion applicable to common stock of United Railways Investment Company, \$1,369,789, or 6.715 per cent.

†Proportion applicable, as before, \$828,705, or 4.062 per cent.

It should be noted that the foregoing statement includes no charges for depreciation as such, and no amounts charged against income for sinking fund requirements. Moreover, the results included for the Philadelphia Company and its affiliated companies are for the year ended March 31, 1915. The report states that the 6 per cent serial notes of 1908 have now been reduced from \$3,500,000 to \$700,000 and \$2,800,000 of the notes cancelled. During

the period covered by this report \$600,000 was paid on the principal of the notes and on Aug. 16, 1915, \$200,000 more was paid. The 6 per cent convertible gold bonds of 1910 have been reduced from an original issue of \$1,229,000 to \$790,000. A total of \$1,066,000 par value of the 5 per cent collateral trust sinking fund gold bonds has been purchased out of earnings and is now held by the trustee of the sinking fund. During the six months ended June 30, 1915, the floating debt was reduced \$79,000, and to date \$149,000. The United Railroads of San Francisco has paid \$50,000 on account of its notes held by the United Railways Investment Company, thus reducing the amount now in the treasury to \$740,000.

The statement of income, profit and loss of the subsidiary United Railroads of San Francisco, controlled through the California Railway & Power Company, for the year ended June 30, 1915, follows:

Gross earnings:	
Passenger	\$7,968,094
Advertising	56,000
Total	\$8,024,094
Operating expenses and taxes:	
Maintenance of way and structures.....	\$633,943
Maintenance of equipment.....	435,826
Transportation	3,129,801
General	558,255
Total	\$4,757,826
Taxes	516,000
Total operating expenses and taxes.....	\$5,273,826
Net earnings	\$2,750,268
Other income	208,058
Gross income	\$2,958,326
Income charges	522,147
Net income before deducting bond interest.....	\$2,436,179
Bond interest:	
United Railroads' bonds.....	\$954,160
Underlying bonds	674,492
Total	\$1,628,652
Net income	\$807,526
Surplus at beginning of year.....	1,018,632
Profit and loss credits.....	154,146
Profit and loss—gross surplus.....	\$1,980,305
Profit and loss charges.....	961,649
Profit and loss—surplus, June 30, 1915.....	\$1,018,656

The total earnings of the United Railroads of San Francisco decreased from \$8,506,725 for the year ended June 30, 1914, to \$8,024,094 for the last fiscal year, an amount of \$482,631. This decrease took place entirely in the passenger earnings, which fell off 5.7 per cent. The operating expenses, however, increased from \$4,722,737 to \$4,757,826, an amount of \$35,089 or 0.74 per cent, while the taxes showed an increase from \$503,800 to \$516,000, an amount of \$12,200 or 2.4 per cent. The net earnings of the company therefore suffered a loss of \$529,920 or 16.1 per cent. The other income of the company increased \$22,421, income charges increased \$99,323 and bond interest decreased \$16,058, so that the net income showed a decrease of \$590,765. After the profit and loss credits and debits, however, the surplus at the end of the last fiscal year was very slightly larger.

The decrease in the passenger earnings for the year is said to be essentially accounted for by the jitney competition and by the general depression. At the present time it is stated that, notwithstanding the jitneys, the earnings are running ahead of last year. During the fiscal year there was a decrease of \$135,631 in "railroads, properties and franchises," while the additions and betterments totaled \$202,174. The reserve for depreciation increased \$426,198 during the year. Since June 30, 1914, \$205,000 of underlying bonds have been retired.

The business of the Sierra & San Francisco Power Company, outside of the sale of power to the United Railroads of San Francisco, which business at June 30, 1914, amounted for the year to \$397,963 or approximately 35 per cent of the gross receipts, increased at June 30, 1915, to \$455,276 or approximately 39 per cent of the gross. The gross income of the Coast Valleys Gas & Electric Company showed a reduction of less than 1 per cent, notwithstanding the heavy and continuous rains lessening the demand for electric energy for irrigation purposes, and also notwithstanding the reduction in rates required by the commission.

JITNEYS CAUSE RECEIVERSHIP

Atlantic City & Shore Railroad Suffers Unbearable Losses Because of Unrestricted and Unfair Jitney Competition

Clarence L. Cole on Nov. 26 was appointed receiver of the Atlantic City & Shore Railroad, Atlantic City, N. J., by Judge Rellstab in the Federal Court at Trenton. The main cause of the receivership was the losses brought about by jitney competition, the growth of which has been described from week to week in the Traffic and Transportation department of the *ELECTRIC RAILWAY JOURNAL*.

During the five years preceding 1915 the company's net profits aggregated \$200,000, all of which was invested in extensions and road betterments. With the growth of the jitney traffic the company's gross receipts for the current year were reduced by \$100,000, so that instead of closing the year with a profit, as heretofore, it was confronted with a deficit of \$80,000. The jitneys were permitted to pick up the best part of the traffic without regulation or restrictions, thereby creating an unfair competition which the company could not meet. An appeal was made to the authorities of Atlantic City, requesting the enactment of regulations which would protect the company, but the request was denied.

Mr. Cole after his appointment issued the following statement:

"There will be neither suspension of service nor any material curtailment of cars for the immediate future at least. I will confer with officials of the line, counsel for bondholders and others, and proceed to map out a policy. How it will succeed experience alone will tell. Ultimately if rehabilitation should be impossible under the conditions the court may order the sale of the line."

The application for the receivership was made in behalf of H. F. Bachman & Company, Philadelphia, who have a claim of \$12,682. In addition, it was set forth that the company owed the West Jersey & Seashore Railroad \$35,000, and that it would be unable to pay \$23,875 due to the Girard Trust Company, Philadelphia, as December interest on a bond issue of \$950,000.

CO-RECEIVERS FOR EMPIRE UNITED

C. Loomis Allen is Appointed by Court to Act with H. S. Holden in Receivership of New York Line

C. Loomis Allen was on Nov. 27 appointed co-receiver of the Empire United Railways, Inc., to act with H. S. Holden. This action was taken at a hearing before Justice W. S. Andrews to show why Mr. Holden's temporary appointment, noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13, should not be made permanent. Not a single dissenting voice was raised to the appointment of the two permanent receivers instead of one.

Alexander H. Cowie, who represented the bondholders' protective committee and was also empowered to represent the trustee, the Columbia Trust Company, New York, proposed Mr. Allen's name. Mr. Cowie stated that on Nov. 1, when the road went into the hands of the temporary receiver, there was a feeling of uneasiness among the bondholders of the subsidiary Rochester, Syracuse & Eastern Railroad, and a committee was appointed to protect their interests. Bonds of \$4,896,000 were outstanding, and about \$2,041,000 have already been deposited. Mr. Cowie went on to say that under the mortgage provision covering these bonds the trustee could apply within thirty days for a sole receiver to operate the property behind the mortgage. The committee felt that this was too drastic a measure and suggested that a co-receiver be named at this time, but if such were not done the trustee would probably ask for a separate receiver.

William Nottingham for the company stated that it only desired an amicable readjustment of affairs with as little expense to the company as possible. He said that the bondholders above mentioned would have the right under the mortgage to divorce the Rochester, Syracuse & Eastern Railroad from the Syracuse, Lake Shore & Northern Railroad and the Auburn & Northern Railroad, which, with the former, make up the Empire United Railways, Inc. He did not believe, however, that this would be to

the advantage of the consolidated property, as the Rochester, Syracuse & Eastern Railroad would then have to pay a large rental for trackage as before the consolidation. He therefore stated that the company acquiesced in the naming of a co-receiver, and Deputy E. H. Lewis, representing the attorney general's office, also agreed to the appointment.

OAKLAND-ANTIOCH REFINANCING APPROVED

California Railroad Commission Authorizes New Securities for Capital Debts—Deferred Interest Unpaid and New Stockholders' Loan to Be Funded in 1918

The California Railroad Commission has approved a plan to refinance the Oakland, Antioch & Eastern Railway, Oakland, Cal., through the issuance of \$1,195,000 of first mortgage bonds and \$262,200 of promissory notes. The proceeds of both bonds and notes sold are to be used solely for the company's debts for capital expenditures, represented by notes or accounts payable. The bonds are to be sold to bondholders or stockholders for cash, or issued in payment of bond interest earned, at not less than 80 per cent face value. The \$262,200 of 6 per cent notes maturing on Jan. 1, 1918, are to be issued to stockholders for cash at face value. Of the bonds, \$328,000 may be pledged as security for the \$262,200 of notes, stockholders being obligated in case of non-payment of principal or interest to accept the pledged bonds in full compensation at 80 per cent of face value. Bondholders who have not signed the present agreement may participate at any time just as the signers. The application to the commission was noted in the *ELECTRIC RAILWAY JOURNAL* of July 13.

The company stated before the commission that its stockholders had paid assessments amounting to \$1,215,000 and incurred a deficit of almost \$456,774, and after two years of operation they had found their indebtedness and their interest obligations beyond their ability to pay. Over one-eighth of the capital stock, or 12,600 shares, was forfeited for non-payment of assessments. The company told the commission that another assessment would bring still greater forfeiture with a possibility of a general refusal to support longer the growing burden of debt. On June 30, 1915, there was due \$1,027,657 of outstanding indebtedness, secured by \$1,493,000 of pledged bonds. There was due on July 31, 1915, accounts payable of \$219,643, or a total of \$1,247,300 of pressing obligations. In addition \$317,500 of gold notes will be due on Feb. 1, 1918. The company thus faced receivership or a temporary readjustment, pending demonstration of its earning capacity.

Under the plan now approved as a remedy for this condition the bondholders' agreement calls upon the bondholders of the Oakland, Antioch & Eastern Railway and the two controlled lines, the Oakland & Antioch Railway and the San Ramon Valley Railroad, to deposit their interest coupons maturing during 1915, 1916 and 1917 with the Union Trust Company of San Francisco. Before Jan. 1, 1918, the Oakland, Antioch & Eastern Railway agrees to deposit with that trustee as many first mortgage bonds, dated Oct. 1, 1911, as at 80 per cent shall equal the face value of all interest coupons deposited and unpaid by Jan. 1, 1918. Moreover, in the interim, the railway agrees to pay 6 per cent interest on the deposited coupons. On Jan. 1, 1918, the trustee is to distribute the deposited bonds, the bondholders surrendering for cancellation their receipts showing the face value of the deposited coupons. The stockholders' agreement calls upon the stockholders to lend the Oakland, Antioch & Eastern Railway \$3 a share payable at different periods before July 1, 1916. The railway agrees to deposit with the trustee promissory notes equal to the stockholders' payments and first mortgage bonds double the face value of the notes. On Jan. 1, 1918, the deposited bonds at 80 per cent are to be distributed to the stockholders in payment for their loans.

Commissioner Edgerton, who wrote the decision, stated that he could not authorize bonds to be issued for bond interest payments, but if the security holders of the railway desired to make a total sacrifice of \$510,000 they should be permitted to do so, in so far as the bonds and notes represent capital expenditures. Yet, if any holders declined such a sacrifice, it was their privilege and right.

American Railways, Philadelphia, Pa.—It is reported that a single holding company will take over the control of the American Railways and the National Properties Company. The plan for the amalgamation of these two companies was described in the *ELECTRIC RAILWAY JOURNAL* of Nov. 6. The main feature was the purchase by the National Properties Company of the American Railways common stock, payment being made in new collateral trust bonds of the former company. The formal call for deposits under such an arrangement, first noted in the issue of Nov. 27, has been extended until Dec. 15.

Baton Rouge (La.) Electric Company.—An initial dividend of 2 per cent has been declared on the common stock of the Baton Rouge Electric Company, payable on Dec. 1 to holders of record on Nov. 22.

Citizens' Traction Company, Oil City, Pa.—An initial dividend of 1 per cent, or 50 cents, has been declared on the common stock of the Citizens' Traction Company, payable on Dec. 1 to holders of record on Nov. 22.

Clarksville & Dunbar Cave Railway, Clarksville, Tenn.—A. C. Murray, formerly president of the Clarksville & Dunbar Cave Railway, is now operating this 5.5-mile line as receiver. This change in condition was caused by automobile competition.

Kansas City Railway & Light Company, Kansas City, Mo.—The depositaries for receiving claims and stock under the Kansas City Railway & Light Company reorganization plans, primary and supplemental, are as follows: In Kansas City, Mo.—New England National Bank, First National Bank, Fidelity Trust Company, Southwest National Bank of Commerce, City Center Bank, Commerce Trust Company, Gate City National Bank, Pioneer Trust Company, National Reserve Bank, Commercial National Bank and Western Exchange Bank. In Chicago, Ill.—Continental & Commercial Trust & Savings Bank. In Louisville, Ky.—National Bank of Kentucky.

Lima-Honeoye Light & Railroad Company, Avon, N. Y.—It is reported that the Lima-Honeoye Light & Railroad Company, operating a 6-mile line between Lima and Honeoye Falls, is now in the hands of a receiver. A previous note in regard to commission refusal to allow the separation of the light from the railway business was published in the *ELECTRIC RAILWAY JOURNAL* of July 3.

Minneapolis, Anoka & Cayuna Range Railroad, Minneapolis, Minn.—The Minneapolis, Anoka & Cayuna Range Railroad has completed the last step in the reorganization which has been under way since Jan. 26, 1914, when F. H. Hunter was appointed receiver for the old Minneapolis & Northern Railway, which built the line. Mr. Hunter managed the property until Jan. 27, 1915, when Charles P. Bratnaber and his associates acquired the title by lien foreclosure. Mr. Bratnaber then sold the line to the Minneapolis, Anoka & Cayuna Range Railroad, and the property was finally cleared of outstanding obligations on Nov. 13, 1915, when the receiver was discharged and deeds of conveyance were filed.

Monongahela Valley Traction Company, Fairmont, W. Va.—At special meetings of stockholders of the Monongahela Valley Traction Company and the Fairmont Gas Company on Nov. 24, the sale of the gas company to the traction company was ratified. The details of this proposed sale were published in the *ELECTRIC RAILWAY JOURNAL* of Nov. 6.

Republic Railway & Light Company, New York, N. Y.—Reilly, Brock & Company, Philadelphia, Pa., have sold at 97.75 and interest, to yield more than 5.75 per cent, the unsold portion of the \$3,000,000 of 5 per cent three-year secured gold notes of the Republic Railway & Light Company. The purchase of these notes was mentioned in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20. The proceeds will be used to pay off the \$3,000,000 of 5 per cent notes maturing on Jan. 1, 1916. The new notes are dated Dec. 1, 1915.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The San Francisco-Oakland Terminal Railways has asked the California Railroad Commission for authority to issue promissory notes to banks as follows: \$36,569 to each of the following: Central National Bank of Oakland, Bank of

California, National Association, Savings Union Bank & Trust Company, Anglo & London Paris National Bank, and Oakland Bank of Savings; a note for \$29,520 to the Central National Bank of Oakland, and a note for \$6,089 to the First National Bank of Oakland. All these notes are payable one year from date and bear interest at 6 per cent. They are to redeem notes, now due, which have been partly paid.

Southern Public Utilities Company, Charlotte, N. C.—The Illinois Trust & Savings Bank, Chicago, and Wm. Morris Imbrie & Company, New York, are offering for sale \$3,250,000 of first and refunding mortgage 5 per cent gold bonds of the Southern Public Utilities Company. The bonds are dated July 1, 1913, and due on July 1, 1943. The authorized issue is \$30,000,000 and the above-stated amount represents all the outstanding securities. They are redeemable on any interest date beginning with Jan. 1, 1916, at 105 and interest. A large portion of the issue has already been placed with investors, but the unsold balance is being offered at 95.5 and accrued interest, to yield about 5.3 per cent.

Taunton & Pawtucket Street Railway, Taunton, Mass.—In accordance with the recent opinion handed down by the full bench of the Supreme Judicial Court, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16, Judge Wait of the equity session of the Superior Court on Nov. 23 entered a decree directing the foreclosure of a trust mortgage held by the Federal Trust Company, securing a total of \$200,000 of bonds issued by the Bristol County Street Railway. The court also appointed as receivers of the property covered by the mortgage Thomas T. Robinson, Dedham, Mass., John Lovejoy, Rockland, Me., and John A. Arnold, Pawtucket, R. I. The receivers of the old Bristol street railway sold the property to the Taunton & Pawtucket Street Railway subject to the above-mentioned mortgage. The purchasing company has maintained in a long legal fight since 1909 that the mortgage and the bonds secured thereby were illegal and invalid and did not constitute a lien upon the property it had acquired. The foreclosure now ordered, however, forms the final decision against this contention, and the bondholders are now in a position to realize upon their holdings through the foreclosure of the street railway property.

Virginia Railway & Power Company, Richmond, Va.—W. J. Parrish has been elected a director of the Virginia Railway & Power Company, the board being increased to fifteen members.

Washington (D. C.) Interurban Railway.—The property of the Washington Interurban Railway, including the single-track electric railway from Fifteenth and H Streets, Washington, D. C., to Berwyn Heights, Md., a distance of 8.5 miles, is to be sold at foreclosure on Dec. 23 at the latter place. It is said that the foreclosure is made under the first mortgage of the Washington, Spa Springs & Greta Railroad, the predecessor company, under which mortgage \$232,000 of twenty-year 5 per cent bonds are outstanding. The court authorization of the sale was noted in the *ELECTRIC RAILWAY JOURNAL* of July 31.

Washington-Oregon Corporation, Vancouver, Wash.—The reorganization plan of the Washington-Oregon Corporation permits every creditor to participate in the North Coast Power Company, which recently purchased the corporation's properties, as noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13. The holders of first mortgage bonds of the corporation will receive 40 per cent of first mortgage bonds of the power company and 60 per cent of preferred stock, while the holders of second mortgage bonds will receive 49 per cent of common stock and an option to buy the balance of preferred and common stock.

Washington Water Power Company, Spokane, Wash.—The maturity of \$3,336,000 of 6 per cent notes, due on Feb. 2, 1916, has been provided for by the Washington Water Power Company through the sale of \$1,700,000 of two-year 5 per cent notes, dated Feb. 2, 1916, and \$1,700,000 of first refunding mortgage 5 per cent bonds, due in 1939. The first issue was sold largely to holders of maturing notes. The bonds were purchased and resold at par and interest by White, Weld & Company and Lee, Higginson & Company, New York.

DIVIDENDS DECLARED

Baton Rouge (La.) Electric Company, 3 per cent, preferred; 2 per cent, common.

Brooklyn (N. Y.) Rapid Transit Company, quarterly, 1½ per cent.

Citizens' Traction Company, Oil City, Pa., 50 cents, common.

Frankford & Southwark Passenger Railway, Philadelphia, Pa., quarterly, \$4.50.

Indianapolis (Ind.) Street Railway, 3 per cent.

Louisville (Ky.) Traction Company, quarterly, 1 per cent, common.

Traffic and Transportation

SKIP STOP DENIED IN MILWAUKEE

Popular Vote, After a Three Months' Trial of the Skip Stop, Is Against the Plan

The Wisconsin Railroad Commission has decided not to authorize the general introduction of the skip stop on the system of The Milwaukee Electric Railway & Light Company. A test of the system has been made, with the authority of the commission, on three of the lines of the company during the past three months. The trial was authorized at the request of the city of Milwaukee and on Nov. 20, at the direction of the commission, a vote was taken of the patrons of the line to determine how popular the plan was with them. To secure an indication of the relative convenience or inconvenience to patrons living at different distances from the business center of the city, each line was divided into six zones, and during the week in question ballots by which passengers could state their preference were distributed and collected by inspectors of the commission working in groups of two. The ballots were so arranged that by tearing off one corner the preference of the patron could be easily indicated without the inconvenience of writing while on a moving car. The ballots were issued when the passengers paid their fare and were collected when they left the car. The returns were separated by zones. Approximately 45,000 ballots were distributed, and of these 36,040 were returned to the inspectors.

Of the total votes cast, 41.6 per cent were in favor of the plan and 58.4 per cent opposed to it. The votes by zones showed that a larger percentage of the patrons in the zones farther from the business center favored the plan than in the zones nearer the center of the city. In the nearest zone the votes in favor of the plan, on the three lines, were respectively only 38.2 per cent, 39.5 per cent, and 31.8 per cent, whereas in the farthest zone they were 49.8 per cent, 48.1 per cent and 36.6 per cent.

As a result of this study the commission has decided that the plan "would cause material inconvenience to a majority of the patrons, and that this inconvenience would more than offset the advantages of speed and operation to be gained." In consequence, the plan was discontinued on Dec. 1.

In commenting on the defeat of the plan a representative of one of the political parties in Wisconsin is quoted as saying that in his opinion much of the opposition arose from the idea that the benefits from the skip stop accrued primarily to the company rather than to the public.

James D. Mortimer, president of The Milwaukee Electric Railway & Light Company, expressed the belief that if the trial had extended over six months instead of three months the patrons would have had a better chance to realize the advantages to them of the quicker service and the vote would have been different. He also said that the company had encountered practically as much antagonism when it had introduced the near-side stop in Milwaukee, but that as the merits of this improvement became more familiar to the people all opposition had disappeared.

SCOPE OF ILLINOIS TRACTION SERVICE

Company Issues Pamphlet Showing Interchange of Freight with More than Eighteen Steam and Electric Roads in Eight States

The Illinois Traction Company, Peoria, Ill., has issued a circular in which is set forth the broadened scope of services which it is performing for shippers in the St. Louis and East St. Louis district. In the pamphlet are listed names of stations in Illinois, Indiana, Minnesota and the Dakotas reached by the McKinley System and its connecting steam railroads. It also gives routing instructions and tariff references, which commercial traffic managers and shipping clerks will find useful. There is an account of the equipment owned and operated by the company.

The McKinley System has its main freight station in St. Louis, at Twelfth Street and Lucas Avenue, and in addi-

tion substations for package freight, to which drayage is absorbed, at the receiving stations of the St. Louis Transfer Company, the Columbia Transfer Company, Fidelity Transfer Company and Beck Drayage Company.

H. H. Wylie, general agent of the Illinois Traction System at St. Louis, is quoted as follows:

"St. Louis shippers, and travelers generally, have not been fully initiated into the workings of a big interurban system. Every day there come up incidents of this. The idea prevails that we handle passengers and a little express business, but relatively few merchants and manufacturers realize what the system is doing in the way of freight distribution. With the municipal loop agitation, and effort being made by St. Louis to secure the entry of other interurbans, the proposition of educating the people in the benefits of interurban service is an important one. In a small way we are trying to do something along these lines with the pamphlet 'Specific Services.' The McKinley System interchanges freight with more than eighteen steam and electric railroads in Missouri, Illinois, Indiana, Iowa, Michigan, Minnesota and North and South Dakota, and it has combination rates and services with many boat lines on the Mississippi and Illinois Rivers, and Lake Michigan."

In addition to the location of the St. Louis team tracks and substations, the pamphlet enumerates those in East St. Louis, Granite City, Madison and Venice. According to the pamphlet, the Illinois Traction System offers special advantages for the movement of merchandise or package freight, which is transported on express time at freight rates. The time of transit to many places within 200 miles of St. Louis is reduced to the utmost minimum. Package cars are forwarded daily to points in Illinois, Iowa, Minnesota and the Dakotas.

FAVORABLE SKIP-STOP VOTE IN ST. LOUIS

The skip-stop schedule on trial on the Broadway and the Olive Street lines of the United Railways, St. Louis, Mo., was indorsed by the patrons of the lines by a majority of more than three to one in a referendum on Nov. 22. The total vote was, "yes" 67,588, "no" 21,395. Richard McCulloch, president and general manager of the company, discussing the result of the election, is reported to have said:

"The company is pleased with the outcome and feels that many of those who did not vote are for the 'eliminated stop' schedule, because those who were opposed to the new system were active in their objection. Although only half of the patrons of the lines voted, we feel that the public has shown considerable interest in the question."

Putting this question to passengers grew out of the application of the United Railways for a permit to eliminate several hundred stops, including all of its lines. The Public Service Commission, while declining to grant the permit, did authorize the company to eliminate 101 stops along its Broadway and Olive Street lines, during three months, to find, through such a test, whether the proposed plan was popular. The company, after making the experiment, asked passengers to pass upon the matter.

STATE SAFETY FIRST CONFERENCE

A safety first conference, called under the auspices of the State Department of Labor, was held in Oklahoma City, Okla., on Nov. 17 and 18. Nearly 200 representatives of different industries were present to listen to various speeches on safety work and to examine safety exhibits.

The chairman and speaker at the first session was George W. Knox, second vice-president and general manager of the Oklahoma Railway. Mr. Knox described the purposes of the meetings and discussed safety first work in general. The best definition of safety first that he had ever seen was "the exercising of ordinary care and the elimination of taking chances." He believed that the idea of indemnity insurance is wrong and that this method constitutes a premium-offering scheme for carelessness. To his mind the problem of how to prevent accidents is the easy part of the whole proposition, but the difficult part is to get people to think and act in a precautionary manner. Mr. Knox felt that a precautionary system of education should be devised and established in all schools and colleges, particularly for the elementary grades when the young mind is most susceptible to impressions. This method would result in incul-

cating thoroughly and absolutely all of the essentials for so shaping one's acts that all causes of danger will be eliminated to the fullest degree possible.

At the last session of the conference the Oklahoma Safety First Council was definitely organized. Oklahoma is said to be the first State to form such an organization. The body will be patterned to a certain extent after the National Safety Council, and the by-laws of the national organization will be used as far as possible. The purpose of the organization is to secure an energetic representative in every leading industry of the State to perfect smaller organizations in the industry. The latter, in turn, would perfect local organizations in the towns. A central committee, consisting of representatives from several different lines of industry, was named, with W. G. Ashton, State Commissioner of Labor, as chairman. More members are to be added as rapidly as possible. This winter it is planned to have a campaign for arousing meetings in every town. Motion picture films and stereopticon slides will be utilized.

RAISED SAFETY ZONES FOR DETROIT

Detroit will experiment with the raised safety zone in an endeavor to protect street car patrons from vicious and reckless automobile drivers who now drive heedlessly through the chalk-marked safety zones in the streets. The experiment will be made at Woodward and Adams Avenues, two blocks away from the most congested crossing in the heart of the city. The raised platform will be built of concrete. Police Commissioner Gillespie will be in charge of the experiment.

When safety zones for street car riders were first laid out on Detroit streets the ends of the zones were protected by standards. So many of these were knocked over at night, however, by automobile drivers, that the police department eliminated the standards and marked the ends of the zones with round disks. These do not furnish any obstruction to a driver wanting to drive through the safety zone, and as a result many street accidents have occurred within the zones. The determination to elevate the surface to an extent that will compel motorists to observe the zones is a kind of desperate last hope of the police department.

Officials of the Detroit United Railway have not looked with particular favor upon the kind of raised zone which is proposed, although they have expressed themselves as content to abide by any experiment which will decrease street accidents. It is the contention of the street railway operators that Detroit's climatic conditions in winter will make a concrete platform close to the car tracks dangerous for passengers. It is their idea that the cities cited as examples of the value of the raised zone are not confronted with the winter conditions which exist in Detroit. They fear that in the rush hour with crowds endeavoring to get upon a narrow concrete platform passengers may be shoved or slip in front of the car wheels.

Six-for-a-Quarter Tickets Discontinued.—The Lincoln Railway & Heating Company, Lincoln, Ill., has abolished the custom of selling six tickets for 25 cents.

Early Shopping Card.—The Buffalo, Lockport & Rochester Railway, Rochester, N. Y., is displaying in all its cars an early shopping sign. The card reads "Christmas Is Coming—Do Your Shopping Now." The card carries a picture of St. Nicholas.

Interurban Increases Fare.—The Indianapolis, Columbus & Southern Traction Company, Columbus, Ind., announced an increase from 1½ cents to 2 cents per mile, effective on Dec. 1. The 10 cents extra fare for limited cars will be continued.

Massachusetts Fare Increase Suspended.—The Public Service Commission of Massachusetts has suspended until May 1, 1916, the proposed increase in fares by the Massachusetts Northeastern Street Railway, Haverhill, Mass. The commission has fixed on Dec. 14 as the date for commencing the hearing in the case.

Gates on All Seattle Cars.—The work of installing safety gates on cable cars of the Puget Sound Traction, Light & Power Company, Seattle, Wash., has been completed, and every car the company now operates has gates. The electric cars were equipped first, the cable cars being the last to remain with open gates and running boards.

Installing Thermometers in St. Louis Cars.—In compliance with the orders of the Public Service Commission of Missouri the United Railways, St. Louis, is installing thermometers in its 1400 cars. Under the ruling of the commission the temperature inside the cars must be at least 45 deg. Fahr., and not more than 70 deg. Fahr., when the outside temperature is 35 deg. Fahr., or less.

Complainants Fail to Appear at Fare Hearing.—None of the plaintiffs appeared at the hearing before the Public Service Commission of the Second District of New York on the complaint of L. L. Amidon and others against the Warren & Jamestown Electric Railway, in which they seek a reduction of the fare between Frewsburg and Jamestown, N. Y., from 10 cents to 5 cents. The hearing has been adjourned indefinitely.

City and Company to Confer on Car Type.—The Ontario Railway & Municipal Board on Nov. 22 directed the city of Toronto and the Toronto Railway to confer immediately as to the best type of car to be substituted for the running board vehicle. They have thirty days to agree on a type of car. If at the end of that time they fail to come to a complete understanding the city will have fifteen extra days to suggest an alternative type of car, with final appeal to the railway board.

Increase in Wages in Manchester.—The Manchester (N. H.) Street Railway, Manchester & Derry Street Railway and the Manchester & Nashua Street Railway have increased the wages of their trainmen to the following scale: First year, 23 cents an hour; first half of second year, 24 cents an hour; second half of second year, 25 cents an hour; third year, 26 cents an hour; fourth year, 26½ cents an hour; fifth year, 27 cents an hour; sixth year, 28 cents an hour; seventh year, 29 cents an hour; after seven years, 30 cents an hour.

Illinois Commission Jurisdiction Suit on Dec. 14.—In the suit in the Circuit Court of Cook County in which the city of Chicago questions the authority of the Public Service Commission of Illinois, the court, acting upon the joint application of the Attorney General for the State and the Corporation Counsel for the city, has decided to hear arguments on Dec. 14. Counsel having agreed not to enforce the service order until the case has been argued, the court has not acted on the prayer of the complainant for a temporary order to restrain the commission from putting the service order into effect. The terms of the order of the commission fixing service standards were reviewed at length in the *ELECTRIC RAILWAY JOURNAL* of Oct. 20, page 931.

Rates Advanced in Missouri.—The Missouri Public Service Commission recently granted an increase from 2 cents to 2½ cents a mile for passenger fares, with somewhat lower rates on round trips and mileage books, and an increase of about 5 per cent in freight rates. The commission held that a former state reduction from 3 cents to 2 cents a mile in the passenger rates was not accompanied by a sufficient increase of business to offset the lower income. In granting a general increase to the petitioning carriers the commission said: "When it is considered that we are asked to fix one schedule of rates that will be reasonable for fourteen railroads serving territory dissimilar in cost of construction, in destination and character of traffic, some containing large commercial centers and forming valuable connections with other carriers, while others do not, it is apparent, however well informed the commission should be as to the value of the property upon which the carrier is entitled to earn a reasonable return, no adjustment of the rates could be expected in which equal results would follow as to the return received by each carrier."

Buffalonians See the Liberty Bell.—The presence of the Liberty Bell in Buffalo on its return to Philadelphia after its circuitous transcontinental trip from San Francisco presented one of the most difficult traffic problems handled by the International Railway, Buffalo, N. Y., in some time. During the hour that the bell was on exhibition in Buffalo, it is estimated that at least 60,000 persons tried to view it, and that 75 per cent of those who inspected the historic relic rode on the street cars. The ease with which the problem was handled by the railway without delay or extreme overcrowding delay was commented upon by the police and city

officials. Nelson H. Brown, general superintendent of transportation, and T. W. Connette superintendent of the Buffalo city lines, took personal supervision of the car movement. Cars of almost every route in the city were looped through Main, Exchange, East Seneca and Michigan Streets, within less than 500 ft. of the bell, so the need for transferring from one line to another in congested downtown centers was almost entirely eliminated. The superiority of the controlled entrance type of near-side pay-as-you-enter cars over the old type cars was again demonstrated.

Skip Stops Begun in Detroit.—Starting on Sunday, Nov. 28, the Detroit (Mich.) United Railway began the operation of skip stops on the Woodward Avenue line, the heaviest passenger traffic line in Detroit. The skip stops are not effective within the heart of the city. In so far as possible the stops have been made at alternate blocks, cars running in opposite directions not stopping at the same intersection except at transfer points. Stops have been marked by poles painted white. The company was moved to immediate action following the receipt of a letter from Commissioner of Police Gillespie, in which he urged the establishment of the skip stops. Briefly, his reasons for asking for the new plan of stops are: The addition of trailers on Woodward Avenue has practically blocked east and west traffic in many of the short blocks; the contemplated action of the Common Council in compelling motorists to stop with the street cars will be made more practical; the belief that the plan will make possible the putting on of more cars, thereby affording greater accommodations for the public, especially during the rush hours. If the experiment on Woodward Avenue proves satisfactory to the authorities and the public the skip-stop plan will be extended to other lines in the city.

Ohio Supreme Court Decides Fare Case.—The Ohio Supreme Court on Nov. 19 handed down a decision in which a 5-cent fare is established on the line of the Interurban Railway & Terminal Company between Pleasant Ridge and Fountain Square, Cincinnati. Pleasant Ridge, then an independent village, granted franchise rights on competitive bidding as to fares in 1901. The Rapid Transit Company was the successful bidder. It offered a 7-cent fare with transfers, with the proviso that the fare would be reduced to 5 cents should the village be annexed to the city of Cincinnati. The franchise was afterward assigned to the Interurban Railway & Terminal Company. Subsequently the village was annexed to the city. Suit was filed to enforce the terms of the franchise and the decisions of both Courts of Common Pleas and Appeals were in favor of the city. The company made the defense that it did not own the lines through Norwood and is compelled to pay the Cincinnati Traction Company 3 cents out of each fare for the use of its tracks. It contended further that the village ordinance was invalid, for the reason that it attempted to fix the rate of fare outside its own limits. The court held that the acceptance of the franchise constituted a binding contract between the two parties.

"Safety" Motion Picture Films Available.—The use of motion picture films in educational work is becoming more common every day, and perhaps in no other branch of education have they proved more effective than in teaching workmen and the public generally about the causes and remedies for accidents. Three electric railway companies which have had made for their own use series of films showing accidents common in electric railway operation and the means of avoiding them are the Chicago (Ill.) Surface Lines, Pittsburgh (Pa.) Railways and Pacific Electric Railway, Los Angeles. It is interesting to learn that arrangements have recently been made by the National Safety Council of Chicago by which these films are available to other railway companies. The National Safety Council held its last annual convention at Philadelphia on Oct. 19-21. This meeting was reported on page 905 of the issue of this paper for Oct. 30. The members are largely steam railroads and industrial corporations, although a number of electric railways were represented at the Philadelphia convention. H. A. Bullock, of the Brooklyn (N. Y.) Rapid Transit Company, was elected at that meeting a member of the board of directors and chairman of the membership committee of the electric railway section, and hopes to interest other electric railway companies in the important work being done by the Council.

Personal Mention

Mr. C. F. Bruce, auditor and purchasing agent of the Tulsa (Okla.) Street Railway, has resigned to become secretary and treasurer of the Southwest Mortgage & Investment Company, Tulsa.

Mr. A. Ludlow Kramer, president of the Electric Properties Corporation, New York, N. Y., has resigned in order to take a rest after an operation. Mr. Guy E. Tripp, chairman of the Westinghouse Electric & Manufacturing Company, has been elected to succeed him temporarily.

Mr. C. Loomis Allen, chairman of the board of the Maryland Electric Railways, vice-president of the Syracuse & Suburban Railroad, president of the Newport News & Hampton Railway, Gas & Electric Company, and formerly president of the American Electric Railway Association, has been appointed co-receiver of the Empire United Railways, Inc., Syracuse, N. Y. Mr. H. S. Holden, Syracuse, was appointed receiver of the company on Nov. 1.

Mr. J. S. Pevear, president of the Birmingham Railway, Light & Power Company, Birmingham, Ala., a subsidiary of American Cities Company, whose time has been largely engaged in connection with the administration of the United Gas & Electric Engineering Corporation in New York, took active charge of the Birmingham property on Dec. 1. Mr. J. P. H. De Windt will remain with the Birmingham property in the capacities of vice-president and general manager.

Mr. H. C. Kendall has resigned as traffic engineer with the Portland Railway, Light & Power Company, Portland, Ore., to accept a position with the Denver (Col.) Tramway, of which Mr. F. W. Hild, former general manager of the Portland Railway, Light & Power Company, is now vice-president and general manager. Mr. Kendall was engaged about three years ago to make a traffic survey and work out rerouting plans for the Portland Railway, Light & Power Company. Prior to coming to Portland he was connected with the Illinois Traction Company. Mr. Kendall is a graduate of Massachusetts Institute of Technology.

Dr. W. F. M. Goss, chief engineer of the Chicago Association of Commerce committee on smoke abatement and electrification of railway terminals, has been dean of the college of engineering of the University of Illinois since 1907. For two years past he has been absent on leave from the university to permit him to devote his entire attention to the work of the committee, an abstract of the report of which appears elsewhere in this issue. Dean Goss is well known in the fields of steam railroading, mechanical engineering and education, to each of which he has made notable contributions. Immediately after completing his studies at the Massachusetts Institute of Technology in 1879 he organized the department of practical mechanics at Purdue University. He was identified prominently with Purdue for a long period, occupying the positions of professor of experimental engineering, dean of the schools of engineering and director of the engineering laboratories. In this connection he co-operated with the steam railroads in making tests of locomotives and of parts of railroad equipment, which work has been continued at Illinois. He recently served as president of the A. S. M. E. and has held numerous other positions in technical societies. He is the author of several books, principally on locomotive topics. At Illinois he was instrumental in establishing the department of railway electrical engineering, which is co-ordinate with those of railway mechanical and railway civil engineering. These three departments form a special school which has exceptional facilities for their work.

DR. W. F. M. GOSS

Mr. Nathan A. Rumney, the newly appointed general freight and express agent of the Detroit (Mich.) United Lines, was born in England on June 16, 1878. When he was

NATHAN RUMNEY

eleven years old he moved to Detroit, Mich. After completing his education in the public schools of that city, he began work with the Michigan Central Railroad in 1894. In October, 1901, he joined the late George W. Parker, his predecessor, in organizing and developing the express and freight service on the Detroit United Lines. His first position with this company was in the general freight department, and he afterward filled various traffic positions until he was appointed traveling freight and express agent

in 1905. As general freight and express agent, Mr. Rumney will assume charge of a department handling the heaviest electric interurban express and freight traffic in this country with the possible exception of the Pacific Electric terminal at Los Angeles, Cal. The Detroit freight terminal alone receives and delivers more than 1,000,000 lb. of freight daily. The system of the Detroit United Lines comprises more than 850 miles of track.

Mr. G. H. T. Shaw recently succeeded Mr. C. A. King as general manager of the Lee County Central Electric Railway, Lee Center, Ill. From 1887 to 1889 Mr. Shaw was connected with the Lake Shore & Michigan Southern Railroad as a rodman and assistant engineer on the line between Cleveland and Buffalo. In 1890 he served as assistant engineer in charge of field work on building the section of double track for the Chicago & Northwestern Railroad from Rochelle to La Fox, Ill. In 1892 and 1893 he was engineer in charge of a party in the location of the Ferrocarril del Cauca from Buenaventura to Cali, Colombia, South America. From 1893 to 1905 Mr. Shaw established himself as a consulting engineer with offices at Dixon, Ill. During this period he had charge of large works in swamp drainage in Illinois, Wisconsin and Indiana and irrigation projects in California and Oregon. From 1905 to 1910 Mr. Shaw was located at Toluco, Mexico, in charge of extensive surveys for the location of 1100 km. of railway from Mexico City to Acapulco. From 1910 to 1913 Mr. Shaw was manager for the Balsas & Pacific Railway, with offices in London, England. This company had started to build a railway along the route of surveys made by Mr. Shaw, who called in the surveying parties in 1913. Since then Mr. Shaw has been located at Lee Center. The Lee County Central Electric Railway is now the owner of a part of a system of interurban electric railways started in 1903 by Mr. Shaw and his associates and projected to extend from DeKalb, Ill., to Rock Island, Ill. Mr. Shaw was president of the three companies. The old companies are all defunct, but it is the hope of the present company to build the system along the lines which were formerly in view.

OBITUARY

P. E. Huber, one of the founders of the Oerlikon Works in Switzerland, died at Zurich, on Oct. 4, at the age of seventy-nine. He was a native of Zurich and received his education in the local Polytechnic High School, of which Mr. Alfred Escher was at the time president. After practical experience with the Sulzer firm in Winterthur and with Escher, Wyss & Company in Zurich, Mr. Huber in 1863 founded the firm of P. E. Huber & Company at Oerlikon, which, after various changes, in 1876 took the form of the Maschinenfabrik Oerlikon. Mr. Huber continued to be the active director in charge until 1894, and from then until 1911 remained as president of the advisory council of the firm, of which he was a member at the time of his death. He also served as president of the Aluminum-Industrie A. G., Neuhausen.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Evanston (Ill.) West Side Railway.—Incorporated in Illinois to own and operate electric railways. Capital stock, \$10,000. Incorporators: Bertram W. Rosenstone, Henry J. Myerson and Oscar A. Ross.

*Lawrence, Topeka & Western Railway, Lawrence, Kan.—Incorporated in Kansas to construct an electric railway from Lawrence to Topeka. The line will be on the north side of the Kaw River. Capital stock, \$100,000. Incorporators: Former Governor W. R. Stubbs, J. D. Bowersock, J. E. Stubbs, A. Henley, C. E. Dutton and C. R. Hosford, all of Lawrence.

FRANCHISES

Long Beach, Cal.—The Pacific Electric Railway has received permission from the Council to abandon its line beginning at Seventh Street and Pine Avenue and extending westerly to Seventh Street and Riverside Drive.

Belvidere, Ill.—The Elgin & Belvidere Electric Company has accepted the ordinance adopted by the Council of Belvidere on Sept. 2 which provides for the abandonment of the city lines. The line on West Lincoln Avenue and the tracks on South State Street south of Logan Avenue are to be taken up and the poles removed within thirteen months and the tracks on the State Street line north of a point just south of the Chicago & Northwestern Railroad within two years.

Buffalo, N. Y.—The International Railway has asked the Council for a franchise to construct a double-track extension on Washington Street between Ohio and Perry Streets; also on Ohio Street from Washington to Main Street. This extension will connect with the new terminal station being built by the Lackawanna Railroad, the Cleveland & Buffalo Transit Company and the Detroit & Cleveland Navigation Company at the foot of Main Street at Ohio Street.

Salt Lake City, Utah.—The Utah Light & Traction Company has asked the Council for a franchise to extend its Capitol Hill line along Second North Street across the front of the capitol, thence north on West Canyon Avenue to a point east of the capitol building.

Seattle, Wash.—The franchise committee of the Council has recommended that the petition of the Puget Sound Traction, Light & Power Company to operate a shuttle service in the circuitous route of the Ballard Beach line be granted. The company proposes to operate the Ballard Beach cars direct to the city and to operate a one-man car over the shuttle line. The committee, however, recommended that the company issue transfers to and from the shuttle line on a 4-cent ticket, and the company has agreed to this provision.

TRACK AND ROADWAY

Pine Bluff (Ark.) Company.—Material has been received for the reconstruction of this company's line on Cherry Street from Sixth to Twenty-sixth Avenue. From Sixth to Sixteenth Avenue the line will be double tracked, and to the end of the line at Twenty-sixth Avenue a concrete foundation will be laid and the track rebuilt.

San Diego (Cal.) Electric Railway.—Plans are being made by this company to extend its line on University Avenue to Euclid Avenue.

Municipal Railways of San Francisco, San Francisco, Cal.—The Board of Works has approved the city engineer's plans for the construction of the Church Street municipal railway between Eighteenth and Twenty-second Streets. This section of the road will run through Mission Park from Eighteenth to Twentieth Street and over a right-of-way the city has bought between Twentieth and Twenty-second Streets. The specifications provide for the removal of buildings, grading and track construction. Bids will be received by the Board of Works on Dec. 8.

Belleville & Mascoutah Traction Company, Belleville, Ill.—During 1916 this company plans to build 10 single-track miles of line between Belleville and Mascoutah.

Chicago, Milwaukee & St. Paul Railroad, Chicago, Ill.—Operation will be begun by this company on its electrified division from Deer Lodge to Three Forks, Mont., on Dec. 8. The complete electrification will consist of four divisions extending across the Rocky Mountains, comprising 650 miles of single track. Construction crews are now working on the second division from Three Forks to Harlowton.

Illinois Traction System, Peoria, Ill.—Efforts are being made to have this company build a line from Edwardsville east to Marine and to Highland.

*Washington, Ind.—Plans are being considered to build an electric railway between Washington and Linton through Bicknell, Frelandville, Pleasantville and Dugger. Options on the right-of-way, it is understood, have been taken. A. L. Brocksmith, Bicknell, is interested in the project.

Charles City (Iowa) Western Railway.—An extension from Charles City to Colwell, 8 miles, has been completed by this company.

Tri-City Railway Company, Davenport, Iowa.—This company is considering the extension of a line into territory to the southeast of Moline.

Fort Scott & Pittsburg Railway, Fort Scott, Kan.—A report from this company states that negotiations are now under way with a construction company to build its line from Fort Scott to Pittsburg, 36 miles. The line will connect Fort Scott, Garland, Arcadia, Mulberry, Frontenac and Pittsburg. H. A. Cooper, Redfield Building, acting secretary. [Sept. 4, '14.]

Arkansas Valley Interurban Railway, Wichita, Kan.—A report from this company states that operation will be begun this week on its new 29-mile line to connect Halstead and Hutchinson via Burrton.

Berkshire Street Railway, Pittsfield, Mass.—It is expected that this company's Lee-Huntington extension will be in operation from Lee to Otis within a month. The company recently filed with the Public Service Commission an application for a certificate of operation covering that portion of the new extension, built two years ago, but not yet placed in operation.

Electric Short Line, Minneapolis, Minn.—Tracklaying has been begun by this company on its 45-mile extension from Winsted to Hutchinson and it is expected to have the new line in operation by January, 1916. The company expects to build about 50 miles of new line during 1916.

Fallon (Nev.) Electric Railroad.—This company reports that it expects to begin operation early next spring.

Interborough Rapid Transit Company, New York, N. Y.—Bids for the installation of tracks on the White Plains Road extension of the Lenox Avenue branch of the existing subway were opened last week by the Public Service Commission for the First District of New York. This line extends northerly from the terminus of the existing road at Bronx Park through White Plains Road to 241st Street, near the northern city line. It is to be a three-track elevated railroad, and will be operated in conjunction with the present subway system by the Interborough Rapid Transit Company. The steel structure for the new line is rapidly approaching completion, and the contract for station finish work has already been awarded. The two lowest bids for the work were received from the Coast & Lake Contracting Corporation, at \$53,930.50, and the Southeastern Construction & Engineering Corporation at \$101,205.86. Bids were opened on Nov. 30 by the Public Service Commission for the First District of New York for the construction of Section No. 2, Routes Nos. 19 and 22, being a part of the Southern Boulevard and Westchester Avenue branch of the Lexington Avenue subway. The line, which will be elevated, extends on Whitlock Avenue and Westchester Avenue from Bancroft Street to Eastern Boulevard. Unofficial totals of the two lowest bids are: Lawrence C. Maxwell, 1665 Eighty-second Street, Brooklyn, \$2,063,877; A. L. Guidone Company, 131 East Twenty-third Street, New York, \$2,072,700.

Manhattan & Queens Traction Corporation, New York, N. Y.—This company reports that during 1916 it expects to build 4 miles of single track.

Westchester Street Railroad, White Plains, N. Y.—This company is improving its White Plains-Tarrytown line. Practically the entire roadbed is being changed or raised to conform with the grades of the Tarrytown-White Plains State Road improvement. The tracks on Benedict Avenue, Yonkers, are being removed from the side to the center of the street. Tracks will also be laid in Elmsford.

Grand Forks (N. D.) Street Railway.—This company reports that during 1916 it will construct about 1 mile of new track in Grand Forks.

Ohio Valley Traction Company, Portsmouth, Ohio.—This company reports that it expects to build 21 miles of single track during 1916 to connect Ironton and Portsmouth. All materials have been purchased and all contracts let. The line will be completed about May 1, 1916.

Oklahoma (Okla.) Railway.—This company reports that during 1916 it expects to construct a 16-mile single-track extension from Edmond to Guthrie.

Oklahoma Union Traction Company, Tulsa, Okla.—This company reports that during 1916 it expects to build 15 miles of new interurban line between Tulsa and Sapulpa.

Sombra, Ont.—Plans are being discussed for a hydro-electric radial line for the river front to touch all the points of population from Wallaceburg to Sarnia. W. A. Scott, Bickford, Ont., clerk.

Portland Railway, Light & Power Company, Portland, Ore.—This company is seeking the abandonment of two short pieces of its line, one of which is on Burnside Street from Fifth to Washington Street at Sixteenth Street, and the other on Maryland Avenue from Shaver to Prescott Street. The company contends that both of these lines are little used and are operated at heavy expense.

Panama (Panama) Electric Company.—A report from this company states that plans are being made to build an extension to Fort Amador. The power plant being constructed by the company is nearing completion.

Harrisburg (Pa.) Traction Company.—The Council of East Berlin has granted right-of-way to this company into East Berlin for the maintenance of a trackless trolley line between East Berlin and Dover. The Council of Dover has already granted this permission. The line will carry both passengers and freight. It is expected that work on the proposed route will be begun in the near future.

Highland Grove Traction Company, McKeesport, Pa.—This company reports that it proposes to construct an extension from McKeesport to East Pittsburgh.

Slate Belt Electric Street Railway, Penn Argyll, Pa.—During 1916 this company expects to construct 15 miles of new line between Wind Gap and Stroudsburg.

Rhode Island Company, Providence, R. I.—Track has been laid by this company on Broad Street, Central Falls, to connect with the new Blackstone River bridge.

Chattanooga (Tenn.) Traction Company.—Grading has been begun by this company on its extension to Hixon. It is stated that grading will be completed in ninety days and the laying of track will be begun, the order for the rails having been placed some weeks ago.

***Cleveland, Tenn.**—H. M. Linn, Cleveland, is agitating the project of an electric railway from Cleveland to Chattanooga, Knoxville and Ocoee. In this connection he is quoted as stating: "Officials of the Tennessee Power Company recently went to Benton, where they recorded a charter for operation of an electric railway from a point on the Louisville & Nashville Railroad, near Ocoee, to Parksville. The company now operates between 5 miles and 6 miles of steam railway between these points and proposes to convert this line into an electric road for both freight and passengers. Every move thus far points to the development of a pleasure resort at Parksville."

Nashville Railway & Light Company, Nashville, Tenn.—This company has filed an amendment to its charter, authorizing it to construct a branch line from the Nineteenth Street line between Lillian and Rothschild Streets into Shelby Park.

Beaumont (Tex.) Traction Company.—Plans are being considered by this company, to extend its Sabine Street line on Doucette Street to Grove Street, Beaumont.

Temple & Marlin Interurban Railway, Temple, Tex.—Formal organization of this company was completed at a meeting held at Marlin on Nov. 24. The following officers were elected: G. W. Glass, Marlin, president; George Harter, Temple, first vice-president; J. J. Waits, Durango, second vice-president; W. W. Turner, Marlin, secretary; T. A. Cheeves, Marlin, treasurer, and S. D. Hanna, Temple, chief engineer. The company expects to have the line in operation within the next eighteen months. [Sept. 25, '15.]

Bingham Canyon, Utah.—As soon as franchises in Bingham and through the county can be secured work will be begun on the electric line between Bingham and West Jordan, where the line will connect with the Salt Lake & Utah Railroad. Surveys have been completed and the capital for construction, estimated at \$250,000, is available at once. Harry S. Joseph is interested. [Aug. 7, '15.]

Monongahela Valley Traction Company, Fairmont, W. Va.—H. L. Lambert, vice-president of the Undercurrent Company of America, has been in consultation with officials of the Monongahela Valley Traction Company in regard to the installation of a car line without poles or overhead trolley wire to operate from Clarksburg's business center, across the new concrete bridge to the Baltimore & Ohio Railroad station in Glen Elk, testing out the patents of the Undercurrent Company of America.

Weston & Glenville Electric Railroad, Weston, W. Va.—At a meeting of this company held on Oct. 30 it was decided to discontinue business as a corporation and surrender its charter and corporate franchises. Notice of the dissolution of this company has been sent to the Secretary of State of West Virginia. [July 10, '15.]

SHOPS AND BUILDINGS

Illinois Traction System, Peoria, Ill.—The Jacksonville Railway & Light Company, Jacksonville, Ill., a subsidiary of the Illinois Traction System, has purchased the building occupied by the Jacksonville National Bank. The first floor of the building will be equipped for a salesroom and waiting station for this company.

Boston (Mass.) Elevated Railway.—This company is completing extensive alterations and additions to its freight and trolley terminal property at Copps Hill Wharf. The company has recently purchased from the New Haven Railroad a tract of 1 acre of land adjoining that owned by the elevated. The enlarged terminal will include about 2 acres. It will have three freight sheds to one now used. Seven automobiles and property to the value of about \$12,000 were destroyed on Nov. 23 when an explosion of gasoline set fire to the garage in the Boston Elevated yards on Harrison Avenue.

Laurel Light & Railway Company, Laurel, Miss.—This company is demolishing the old building at the Laurel-Ellisville Park and is erecting a moving picture theater with other attractive structures.

***Dallas, Tex.**—It is reported that interurban electric railway interests centering in Dallas have reached an agreement for the construction of a large system of terminals and a Union station. Stone & Webster Engineering Corporation, Boston, is interested.

POWER HOUSES AND SUBSTATIONS

Connecticut Company, New Haven, Conn.—This company has applied to the Council for a permit to rebuild and enlarge its power station on Commerce Street, Hartford. Four 1000-hp. boilers and a coal conveyor will be installed. The station will be equipped with smoke consumers. The cost of the proposed improvements, it is estimated, will reach the sum of \$197,000.

Sapulpa & Oil Field Railway, Tulsa, Okla.—This proposed railway is contemplating the installation of a power plant at Shamrock to supply electricity for operating machinery in the oil fields and also for railway use. High-tension lines will be used. J. A. Frates, general superintendent of the St. Louis & San Francisco Railroad, St. Louis, is president of the company.

Manufactures and Supplies

ROLLING STOCK

Oakwood Street Railway, Dayton, Ohio, is reported as preparing plans for the purchase of new cars.

Dayton, Springfield & Xenia Southern Railway, Dayton, Ohio, it is reported, will rebuild three of its cars shortly.

Springfield (Mo.) Traction Company during the year rebuilt four double-truck and two single-truck cars in its own shops.

Salt Lake & Ogden Railway Company, Salt Lake City, Utah, is reported to be in the market for six large open trail cars.

Alton, Granite & St. Louis Traction Company, Alton, Ill., has rebuilt two cars in its own shops for limited service between Alton and St. Louis. The company is now rebuilding another car.

Pittsburgh (Pa.) Railways has ordered fifteen center-entrance interurban cars from The J. G. Brill Company, in addition to the order for 175 city cars reported in the ELECTRIC RAILWAY JOURNAL of Nov. 27.

New York (N. Y.) Municipal Railway, noted in the ELECTRIC RAILWAY JOURNAL of Nov. 27, as expecting shortly to buy 100 more cars for its subway system, has issued requests to carbuilders for bids on this equipment.

Lewiston, Augusta & Waterville Street Railway, Portland, Me., has ordered from the Laconia Car Company seven 35-ft. flat cars with diamond arch bar trucks. This order is in addition to that ordered by the same company in October for five flat cars with trucks.

Worcester (Mass.) Consolidated Street Railway has converted two double-truck closed cars and one double-truck open car into the prepayment type. The reconstruction of nine double-truck open cars into the prepayment type is also under construction and is expected to be completed before the end of the year.

Chattahoochee Valley Railway, West Point, Ga., has ordered one 32-ft. 9-in. Edison storage battery car from the Railway Storage Battery Car Company, New York, N. Y. The car, which will be built by The J. G. Brill Company, is somewhat similar in general type to the two storage battery cars now operating on the Long Island Railroad between Valley Stream and Mineola. It will have double folding doors at each platform opening and will have two compartments, with a partition door in between, for separating whites from negroes.

TRADE NOTES

Westinghouse Traction Brake Company, New York, N. Y., has received an order to equip with straight air brakes two passenger cars of the Bush Terminal Railroad, Brooklyn, N. Y.

Spray Engineering Company, Boston, Mass., has adopted a new trademark and also the trade name "Spraco" to apply to all its products, including air washers, nozzles and cooling systems, etc.

I. R. Nelson Electrical Manufacturing & Repair Works, Newark, N. J., have moved into larger quarters in Newark. The new factory is located on Bond Street, where two buildings are being equipped with modern machinery for the manufacture of field and armature coils and general electrical repair materials for traction and industrial motors and generators. A system of vacuum drying and impregnating apparatus is also being installed.

Western Electric Company, New York, N. Y., announces that on Nov. 18 all of the assets of the Western Electric Company of Illinois were acquired by transfer to a company chartered under the laws of the State of New York, to be known as Western Electric Company, Inc. The stockholders of the Western Electric Company came to the conclusion that it was desirable that the company should have two classes of stock, common and non-voting preferred. As the statutes of Illinois do not provide for such classifications it was decided that the company should change its legal domicile. No change in the policies, operations, or management of the company is involved. The same board of directors and officers still continue. The Western Elec-

tric Company, Inc., under the laws of New York will have \$15,000,000 of 6 per cent cumulative preferred stock and 150,000 shares of common stock at no par value, but with \$5 paid in, making a total of \$750,000. The Western Electric Company has changed its Detroit headquarters from 263 Franklin Street to Kirby and Dequindre Streets. The new building is two stories high and has a frontage of 150 ft. and a depth of 130 ft. adjoining the Grand Trunk Railway in the section that forms a part of the inner belt railway of Detroit. The total floor space is 50,000 sq. ft., and the yard with an area of 54,000 sq. ft. is large enough to accommodate stocks of cross-arms, clay conduit and poles.

ADVERTISING LITERATURE

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued Bulletin No. 24 describing its complete line of small motors.

Chicago Patented Tools Company, Racine, Wis., has issued a card illustrating its "Potstada" drop forged steel shear for cutting steel plate up to $\frac{3}{8}$ in. in thickness.

Harrison Safety Boiler Works, Philadelphia, Pa., have issued a reprint of a paper entitled "Establishing and Maintaining Boiler Room Economy," which was presented before the Ohio Society of Mechanical, Electrical & Steam Engineers by George H. Gibson.

Pelton Water Wheel Company, San Francisco, Cal., has issued sheets in the Spanish, Portuguese and English languages, which are intended to direct the attention of machinery users to the possibility of using Pelton water wheels for every class of apparatus.

Dick, Kerr & Company, Ltd., London, England, have just published a well illustrated pamphlet showing the character and scope of the work recently undertaken by them. At present they have large engineering works at Kilmarnock and at Preston, England. The former are devoted to the production of narrow gage steam locomotives, electric locomotive bodies, dump carts for contractors and similar material, while at Preston heavy electrical machinery is made, including generators of all types from 1000 kw. up, with direct connected turbines, converters, transformers, railway motors, etc. At these works, also, metal filament lamps have been manufactured during the past three years, and the Britannia works at Preston can turn out 8000 a day. Among the turbo alternators built at Preston recently are three of 1875 kva. for Madras, one for 2500 kva. for St. Helen's and one for 5500 kva. for the London & Southwestern Railway. Among the machines of lower speed designed for use of the reciprocating steam engines or water turbines are four of 1500 kw. for the Japanese State Railways and three of 8900 kva. for the British Columbia Electric Railway. Dick, Kerr & Company were responsible for the equipment of the Bury & Holcombe Brook line of the Lancashire & Yorkshire Railway with a direct current overhead system at a voltage of 3500. The concern also takes contracts of a civil engineering character.

RECENT ENGLISH DEVELOPMENTS

For many years the matter of connecting the populous district to the east of Middlesbrough by means of a tramway has been considered, and despite numerous setbacks the project is at last nearing realization. Within the next few weeks trackless trams will be running from North Ormesby, through Cargo Fleet and South Bank to Grangestown, and from South Bank to Normanby. For the immediate future, the system will have terminals at the Middlesbrough end of Smeaton Street, North Ormesby, near the Market Place, Grangestown, and the junction with the Redcar Road at Normanby. The standards have been erected along practically the whole of the route, and the cable is now being put into position. A large shed has been erected on the Middlesbrough side of South Bank to accommodate the cars, which will be similar in type to those which are running so successfully in Bradford and Leeds.

To meet the depletion in the municipal service occasioned by men undertaking military duties, women tramcar conductors were recently introduced on a section of the Nottingham electric car routes, a limited number, mostly related to men who have gone to the front, being at first engaged. It is intended to increase the number if the experiment proves successful.

No. 24

JUDGE McCALL'S REMOVAL

Few people, we believe, will find fault with Governor Whitman for his action this week in removing Chairman McCall of the Public Service Commission of New York, First District. The charges which form the basis for the removal are quite different in character than those which were presented against the late chairman and certain other members of the commission last spring. It is difficult to understand how a man of Judge McCall's undoubted ability and experience could have neglected to comply with a perfectly proper provision of the public service law, which was certainly violated in the spirit if not in the letter. The Governor was justified in this removal, but it remains to be seen whether he will exercise equally good judgment in the appointment of a successor and with the other appointments for public service commissioners which will come up during his term. Any further appointments should be made purely on the basis of fitness for office. Such a qualification includes knowledge of the needs of the public utility companies and of the public in the way of public utility service, a judicial ability to decide conflicting claims dispassionately and correctly, a standing in the community which will give these decisions weight, and a temperament which will withstand adverse criticism when the possessor knows he is right. The last appointment made by the Governor to the commission in the first district was said to be based upon "personal" reasons. We hope that the appointment of a successor to Judge McCall will be based on the fitness to office only of the appointee. The responsible nature of the duties demands this.

REWARDING REAL DIRECTORS

Much attention has been paid to the new \$50,000,000 American International Corporation, formed to open up safely and intelligently a way for American investments in foreign markets and to finance and operate new projects in developing the resources of foreign countries with which trade is desired. A notable work, truly, but the very magnitude of the proposition has caused many to overlook one interesting feature of the corporation that is in reality the best earnest of successful operation. We mean the allowance to the directors of \$1,000,000 of managers' "preferred" stock, which although only one-fiftieth of the total stock will participate to the extent of one-fifth in all excess profits after the dividends on this stock and the common stock up to 7 per cent have been paid. This method of giving directors a share in the profits is new in this country, but very common abroad, where it has been found of great advantage in securing the service of capable men

and their steadfast attention to increasing the profits of the corporation. Its efficacy, of course, largely depends on whether the holding of the managers' stock is rigidly restricted to those actively engaged in the work of management. It must be remembered that the plan constitutes simply a monetary inspiration, and if excessively large boards of directors and the membership of names only are still desired, American corporations in general will not secure many benefits by emulating the American International Corporation. In other words, the plan constitutes a reward for efficient management, but this reward is susceptible of sure and unerring application only when all inefficient and useless deadwood in the directorate is thoroughly eradicated.

"PLAIN TALKS TO OUR STREET CAR PATRONS"

What is publicity from the electric railway standpoint? This is a question that the ELECTRIC RAILWAY JOURNAL has endeavored to answer a good many times. But just what electric railway publicity is—what it consists of; what it looks like, and how it is handled—remains obscure in a great many minds. For this reason we commend to the attention of the industry a pamphlet under the above title issued by The Milwaukee Electric Railway & Light Company, containing reprints of sixteen articles printed in the local newspapers. Twenty-two of these have been printed and others will follow. The articles show how losing rates and excessive taxes prevent the giving of the best service; explain the size and usefulness of the system; show how the city of Milwaukee broke its agreement with the company and prevented the earning of a fair return under the conditions fixed by the original bargain with the city; how the earnings per passenger have declined; how money that should be spent on electric railway service is diverted to other purposes; explain how the company is taxed by the State on more than \$5,600,000 of actual values, the existence of which for earning purposes the State refuses to recognize; indicate how politicians trying to win favor by baiting street railways, whittle down wages and cripple the service; prove that rising costs and falling revenues justify prompt action for the relief of the company; and in conclusion they meet squarely the question, Why higher fares? We know of no better concrete example of what electric railway publicity means than is embodied in these articles. Their effect upon the public has been very satisfactory. Although it was for the information of its patrons rather than for the industry as a whole that these articles were prepared, we feel quite safe in saying that copies of them will be gladly sent to any railway man who asks for them.

FUNDAMENTAL RATE ISSUE PASSED UPON

The recent decision of the Missouri Public Service Commission in increasing railroad passenger rates from 2 cents to 2½ cents, even with certain restrictions on mileage book rates and the like, will undoubtedly be considered a surprising development in railroad rate-making. This is not so much on account of the size of the increase as on account of the fact that in making its decision the commission in the face of a State-wide notorious unfriendliness to common carriers has dared to express itself quite candidly on a fundamental issue heretofore usually dodged. In its two big rate cases the Interstate Commerce Commission each time evaded the issue of a general advance in railroad rates, with the objection that such an advance might mean the accumulation of excessive profits by some lines. Now, however, the Missouri commission has placed on record a definite attack on this point of view that must sooner or later be fully and openly met in the tribunals of highest resort.

On the unassailable premise that railroads need advanced rates in order to be able to meet their obligations and maintain dividends in such a manner as to encourage further investments, the commission has granted a general increase. The reasons advanced in support of this act form the noteworthy part of the decision. Considering that it had been asked to fix one schedule of rates that would be reasonable for fourteen railroads serving dissimilar and not equally advantageous territories, the commission proclaimed that, however well-informed it might be as to the values upon which the companies were entitled to earn a fair return, it could not adjust the intra-state rates so as to produce an equality of earnings through district or line discriminations. Moreover, it justified this refusal to tinker with the rates of individual companies by emphatically declaring that differences in conditions respecting operating efficiency, economies of capitalization, and favorable routes and locations, are all elements that might with justice be reflected in differences among the various companies with regard to the profits secured from operation.

This basing of rates so that each company honestly constructed and operated can acquire a reasonable return, without a confiscation of profits in the case of the companies that under more favorable conditions and economy of operation have proved profitable, is quite at variance with the usual desire of the demagogue to cut down the profits of every prosperous company by passing maximum rate laws without regard to how these laws may affect the return of companies not so favorably situated. Thanks to recent rate decisions, such state laws can no longer be operative when they run into conflict with interstate rates, but the fundamental question involved in the Missouri decision still remains fairly up to the federal and other state commissions. If the Missouri commission finds it inequitable and even impossible to equalize profits by basing rates on values established, what will the Interstate Commerce Commission do with its enormously costly federal valuation figures? Does anyone con-

template that these valuation figures and a reasonable return thereon will be used in fixing different rate standards for separate companies so as to equalize the profits? If so, it would be well to look ahead and see whether the fundamental idea of the Missouri commission can be rebutted or whether it must be accepted as leading to the most equitable solution of the rate problem. If the Missouri decision can move the national authorities to meet fairly and squarely this fundamental issue raised, it will fulfill an inestimably greater need than the mere increasing of the Missouri rates, deserved as this was.

CLOSING THE TRACK RENEWAL LOOPHOLE

No street railway manager will disagree with the statement that one of the most urgent needs of the industry is a better public understanding of electric railway problems. In line with that thought, would not public attention directed to the unnecessary waste of materials and labor in making premature pavement and rail renewals aid in stopping one of the leaks in street railway operation? In other words, is not the decided stand taken by the Puget Sound Traction, Light & Power Company, Seattle, Wash., for relief from wasteful franchise obligations, mentioned on page 1005 of our Nov. 13 issue, suggestive of similar action by other companies? Perhaps in the first instance it would be unnecessary to resort to the public service commission, and certainly not in communities where the relations of the public and the railway company are otherwise satisfactory. Where companies are obliged to comply with wasteful ordinance requirements this field offers a fruitful opportunity for curbing unnecessary expenditures. Reference to the communications from engineers discussing rail renewals, published in recent issues, shows that municipal requirements rather than the exigencies of the case frequently preclude consideration of renewal problems from an economy standpoint. This condition is especially true of the pavement. Doubtless there are many instances where the waste is so inconsiderable as not to warrant serious objection on the part of the railway company. On the other hand, there are cases where the railway company could profitably afford to bring to the attention of the public the money lost in premature rail renewals.

Loopholes such as these have done much to reduce the railway company's net earnings, and an increase in rates to offset this loss in most communities is strictly out of the question. A diplomatic campaign of education continuously conducted whenever the railway is confronted with premature renewals should produce results. Sometimes these renewals may be treated as betterments and charged to capital account, but properly most of them should be paid out of operation. If the rate of increase in the depreciation fund has been such as to make the time elapsed insufficient to accumulate money to pay for an unnecessary renewal, where else can funds be obtained? No legitimate source, other than taking it out of the earnings, is afforded. Manifestly, if money spent in this manner could be saved it could be used on parts of the property where it was

rightfully required. Summing up, we are of the opinion that an educational campaign to close these apparent loopholes will do much good and will materially aid in giving adequate protection to the integrity of electric railway securities.

CHICAGO ELECTRIFICATION AS AN ECONOMIC MEASURE

The complete report of the Chicago committee on smoke abatement and railway terminal electrification has come to hand this week, and an abstract of a number of the points not covered in the initial statement published last week is given elsewhere in this issue. The report is a volume of more than 1200 pages. Briefly, the portion on smoke abatement shows that the steam railroads are responsible for but 12 per cent of the total fuel burned in the city so that if all of these railroads should be electrified the reduction in the total smoke pollution of the atmosphere would be comparatively negligible. The second part of the book may be epitomized into three statements: (1) that the work will be much more difficult and costly than anything of its kind that has heretofore been undertaken; (2) when completed, the interest on the investment would bring about a heavy deficit annually, and (3), that the constitution of Illinois forbids participation by Chicago in any part of the heavy expense of this work.

Of course, the discovery that the railroads' smoke is almost a negligible fraction of that produced by other sources is by no means an argument against the importance of the subject under all circumstances. Steam locomotive smoke in particular locations is still going to constitute a reason for the substitution of electric power, and although the benefits accruing from the change may be indeterminate they will none the less be valuable. Locomotive smoke is in many instances a nuisance of more concentrated nature than that caused by domestic fires or factories. To the city at large it may be of minor importance, but it is not to be denied that in the immediate vicinity of a terminal in a large city, property values may be affected to an enormous extent.

An illustration will be found in the district in New York City that is reaping benefits from the electrification of the New York Central and New Haven railroads. Here an area two blocks in width extending from Forty-second Street to Fifty-sixth Street, which was at one time a veritable pest hole, has now become one of the most attractive portions of the city for business and amusement purposes, and, still farther north from the terminal, Park Avenue has become the most popular location in New York for high-priced apartment structures.

Undoubtedly the problem is one of great magnitude and difficulty, but the world would have stood still from the day of Adam if progress had not been made in overcoming obstacles of this kind. Is not this a time for the citizens of Chicago, acting through the municipality on the initiative of the Association of Commerce which instituted this original investigation, to see what they can do to help in this work? They are to be

the chief beneficiaries in the increase in real estate values, in the advertisement which would come to the city from the completion of a work and from satisfactory terminal facilities. At present it is said that the constitution forbids the participation of Chicago itself in any way, but such things have been known as the bringing about of changes in constitutions. If the work of electrification cannot be undertaken at once the city of Chicago would do well to put itself in a position so that it can financially assist some of the more important companies to electrify if they cannot figure out a net direct saving from a railroad standpoint when all of the factors are taken into consideration.

It is not too much indeed to expect that the results obtained by electrification in New York would be repeated, at least in part, on many of the existing steam railroad terminals in Chicago. A glance at the map of the city shows a number of terminals right in the heart of Chicago, where there is a great deal of property which would be most desirable if it did not abut on railroad entrance tracks and switch and freight yards. We wish that the committee in its exhaustive study of the smoke abatement problem and detailed analysis of the cost of electrical conversion had also given at least an estimate of the returns to the owners of this property and to the city at large for railway terminal electrification. It is true that the railroads themselves would derive directly only a small portion of the benefits thus obtained from the abolition of smoke and the greater track capacity, but the citizens of Chicago would undoubtedly derive in annual returns many times the annual deficit, even although it should be as high as the estimate of \$15,000,000.

From the railroad standpoint there are distinct economies which accompany the use of electric power, but the railroads should not be asked to make the change where these direct returns are insufficient to pay at least the interest and depreciation upon the investment. If this is not the case, there is no incentive to the railroad to make the change. The Chicago report gives no indication that there may not be economic advantages with some individual roads, but simply that on the basis of the estimates of costs made it is not profitable for the roads as a whole. The question as it stands at the present day is larger than one of the exact and detailed costs of the proposed installation. Whether the committee has possibly been too conservative in its figures of cost for the entire installation is largely a matter of detail. We hope that a careful analysis of the situation as it applies to individual roads will show that even on the basis of net profit in dollars and cents certain roads will find the change warranted. The electrification of a few roads will constitute the best proof possible of the indeterminate benefits of electric operation, and it may induce the city to meet part of the expense for those railroads which cannot afford to electrify. If a precedent is needed it will be found in those States where the community now defrays part of the expense necessitated by the elimination of grades.

Steel Cars for Michigan Railway

Special Types Have Been Designed for Limited, Local and Express and Freight Service—The Electrical Equipment Includes 600-2400-Volt Motor Groups with Auxiliary Control and Lighting System Operated by Storage Battery

The all-steel passenger and express cars recently placed in service by the Michigan Railway Company on its new 2400-volt, third-rail line, which was described in the *ELECTRIC RAILWAY JOURNAL* for June 19, 1915, are remarkable in many respects. They are equal in appointment and provisions for the passengers' comfort to the finest steam railroad coaches, and they are the first cars to carry 600-2400-volt electrical equipment operated from a third-rail, possessing also the specially notable feature of storage-battery operation for the lighting system, control and all auxiliary equipment. Three types of cars have been provided for the different

transfer all the load to the center sills, which also absorb buffing and pulling strains when the cars are operated in trains. The space between the sills is utilized to carry the conduits and some of the brake rods. The maximum depth of the center sills is 26½ in., tapering off to a depth of 8 13/16 in. inside the bolsters and to 7 13/16 in. at points just inside the corner posts. They are made up of 5/16-in. open-hearth steel plates with 3½-in. x 5/16-in. x 3-in. angle flanges, and they are spaced 20 in. face to face of web plates, the top cover plate being 30 in. wide by 3/16 in. thick. The intermediate sills are formed of 3-in., 6.7-lb. Z-bars, and the side sills of 8-in.,

MICHIGAN RAILWAY'S CARS—VIEW OF LIMITED CAR SHOWING BEADED STEEL CAR SIDING

services—limited, local, and express, or freight—and the features of each type are outlined in the following paragraphs.

LIMITED CAR ARRANGEMENT

The motor cars for limited passenger-train service are, without doubt, the finest in interurban service in this country. They are of the side-entrance type, a feature adopted to provide exclusiveness for the parlor-observation compartment which occupies the rear end. The principal dimensions are as follows:

Length over all.....	67 ft. 8 in.
Length over vestibules.....	6 ft. 10 in.
Length parlor compartment.....	18 ft. 2 in.
Length passenger compartment.....	17 ft. 3 in.
Length smoking compartment.....	11 ft. 7½ in.
Length baggage compartment.....	10 ft. 1 in.
Width corridor at side entrance.....	3 ft.
Width over sheathing.....	9 ft. 6 in.
Height rail to top of floor.....	4 ft. 4 in.
Height rail to top of roof.....	13 ft. 7 in.
Truck centers.....	42 ft. 2 in.
Wheelbase.....	8 ft.
Wheels.....	37 in. diameter
Journals.....	6 in. x 11 in.

STRUCTURAL DETAILS

Undoubtedly the most unusual structural feature in these cars is the fish-belly girder type of underframe, which was necessitated to simplify the framing for the side entrances and for the large windows in the parlor section. Relatively light cross-bearers and side sills

11¼-lb. channels. The Z-bars are supported on 4-in., 6¼-lb. channel cross-bearers. Riveted to the tops of the side, intermediate and center sills is a No. 14 open-hearth steel plate, upon which is placed two courses of ½-in. Salamander hairfelt for insulating purposes. Over this, and fastened to 7/8-in. x 1-in. nailing strips, is Keystone flooring, which in turn is covered with Flexolith.

Pressed-steel U-sections of 1/8-in. metal form the panel and single window posts. These are framed into the side sills and the 5-in. channel side plates. The posts were arranged for six double windows, two large parlor compartment windows, the side entrances and one baggage door. The side sheathing below the windows is 3/32-in. sheet metal, over which is riveted Pullman beaded-steel car siding, and just inside the sheathing is a ¾-in. layer of Flaxlinum insulation. The inside finish is of 1/8-in. open-hearth steel backed by 3/16-in. Agasote insulation. The belt rail along the bottom of the windows is formed of a 3-in. x 2½-in. x 3/8-in. angle on the outside, riveted to a 2-in. x 2-in. x 3/16-in. angle on the inside. In the transverse section of the car body it will be noted that all rivets in the inside and outside finish are covered with pressings, which in some instances were spot-welded in place.

The roof is of the plain-arch type and is formed of 1¾-in. x 1¾-in. x 3/16-in. angles joined at the center

MICHIGAN RAILWAY'S CARS—LIGHTING CIRCUITS

and quarter points with 3 1/4-in. x 3/16-in. x 12 and 8-in. gusset plates respectively. Fireproof Agasote 1/4 in. thick and covered with No. 6 duck forms the roof covering, and 3/16-in. Agasote was adopted for the headlining. In order to give additional rigidity to the roof, longitudinal rafters consisting of 1 1/4-in. x 1 1/4-in. x 1/8-in. angles were installed just above the side plates, and 1 1/2-in. x 1 1/2-in. x 3/16-in. angles 16 in. each side of the car-body center line. These are continuous between bonnets and reinforced by additional longitudinal members over the side entrances and at the supporting points of the trolley and pantograph. Steel finish, except for the window frames and stools, obtains throughout the entire car body.

The doors in the partitions are all hinged and equipped with door checks. Each end of the car is provided with a center-end door, and to facilitate handling the trolley, the rear door has a brass hand rail. O. M. Edwards balanced trapdoors with foot latches are provided at the two side entrances and are covered with interlocking rubber tile. The steps are formed of steel pressings with the treads covered with Pullman stand-

ard peerless rubber treads. Other specialties included in the car's equipment are O. M. Edwards sash locks and storm strips, Tuco friction curtain rollers with Pantasote curtain material, Ohio Brass sand traps and valve, Tomlinson automatic M.C.B. radial drawbars, Ackley drum-type hand brakes, General Electric nitrogen filled mazda headlights, Pyrene fire extinguishers, Baltimore ball-bearing center-bearing plates and Everwear mats.

Sixteen Peerless exhaust-type ventilators are installed in the roof with brass registers on the inside of the car. These combined with a Sorocco blower provide a satisfactory ventilating system for the several compartments. An especially-designed hot-water heating system was furnished by the Peter Smith Heater Company, equipped with a double-circulating system through a central tank. This supplies eight 1 1/2-in. coils supported on racks just above the floor line on each side of the car and assures efficient heating at the low temperatures prevailing during the Michigan winters. With the exception of a change of the type of ventilators, this heating and ventilating system is the same as

MICHIGAN RAILWAY'S CARS—OBSERVATION END OF CAR FOR LIMITED SERVICE—STEEL UNDERFRAME

MICHIGAN RAILWAY'S CARS—THIRD-RAIL SHOE RAISED AND IN OPERATING POSITION

that used in the Michigan United Traction Company's steel cars described on page 108, of the July 18, 1914, issue of the *ELECTRIC RAILWAY JOURNAL*. An inside width of 9 ft. permits the use of stationary seats 3 ft. 5 29/32 in. in length, practically equal to the standard seat width for steam railroads. The parlor compartment is furnished with four revolving chairs and seven upholstered armchairs.

AUXILIARIES OPERATED BY STORAGE BATTERY

Aside from the design and the exterior and interior finish of this limited car, the most notable feature is the storage-battery operated auxiliaries and lighting system. The method of charging the storage batteries is different from that used in the lighting system on the steel cars of the Michigan United Traction System, described on page 106 in the July 18, 1914, issue of this paper. The storage battery on this car consists of two groups, one with fifty cells of Edison A-12-H and the other with thirty cells of Edison A-8-H divided into three groups, five cells for the headlight and twenty-five cells for the car-lighting system. The group of fifty cells supplies energy to operate the control, compressor, third-rail shoe, pantograph and trolley, and other auxiliaries. The battery is located under the car where it is arranged for ease of inspection.

The control is of the Sprague-GE non-automatic type, giving six steps in series and four in series-parallel. Fourteen contactors, designed to interrupt the 2400-volt current at their main contacts, are employed. Control cables are installed on all cars to provide for operation in trains as traffic requires. Switches are located in the operator's cab for changing from 600-volt to 2400-volt

operation, for raising and lowering the pantograph, and for operating the third-rail shoes of the entire train.

The storage batteries are charged by taking current from the ground side of the 1200-volt motors. The auxiliaries are operated at 60 volts, the car lighting at 30 volts and the headlight at 6 volts. The feature of this installation is that the battery is charged from a high-voltage circuit and takes current continuously in accordance with the operating requirements. The lighting battery is in series with the main battery and is on charge during the day and cut off during the lighting period, at which time it is discharged direct to the lighting circuits without a regulating device. The lighting system control is of the multiple-unit type operated from a switch in the cab. All batteries in the train lighting system are changed over simultaneously from charge to discharge, or the reverse. Battery circuits are arranged to meet any emergency, it being possible to supply the lighting-system energy from the main battery should the batteries in the lighting system have been completely discharged or disabled. Such a contingency, however, has never occurred, although the cars have now been in operation more than one year.

Operation of auxiliaries by the storage battery was considered advisable in order to confine the 2400-volt d.c. energy to the motors and controller. All auxiliaries, including the operating switches, the third-rail shoes, the pantograph and the trolley pole are controlled by the multiple-unit system. Provision is also made for charging the batteries when the cars are operating over either 2400-volt or 600-volt lines.

CURRENT COLLECTION AND OTHER DETAILS

Energy is supplied to the electrical equipment on these cars from both a third-rail and an overhead trolley. The third-rail conductor is charged at 2400 volts, and when the entrance to a city street is approached the energy supply is obtained from an overhead trolley also charged at 2400 volts. In the city streets, however, a 600-volt trolley is installed. On the 2400-volt trolley the pantograph serves as the current collector, while on the 600-volt trolley an ordinary pole is used. The two types were necessary to provide for high-speed operation where overhead trolley was provided in the villages along the route or in car-storage yards. The pantograph and the trolley pole are pneumatically controlled and are

MICHIGAN RAILWAY'S CARS—CONTROLLER AND OVERHEAD SWITCHES IN MOTORMAN'S CAB

MICHIGAN RAILWAY'S CARS—INTERIOR VIEW OF LOCAL CAR, SHOWING STEEL FINISH

MICHIGAN RAILWAY'S CARS—FLOOR PLAN OF CAR FOR LOCAL SERVICE

so interlocked that it is impossible for both to be raised at the same time. This avoids any possibility of short-circuiting the 2400-volt direct current through the car to the 600-volt line at the section insulators. The pantograph is fitted with copper wearing strips and operates at 15-lb. pressure. The trolley pole is equipped with a Wasson pneumatic base, which permits it to be interlocked with the pantograph-raising mechanism.

The third-rail shoe is also raised and lowered pneumatically. Owing to the fact that a 32-in. clearance is allowed between the third-rail and the near track rail on private right-of-way, the third-rail shoe projects outside the car-body clearance line too far for safe operation in city streets. Accordingly, the folding shoe which is shown in one of the accompanying illustrations was adopted, this having a machine-steel contact shoe that is bolted to the shoe mechanism. In ordinary operation two compression springs hold the shoe on the over-running third-rail. These springs also hold the shoe in the raised position, so that air is required only to raise and lower the shoe. Should it be necessary to cut sleet during the winter months, the machine-steel contact shoes are removed and a special shoe with steel inserts substituted. When this is done the air cylinder is employed to obtain greater pressure than afforded by compression springs, and pressure up to 750 lb. is available.

In connection with the over-running, 2400-volt, third-rail installation an interesting phenomenon occurred during the past winter. Only one sleet storm was experienced, at which time about $\frac{3}{4}$ in. of ice formed on the top of the rail. Delay in substituting the sleet-cutting shoes for the ordinary shoes developed the fact that although this much sleet was on the top of the rail no difficulty was experienced in collecting sufficient energy to operate the car at full speed. This was believed to be due to creepage of the 2400-volt current from the side of the rail to the shoe over the ice coat on the rail-head. Whether this condition will always obtain is

not known, but it did occur during the only sleet storm in the winter of 1914-1915.

Special Baldwin Locomotive Works trucks were necessary for these cars, and they are probably the heaviest trucks ever used in electric interurban service. Each weighs 17,800 lb. and is constructed for a 50,000-lb. center-plate load, a special design being required to provide sufficient clearance for the 600-2400-volt motors. The motors are General Electric No. 239, having 150 hp. capacity, four of them being installed on each limited car. The motors are rated at 1200 volts and are connected two in series. When running over the 600-volt city lines they operate at half speed. The motors are longitudinally ventilated, of a type especially developed for heavy, multiple-unit cars. "Tool steel" gears and pinions with a gear ratio of 33:39 are installed, this giving a free-running speed of 75 m.p.h. The actual schedule between the city limits of Grand Rapids and Kalamazoo calls for a 49-mile run with one stop to be made in fifty minutes. The total weight of all electrical apparatus was 37,000 lb., exclusive of the storage battery, which weighs 4000 lb. The car body proper weighs 66,000 lb., and this weight, together with the trucks and electrical equipment, makes the total weight of the car 142,600 lb.

The air brakes are of the combined straight and automatic type, air being furnished by a C.P. 28 compressor with motor wound for 60 volts. This compressor is capable of delivering 25 cu. ft. of free air against 90 lb. per square inch tank pressure. This capacity of compressor is ample as no air is required for whistles, electro-pneumatic horns being provided for giving warning signals. Each limited car has an 18-in. brake cylinder, two 16-in. x 60-in. main reservoirs, a 20½-in. x 36-in. supplementary reservoir, and a 16-in. x 33-in. auxiliary reservoir.

Essentially, the local all-steel car is a replica of the Michigan United Traction Company's steel passenger

MICHIGAN RAILWAY'S CARS—CAR FOR LOCAL SERVICE

cars described on page 106 of the *ELECTRIC RAILWAY JOURNAL* for July 18, 1914, the principal dimensions being as follows:

Length over bumpers.....	61 ft.
Length over vestibules.....	59 ft. 7½ in.
Length passenger compartment.....	28 ft. 6½ in.
Length smoking compartment.....	11 ft. 1½ in.
Length baggage compartment.....	10 ft. 2¼ in.
Rear vestibule.....	5 ft. 9¾ in.
Width over sheathing.....	9 ft. 6 in.
Truck centers.....	36 ft.
Length of seats.....	41 in.
Center to center of seats.....	2 ft. 10 in.
Width of aisle.....	26¾ in.
Seating capacity.....	56

The local cars are equipped with the same type of motor as the limited cars, but a two-motor equipment instead of a four-motor equipment is used, both motors being mounted on the front truck. The gear-ratio for these motors, however, is increased to 27 : 63, which gives a maximum free-running speed of 42 m.p.h. All

to bumper with transverse members only at the body bolsters and needle beams. In other words, the underframing is made up with relatively few transverse members and no diagonal bracing. The center sills are formed of 7-in., 17½-lb. I-beams, the intermediate sills of 7-in., 14¾-lb. channels and the side sills of 7-in. x 3½-in. x 9/16-in. angles. All these frame into the bumpers which are formed of 7-in., 14¾-lb. channels bent to a 5-ft. radius. The front end of this underframe is fitted with a ½-in. x 48-in. steel plate securely riveted to the bumper and the longitudinal members. This plate extends back from the bumper to the first cross-bearer and is employed as a reinforcement against buckling in collisions. The needle beams are formed of 8-in., 18-lb. I-beams spaced at 8-ft. centers and riveted to the lower flanges of all longitudinal beams.

The body framing includes continuous side posts and carlines formed of 3-in., 5½-lb. I-beams. These are

MICHIGAN RAILWAY'S CARS—ALL-STEEL CAR FOR EXPRESS AND FREIGHT

the electrical equipment, including the lighting system and the auxiliaries, is operated by a storage battery, which is essentially the same as that on the limited cars.

The weight distribution of the local cars is as follows: Trucks, 25,000 lb.; electrical equipment, 22,600 lb.; body, 46,000 lb.; storage battery, 3000 lb.; air brakes, 2500 lb.; total weight, 99,100 lb.

STEEL MOTOR FREIGHT CARS

The all-steel motor freight cars are 61 ft. in length and they are equipped with the same heavy trucks and the same electrical equipment as the limited passenger cars. The gear ratio, however, is 23 : 67, which gives a maximum free-running speed of 38 m.p.h. With this gear ratio and four 150-hp. motors, these cars will pull a 500-ton trailing load, or will comfortably handle ten loaded freight cars. The body is arranged for single-end operation with 6-ft. sliding-door openings on each side at the center, a steel swinging train door at the center of the rear end and a swinging steel door on the right-hand side of the motorman's stand. The general dimensions of this car are as follows:

Length over bumpers.....	61 ft.
Truck centers.....	36 ft.
Width over sheathing.....	8 ft. 11 in.
Width inside.....	8 ft. 4¾ in.

The most unusual feature of these freight motor cars is found in the arrangement of the underframing, which consists of six longitudinal sills continuous from bumper

sheathed on the outside with 3/32-in. patent-level steel plates, each sheet of which extends from the bottom of the side sill to the top of the letterboard. The latter panel is formed of ½-in. x 8-in. patent-level steel plate in a continuous piece from corner post to corner post. The vestibule sheets are also 3/32-in. sheet steel securely riveted to the body framing. The roof, which is of the plain arch type, is covered with ¼-in. fireproof Agasote bolted to the I-beam carlines and covered with No. 8 cotton duck. The inside of the car is sheathed with ½-in. steel plate extending from 6 in. above the floor to 48 in. above the floor. Above this plate and between it and the letterboard are two steel battens, ½ in. x 7 in. in section, securely riveted to the body framing. The car body is floored with 1¾-in. yellow pine and the doorways are fitted with 3/16-in. steel threshold plates. Other specialties in these freight cars include Tomlinson M.C.B. radial drawbars, condulets and steel shades of Crouse-Hinds manufacture, and General Electric automatic air brakes with C. P. 35 compressor. Completely equipped and ready for service this freight car weighs 110,000 lb.

In all the Michigan Railway has ordered eight cars of the limited type, six local cars and four freight cars. They were designed by the mechanical department of the Michigan United Traction Company, under the supervision of R. C. Taylor, master mechanic, and J. F. Collins, vice-president and general manager, and were built by the St. Louis Car Company, St. Louis, Mo.

Estimated Costs of Chicago Terminal Electrification

Those Sections of the Report of the Committee on Smoke Abatement and Electrification of Railway Terminals Which Deal with First Cost of the Introduction of Electric Operation Are Abstracted in Detail

The report of the committee of investigation on smoke abatement and electrification of railway terminals in Chicago was abstracted in last week's issue to show the committee's findings and to give in general the broad financial considerations involved by the project of electrification. In the following paragraphs those parts of the report that deal with the estimated costs are outlined in greater detail, so that an idea may be obtained as to bases used by the committee in arriving at its conclusions.

Three systems of electrification were considered throughout in the report; namely, the single-phase system, the high-voltage d.c. system and the 600-volt system. Neglecting the latter, as it is now generally recognized as impracticable for long-distance electrifications, the final costs on the two others are so close together that the choice between them may be said to be not worth considering in connection with the purposes of this abstract. For this reason, and to simplify the presentation, only the data that apply to the single-phase system will be reproduced.

BASIS OF ESTIMATES

The committee's detailed analyses, underlying the estimates, of the cost of labor and material for electrification, are based upon statistics for the year 1912. Since the extent of trackage and the volume of traffic are increased each year the actual cost will depend to some extent upon the period which may elapse between the committee's statistical year and the beginning of construction, as well as by the duration of the construction period. A program of construction has therefore been assumed whereby actual work of electrification would begin in December, 1916, and would end in December, 1922. In the development of estimates of cost the values of material and labor necessary to meet conditions prevailing in 1912 have first been set forth. The estimates have then been increased to cover growth in traffic and trackage, contingencies, engineering and interest, insurance and taxes during construction, as controlled by this program of construction.

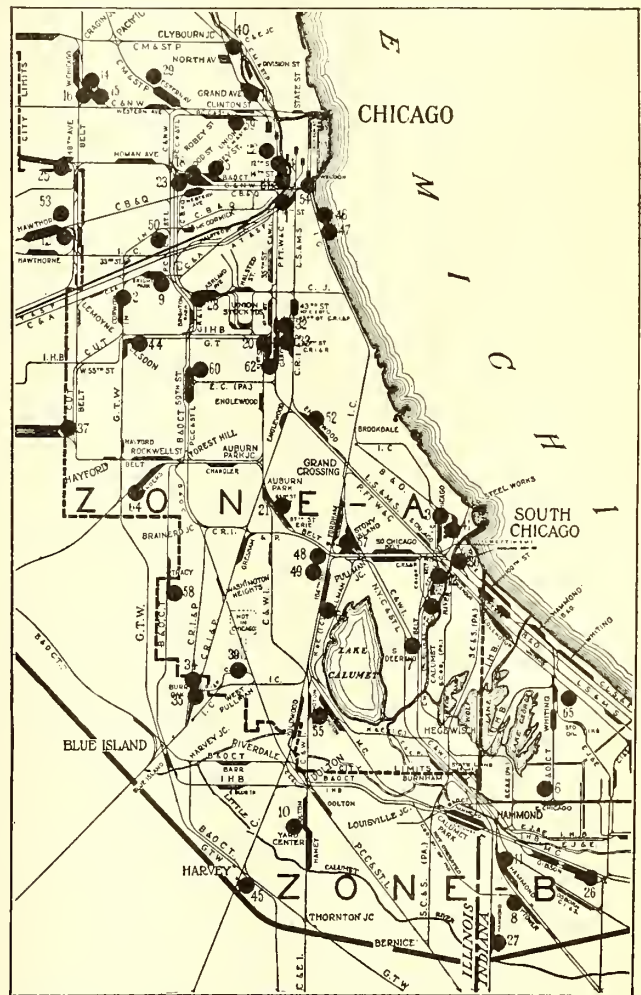

The rate at which Chicago's railroad trackage and traffic are increasing is established by the committee through records of previous years. The percentage used in extending the estimates provides for the continued growth of certain items up to the time when complete electric operation is to begin; namely, the end of the year 1922. Other aspects of the work may be assumed to be unaffected by the growth of the terminal after electrification has once been determined upon, but so long as the terminal is looked upon as a steam-operated terminal, structures will be built which serve only to accommodate steam locomotives and their trains, and the development will continue without much regard to the requirements of electrification. All such increase, however, should cease when the date of the initial work of electrification is once determined. This date, under the program governing the estimate, has been assumed to be Dec. 31, 1916.

The item entitled "contingencies," which appears in the estimates, is designed to cover incidental expenditures which may arise from sources difficult to anticipate, as well as costs arising from exceptional causes,

such as future increases in the price of labor and materials. Another item included in the estimates is that of engineering, design, supervision and administration, the fact being generally recognized that the allowance for engineering may properly be differentiated for the several major items. An item also appears to cover interest, insurance and taxes during the period of construction, experience having shown that a flat rate of 1.75 per cent per annum for the entire period is justified in work similar to that contemplated.

Except in the case of land as a site for a central power station and of land for transfer yards, it has been assumed that there will be neither cost nor credit arising from transfers of real estate. The removal of steam locomotive terminals from the territory to be electrified makes available certain areas which may be sold or put to other uses by the railroad companies owning them. On the other hand, the necessity for establishing substations, inspection sheds for locomotives and multiple-unit equipment and other structures incidental to electric operation, will require land which in many cases is not now available.

In the development of the estimates it has been

CHICAGO ELECTRIFICATION—PARTIAL MAP SHOWING EXISTING STEAM LOCOMOTIVE TERMINALS

assumed that traffic will not be materially hindered and that the entire burden of cost imposed by local conditions will be borne by the work under construction. Also, no separate item has been entered to cover the cost of preliminary or experimental operation, as it is assumed that the contingency factor will cover this item. The trackage to be electrified includes 6.7 per cent of the total that is owned by local industries, but the costs as presented in the several summaries do not differentiate between the cost of equipping privately-owned tracks and those owned by railroads.

ENERGY REQUIREMENTS

The determination of the amount of energy required has been based upon a knowledge of the total volume of traffic to be handled within the proposed limits of elec-

trification, and this knowledge was obtained by the committee through the results obtained by actual records of the railroad companies in combination with results obtained from tests. The records obtained from the railroads covered five separate weeks during different months of the year, the week of Oct. 8-14, 1912, being covered in greater detail than the others, as hourly records were made in addition to the daily totals. From these records data were obtained covering the locomotive-miles, the locomotive-hours, the weight of train in tons, the number of cars handled and the weight of coal consumed by every locomotive operating within the area covered by the investigations. The total of ton-miles, except in yard service, was determined directly from these reports. For determining the locomotive mileage and ton mileage of yard engines, recourse was had to an elaborate series of tests to determine the average speed and the average train load of switch engines throughout the various yards included in the electric zone. Summarized, these results are given in Tables I and II.

From the results it was found that the total traffic (as measured by ton-miles in all classes of service) for the average day of the five periods for which these reports were made, was 4.7 per cent less than that for the average day found during the report period in the month of October, and this has been accepted as fairly representing the average day for the year.

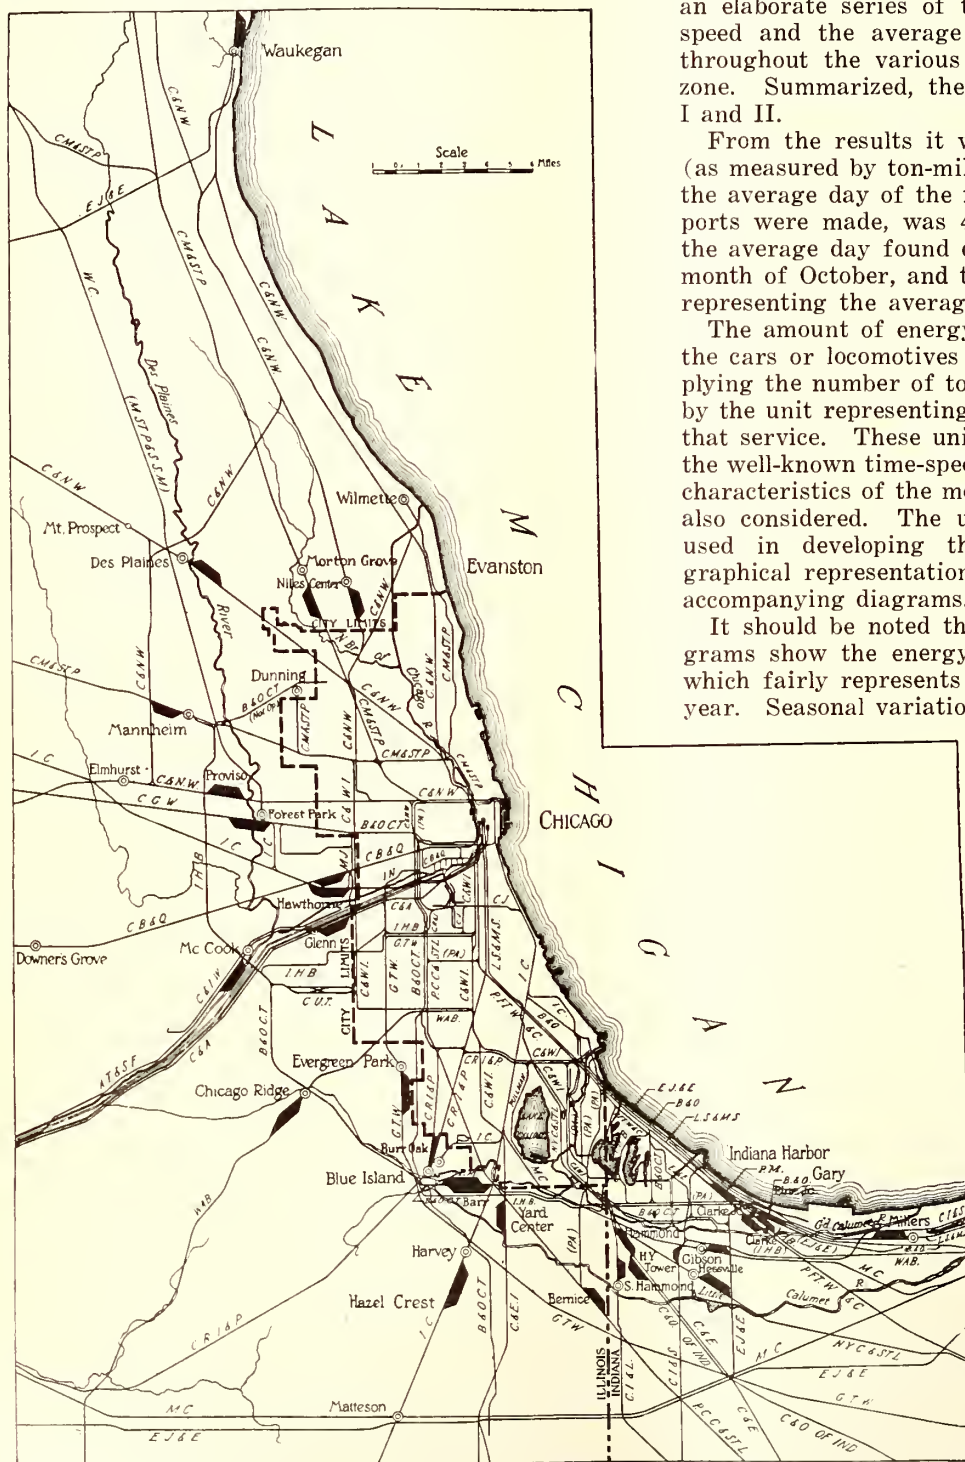

The amount of energy in kilowatt-hours required by the cars or locomotives has been determined by multiplying the number of ton-miles in each class of service by the unit representing the watt-hours per ton-mile in that service. These units were determined initially by the well-known time-speed-curve method. Curves of the characteristics of the motors of the type and sizes were also considered. The units shown in Table III were used in developing the loads in various services, graphical representations of these being shown in the accompanying diagrams.

It should be noted that the energy-consumption diagrams show the energy for the average October day, which fairly represents the average day for the entire year. Seasonal variations in the flow of traffic are not

of great import, and calculations based on the daily records show that the load variation on a ton-mile basis for the average week is substantially 5 per cent above the average day, the record for Sunday being 23 per cent lower than the average day. In general, the maximum hourly loads for the various week-days are practically the same, and the difference in total daily loads is due only to a variation in the load factor. The ratio of the sum of the maximum hourly load of all the roads is 109,258 kw.-hr. and the maximum hourly load of the same roads operated jointly is 99,207 kw.-hr. The ratio between the two is 110 per cent, and this represents the diversity factor.

DIRECT COSTS

As a matter of convenience in developing the estimates.

CHICAGO ELECTRIFICATION—LOCATIONS SELECTED FOR PROPOSED TRANSFER YARDS

TABLE I—SUMMARY OF TRAIN MOVEMENTS AND COAL CONSUMED BY STEAM LOCOMOTIVES AT CHICAGO

	Yard Service	Road Freight Service	Freight Transfer Service	Passenger Transfer Service	Passenger Service
Locomotive-hours of service for the average day	8,828	644	1,778	138	1,263
Locomotive-hours of service for the year	3,231,047	235,703	650,748	50,508	462,258
Locomotive-miles for the average day	28,604	6,026	10,127	1,067	23,769
Locomotive-miles for the year, millions	10.469	2.205	3.706	0.390	8.699
Ton-miles for the average day	12.173	6.927	10.380	0.462	8.638
Ton-miles for the year, millions	426.28	242.47	363.33	16.19	302.03
Coal consumed for the average day, tons	3,635	665	1,261	59	1,167
Coal consumed for the year, tons	1,330,410	243,390	461,526	21,594	427,122

Coal consumed per locomotive-mile, pounds	254	221	249	111	98
Coal consumed per 1000 ton-miles, pounds	597	192	243	255	270

of first cost the whole problem of electrification has been divided into a series of studies, beginning with that of the power station.

Estimates have been based upon the use of water-tube boilers of 650 hp., these being equipped with automatic stokers capable of operating the boilers at a rating of from 200 per cent to 240 per cent of the normal rating, the peak loads requiring operation at a rating of 200 per cent. Seven steam turbines of the single-unit type will be provided, these operating at 1500 r.p.m. The generators will be of the 11,000-volt, 3-phase type, and transformers will raise the generator voltage to 33,000 volts. Reactance will be provided for feeders.

The average power station load for the maximum hour is approximately 115,000 kw. with an estimated power factor of 70 per cent, and the provision of seven 20,000-kw. turbo-generators, or an installed capacity of 140,000 kw. based on the usual maximum continuous rating, will allow the plant one spare unit. The power station characteristics and the load, assuming the use of the 11,000-volt, single-phase system of traction, are set forth in Table IV.

The estimated cost of this power station, excluding all allowances for contingencies and for engineering are as follows: Real estate, foundations, intake and discharge tunnels, and buildings, complete, \$1,931,000;

CHICAGO ELECTRIFICATION—ENERGY REQUIREMENTS AT TROLLEY FOR ALL SERVICES

Boilers, stokers, pumps, chimneys, coal-and-ash-handling plant, and other boiler plant accessories, \$1,571,000; Turbo-generators, condensers, switch-boards, exciters, transformers and other turbine-room accessories, \$2,425,000. This makes a total cost for the plant of \$5,927,000. The cost based upon an installed capacity of 140,000 kw. is \$42.34 per kilowatt, and if an amount of 10 per cent is added for contingencies and 10 per cent for engineering, the cost becomes approximately \$50 per kilowatt.

However, the estimated total cost of the power station for the electric operation of the Chicago terminals is based upon the cost of labor and materials as determined for the year 1912. If these costs are extended in accordance with the system that has been adopted in connection with the estimates, as previously mentioned, there should be added, (1) to cover growth in traffic and mileage of railroads from December, 1912, to December, 1922, 30 per cent; (2) to cover contingencies, 10 per cent; (3) to cover engineering, design, supervision and administration, 10 per cent; (4) to cover interest, insurance and taxes during construction for six years from 1916 to 1922, 10.5 per cent. The values thus derived may be accepted as the total cost on the basis of the requirements of the year 1922, so that the above-mentioned cost of \$5,927,000 would be increased to \$10,302,104 as the cost of the power station considered in these estimates.

For the transmission system between the power station and the substations located throughout the electrified district, the estimates are based upon the following general specifications: A voltage of 33,000 on all circuits; duplicate circuits to all substations; interconnection of substations with transmission lines to a reasonable extent; overhead open wire constructions located on the rights-of-way of the railroad transmission conductors supported on the structures of the contact system.

TABLE II—SUMMARY OF RESULTS RELATING TO OPERATION AND TRAFFIC WITHIN AREA OF INVESTIGATION

Average of	Yard Service	Road Freight Service	Freight Transfer Service	Passenger Transfer Service	Through Passenger Service	Suburban Passenger Service

TABLE III—ESTIMATED UNIT CONSUMPTION OF ENERGY AT PANTOGRAPH

Service	Watt-Hours per Ton-Mile
Yard	60
Road freight	28
Freight transfer	38
Passenger transfer	30
Through passenger	37
Suburban passenger with locomotives	63
Suburban passenger with multiple-unit cars	71
Make-up and put-away	30

TABLE IV—POWER STATION CHARACTERISTICS AND LOAD

Peak load, one hour, kilowatts	114,600
Estimated power factor	70
Load factor, per cent	64.2
Output per day, kilowatt-hours	1,765,200
Output per year, kilowatt-hours	646,063,200
Number of generator units installed	7
One hour continuous capacity of unit, kilowatts	20,000
Maximum overload capacity of unit, kilowatts	27,000
Rating of six units in service on maximum load, kilowatts	120,000
Loading of generators during maximum hour, per cent	96
Total installed capacity, kilowatt	140,000
Installed capacity of step-up transformers, kilovolt-amperes	112,000
Maximum capacity of transformers for five minutes, per cent overload	200

The make-up of the transmission system, allowing 5 per cent for sags, special crossings, etc., involves 950 miles and 2,036,000 lb. of wire. Approximately 500,000 lb. each of 250,000 circ.-mil. wire, No. 00 wire, and No. 1 wire are included in this total, the remainder

CHICAGO ELECTRIFICATION—ENERGY CHART FOR YARD SERVICE

CHICAGO ELECTRIFICATION—ENERGY CHART FOR SUBURBAN SERVICE WITH MULTIPLE-UNIT CARS

being of intermediate sizes. The steel supporting structures for the overhead contact system are designed for the joint load imposed by the transmission line and overhead ground wires in addition to that of the contact system, duplicate circuits, where run, being carried on opposite sides of the track. The estimates of the contact system therefore include the

CHICAGO ELECTRIFICATION—ENERGY CHART FOR THROUGH PASSENGER SERVICE

CHICAGO ELECTRIFICATION—ENERGY CHART FOR SUBURBAN SERVICE WITH LOCOMOTIVES

cost of a considerable amount of steel and concrete chargeable to the transmission system, but no attempt is made in the estimates to distribute this amount or to provide credit where the supporting structures do not carry transmission lines. A small mileage, 3.87 miles, of construction for independent supporting structures has been provided for in the estimates, the poles being spaced at intervals of 300 ft. with the lowest wire 30 ft. above the ground. Across navigable waters transmission towers giving a minimum clearance of 120 ft. above high water are provided for, there being twenty-nine of such locations within the electric zone. The estimated costs for this transmission system are given in Table V.

The estimated cost here given, amounting to \$853,660 is, however, extended in the manner that has been followed throughout in the estimates by the addition of 30 per cent to cover growth of traffic, 20 per cent for contingencies, 10 per cent for engineering and 10.5 per cent for interest, insurance, etc. The introduction of these factors increase the above mentioned amount by approximately 90 per cent, or to \$1,618,693, which price is entered in the estimate as the cost of the transmission system.

The estimates provide for thirty-one substations varying from 3000 kva. to 15,000 kva. The buildings are of brick and are located along the railroad right-

causes. The cost of this item comes to \$329,700, but when the usual factors of extension are applied it rises to \$573,073.

OVERHEAD CONTACT SYSTEM

The type of overhead construction for main track which has served as the basis for estimates of cost consists of $\frac{5}{8}$ -in. stranded steel messenger cable, supported by structural steel bridges in cases where local conditions prevent the use of guys, and by cross-catenary spans similar to those used on the Norfolk & Western Railroad and described in previous issues of the ELECTRIC RAILWAY JOURNAL under normal conditions. These bridges, which are shown in the accompanying illustrations, are spaced normally at intervals of 300 ft. From the primary messenger cable a secondary messenger of No. 0000 steel wire is suspended by hangers spaced at intervals of 10 ft. and a No. 0000 grooved, solid-copper, contact wire is suspended about 2 in. below the secondary messenger, which supports it by clips placed midway between the hangers. For yard track a $\frac{3}{8}$ -in. stranded steel messenger cable is used, and from this a No. 00 grooved, copper contact wire is suspended by light hangers spaced at intervals of 15 ft. Over busy tracks a No. 0000 contact wire is used. The messengers are normally supported by cross-catenary spans located at 300-ft. intervals. Industrial

CHICAGO ELECTRIFICATION—OVERHEAD CONSTRUCTION PROPOSED FOR GENERAL USE

CHICAGO ELECTRIFICATION—CONSTRUCTION PROPOSED FOR NARROW RIGHT-OF-WAY WHERE GUYS CANNOT BE USED

of-way. Switches will be arranged for remote control from an adjoining signal tower or other building where some employee will normally be on duty, the cost of this being based on the assumption that the distance between the substation and control point will not average more than 1000 ft. Of the substations, sixteen are to be arranged to act as tie stations for the transmission lines. Altogether 207,500 kva. capacity of transformers will be needed on the basis of the year 1912, the cost being \$1,164,870. However, when this sum is increased 30 per cent to cover growth and traffic, 10 per cent to cover contingencies, 10 per cent to cover engineering and 10.5 per cent to cover interest, insurance, etc., the total estimated cost for substations becomes \$2,024,736.

Switching stations have been provided for in the estimates at various points throughout the terminals for sectionalizing the overhead conductors of the contact system and thus allowing conductors to be isolated in case of disorder due to overload, short circuit or other

tracks are provided with a 7/16-in. stranded steel messenger cable from which a No. 00 copper contact wire is suspended by $\frac{1}{4}$ -in. hangers spaced at intervals of 15 ft., wooden poles spaced at intervals of 150 ft. being used for the supporting structures.

The quantity of the material and the cost of labor and the material required for the overhead contact system have been estimated for each class of track and the average cost per mile of track has been determined as a basis for estimating the total cost. In general, the cost of labor for erecting all main track longitudinal wire systems was estimated at \$866 per mile of single track. The complete unit costs for labor and material for the overhead contact construction per mile of track are shown in Table VI.

For the yard construction it was necessary to make special estimates for ten different classes of yards and the estimated unit costs per mile were then applied to the various yards to be electrified in accordance to the

TABLE V—ESTIMATED COSTS OF TRANSMISSION SYSTEM

Copper wire	\$377,000
Insulators	52,000
Erection of wire and insulators	84,000
Ground cables, material and erection	158,660
Structural steel and concrete in addition to that provided for contact system	22,000
Towers and foundations where bridges cross over tracks	15,000
Towers and foundations at river crossings	145,000
Totals	\$853,660

TABLE VI—ESTIMATED UNIT COSTS OF LABOR AND MATERIAL FOR OVERHEAD CONTACT CONSTRUCTION PER MILE OF MAIN TRACK

Type of Support	Length of Span, Feet	—Cost per Mile of Single Track—					
		Two Tracks	Three Tracks	Four Tracks	Five Tracks	Six Tracks	
1	2	3	4	5	6	7	
Cross catenary, tubular poles, track in cut or on fill	300	\$5,430	\$4,800	\$4,500	\$4,370	\$4,330	
Intermediate strut bridge, track in cut or on fill	250	6,014	5,160	4,914	4,780	4,708	
Intermediate strut bridge, track in cut or on fill	200	7,174	6,100	5,672	5,440	5,295

	300	6,700	6,100	5,780	5,480	5,270	
	250	7,518	6,817	6,419	6,097	5,809	
	200	9,369	8,477	7,780	7,187	6,690	

TABLE VII—MILEAGE AND ESTIMATED COST OF OVERHEAD CONTACT SYSTEM

	Mileage	Estimated Cost
Main track	1,475.59	\$7,975,170
Other tracks	1,733.83	5,965,951
Private industrial tracks	229.72	899,869
Total for all tracks	3,439.14	14,840,990

particular class to which they belong. The estimated unit prices for yard construction range between \$2,900 per mile and \$5,600 per mile. Industrial tracks were covered by estimated unit costs which depended upon the length of spans and the length of spurs, a 1000-ft. spur involving costs that range between 70 cents per foot and \$1.10 per foot, depending upon whether the length of span was 90 ft. or 45 ft.

By the application of these unit costs to the total mileage involved in the electrification it was determined that the total cost for labor and material for the overhead contact system would be as shown in Table VII.

To these costs are added the amounts involved by the introduction of the previously-cited factors of extension, which in this case are 30 per cent to cover growth in mileage, 20 per cent to cover contingencies, 10 per cent to cover engineering, etc., and 10.5 per cent to cover interest, etc., during construction. This increases the above-mentioned estimated cost to a total of \$28,141,188 for the overhead contact system.

To protect employees riding on the tops of freight cars bridge warnings have been considered necessary wherever the contact wire has had to be depressed below the standard height of 25 ft. to clear an overhead obstruction. On high-speed lines an automatic device has been provided for, whereby the usual hanging ropes or rods will be raised by the action of the track circuits as the locomotive approaches and will be dropped back into position as soon as the pantograph has passed. For slow-speed tracks rods of light bamboo or similar material which may be deflected but not injured by the moving pantograph may be used. It is estimated that the automatic device should cost \$500 per track for one side of an obstruction, and that the non-automatic warnings should cost \$50. The cost of such devices for all necessary locations within the electrified zone was estimated to be \$656,200, but this figure is raised to \$1,071,989 by the addition of the customary factors of extension, which in this case are 12 per cent to cover growth in mileage from 1912 to 1916, 20 per cent to cover contingencies, 10 per cent for engineering, 10.5 per cent for interest during construction.

Bonding is provided for in the estimates on the basis that all bonds are to be of the protected type, installed under new splice bars with new bolts. The length of a bond is assumed at 24 in. in all cases, and expanded

terminals in drilled holes are figured on throughout. Both rails will be bonded for main line tracks, but only one rail for yard and industrial tracks. Two bonds per joint are used in all cases, of a size ranging from 83,000 circ.-mil for 70-lb. rails or less, to 105,500 circ.-mil for rails between 85 lb. and 100 lb. in weight.

Cross bonding is to be installed at intervals of 1 mile on main tracks. The report states that yard and industrial tracks are to be cross bonded at intervals of approximately 1000 ft., although only one rail is to be bonded. Cross bonds will be of bare copper cable of 500,000 circ.-mil. size for main track and 200,000 circ.-mil. size for yard and industrial track.

The cost of joint bonding on this basis is estimated to be \$385 per mile of main track and \$190 per mile of yard and industrial track, the respective costs for cross bonding being \$10 per mile and \$17 per mile. To this is added the cost of substation connections at a unit price of \$15 per mile of main track. Including the usual factors of extension, which in this case are applied at the rate of 30 per cent to cover growth, 20 per cent to cover contingencies, 10 per cent for engineering and 10.5 per cent for interest during construction, the total cost of the return circuit is estimated to be \$4,446,033.

In connection with the return circuit the conclusion has been reached that inductive effects can be prevented by providing rather liberal bonding of track rails, by careful arrangement of feeding points, and by installing booster transformers in the railroad circuits. Neutralizing apparatus will not be required in the telephone and telegraph circuits. It will not be necessary for telephone and telegraph lines to be cabled or moved from the vicinity of the railroad circuits to any extent greater than that required to prevent physical interference. By locating substations at intervals of from 5 miles to 8 miles, the tracks will be divided into sections fed by substations at each end and the current drawn by trains in any one section will be confined to that section, the inductive disturbances being largely balanced out.

Booster transformers are to be located about 1 mile apart on main lines having heavy traffic and 1½ miles apart on main lines having light traffic. On this basis it is estimated that 325 booster installations will be necessary throughout the electrified zone, the cost of these being \$525,650. To this figure, however, is added the usual factors of extension, which in this case are 30 per cent to cover growth in mileage, 20 per cent to cover contingencies, 10 per cent for engineering and 10.5 per cent to cover interest during construction. This makes a total cost of \$996,727.

A complete telephone system has also been provided in connection with this electrification because it is considered essential that all elements of the electric installation be in close communication with one another. All of the line and equipment for this service will be installed and maintained by the local telephone company on a rental basis. However, radiating from certain important substations there are to be telephone patrol lines which will be installed and owned by the railroad company to provide for prompt transmission of reports concerning defects or troubles found by the men who will patrol the electric lines. Two stations per mile are to be provided along the electrified right-of-way and it is estimated that the average cost will be \$300 per route mile. With the usual factors of extension the cost of this telephone patrol line will be \$272,052.

ELECTRIC LOCOMOTIVES AND MULTIPLE-UNIT EQUIPMENT

In connection with the estimates of cost of electric locomotives the various locomotive services have been classified as yard, road-freight, freight-transfer and

TABLE VIII—CHARACTERISTICS OF THE STEAM LOCOMOTIVES IN SWITCHING SERVICE IN CHICAGO

Weight on Drivers, Pounds	Average Weight on Drivers, Pounds	Average Rated Maxi- mum Trac- tive Effort, Pounds	Per Cent of Total Number of Locomotives
50,000 to 75,000	66,700	19,880	0.72
75,000 to 100,000	94,700	20,000	12.72
100,000 to 125,000	120,000	23,230	30.47
125,000 to 150,000	138,400	30,140	33.16
150,000 to 175,000	166,700	37,420	11.11
175,000 to 200,000	182,500	40,450	8.24
200,000 to 225,000	203,900	42,850	3.58
Average	135,900	28,790	100.00

through-passenger. The locomotives for yard service that are now in operation are of characteristics in accordance with table No. VIII. From tests made in sixty-six yards of thirteen railroads, however, and covering over 800 locomotive-hours of service, the average weight on drivers of the locomotives in service was found to be 138,000 lb. The average characteristics of this service have been previously shown in Table II. The weight of the electric locomotive for yard service has been taken for all systems as 160,000 lb., on all the drivers. The estimates are based upon a locomotive with two four-wheeled trucks, having geared motors of 120 hp. each, giving a normal rating of 480 hp. for one hour.

For the road-freight service the electric locomotive selected as a basis for estimates is similar to the yard locomotive except that it has eight motors, two of which are geared to each of the four axles. The total weight has been taken at 230,000 lb. The motors are each of 250-hp. capacity at one hour rating and will develop a tractive effort of 80,000 lb., or sufficient to slip the wheels at 40 per cent adhesion. This locomotive is capable of handling the average trailing load shown in Table II at an average speed of about 22 miles per hour, about 50 per cent more than the average speed of the present steam locomotive. The electric locomotives required for freight-transfer service, the character of which is shown in Table II, need not be different from the type selected for the yard service, and the heavier part of the freight-transfer service may be handled by the road-freight locomotives.

The electric locomotives for passenger service will have to handle a maximum trailing weight of passenger trains of about 900 tons. Most of the lighter trains and those having frequent stops are to be operated with multiple-unit motor cars, leaving the through passenger trains and suburban trains which go to points beyond the limits of electrification to be handled by electric passenger locomotives. The locomotive selected for this service is of the type used by the Pennsylvania Railroad at the New York terminal, having 2000 hp. of motors mounted in the cab above the wheels and driving the locomotive by coupling rods and side rods through a jack-shaft. The total weight will approximate 320,000 lb. and the normal one-hour rating of the motors will give a 24,000-lb. tractive effort at 31.5 miles per hour. This is the only type of locomotive selected for passenger service, the freight locomotives being available for passenger trains making frequent stops.

For the suburban service a motor car has been selected which, when fully equipped with two 250-hp. motors and with average seated load, weighs 117,000 lb. It is approximately 54 ft. long over the body and 64 ft. long over all and has a seating capacity for seventy passengers. The trailer cars have the same dimensions, will seat seventy passengers, and will weigh, with the average load, 88,000 lb. In each train a number ranging from three with an eight-car train to none with a two-car train, will be used, and this will permit speeds averaging about 5 per cent higher than those now common on the steam operation.

The required amount of equipment for each of the different services is made up on the following basis: For locomotive passenger service a study was made of the through passenger schedules, and a sufficient number of locomotives was provided for each railroad to protect all of its passenger trains between the city terminus and the point at which provision is made for the change of motor power, assuming that each train will operate on a schedule indicated by the time-table. For multiple-unit passenger service electric equipment was provided to give 10 per cent more seating capacity than the present service, assuming that each schedule would be maintained, as shown by the present time-tables. For road-freight service the number of locomotive-hours and trailing ton-miles for each railroad during each hour of the average day was made the basis. For yard and transfer service the basis was the number of locomotive-hours for each railroad during each hour of the average day.

In connection with the locomotive passenger service it was decided that for the purpose of protecting the schedule thirty minutes spare time would be allowed at the terminal for coupling or uncoupling and for getting the locomotive into position. Where the minimum requirement to protect schedules is four locomotives or less, the number has generally been doubled. On roads having twenty or more scheduled trains daily, one spare locomotive for each twelve appearing on the schedule is regarded as ample. It has been assumed that the electric locomotives will be in operation 80 per cent of the total time, the remaining 20 per cent being required for inspection and repairs. On this basis there will be required to provide for the 704 scheduled trains which make 12,460 miles daily within the limits of the electric zone a total of 228 electric locomotives. Of these, it is calculated that a minimum of 138 will be required to meet the schedules and that the remaining 90 will act as spares. The locomotives will therefore average about 55 miles per day or two and three-quarters hours of work.

For the multiple-unit passenger service, equipment will be required for a service that has been established at 661 suburban trains daily, making 11,328 train-miles with an average of 4.4 cars per train. To the number of cars required actually to protect the schedules, there have been added 15 per cent to provide, first, for inspection and repairs, and second, for exigencies such as extra service, accidents and bunching of trains. It has been assumed that each motor car will be available for service twenty-four hours per day, but that inspection and repairs will consume about 5 per cent of the total time. The number of multiple-unit and trailer cars required for suburban passenger service by the nineteen roads operating it will be as follows:

Average number of scheduled trains daily.....	661
Average number of train-miles daily.....	11,328
Total number motor cars.....	470
Minimum number to meet schedules.....	406
Spares.....	64
Total number trailer cars.....	251
Minimum number to meet schedules.....	214
Spares.....	37
Present number of suburban coaches.....	742

For the road freight service, which is defined as that which involves the movement of freight cars between points within and points outside of the proposed limits of electrification, the basis employed in determining the number of locomotives is the maximum locomotive-hours for each road for the average day. To the daily requirement was added 20 per cent to provide for inspection and repairs, and 5 per cent for exigencies of operation. On this basis, the number of electric locomotives required to handle the road freight service for the nineteen roads operating this service would be 100.

This number includes 20 spares, and the 80 locomotives for the minimum average service would haul 5,668,326 ton-miles in the 548 locomotive-hours of service required for the average day. The locomotive mileage for the day would be 5369, an average of 53 miles, or 5.65 hours per locomotive-day.

In yard service at the present time, 519 locomotives are ordinarily at work during the maximum hour and to this is added 113 locomotives in transfer service. In determining the total number of electric locomotives required to perform the yard and transfer service in the Chicago terminals it has been assumed that the traffic will have the same flow and that it will be handled in the same average loads and at the same average rate of speed as the present service. Upon this basis, locomotive-hour diagrams have been worked out for each road, and the number of electric locomotives required to handle the yard and transfer service of the road in question has been determined from these. One of the diagrams is presented in an accompanying illustration. To the average daily locomotive requirements thus determined there has been added 9 per cent to protect against the time required for inspection and repairs, and 11 per cent for possible exigencies of service and accidents. On this basis, the total number of electric locomotives required to handle yard and transfer service will be 688, of which 116 are spare engines, leaving a minimum requirement for the average day of 572, it being assumed that the average daily hours of work for each electric locomotive will be 16.5 as opposed to 14.5 hours for the steam machine.

The unit costs for the electric equipment, including cost of delivery in Chicago, are assumed as follows:

Yard locomotives	\$33,000
Freight locomotives	50,000
Passenger locomotives	67,500
Motor cars	20,100
Trail cars	10,400

Based upon the requirements of 688 yard locomotives, 100 freight locomotives, 228 passenger locomotives, 470 motor cars and 251 trailers, the total costs of the equipment for Chicago terminals would be \$55,150,400. To this is added \$34,675 for seventy-three line inspection cars and \$85,000 for seventeen repair trains. When the extension factors are added, the total figure becomes \$91,703,557, the extension factors being 30 per cent to cover growth in traffic, 10 per cent for contingencies, 5 per cent for engineering and 10.5 per cent for interest during construction.

In the estimates a separate allowance was also made for spare parts for the electrical equipment, and this, including the factors of extension, amounted to a total of \$485,343.

ALTERATIONS TO STRUCTURES

Incidental to the execution of any plan of electrifying the railroad terminals of Chicago through the use of an overhead contact system, certain definite and important changes in existing facilities of permanent structures will be required. Among these is the cost involved in securing the minimum clearance under overhead structures, and this is estimated to cost, with the factors of extension, \$834,261. Changes have also been assumed to be necessary in all existing wires and cables which cross above the present tracks, or which parallel tracks in such a manner as to present possible physical interference with the contact system or transmission line. These changes are estimated to cost, with the extension factors, \$2,028,007.

Changes in the existing signal systems have also been considered in the estimates owing to the extensive use of direct current signal apparatus. The total estimated cost for all roads affected amounts to \$3,491,-

595. On the basis of the 1475 miles of electrified track, this would amount to \$2,365 per track-mile. The factors of extension raise the total cost of the estimated changes in the signals to \$6,111,407.

New steam locomotive terminals would have to be established at points beyond the city limits under the general plan of electrification. Provisions will also have to be made for the change of motor power at points outside the city and for the care and handling of electric locomotives and multiple-unit equipment. In a few cases the facilities which are now in use for steam equipment may be rearranged to accommodate electric equipment.

The principal existing facilities which will be rendered worthless to the railroad under electrification and will be abandoned include 42 roundhouses, 53 coal-ing stations and 96 water tanks. The original cost of these properties was \$3,127,259 and the present value is \$2,318,604. The salvage value of the property is estimated to be only \$249,000. These figures apply, however, only to the year 1912. Subsequent to that

CHICAGO ELECTRIFICATION—TYPICAL DIAGRAM FOR DETERMINING ELECTRIC SWITCH ENGINE REQUIREMENTS

time, a rate of increase may be assumed at the rate of 3 per cent per annum, so that in December, 1916, when the electrification is assumed to be definitely decided upon, the value will have increased 12 per cent. However, to offset this there is a salvage value and by deducting this from the assumed value at the time when electrification commences a total amount of \$2,317,957 is estimated as the amount which will be rendered useless in the event of electrification and which must stand as an independent item in representing property that is wholly dissipated.

Thirty-six roads will be provided with these transfer facilities, the total cost of which will amount to \$19,617,000. Among the items that go to make up this cost are: buildings, \$6,323,600; grading, \$1,700,700; land, \$1,254,500, and, machinery, \$1,226,000. Elsewhere the estimates include a charge of \$96,383 for the transferring of machinery from the old locations to the new ones. Other items included in the cost of new facilities are: Tracks, \$3,490,290; electric equipment

TABLE IX—ESTIMATED FIRST COSTS OF TYPICAL STEAM LOCOMOTIVES

	Average Weight on Drivers, Pounds	Average Total Weight, Pounds	First Cost
Through passenger locomotives.....	144,000	314,000	\$18,500
Road freight locomotives.....	160,000	324,000	18,500
Transfer locomotives.....	160,000	324,000	15,500
Yard locomotives.....	135,000	268,000	13,000
Suburban passenger locomotives.....	91,000	222,000	12,500

of new track, \$597,000; viaducts and subways, \$505,000; miscellaneous, \$2,553,135.

In accordance with the custom followed in the estimates factors of extension have been applied as follows: To cover growth in the mileage of railroads 30 per cent, contingencies 20 per cent, engineering 10 per cent, interest during construction 10.5 per cent. The imposition of these factors raise the cost of the new terminal facilities to \$37,197,383.

ROLLING STOCK RELEASED BY ELECTRIFICATION

The electrification of the railroad terminals in Chicago will result in the elimination of steam locomotives from the tracks of the city and its immediate vicinity. Locomotives thus released may be disposed of. Similarly, it is assumed that under electrification all suburban business which is confined to the electrified trackage will be performed by multiple-unit equipment, with the result that the cars now in this service will be released for other use.

A detailed analysis of schedule requirements shows that the introduction of electric operation will reduce by thirty-seven the number of steam locomotives required to perform the through passenger service. Within the electric zone, as before mentioned, this work is estimated to require 228 electric locomotives. In road freight service, under conditions imposed by existing schedules, the number of steam locomotives released will be 20, the estimated number of electric locomotives to do this work being 100, as before mentioned. In suburban passenger service all of the steam locomotives and coaches, numbering respectively 151 and 742, will be released. For yard and transfer service the number of steam locomotives in service was determined at 612 and 140 respectively, all of which will be released, the total of 752 steam locomotives being replaced by 688 electric locomotives.

The value of the locomotives to be released is based on the first costs of typical locomotives in the various services, these being outlined in Table IX. The value of suburban passenger coaches to be released has been based upon an average first cost of \$5,200. The total first cost of rolling equipment to be released is thus \$16,926,400. However, the number of locomotives and coaches to be released will increase as the business of the terminal increases, and a factor of extension of 21 per cent has been applied to cover growth at 3 per cent per annum for seven years, from December, 1912,

TABLE X—SUMMARY OF ITEMS COVERING INSTALLATION COSTS OF ELECTRIFICATION OF CHICAGO RAILROAD TERMINALS

Power station	\$10,302,104
Transmission system	1,618,693
Substations	2,024,736
Switching stations	573,073
Overhead contact system	28,141,188
Bridge warnings	1,071,989
Return circuit	4,446,033
Prevention of inductive effects and electrolysis.....	996,727
Telephone system	272,052
Electric locomotives, multiple-unit equipment, work and inspection equipment	91,703,557
Spare parts	485,343
Changes in overhead structures.....	834,261
Changes in wire lines	2,028,007
Changes in signal systems.....	6,111,407
Removal and re-establishment of steam locomotive terminals:	
a. Cost of transferring machinery.....	\$96,383
b. New steam locomotive terminals and transfer yards	37,197,383
	<u>37,293,746</u>
Total	\$187,902,916

to December, 1919. This brings the total estimated first cost of rolling equipment to be released up to \$20,480,944.

However, the real release value of the equipment will not be equal to its first cost. The locomotives are estimated to have values ranging from 65 per cent to 40 per cent of the first cost. Many of the cars used in the suburban service are old, the average not being far from twenty years, and it has been assumed that \$500 per car represents a fair average release value for such equipment. On this account the estimated release value of all rolling stock to be displaced in the event of electrification is \$9,496,806, including the factor of extension of 21 per cent previously cited.

Summing up all of the foregoing cost of electrification it will be found that the total estimated cost is \$187,902,916. In detail the summary is shown in Table X.

INDETERMINATE COSTS OF ELECTRIFICATION

The committee's estimates of costs above outlined are based upon a definite program of procedure and the estimates may be expected to work out in practice only insofar as the procedure is followed. This procedure has been designedly chosen to give results which may be expected, as those of minimum costs. However, in determining the extent of trackage to be electrified the committee's plan has been based upon the conception that electrification is proposed as a means of smoke abatement. The plan provides for the electrification of all tracks within the city and the termination of such electrifications as soon as practicable beyond the limits of the city. The railroad official who reviews the work will probably feel that if electrification is imposed the extent of trackage affected should be determined from considerations which are the outgrowth of operating conditions, whereas the committee has thought to deal with the minimum trackage consistent with reasonable operating requirements.

In addition, eight railroads have submitted statements of betterments which might be deferred for many years, but would become necessary at once if electrification were decided upon. The list of these precipitated costs covers items for grade separation, for an extension of four-track work where two tracks are now provided, for grade reduction and for changes incident thereto and for relaying rails in certain yards. Extensions of electrified trackage beyond the limits estimated on by the committee are included. In round numbers, the sums of these respective items are \$29,000,000 and \$21,000,000, a total of \$50,000,000, and the committee's estimate of the cost of electrification for the eight railroads is in round numbers \$92,000,000. The excess costs, including those due to extensions of the electrified tracks and to precipitated costs are, therefore, 54 per cent of the amount covered by the committee's estimate, and on this basis the total precipitated costs will amount to \$96,313,400. This, added to the figure in the committee's estimate, makes a total from all sources of \$274,440,630. The total, it may be said, provides for a deduction of \$9,775,686 to cover the salvage from rolling equipment and from facilities to be abandoned or utilized for the purpose. No allowance is made in the first costs for the dissipated values involved by abandoning steam engine terminals, this loss being considered as an operating charge pro rated over a period of ten years.

In connection with Electrical Prosperity Week in Louisville, the Louisville (Ky.) Railway ran a special car in the evenings, routed so as to cover practically the whole system, and gaily lighted so as to call attention to the signs it bore relating to the week of celebration. This car was rigged out by Jovian volunteers.

Papers Presented Before C. E. R. A. Accountants

Central Accounting Body at Sessions in Detroit on Dec. 7 and 8 Considered Topics Dealing with Depreciation and Appreciation, Accrued Accounts, Journal Entry Ticklers, and Shop Orders

The twenty-eighth meeting of the Central Electric Railway Accountants' Association was held on Dec. 7 and 8 at the Hotel Statler, Detroit, Mich. The first session, which opened on Tuesday afternoon, was devoted to an address by the president, H. B. Cavanaugh, auditor Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio; to reports of the various committees, including those on standing passenger and freight accounting and on forms, and to a paper on the subject of "Depreciation and Appreciation," by W. H. Forse, Jr., secretary-treasurer Union Traction Company of Indiana, Anderson, Ind. At the second and concluding session on Wednesday morning three papers were read, as follows: "Accrued Accounts," by A. E. Dedrick, auditor Mahoning & Shenango Railway & Light Company, Youngstown, Ohio; "Shop Orders," by B. H. Jacobs, assistant auditor Cleveland (Ohio) Railway, and "The Journal Entry Tickler," by E. L. Kasemeier, auditor Ohio Electric Railway, Springfield, Ohio. The address by President Cavanaugh and the papers by Messrs. Forse, Dedrick and Kasemeier are published below in abstract form.

ADDRESS OF PRESIDENT

BY H. B. CAVANAUGH, AUDITOR CLEVELAND, SOUTHWESTERN & COLUMBUS RAILWAY, CLEVELAND, OHIO

The successful auditor of to-day must be versed in every line of operation on his property and must be in constant touch with and have the co-operation of all heads of departments and executives. He should originate forms for statistics and information to be furnished the different departments, and he should encourage the friendship of department heads by making frequent visits, by talking operating statistics with them and by showing an interest in their line of work. The association itself should encourage members of the different departments to attend its meetings, and papers should be presented by men who are not accountants, but who are associated with the companies in other capacities.

In regard to the forms now used by the member companies, it may be said that after several attempts had been made to have the different kinds collected and put into shape so that they would be of benefit, the committee in charge of this matter has adopted a system that takes care of all forms and classifies them as to use. This system is flexible, so that new forms can be substituted and old forms taken out at any time. The file of forms is kept in the office of the secretary, who will gladly furnish any information desired.

The question box seems to have been lost for some unknown reason. It cannot be possible that all understand the many intricate problems that are being presented daily, and this feature of association work should be revived. At the meeting in Cleveland on Dec. 13, 1913, the query box committee answered twenty-six questions, but since that time there seems to have been no questions asked. It would be of benefit to all if each member during the coming year would ask the solution of one or more problems, even though he may have solved them himself, as in this manner the members will put before the association questions that will be new to many.

At the last annual meeting it was decided to dispense

with a separate secretary and to co-operate with the parent association. Accordingly, the secretary of the Central Electric Railway Association was elected as our secretary, and at a meeting in June we changed our constitution and by-laws to conform to those of the parent association, all of which has promoted the best of harmony. Members of the Accountants' Association should attend meetings of the parent body and keep in touch with its methods and requirements, as in this manner they will be better able to furnish the executive officers of their companies with the information they require. In regard to the representation of Accountants' Association on the parent executive committee, it is recommended that the question of having two members on this committee be taken up with the parent association—one member to be the president of the Accountants' Association and the other to be selected from the membership. One member should hold over in order to have continuity in the work.

The Accountants' Association has had before it for several years the question of a railway property doing a general lighting and power business, but there has been no recommendation as to the proper method of handling these accounts, *i.e.*, in the case of a railway property that has no separate organization or power plant for lighting and power work but handles it in connection with and through the general railway organization. It is therefore recommended that a committee be appointed to cover this business, which with many has grown to considerable proportions.

THE JOURNAL ENTRY TICKLER

BY E. L. KASEMEIER, AUDITOR OHIO ELECTRIC RAILWAY, SPRINGFIELD, OHIO

The Ohio Electric Railway auditor's office has a great many ticklers or reminders in various forms, such as a card tickler for the chief clerk to show the dates for statements, reports, etc., and a double tickler, indexed by dates and alphabetically, for periodical payments of the disbursement department. In line with such systems the general bookkeeper has a tickler for journal entries. This is kept in a book used for the general ledger trial balance. The book is divided into three sections; that is, one-third is allotted for the tickler; another for the trial balance, and the last for a condensed balance to bring the figures down in line with the monthly balance-sheet form. On the left-hand margin of the pages used as a tickler there is written a description of every entry. These are grouped in a systematic way, as follows:

Traffic and agents' accounts.

Power interchanged between light and railway departments and divisions.

Payrolls, vouchers, collection vouchers, drafts, credit advices, freight-claim drafts, ticket-refund drafts, etc.

Store issues, scrap issues, material reclaimed, fuel issues, stationery issues, etc.

Accrual entries for insurance, bond interest, taxes, etc.

Sinking funds.

Trust company's bond coupon deposit accounts.

Mortgage bond issues, changes, etc.

Vertical columns are headed by months, and when the journal entry is made its number is placed in the

month's column. If no entry is necessary, a dash is put in that place. For quick reference, journal entry numbers are not duplicated. As there are usually about fifty entries each month, 100 numbers are set aside for a month, as January, 5001; February, 5101; March, 5201, and so on indefinitely.

When the time for closing the books draws near, it is very easy of accomplishment to run the eye down the column for the month in question and see just what entries have not been made. This record is useful many times each month to locate certain journal entries and to refer to such as are made only once or twice each year. The vertical columns headed by months are made very narrow so that a page of the tickler book when opened will exhibit with the usual short leaf insert about six years' entries at a glance.

ACCRUED ACCOUNTS

BY A. E. DEDRICK, AUDITOR MAHONING & SHENANGO RAILWAY & LIGHT COMPANY, YOUNGSTOWN, OHIO

Accrued accounts are those which are used to place on the books such items, either actual or estimated, as will reflect as nearly as possible the true financial condition as of a future given date. Such accounts in general may be divided into two broad classes: (1) accounts that may be definitely determined each month, as bond and note interest, rentals, taxes and miscellaneous accruals, and (2) accounts that may be quite accurately estimated, as accident reserve, insurance reserve (where the utility carries its own insurance), depreciation and renewal reserve, taxes, uncollectable debt reserve, and many other accounts that are commonly used by utilities.

In the ordinary conduct of business the prorated accrual of bond interest is considered accurate, for the reason that the utility pays as much interest for February with twenty-eight days as for March with thirty-one days. Note interest, however, can be figured accurately, based on the number of days in each month. Taxes as a whole may be closely estimated. Some classes of taxation, particularly that applying to tax on gross earnings, can be accurately figured, as the base and rate are definite factors. Property and real estate taxes, however, vary so materially in different States and from year to year that actual accruals are not possible. Accruals for bad account reserve, insurance reserve, depreciation reserve and others may be closely apportioned by a careful analysis of conditions.

One form of accruals not ordinarily encountered in the daily routine of work should be considered. Assume, for example, a hypothetical case of a railway and lighting property being sold. In the final balance sheet set up by the company's accountants appears an accrual of \$50,000 to cover the lag in continuous meter readings not shown on the books. The accountants for the purchaser, however, set up a counter charge of \$25,000 for deferred or accrued operating expenses. This charge represents expense items that the company has secured benefit from but which have not been billed to it or taken on its books. Many items of the latter nature, such as maintenance of municipal bridges, paving repairs, etc., are not billed to a utility until months after the work has been done. Both of these accruals are correct in principle, though subject to adjustment as to the amount.

Closely allied with tax accruals are paving and sewer assessments, which usually accompany the tax bills to Ohio utilities. Yet these are not taxes in any sense of the word and are chargeable to capital or renewals, as the case may be. Some of the smaller companies charge paving assessments to operating expenses, prorating them over the year's business. This practice, however,

is ethically wrong from an accounting standpoint, as it does not throw the expenses into the proper period. The accruing of a proper depreciation and renewal reserve would obviate this difficulty. In connection with assessments of this character, it is often advisable, where it can be mutually arranged, to have the municipality raise the funds and carry the account for three to five years before it is extinguished. The municipality can usually raise money at a lower rate than the utility, but the principal advantage lies in the fact that the burden may be distributed over a period of years and in many instances will be paid out of surplus earnings. Thus the utility is relieved of a burden of securities which, once issued, would probably be a liability against the property for a long term of years and impose a fixed charge that might be avoided.

DEPRECIATION AND APPRECIATION

BY W. H. FORSE, JR., SECRETARY-TREASURER UNION TRACTION COMPANY OF INDIANA, ANDERSON, IND.

It is impossible to frame concise general rules for making allowances for depreciation which will not, in their application, be attended with a large margin of possible error. Experience data collected from a number of electric railway accountants show the wide diversity of opinion of men in actual and direct contact with these carriers. The percentages in Table I are the various rates used for the year ended June 30, 1915, for the annual charge for depreciation on rolling stock equipment.

TABLE I—SHOWING VARIOUS ANNUAL RATES USED FOR DEPRECIATION OF ROLLING STOCK EQUIPMENT

Road No.
1—An arbitrary charge of \$1,200 per year.
2—4 per cent of original cost less estimated value of salvage.
3—6 cents per car-mile for maintenance and depreciation.
4—3 per cent of the original value.
5—5 per cent of the valuation of equipment.
6—An arbitrary charge of \$3,600 per year.
7—3 per cent of record book value.
8—One twenty-fifth of 75 per cent of original cost. (Twenty-five year life; 25 per cent salvage.)
9—Arbitrary deduction from income: \$500,000 per year for several years.
10—1 per cent of appraised value.
11—2 per cent of value.
12—3 per cent of cost of equipment.
13—1 per cent of gross value.
14—An arbitrary charge of \$2,400 per year.
15—One twenty-fifth of 75 per cent of original cost.
16—5 per cent of value.
17—2 per cent of estimated value.
18—4 per cent of estimated cost less 25 per cent salvage.
19—2½ per cent of present value.
20—Arbitrary charge of \$12,000 per year.
21—2 per cent of book value.
22—2½ per cent of inventory value.
23—An arbitrary charge of \$1,000 per year.
24—5 per cent of appraised value.
25—6 per cent of gross income.
26—6 per cent of gross earnings for maintenance and depreciation.
27—Arbitrary charge of 4.3 per cent of investment.
28—5 per cent of appraised value less estimated salvage.
29—10 per cent of value.
30—5 per cent of estimated value.
31—2 per cent of book cost including betterments.

It is apparent from a study of the foregoing table that electric railway accountants have grappled with the problem and made a sincere effort to comply with commission requirements. It is likewise apparent that there is an honest difference of opinion regarding the life of rolling stock. The figures as they stand represent an expectation of life ranging from ten years to 100 years.

Table II on the next page has been compiled from electric railway reports and is merely inserted for the purpose of indicating variation of practice. It is inadvisable to jump at conclusions, however, in reading this table. Local conditions must be studied and every fact supporting the figures must be known before an intelligent opinion can be expressed regarding the adequacy or inadequacy of any figures or percentages of this kind.

It is an established fact that a railway system cannot be kept in an absolutely new condition. It may be maintained at 100 per cent efficiency, yet during the early years of its life the maintenance costs will vary considerably until it finally settles down to a practically constant percentage of wear and of depreciation and a practically constant expenditure for repairs and renewals. This leads to a consideration of the subject of renewals and its relation to maintenance and depreciation. Railway rolling stock especially is renewed and rebuilt until of its original component parts there sometimes remains scarcely a trace. One railway system is known to expend in nine years for repairs and renewals of rolling stock a sum equivalent to the total original cost of the equipment. It is quite possible, in this manner, to take care of depreciation through the maintenance and renewal of principal parts and the replacement of units in service. This method has been used very satisfactorily by some steam railways for years. Certainly the question of depreciation cannot properly be discussed without careful consideration of the items of renewals and replacements. In actual practice the use of depreciation accounts may be entirely unneces-

TABLE II—MAINTENANCE AND DEPRECIATION AS SHOWN IN PUBLISHED REPORTS OF ELECTRIC RAILWAYS
Percentage of Gross Operating Revenue

	Maintenance	Depreciation (and Renewals)	Total

sary when renewals of principal parts and replacement of units in service have been adequately taken care of through maintenance (operating expense) accounts.

The plan of accounting for depreciation of railway property, as required by the Interstate Commerce Commission, is neither scientific nor practical in application and operation. A railway which cost \$100,000,000 to build and equip may own rolling stock which cost \$10,000,000. Is it consistent to select one item of this great transportation machine, and write down its value month by month on a mere guess, while the remaining \$90,000,000 of investment, much of it having enormously increased in value, is left undisturbed? Is it a good plan to inject so much of theory and estimate into the accounts of railways?

There was a Conference on Valuation in Philadelphia Nov. 10 to 12, 1915, at which Milo R. Maltbie, member of the advisory board division of valuation, Interstate Commerce Commission, advocated the inclusion of appreciation of land values as an item of income, to be credited as such, on the same theory that depreciation is allowed as a charge to operating expenses (ELECTRIC

RAILWAY JOURNAL, Nov. 13, 1915). Yet the inclusion of appreciation of land values as current income, month by month, would be as impracticable and as hard to calculate as the wasting of property (depreciation of rolling stock) month by month. Why should either of them be included in the income account? Would it not be much more sensible to take care of such estimated fluctuations through the surplus account?

If, for example, the book valuation of the various units making up a railway property has not been increased by the estimated appreciation in value of portions of the property, such as right of way, roadbed, terminals, etc., and a book surplus has accumulated, is it not permissible to say that this ability to accumulate a surplus through the operation of the property proves the value of the property as a transportation machine? The existence of a comparatively adequate surplus generally warrants the assumption that replacement of worn-out physical property can be made as and when required by actual depreciation. A surplus may be built up as insurance against financial panic, disastrous floods and fires, and other exigencies as well as for assurance of the replacement of physical property at the termination of useful life. It is not reasonable or fair to assume that a corporation has not provided for depreciation merely because the balance sheet does not contain a separately-tagged depreciation—or replacement—reserve account. Its real surplus may, as a matter of fact, be adequate to take care of many other contingencies besides the wasting of assets or so-called physical depreciation.

A careful examination and analysis of the balance sheet is more important and will be more fruitful of results than mere theorizing regarding the depreciation of a portion of the physical property. Arbitrary regulations of the income account should not in justice be substituted for first-hand knowledge of property and earning values. In order to avoid the monthly arbitrary changes in operating expenses and net earnings, which are unavoidable under the commission plan of accounting, the surplus account should be used to reflect fluctuations in net worth when all the facts are known. If this were done, the use of the depreciation accounts required of railways under the plan now compulsory would be almost wholly unnecessary.

Supplement to the Trade Directory of South America

The bureau of foreign and domestic commerce, Department of Commerce, through the co-operation of American consular officers, has completed a revision of the lists of importers and merchants located in Buenos Aires, Bahia Blanca and La Plata, Argentina. These lists form a supplement to the Trade Directory of South America, which was published in 1914 as a section of the new edition of the World Trade Directory. In publishing the Trade Directory of South America, the bureau of foreign and domestic commerce was obliged to go to press without the list from Caracas, Venezuela. A revised directory for that city has been prepared by the American Consular Service, and is presented in this supplement, together with a later list for La Guaira, Venezuela. The supplement contains thirty-seven pages, and is sold at 5 cents per copy to cover partially the cost of printing. Those desiring one or more copies of this supplement should make application to the Superintendent of Documents, Government Printing Office, Washington, D. C., or to the branch offices of the bureau of foreign and domestic commerce. Money order or check should be made payable to the Superintendent of Documents.

Railway Conditions in California*

Only One of Twenty-five Electric Lines Paid Dividend Last Year—Plight of the Carriers Is Described and Causes Analyzed—How the Public Can Help to Better the Situation

BY PAUL SHOUP, PRESIDENT PACIFIC ELECTRIC RAILWAY, LOS ANGELES, CAL.

What is to be the future of the electric railways in California? Into these enterprises have been poured several hundreds of millions of dollars. The resulting railways have been, and are, great assets to the communities they serve. Yet according to the official statements of the operating revenue for each of the last three fiscal years of twenty-two electric railways of California, the revenues are insufficient. Out of twenty-five roads, just one electric railway paid a dividend to its stockholders last year and that had no bonded debt.

CONDITION OF PROPERTIES

It may be said that while there are material reductions in gross earnings of the roads during the three-year period and marked reductions in the net earnings, yet these are not such as to imperil the properties. This possibly would be true were it not for two facts. In the first place, three years ago the interurban roads as a whole, and a number of the city lines, were not earning their fixed charges. They could afford to lose but little. In the second place, practically all of the roads have, in the three-year period, had to invest large sums of money because of public requirements, such as in paving and track reconstruction incident to paving, newer and much more expensive rolling stock, and many safety devices.

The interurban electric railways of California are not now earning, and have not during any one of the three fiscal years ended June 30, 1915, earned interest and other fixed charges upon the investment—that is, the money actually put into the properties and properly chargeable under the Interstate Commerce Commission classification to capital account. In other words, they have not earned the actual interest upon all the debts they owe, represented by funded and floating debts, or upon the reproduction cost of the properties to-day, the rights-of-way and other real estate being valued, not at reproduction cost but at original cost. The city lines are not much better off. The same statement might be made with reference to them, but their final income accounts for the last year are not at hand, nor am I so familiar with these city properties as a whole. It can be stated with certainty, however, that they are not prosperous. In short, it may be said that more than two-thirds of the electric railway companies of California did not earn their fixed charges last year. This is a serious situation to every community that is served by electric roads, as well as to the employees, the owners and every community that would like to have electric railway service.

CAUSES OF THE PRESENT SITUATION

What are the causes of this condition? Some are uncontrollable. Some are those that other lines of business have to meet. The first is the business depression. The companies face that cheerfully; it is a condition which will pass. The second is the development of the automobile and the extension of the good roads. Privately owned and operated machines form a new and permanent factor. They have made serious inroads upon earnings, but they present a condition that must be

faced. Likewise no fight can be made upon the good roads. They are a great asset to California, and in the end the State will reap great benefit.

Other causes, however, are open to criticism. For instance, notice paving expenses. With the advent of the automobile cutting into the revenue came the demand for better streets. People are not satisfied with the light paving as of old. Under the present Los Angeles city specifications, and this is simply to meet the demands of traffic, it costs at least \$20,000 per double track-mile on an average just to pave the space occupied by the electric railways, and sometimes, depending on track centers, much more. There has been no such increase in earnings as to justify this increase in investment.

Tremendous investments are put in where there is no possibility of getting any considerable part of the capital back before the expiration of the limited franchises. The Pacific Electric Railway is now paving a section of Santa Monica Boulevard in the city limits, a little more than 2 miles long, at a cost of \$225,000, according to the work order estimate, or more than \$100,000 a mile. The asphalt paving will cost approximately \$70,000. With a franchise expiring in thirty years, and connecting franchises expiring in a much shorter time, and with operating expenses and taxes, on the average, taking more than 70 per cent of the revenue, could it be proved that this investment would be a desirable one, especially as the section involved is in the further limits of the 5-cent fare territory and the rate per passenger is very low, probably not in excess of 1 cent?

The public is demanding this kind of construction, not only in this city, but in every city in California, and because of a very natural demand for good streets. But the question is, with decrease in revenue through automobile competition, both private and publicly operated, can the electric railways find the money to do this work? Is it right for them to risk other people's money in such an investment?

The second cause of present conditions is high taxes. The taxes paid by the electric roads have always been very heavy. If it takes two-thirds of the revenue to meet operating expenses it can readily be seen what a large proportion of the net earnings taxes are. Out of each \$1 of revenue the railways now pay 5¼ cents to the State. This represents increases in the last few years as follows, in percentage:

Year	Percentage to State	Increase Over Previous Year
1913.....	4 per cent	17.8 per cent
1914.....	4¾ per cent	26.2 per cent
1915.....	4¾ per cent	3.9 per cent
1916.....	5¼ per cent	12. (estimated)

The Pacific Electric Railway last year paid on its operating properties \$496,477 in taxes. Thus, of the money it had left after paying its operating expenses, more than 17 per cent went to taxes. Incidentally, it may be stated that this company did not earn its interest and fixed charges by \$500,000.

The third cause is the greatly increased expenses due to the very proper precautions the electric railways are taking in connection with the safety-first movement. This includes installation and operation of safety de-

*Abstract of address delivered before Jovian Electric League at Los Angeles on Oct. 21.

vices, such as interlocking plants and signal systems, training schools and flagmen, and a higher standard in the operations all along the line. Wages on practically all of the interurban lines and upon a great many of the city lines have been increased in the last three years. No one has fault to find with these measures, but they involve expenses that must be met by increasing revenues.

The fourth cause is the jitney and motor truck competition. This, of the causes that can be controlled by the public, is most important of all. If these carriers are to take over the electric railway business or any part thereof, they must take over likewise the obligations and responsibilities of such carriers to the public. This is not true now. Jitneys in the cities are being regulated, but they have no such obligations yet as the electric lines have along the line of taxes, paving obligations, and service and fare regulations. The interurban jitneys are practically not regulated except as they come in contact with city regulation. But these various lines, city and interurban, are taking enough of the narrow margin in earnings that the electric railways have to threaten their investments and threaten their efficiency as carriers. It is idle to prove that a jitney is not an economic possibility. It is here just the same.

WHERE THE PUBLIC CAN HELP

The difficulties that electric railways have to face in common with the public they will cheerfully face, but there are other directions where the public can help them and thereby help itself. If the situation is not changed, the electric railways cannot improve and extend their properties. Service must be curtailed and the weakest branches abandoned. This is not a matter of theory. Lines have been abandoned already, for the stronger lines, with unregulated competition and heavier burdens, are no longer able to carry the weak lines.

There will have to be material reduction in other directions in service wherever reductions can be demonstrated as saving more money than is lost through such reductions. This means a cutting down of employees on cars, in shops, on tracks, and in new construction. Not only do the men suffer, but the business of the whole community suffers.

Commutation rates have in many directions been made because it meant the settlement of the country and the creation of individual and round-trip traffic at higher rates. The head of the family would buy a monthly commutation ticket; the others would ride on higher-priced tickets. But if jitneys, without making commutation rates, are to enjoy the higher-priced traffic, then there will have to be a readjustment of the lower rates.

What, then, do electric railways expect? Let one's own conclusions be drawn from the following statements:

1. Electric railways in the State, in behalf of the people whom they serve, the people whom they employ, and those whose money they have invested, have a right to ask that competition of jitneys or motor trucks be asked to take on equal responsibility and obligations to the public.

2. One electric road is not expected to parallel another, or to take another line's passengers from its stations, but this is exactly what automobiles are doing in California. It is therefore very necessary in the interest of service alone to consider under what conditions this question of competition with the electric railways by jitneys should be allowed.

3. The electric railways have reached their limit under present conditions as to taxation. While earnings are being diminished taxes upon the gross income have

been increased. Every dollar diverted from an electric road to an automobile, freight or passenger, means a loss of 5¼ cents to the State, and ordinarily, if within the city, some loss to the city likewise.

4. The electric roads will be unable to get money any longer to pave streets where poor earning lines exist. It is going to be a choice of abandonment under present conditions or modification with respect to paving expenses. Some cities are already realizing this, and where traffic is not heavy are permitting the use of less expensive pavement and not demanding that track be reconstructed.

5. Electric railways are in a quandary as to the rate situation. The public, however, is generally realizing that the railways must have revenues if they are to live, and southern California has been showing in this direction an intelligent appreciation of the conditions. It is probable that many rates will have to be increased.

Electric railways can continue to give good service and to expand if the present difficulties can be overcome, and this with fairness to the public. They can be. This is not a pessimistic talk, but a statement of the situation which must be known and considered if the constructive optimism that has made the electric railways is to be upheld by the people who have been most benefited. The questions raised are not party or political questions at all, but they are questions to be answered by the thinking public expressing its conclusions through governmental channels.

1200 Versus 600-Volt Trolley Systems

S. B. Fortenbaugh States Wherein the Merits of the 1200-Volt System Lie and Estimates Its Cost to Be from 10 to 20 Per Cent Less than the 600-Volt System

In a paper delivered at the recent White Springs meeting of the Public Utilities Association of West Virginia, mentioned in the issue of two weeks ago on page 1085, S. B. Fortenbaugh outlined the advantages of the 1200-volt system for interurban railways. He showed that there are no important compensating disadvantages. To illustrate his statements he gave the results of calculations for a 25-mile line with 5 miles additional in terminal cities, using 30-ton cars and making 20 m.p.h. schedule speed with one stop per mile between cities. Hourly service for eighteen hours per day was assumed.

With 1200 volts one substation of 600-kw. capacity would be required in place of three of 300-kw. capacity each at 600 volts. The load factor would be 20.8 per cent and 13.8 per cent in the two cases respectively, and the efficiency 77 per cent and 70 per cent. The daily energy saving due to the use of the higher voltage was 350 kw.-hr., or 10.4 per cent of the total.

With direct generation of d.c. power at 1200 volts as compared with a.c. transmission the saving in power is about 33.5 per cent, made up as follows: Step-up transformer loss, 3 per cent; transmission line loss, 2 per cent of remainder; "all-day" substation losses, 30 per cent of remainder. On the basis of 2700 kw.-hr. per day delivered to the trolley wire, and 1 cent per kilowatt-hour energy cost the money value of the saving is \$13.50 per day or \$4,930 per year. With a.c. generation and distribution the saving in cost of power is due to improved load factor. On the same basis this saving amounts to \$3.50 per day or \$1,280 per year.

At \$100 per month per substation for labor, maintenance and miscellaneous expense the 1200-volt system saves \$2,400 per year in substation expense.

The total saving is, therefore, \$4,930 per year for direct d.c. generation and \$3,680 for a.c. generation.

Capitalized at 5 per cent these savings are equivalent to additional investments of \$73,600 and \$98,600 respectively.

Mr. Fortenbaugh claimed that the net saving in the initial cost of "electrification material," i. e., cars, substations, transmission, trolley wire, feeders and bonding will vary between 10 per cent and 20 per cent in favor of 1200 volts. Practically the same result is indicated by the consideration of fixed charges, including depreciation, interest, taxes and insurance. The cost of operation also favors 1200 volts by from 10 to 15 per cent.

Cost of Miscellaneous Shop Equipment

In connection with the inventory recently filed by the Bay State Street Railway of Boston, Mass., with the Massachusetts Public Service Commission, as a basis for rate-making, a large number of data were submitted as to the cost of shop equipment. Representative items from the exhibits are given herewith, the cost installed being stated.

REPRESENTATIVE SHOP EQUIPMENT COSTS

Item	Campello, Mass.	Cost
No. 0 Springfield car-wheel grinder.....		\$1,455

11-in. x 24-in. Wood dimension planer.....		170
Universal wood worker.....		170
Double spindle wood shaping machine.....		160
Smith reciprocating vertical mortiser and borer.....		155
36-in. band saw.....		137
36-in. x 37.5-in. double revolving universal saw bench.....		106
8-ft. Type B Oliver swing cut-off saw.....		93
42-in. x 60-in. double arbor combination saw table.....		8,158
42-in. Niles-Bement-Pond motor-driven car-wheel lathe.....		99
Foundation for above.....		441
500-lb. Beaudry belt-driven hammer.....		36
Harrington hair comb.....		54
4.5-in. x 2.75-in. x 4-in. Worthington duplex feed pump.....		15
No. 1 Champion blower.....		53
Singer power sewing machine.....		15
Randall leather creasing machine.....		41
No. 6 hand-operated wood trimmer.....		365
4-ton Yale & Towne electric hoist.....		

The above costs are those obtaining in particular cases and extend through a considerable period, the latest installation listed being as of Nov. 1, 1914. The costs are not necessarily current prices, but are of value as showing the actual money outlay required for the tools specified.

Petrol-Electric Car for New Zealand State Railways

The New Zealand Government is preparing to handle the suburban passenger traffic on the State Railways in this Dominion in a more economical and satisfactory way than by the usual steam operation, and with this end in view has ordered a 200-hp. petrol-electric car from the Thomas Transmission Company, an English firm. Elasticity in power output is obtained by using the motor to generate electricity which is then employed through an electric motor. At low speeds the electrical machines are used, but when the car has reached a speed in which the motors can be run at economical speed geared directly to the wheels a direct mechanical drive comes automatically into operation, the more complicated electro-mechanical drive being automatically cut out. During trials in Birmingham, England, the engine hauled loads of 120 tons and 200 tons. It is designed for a speed of 40 m.p.h. on the level and will be capable of pulling a trailer.

COMMUNICATION

The Single-Phase Repulsion Motor

GENERAL ELECTRIC COMPANY

SCHENECTADY, N. Y., Dec. 3, 1915.

To the Editors:

I have read with great interest the article in the issue of the *ELECTRIC RAILWAY JOURNAL* for Nov. 13 and the editorial in that for Nov. 20 commenting on the single-phase equipment of the Philadelphia-Paoli electrification. In these articles are pointed out the advantages of using the repulsion starting, single-phase motor which is operated at full speed in a double-fed connection, which has otherwise been called the series repulsion connection.

This development is of no less interest to the writer because the system used is very familiar, and for the readers of the *ELECTRIC RAILWAY JOURNAL* who may have forgotten I should like to call attention to an article in your issue for Oct. 11, 1913, page 677, where there is a description of a General Electric single-phase motor equipment which at that time had already been for several years in successful operation on the New Haven road. A large single-phase locomotive which is now in operation on the New Haven road is also described. In this article the diagram of connections for these equipments shows the method of operation in starting as repulsion motor and operating as series repulsion or double-fed motor, and the experience with these equipments has fully borne out the predictions of the writer before the American Institute of Electrical Engineers in January, 1908, announcing the first railway equipment of this kind.

E. F. W. ALEXANDERSON.

Bad Advice to Women

Prominent Women's Journal Criticised for Discouraging Direct Settlements and the Giving of Testimony in Accident Cases

In its issue of November the *Ladies' Home Journal* published the following editorial:

The law is a maze to most women. But every-day law touches nearly all women at some time, and it is wise for them to bear these very simple law points in mind:

First: If you are injured in any accident—automobile, trolley, railroad or what not—never settle a claim for damages with the person who has injured you. Refer the person or company to your lawyer, but don't settle it yourself no matter how much money is offered you.

Second: If you see an accident, and a conductor or a bystander asks you for your name and address as a witness, remember you don't have to give them to him. He has no right to ask them of you; it is your privilege to refuse. If you give your name and address you must be prepared, in case of a suit, to be summoned into court as a witness.

Third: If you discharge a servant and she demands a week's or a month's wages, it is your privilege to give them to her, but there is no right on her side. The law is that where a servant is discharged for cause, he or she is only entitled to the wages due up to the time of discharge.

Fourth: Never buy real estate until the property or the deed has been carefully looked over by a lawyer or a trust company.

Fifth: Never sign a legal document of any sort until a lawyer has looked it over.

The first two recommendations in this editorial have naturally created a great deal of unfavorable comment among claim agents and those actively engaged in the class of work involved in the editorial. Among others to whom the advice seemed most pernicious is C. J. Franklin, formerly general superintendent Portland Railway, Light & Power Company and now a consulting engineer in Portland, Ore. Mr. Franklin has written a letter on the subject to the editor of the *Ladies' Home Journal*. Among other things he says:

"I am sure that it was with no intent to hamper industry or injure any class of people that you gave the advice contained in the first and second recommendations in the editorial. I, therefore, attribute these rec-

ommendations to unreliable or insufficient information upon the subject.

"I take it that where you say in your first recommendation: 'Never settle a claim for damages with the person who has injured you,' that you refer not only to the person in charge of operating the vehicle at the time but also to the claim agent, official or other authorized representative of the company. Your recommendation is very clear in referring the injured person to a lawyer before taking any action.

"Experience has shown that this theory does not work out well in practice. Advice of this character might be all right for those who are in the higher circles of society and finance, who wish to avoid the detail connected with a claim for an injury and who have representative attorneys to handle their legal affairs on a guaranteed fee. But for the great majority of people who have never had occasion to consult an attorney, and do not know whom to consult, the services of the high-class attorney, previously mentioned, is not only beyond their means but this class of litigation on a contingent basis is not attractive to them. The consequence is that, as a rule, they fall into the hands of one of two classes of attorneys.

"The first of these is those attorneys who are perfectly reliable but not prosperous or financially able to take a case where the fee is not guaranteed. They therefore follow a contingent plan, charging as high as 60 per cent of the amount recovered, an amount entirely out of proportion to the services rendered, and suit is instituted for an amount which is wholly inconsistent with the damage sustained by the client.

"The second class of attorney is unscrupulous. He makes a business of handling this class of work and also charges on a contingent basis. He will distort and even go so far as to manufacture evidence in order to further his end.

"In either case, should the injured person recover damages the amount that he or she receives, after all expenses have been paid and the contingent fee of the attorney deducted, is almost always less than the company through its agents have offered the injured person, to say nothing of the trouble, publicity, anguish and loss of peace of mind sustained by reason of a law suit. It is a case of 'if you win you lose.'

"Your second recommendation tends to discourage witnesses from giving their names and is unfair and unjust to all concerned. Under the law all are entitled to a fair trial which is based upon the testimony of those who are in a position to know the facts, and surely, this includes eye witnesses to an accident. Would it not be just as unfair to the injured person whose friend was trying to secure the names of eye witnesses to an accident in order to ascertain the facts as it would be to the railroad company whose representative is trying to do the same thing for its protection?

"Little is known by the average citizen of the trials, tribulations, impositions, ambulance chasers and fake accident claims with which public utilities have to contend, and it is for their protection, not to escape from liability, that reasonable instructions are given to employees what to do in case of accidents and how to prevent them.

"The claim agent of a public utility is instructed never to evade liability and to use every effort to settle a case before resorting to the law. The consequence is that the cases which find their way to the courts may be divided into three classes: First, where there is no liability on the part of the utility; second, where there is liability and the claim for damages is out of proportion to the injury, and, third, fake cases. The latter in-

clude the cases of those who follow the occupation of getting injured in order to collect damages, manufacture their own testimony and supply their own witnesses at trial.

"I think that I am well within the bounds when I say that if your instructions were followed throughout this country, the public utilities engaged in transportation services would be in the hands of receivers, on account of increased claims for damages, in a very short time."

Successful Tests on the St. Paul

A number of actual speed and tonnage tests were made on the completed section of the electrified mountain divisions of the Chicago, Milwaukee & St. Paul Railway on Dec. 8. The passenger train tests were made by one of the new 260-ton locomotives drawing three special cars and running at various speeds up to 70 m.p.h., and the tonnage tests with the freight locomotives included pulling 2500 tons at a uniform speed over various grades at 16 m.p.h.

The railway officials witnessing the tests included A. J. Earling, president of the St. Paul Railway; H. B. Earling, vice-president; H. R. Williams, vice-president; C. A. Goodnow, assistant to the president; Percy Rockefeller, nephew of John D. Rockefeller; John D. Ryan, the copper magnate; A. J. Pettit, Charles W. Harkness and Donald Gedkes, all members of the directorate. A. H. Armstrong and other General Electric officials were also present. At the conclusion of the tests President Earling and the other officials declared them a complete success. The regenerative braking tests made recently, as described on page 1037 of the issue of this paper for Nov. 20, were repeated and proved under actual tests to be completely satisfactory. In fact, it is reported that the economy of this system was made very apparent to practical railroad men in the party, who saw the use of air brakes made unnecessary except at station stops and in emergencies, an enormous saving resulting in reduced wear and tear on track equipment and the elimination of constant grinding of brakeshoes on the wheels.

It is anticipated that the all-steel continental trains of this company will be operated electrically over the continental divide shortly after the first of the year.

Rochester Jitneys Operate Despite Thompson Law

In Rochester, N. Y., a rather unusual situation has arisen in connection with the Thompson bill, passed by the New York State Legislature for the purpose of regulating jitney buses. This law makes it necessary for all persons and corporations owning and operating stage routes, bus lines, or motor vehicles carrying passengers for a fare of 15 cents or less upon any public thoroughfare in any city of the State except the city of New York, to procure, first, the consent of the local authorities and, next, a certificate of convenience from the Public Service Commission.

The law went into effect during May of the present year. At that time a number of jitney buses had been granted licenses by the city of Rochester, and subsequent to this the jitney operators made no attempt to secure permission from the Public Service Commission for the continuance of their operation. At the present time, therefore, the Rochester jitney buses are operating in direct defiance of the terms of the law, at least in so far as regards the requirement for a certificate of public necessity and convenience from the commission.

This situation may be explained through an opinion which was drafted by the assistant corporation counsel

for the city of Rochester, in which it was held that the licenses which had been issued by the city gave the jitneys a legal right to operate there until the expiration of the licenses, or Jan. 1, 1916. This opinion was based on the alleged failure of the Thompson bill to provide any retroactive clause, as it was maintained that nothing appeared in the statutes to indicate that the law had a retroactive effect or was intended to invalidate acts done under laws in existence previous to its enactment. No doubt was expressed that the licenses granted by the city were revocable, but it was held that while these licenses were in force they gave the holder the right to operate in the streets. As a result of this opinion, the city did nothing more to enforce the law than to stop issuing licenses to jitney buses subsequent to the month of May, as indicated in the accompanying graphic record of the jitney movement in Rochester.

These licenses had been issued to the jitney buses on the same basis that the city issued hack licenses, the license fee being \$1 and covering the period of one year.

GRAPHIC RECORD OF THE JITNEY MOVEMENT IN ROCHESTER

Certain police regulations were established for the license holders, but owing to the great difficulty of enforcement these have had very little effect, especially in regard to compelling the jitney buses to maintain fixed schedules and routes, and to stop only at authorized points along the streets.

Notwithstanding this practical absence of regulation, the number of jitney buses has decreased with extraordinary rapidity. The records covering the number of jitneys in operation were commenced late in the month of May, the number at that time being close to 500. At the present time only 120 jitneys are in service, the reduction being at a practically constant rate. Prior to the time that the records were instituted the number was estimated to have reached a maximum of 800, and in view of the rapid decrease it is probable that the movement will die out of its own accord even though the Thompson bill has been rendered ineffective.

At present the city's plan is to increase the license fee, after Jan. 1, to \$50 per year, for any jitney buses that can secure the right to operate from the Public Service Commission. In connection with the matter of licenses for the ensuing year, the jitney bus operators recently appeared before the City Council for the purpose of getting the fee established at as low a figure as possible. At the same time the data contained in the accompanying illustration were submitted before the Council by the railway company, the record of the number of cars in operation being submitted to show that the street railway company had not been able to decrease its service notwithstanding the jitney's spasmodic inroads into its gross receipts.

American Association News

Tentative Programs for Denver Company Section Meeting Announced—The Connecticut Company Forms Section with 150 Members—Meeting of the Chicago Section—Manufacturers' Association Notes

PROGRAMS OF COMING MEETINGS OF DENVER SECTION

A tentative program has been made for coming meetings of the Denver Tramway Company Section as follows:

December meeting: F. W. Hild, general manager of the company, will speak on scientific management or an allied subject, the title to be announced shortly.

January meeting: H. C. Fligg, in charge of the coasting department, will speak on "Schedules, Skip-stop and Express Service."

February meeting: A member of the Colorado State Public Utilities Commission will address the section on a subject to be announced.

FIRST YANKEE COMPANY SECTION FORMED

At an enthusiastic dinner gathering held in the Garde Hotel, New Haven, Conn., on Tuesday evening, Dec. 7, 1915, a company section of the association was formed by 150 employees of the Connecticut Company. The list of speakers included Martin Schreiber, Newark, N. J., chairman of the committee on company sections and individual membership; C. C. Peirce, Boston, Mass., vice-president of the Manufacturers' Association; E. B. Burritt and H. C. Clark, New York, N. Y., respectively secretary of the association and editor of its magazine, and L. S. Storrs and J. K. Punderford, New Haven, Conn., respectively president and general manager of the company. A. C. Flickinger presided at the dinner.

Mr. Burritt told of the work of the association as it relates to the company section movement. Mr. Schreiber enlarged on the benefits of the company section to all concerned, basing his statements partly upon his experience in the Public Service section. Mr. Peirce gave reminiscences of the early days of the companies which later united to form the Connecticut Company, with which he had been personally familiar. Mr. Clark told of the relation of *Aera* to the sections. Messrs. Storrs and Punderford indorsed the movement in their official capacities and extended their best wishes.

The section is the outgrowth of a bowling club which recognized the advantages of organization. A committee, comprising Harold Bates, assistant engineer, as chairman, and I. A. May, comptroller, made a special study of the matter, visiting the section in Newark to examine at first hand the results of the work. Their report was so favorable that the plan went through with a rush. Details of the organization will be given in a later issue.

CHICAGO ELEVATED SECTION

Reports from the specially-favored members of the Chicago Elevated Railroad section made up the principal part of the program of the meeting held Dec. 1. One hundred and ten members and guests were in attendance, and President Johnson presided. Secretary Smith's report showed that thirty-five new members had been added to the section, making 156 in all. He also read a letter from Charles L. Henry, president of the American Electric Railway Association, in which Mr. Henry expressed assurance of his support and co-operation. C. E. Shaw, division foreman of signals and interlocking, and A. H. Daus, assistant master me-

chanic, the delegates of the section to the San Francisco convention, reported concerning their trip. Mr. Daus illustrated his talk with a number of photographs which he had taken en route and mounted on lantern slides. J. A. Jarvis, division superintendent and one of three employees who were sent by the company to the military training camp at Fort Sheridan, Ill., told of his experiences there.

NOTES ON THE MANUFACTURERS' ASSOCIATION

The membership in the Manufacturers' Association, although somewhat less than last year, compares very favorably with that during other years when the convention has been held at points other than Atlantic City. At the meeting of the executive committee on Nov. 12, Secretary McConaughy reported that the total membership at that time was 299, as compared with 359 in 1912 when the convention was held in Chicago, with 274 in 1909 when it was held in Denver, and with 274 in 1906 when it was held in Columbus. At the same meeting Mr. Finigan, who was vice-president in charge of entertainment at the San Francisco convention, stated that the actual expenses for carrying out the entertainment program were \$1,725. The treasurer presented a financial report showing a balance in the bank on Nov. 12 of \$8,904, and a dinner committee to take charge of the arrangements for the banquet at the time of the mid-year meeting in Chicago was appointed. This committee consists of Charles C. Peirce, L. E. Gould, Miles B. Lambert and E. F. Wickwire.

Annual Meeting of A. S. M. E.

The winter meeting of the American Society of Mechanical Engineers was held in New York from Dec. 7 to 10, with a registered attendance of 1210. An announcement of this meeting with a list of some of the papers of electric railway interest appeared in last week's issue of the *ELECTRIC RAILWAY JOURNAL*, page 1140. Abstracts of several of the papers will be printed in a later issue.

Among the features of this meeting, aside from the discussion of engineering topics, was a stirring address by the retiring president, Dr. John A. Brashear, a memorial meeting to the late Dr. Frederick W. Taylor, the father of scientific shop management, conferences of delegates from the society's fourteen local sections throughout the country, excursions to various points of engineering interest, and special social functions.

The officers elected for the coming year are as follows: President, Dr. D. S. Jacobus, Hoboken, N. J.; vice-presidents, George W. Dickie, San Francisco, Cal.; Henry Hess, Philadelphia, Pa.; James E. Sague, Poughkeepsie, N. Y.; W. B. Jackson, Chicago, Ill.; J. Sellers Bancroft, Philadelphia, Pa., and Julian Kennedy, Pittsburgh, Pa.; managers, A. M. Greene, Jr., Troy, N. Y.; John Hunter, St. Louis, Mo.; Elliott H. Whitlock, Cleveland, Ohio; Charles T. Main, Boston, Mass.; Spencer Miller, New York, N. Y.; Max Toltz, St. Paul, Minn.; John H. Barr, New York, N. Y.; J. A. Stevens, Lowell, Mass., and H. De B. Parsons, New York, N. Y.; treasurer, William H. Wiley, New York, N. Y.; secretary, Calvin W. Rice, New York, N. Y.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Rail Bond Testing—II—Determining and Interpreting Bond Resistance

BY H. H. FEBREY, ENGINEER AMERICAN STEEL & WIRE
COMPANY, FORMERLY ASSISTANT ENGINEER PENNSYLVANIA TUNNEL & TERMINAL RAILWAY

In the issue of the ELECTRIC RAILWAY JOURNAL for Dec. 4, page 1130, the writer outlined the principal means used for testing bond resistance. This second and concluding article is taken up with the practical application of the data derived from tests in the field and in the laboratory.

The true resistance of rail bonds, including contact resistance, has been carefully determined, and sufficient data are available for determining the resistance of almost any bond. Table I is convenient for determining the ohmic resistance of bonds of several sizes. The contact resistances are included.

In Table I the third column shows the resistances of complete joints made with 10-in. bonds, the fourth column giving the approximate resistance of the joints in a mile of rail. The last two columns are added for convenience in determining the resistances of single joints and of joints per mile of rail with other than 10-in. bonds. The fifth column gives the resistance per

inch of bond. Obviously the resistance of a joint with a longer or shorter bond is as much greater or less than that of one with a 10-in. bond by the product of the difference in bond length in inches and the resistance per inch. The last column is the corresponding difference per mile of rail. The contact resistances are for 9/16-in. rail webs, but for all practical purposes in testing this is sufficiently close.

TABLE II—ACTUAL CONTACT RESISTANCE OF STUD TERMINALS UNDER A CONTACT PRESSURE OF 15 TONS PER SQUARE INCH

*Based on a conductivity ratio of copper to steel of 12:1.

In Table II are given the contact resistances of terminals of various diameters under a contact pressure of 15 tons per square inch, together with the contact areas in 9/16-in. rail webs. The figures are for single terminals. Table III shows the areas of copper in circular mils equivalent in conductivity to railway steel. Table IV contains the resistance in ohms of continuous steel rails.

The diagram given in Fig. 1 will be found convenient in determining quickly the length of rail of several sizes equivalent to given lengths of bonds of several sizes. To use the chart, begin at the lower left-hand corner and follow the vertical line corresponding to the length of bond selected until this line intersects the diagonal line corresponding to the selected cross-section of bond. Then follow a horizontal line from this intersection to the right to its intersection with the diagonal line corresponding with the selected size of rail. Directly below this intersection, on the right-hand horizontal scale, is the length of rail having the same resistance as the selected bond. For convenience in reading the lengths of 100-lb. rail corresponding to the several bonds the vertical scale has been shown in this diagram.

Owing to the variation in the lengths of rail bonds it is seldom that the resistances found from tests are exactly as derived from the tables and charts. The bond terminal contacts may be anywhere from 3½ in. to 4 ft. or more apart, whereas the tester contacts are commonly at a fixed distance apart. In the comparative methods it is essential that the center tester contact be outside of the bond terminals. It is obvious that there is a division of the current at the bond terminals, a small part of it flowing through the splice bars and the remainder through the bonds. The uncut rail between the bond terminal and the rail end will contain a smaller current than that outside of the bond terminals and should never be used for comparison, unless correction is made for this. It will eliminate the necessity for corrections if the tester contacts are arranged to coincide with or exceed the spacing of the bond terminals and to consider the results of the test on the basis of so many feet of joint.

The diagrams given in Fig. 2 illustrate how to obtain the proper resistance of the bonded joints as tested. The distance Y is commonly taken as 3 ft. This is convenient for roads where both long and short bonds are used. It is apparent that 3 ft. of joint has different resistances in the figures. The capacity of the bond, number of bonds, and length and distance between bond terminals must be taken into account. As a general rule no consideration is given to the splice bars as paralleling the bond as far as resistance is concerned. The resistance of their contact with the rails is generally very high.

The efficiency of installed rail bonds cannot be clearly defined on account of the joint conditions, which preclude a relative consideration of the perfectly bonded joint. The splice bars undoubtedly reduce the joint resistance to some extent, sometimes by a very appreciable amount but more often by a negligible amount. Furthermore the bond conductors may be broken, thereby reducing the capacity, and the solid rail to which the joint is compared may be worn to reduced section, or the rail may be of different ratio of resistance to copper than the mean value of 12 to 1.

The contact resistance is a very small quantity when the installation is perfect, and a newly applied bond will not develop higher than calculated resistance except at the terminals. Experiments have shown that a contact pressure of 25,000 lb. per square inch is necessary in order to obtain an air-tight connection. There is therefore little room for increase in the total resistance of newly installed bonds, and the practice of testing bonds immediately after installation should be extended. The argument often advanced to the effect that it is necessary for a bond to be exposed to the elements for a time in order to determine faulty installation, is to some degree a fallacy. The effect of the splice bars may offset the resistance of the terminal contacts, thereby causing an improperly installed bond to appear good, but this is unavoidable. It will more often be found that the splice bars are of too high resistance to influence the test. The purpose of the test is to locate the poorly-applied bonds, and if the test develops a resistance greater than the calculated value it seems reasonable to assume that the resistance must lie in the terminal contacts of a new bond. If the de-

CASE 5

$$Y = \frac{1}{2} (\frac{1}{A_2 \text{ in ohms}} + \frac{1}{(A_1 + 2D) \text{ in ohms}}) + 2D \text{ (in rail feet)}$$

$$\text{or } Y = \frac{1}{2} (\frac{1}{A_2 \text{ in ohms}} + \frac{1}{(A_1 + 2D) \text{ in ohms}}) + 2D \text{ (in ohms)}$$

CASE 6

BOND RESISTANCE—FIG. 2—FORMULAS FOR CALCULATING RAIL JOINT RESISTANCE

fects in the bonds are corrected immediately the bonds may maintain contact indefinitely.

Bonds which have been installed for a period may be given different consideration. If they are concealed it is possible that the bond conductors may be broken or the terminals may have been loosened by interference with the splice bars. The bonds are therefore subject to deterioration from causes which affect the entire bond and under the circumstances they are entitled to a direct comparison between the perfect bond resistance and the resistance of the entire bond when tested. If the joint, as tested, should measure as equivalent to 6 ft. of rail and the perfect joint was equivalent to 4 ft., the relative efficiency would be 66.6 per cent. To say at what efficiency old bonds should be replaced is impracticable for the reasons already given. Local conditions will govern this. Newly installed bonds, however, should test not to exceed 6 in. more than the calculated resistance.

Another point for consideration is the case where rebonding is done with the old bonds in place. When the new bond is applied to a bonded joint a parallel resistance condition is interposed. The resistance of the old bond should be noted and figured as in parallel with that of the perfect new bond in order to determine what the resistance of the rebonded joint should be.

Frequently joints which are bonded with concealed bonds in paved streets are rebonded by placing bonds around the splice bars. In other instances concealed bonds are bonded over with short bonds attached to the head of the rail.

To take a concrete case, assume a 70-lb. T-rail to be bonded with one 10-in. No. 0000 bond and that a test of 3 ft. across the joint shows it to be equivalent to 14 ft. of rail. This is illustrated by Case 2, Fig. 2. The equivalent of A is (14 ft. 0 in.) — (2 ft. 2 in.), or 11 ft. 10 in. If we add a No. 0000, 8-in. twin-terminal bond to the same joint we have the same condition as in Case 5, where $E_1 = 4$ in. and $2d = 6$ in. Using the equation for equivalent of Y in rail-feet we find that the resistance will be reduced to that of 4 ft. 7 in. by the addition of the twin-terminal bond.

If we had considered the resistance of the twin-terminal bond alone, as in Case 1, the equivalent of 3 ft. of joint would have been 2 ft. 7 in. + 2 ft. 8 in. = 5 ft. 3 in., instead of 4 ft. 7 in., or an error of 8 in.

The difference will be found to be much greater when a long bond is placed around a high-resistance, concealed bond as in Case 6. Assuming that the rail and concealed bond are the same as in the previous case, we find that the resistance of the joint, when rebonded with a 37½-in. No. 0000 bond, is equivalent to 6 ft. 11 in., as against 13 ft. 7 in. for a single long bond.

It will be seen, therefore, that the higher-resistance bonds, say 20 ft. and more in length, will have practically negligible effect on the resistance of joints with short new bonds, but where long bonds are being placed around a joint the resistance of the joints before rebonding is of appreciable importance.

While it is undoubtedly more accurate to determine first the resistance of any joint before bonding in order to obtain the actual resistance of the new bond, it is not often practical to do this, nor is such a procedure warranted where the paralleling effect of the splice bars only is of concern. If many joints test better than perfect, so much the better for the return circuit. The higher-resistance bonds are the ones to be located and replaced.

The various laboratory tests which have been made to determine the actual resistances of carefully installed bonds differ somewhat. That there is a slight, and in some instances inconsistent, variation in the figures

given in different sources of information is probably due to differences in the locating of testing instrument contacts. The personal element and the inequality of testing facilities also contribute in part. In the case of the terminal-contact resistance alone the variations are more marked. Values given for the same diameter terminal in the same thickness of rail web vary anywhere from three to fifteen times the values given herein. Although the maximum difference is less than 0.01 microhm, a variation of 1500 per cent does not seem reasonable.

The contact resistance cannot be measured directly because it is the resistance of an infinitesimal space. The values given herein were obtained by careful tests on plane surfaces in which the minimum resistance per square inch of surface was determined. With this as a unit the actual contact resistances were calculated.

In conclusion, attention is called to the somewhat general complaint that bonds gradually increase in resistance. This may be due to the elimination of the paralleling of the splice bars on account of wear and rust.

Brush Tests on Non-Interpole Motors with Slotted Commutators

BY KEITH MACLEOD, MONTREAL TRAMWAYS

For the purpose of comparison with the results of tests described in an article printed in the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 22, 1914, page 355, the following results recently completed on brushes used on non-interpole motors with slotted commutators are given. These results show the effects of the practice of commutator slotting under the conditions obtaining on the Montreal Tramways.

The recent tests were conducted in substantially the same manner as those previously described, and both sets of tests were made for the purpose of selecting the most economical brush.

When the practice of slotting commutators was started it was noted that the percentage of broken brushes was increasing, and it was primarily to find out if a brush could be selected to stand up under the new conditions that the latest tests were started. It was noted that the old standard brush had no injurious effect on the slotted commutator, which was rather remarkable as this was a brush designed especially for commutators with flush mica. Accordingly this brush was included in the tests, making a total of four types of brush tested.

Each of these, with the exception of No. 2, was the brush recommended by one of three brush manufacturers for non-interpole motors, with slotted commutators, in city service. Data as to brush resistance were not available for, as the manufacturers' representatives pointed out, resistance measurements of carbon have to be made under identical conditions to give results of value. However, considerable mechanical data were obtained. Leaving out No. 2, an abrasive brush not particularly recommended for the tests, these were as given below.

The relative hardnesses, or resistances to scratching with a knife, were as follows: No. 4, softest; No. 5, hardest.

The breaking strengths, as determined by supporting the brushes on round bars placed 1½ in. apart, applying a breaking load at the middle by means of a round iron bar, and calculating the stress by the usual beam formula, were as follows: No. 4, 1020 lb. per square inch; No. 3, 1920 lb. per square inch, and No. 5, 2380 lb. per square inch.

A motor that experience had shown to be typical of

VARIAION IN BRUSH WEAR WITH BRUSH TENSION IN NON-INTERPOLE MOTORS

the non-interpole motors on the road was chosen for the test, and seventeen regular cars equipped with this type of motor were fitted with the test brushes.

Brushes of each type were distributed in various ways among the motors on each car, and each brush was marked with the car number and its position in the car. Thus "1300-2-R-0" would indicate that the brush was on car No. 1300, on No. 2 motor of this car, and in the rear brush-holder. It was also the outside brush. Each brush remained in the same position throughout the test.

Beyond instructions to workmen to report to the foreman any cases of marked brushes needing replacement, and an occasional inspection by the foreman, no particular attention was paid to the brushes under test. The tests were continued for about a year, variation in conditions due to change in weather being thus taken care of.

The results of the tests are shown in Tables I and II.

The results of the test show conclusively that the brushes formerly used as standard on unslotted commutators are not well suited for operation on slotted commutators. There is no great difference in the average rate of wear of the different types, and the rate of wear is practically uniform.

The greatest differences among brushes were in their ability to resist chipping and breaking. While it would seem at first sight that the toughest brush would produce the most wear on the commutator, this proved not to be the case, the wear of the commutators with all types of brush being entirely negligible.

The effect of variation in brush tension on wear was

TABLE I—RESULTS OF BRUSH TESTS ON NON-INTERPOLE MOTORS WITH SLOTTED COMMUTATORS

Type of brush, number	2*	3	4	5
Number tested	91	75	74	77
Per cent chipped and broken	29.7	18.7	20.3	6.5
Wear per 1000 miles, inch	0.025	0.023	0.033	0.024
Normal life, miles	35,000	38,000	26,500	36,500
Cost per motor per 1000 miles, cents	1.26	1.05	3.82	1.00
Cost per motor per 1000 miles allowing one-half normal life for broken and chipped brushes, cents	1.64	1.25	4.60	1.07

*This brush was formerly standard on unslotted commutators.

TABLE II—RATES OF WEAR FOR DIFFERENT PERIODS OF TEST

Type of Brush, Number	FIRST PERIOD		SECOND PERIOD		ENTIRE TEST	
	Total Miles	Wear per 1000 Miles, Inch	Total Miles	Wear per 1000 Miles, Inch	Total Miles	Wear per 1000 Miles, Inch
2	917,840	0.025	1,062,650	0.026	1,980,490	0.025
3	879,920	0.025	1,033,510	0.021	1,913,430	0.023
4	879,920	0.034	607,100	0.033	1,487,020	0.03
5	917,840	0.028	860,350	0.020	1,778,190	0.024

not very marked, the tension being varied between 3½ lb. and 6 lb. per square inch to determine this point.

Comparing the results of the later tests with those of the former ones the following appeared to be the most noticeable differences due to the practice of slotting the commutators:

The rate of wear of brushes of the same type is largely reduced, but chipping and breaking of brushes may increase. This might not be so noticeable in double-ended cars, as the tendency to sharpen the edges of the brushes would not be so great as on cars running continuously in one direction. The chipping can be minimized by selecting the proper type of brush.

The wear of commutators is reduced to an almost negligible quantity.

The effect of brush tension on brush wear is not nearly so marked as with unslotted commutators. This may be due to the fact that where the mica is not undercut it does not long remain exactly flush with the copper, and thus creates a condition favorable to arcing and rapid wear. The fact that there is less effect on wear due to variation in brush tension with slotted commutators should, however, not be made an excuse for slackness in maintaining the tension at its correct value.

It has been noted that unless the undercutting has been very carefully done and each slot gone over by hand to thoroughly remove all mica, the advantages of slotting are considerably diminished. On the other hand the resulting economy fully justifies the best possible workmanship in this operation.

In connection with this matter of selecting the most economical brush it is necessary to keep in mind the quantities which are involved in brush cost. These are: The cost due to the actual wear of the brush; the cost due to the replacing of brushes before they are worn out for any reason, and the cost due to the wear of the commutator.

The wear of brushes may be considered as made up of two components, electrical wear and mechanical wear. The electrical wear is the disintegration that results from the slight arcing under the brushes, which is noticeable in non-interpole motors, especially those with unslotted commutators. This wear is much aggravated by unevenness of the commutator surface or by excessive vibration of the motor as a whole, caused by excessive stiffness in suspension, poor fitting of gears and pinions, roughness of track, etc. The mechanical wear is due to friction between brush and commutator; which depends to a large extent on the condition of the surface of the latter. It is in the reduction of mechanical wear that the advantage of a brush which produces a burnished commutator appears.

Brush tension in general has contrary effects on the electrical and mechanical wear of brushes. Obviously, the less the tension the less the brush wear if no current is passing. On the other hand, low tension encourages bad sparking with deterioration of brush and commutator surface. In non-interpole motors with unslotted commutators the two effects are quite marked, and there appears to be a tension at which the combination of the two rates of wear is a minimum.

On the accompanying curves are shown the effects of brush tension on the wear of the two types of brush. The most economical tension is about the same for both, notwithstanding the wide difference in the actual rate of wear.

Commutator wear is influenced to a large extent by the type of brush used. On unslotted commutators the necessary abrasive for cutting the mica may not be correctly proportioned, with the result that high mica and consequent burning of the copper produce rapid wear. The effect on the commutator wear of varying

the brush tension is not so marked as it is in the case of brush wear, but the general tendency is the same.

The item of cost resulting from the brushes not reaching their full life depends not only upon the tendency of brushes to chip and break, but also on the efficiency of the carhouse force in keeping the brush-holders and springs in good condition and in seeing that worn brushes reach their minimum length before they are replaced. Aside from the carhouse conditions, which are independent of the type of brush, there is always a percentage of the brushes that break up or are so badly chipped as to be unfit for service before they wear out.

It is difficult to fix an average service which these brushes should give before they have to be replaced, but in comparing types of brush it will usually be within the limits of error to assume the average for all chipped and broken brushes to be equal to about half the normal life. This was done in calculating the cost shown in Table I.

That the three items of cost discussed are worth considering is shown clearly by the data given in Table III, which are taken from the results of the test referred to.

TABLE III—RESULTS OF TESTS OF BRUSHES ON NON-INTERPOLE MOTORS WITH UNSLOTTED COMMUTATORS

Type of brush, number.....	2	1
Number tested.....	32	32
Per cent chipped and broken.....	21	40
Cost per motor per 1000 miles due to brush wear only, cents..	2.03	1.15
Cost per 1000 miles due to brush wear, allowing broken and chipped brushes one-half normal life, cents.....	2.46	1.61
Cost per 1000 miles due to wear of commutator, cents.....	2.60	5.48
Total cost per motor per 1000 miles, cents.....	5.06	7.09

NOTE.—No. 1 was a cheaper brush and "brush wear only" cost less in spite of greater wear.

These tests were made more than five years ago to find a brush which would reduce brush costs, these being excessive at the time. As a result of the tests No. 2 was selected and remained standard until the practice of slotting was adopted. As shown in the table, the costs due to brush wear and chipping were favorable to the previous standard, No. 1, and it was only when commutator cost was included that the great advantage of the more expensive brush, No. 2, appeared. That this selection was justified was proved by large reductions in costs, the lower figures obtaining until slotting was started, when they began to rise on account of abnormal chipping.

Steel Twin Ties for Concrete Track Rehabilitation

One of the interesting and valuable possibilities of twin steel ties of the International Steel Company, Cleveland, Ohio, lies in its application to rehabilitated concrete track. A certain railway which has been using a 9-in. girder rail wished to replace it with a 6-in. T-rail. To do this in the ordinary way, the company would have found it necessary to break up and remove the wooden ties and a 7-in. concrete base. This, of course, would have been very costly and slow.

The engineer of the property conceived the idea that by using twin steel ties which are only 3-in. deep he could build up the new track of 6-in. T without disturbing the concrete base of the original wooden ties.

CROSS-SECTION OF ORIGINAL FOUNDATION WITH WOODEN TIES AND 9-IN. GIRDER RAIL

FOUNDATION AS ALTERED TO TAKE NEW T-RAIL ON TWIN STEEL TIES

These ties, by the way, had been creosoted and were in excellent condition, except for mechanical damage due to the character of their fastenings. Thus the application of the shallow but strong-bearing International twin tie will solve the most important rehabilitation problem that has arisen from the use of concrete foundations. The cost of the ties is actually less than would be the cost of removing the old concrete alone. The cost of new concrete is also eliminated and disturbance to traffic is avoided to a very large degree.

Contactors Signals Operate at Low Voltage

Automatic signals operated from a trolley potential varying from 200 to 600 volts represents a most severe test, but signals installed on a certain section of the Louisville (Ky.) & Interurban Railway have met this condition and have given no trouble whatever from this source. The Louisville & Interurban Railway operates an interurban line to Jeffersontown, 12.5 miles from the Louisville terminal station. This line is double track through the city and 5.2 miles out, and then continues as single track with passing sidings to Jeffersontown. The line is fed from a power house 1.5 miles from the terminal station, consequently there is a large line drop near the Jeffersontown terminal, at times momentarily as much as 400 volts. When traffic is heavy the drop is too great and a substation 2.6 miles from Jeffersontown is put into service. As a rule, however, the traffic is rather light, except on Sundays and holidays and at county fair times, and ordinarily does not warrant the operation of this substation. Cars are operated on a one-hour headway, but on Sundays and holidays, as mentioned, a half-hourly headway is maintained and alternate trains have two cars.

CONTACTORS AND SIGNAL ON LOUISVILLE & INTERURBAN RAILWAY

About three-quarters of a mile from Jeffersontown the line passes under the Southern Railway, threading through a cut where the view is obstructed. To protect this block Nachod automatic signals, Type CD, have been installed at the two sidings, a half mile apart. These permit following movements through the block but prohibit opposing ones. At these points the wide variation in voltage obtains at certain periods without affecting the operation of the signals. It is, of course, possible to compensate partly for varying line voltages by proper use of the car controller, but the signal remains with a fixed resistance for all line voltages. Although the signal relays are operated by direct-acting, long-stroke plunger magnets, provision for this wide range of operating voltage is made by oil-cooling the relay coils and by using resistances which are shunted out of circuit before the magnets operate.

The trolley contactors at one of the sidings are shown in one of the accompanying illustrations. They are placed outside of the turnout on the single track, two being necessary in the double-trolley construction. These contactors are suspended from one end only, on a double curve pull-off, thus being free from line stresses. They are placed with respect to the bracket, so that the contactor will have been traversed by the wheel and contact made before the wheel strikes the suspension. In this way the contacting has been done before the wheel receives the slight shock due to the cusp in the wire at the suspension. In another one of the accompanying illustrations the signal at the other end of the block is shown. This is supported on an iron bracket through-bolted to the pole, from which it may easily be lifted and lowered to the ground with connections intact. To make this possible the vertical pole wiring is in a cable made by taping the separate rubber covered wires and tying the cable to cleats as a single wire. This bracket offsets the signal from the pole so that it is plainly visible to approaching cars. A locked fuse box is also provided at man height on the pole in order to isolate the circuits and arrange for easy disconnection, tests and fusing.

Both signals are normally dark, but a west-bound car accepting the "neutral" signal at one siding and passing under the trolley contactor sets the opposing signal at the other siding at stop—a red light and red disk. The signal, in advance of the west-bound car changes to permissive—a white light and white disk, which indicates full protection through the block. A following car may accept this permissive signal and will be counted in on the signal relay, a situation which is indicated by the blinking of the white light. Not until both cars have left the block would the signals again be restored to normal.

The trolley contactors, shown in the illustration, are of the wiping type and receive the wheel very smoothly, operating on some lines at the very high speed of 71 m.p.h. Since these contactors have no moving parts they are directional. A car passing under a contactor toward the signal will set both signals as described, but backing out again under the same contactor will clear them.

Should the signal be indicating "permissive," the entrance of the car into the block will merely cause a movement of the counter one notch forward and one reverse, leaving it in its original position. Should a car over-run the contactor with the signal indicating "stop," the signal aspects will not change although a count will be recorded. If the car backs out again the indications of the signal will not have been changed. The operation of the signal is normal even though the car might have the trolley wheel on the wrong wire for that direction.

The control is thus extremely flexible, the signals showing at all times whether the block is clear or occupied, and if occupied, which way the cars are moving in the block.

Motormen are instructed to throw off power while passing contactors to reduce line drop at that time. These signals are both operated and lighted by the trolley voltage, no changes whatever in the track being necessary. The signal lights are 60-watt tungsten lamps and the disks enameled aluminum, moving parallel to a glass roundel. This combination of lights and disks gives unmistakable indications under the worst conditions of bright sunlight and low voltage.

Fiber Duct Conduit at Worcester

In the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 21, 1915, reference was made to the installation of fiber ducts for feeders by the Worcester Consolidated Street Railway coincident with double-tracking. In this connection the accompanying illustration and other particulars will be of interest.

The new Worcester feeder conduit consists of thirty or thirty-six 3½-in. Orangeburg fiber ducts of the

FIBER CONDUIT FOR RAILWAY FEEDERS AND OTHER CIRCUITS AT WORCESTER, MASS.

Fibre Conduit Company, Orangeburg, N. Y., laid in a trench 5 ft. deep and 30 in. wide at the bottom. They contain both positive and negative feeders, and provide rental space also. The special manholes used are of an offset type with entrances 30 in. in diameter located at one side of the track. The working chamber, brick-lined at the sides, with an 8-in. concrete base and concrete, brick and steel roof, is 8 ft. long and 5 ft. wide, the height being 7 ft. 6 in. At one side is a step 3 ft. high and 2 ft. 9 in. wide below the entrance, which was required by the city to facilitate the location of future underground structures. The negative feeders are carried from duct to duct along the roof, the other cables being racked on the wall in the usual way. Thirteen bull rings, attached to walls and floor, provide means for the handling of cable from the street into the ducts by snatch blocks and pulleys.

News of Electric Railways

TORONTO RAPID TRANSIT REPORT PRESENTED

Engineering Commission Proposes System of Rapid Transit and Radial Railway Entrances to

Cost \$18,817,000

The report on a system of rapid transit and radial railway entrances proposed by Mayor Church of Toronto, Ont., in his inaugural address to the City Council was presented to the city on Dec. 7 by R. C. Harris, Commissioner of Works; F. A. Gaby, chief engineer of the Hydro-Electric Power Commission of Ontario, and E. L. Cousins, chief engineer of the Toronto Harbor Commission, who was in actual charge of the preparation of the report. The system of radial entrances, terminals and yards as proposed by the engineering commission will cost \$18,817,000 divided as follows: west line, from terminal to west focal point, 5.2 miles, \$4,076,000; east line, from terminal to east focal point, Coxwell and Danforth Avenue, 4.7 miles, \$3,120,000; north line, Queen Street to north focal point, Duplex Avenue and Belt line, 3.2 miles, \$7,696,000; east and west yards and freight facilities, \$1,365,000; terminal station at the foot of Yonge Street and carhouse, \$2,560,000. The conclusions of the engineering commission are in effect as follows: the existing surface railway system within the old city limits, provided with more cars, improved equipment, and operated at a higher efficiency, will adequately serve the city within the limits of 1891. The present radials entering the city cannot be considered rapid transit lines. The most feasible entrances for such a system lie along the water front. The entrance from the north may be easily effected by subway construction.

The report states that aside from operating considerations, the additional cost of \$8,000,000, embracing a four-track subway from the water front to College Street, and the erection of a terminal at the latter point, make an uptown terminal unfeasible. The terminal should be at the axis on the water front. Provision should be made for the co-ordination of rail and water traffic. The radial railway trunk lines should, as the future demands, and the city extends, provide for the operation of semi-rapid transit lines.

The commission recommends in effect as follows:

The acquisition by the city of the Toronto Railway system in 1921. The establishment of a transportation commission, with representatives from the city, the Harbor Commission, and the Provincial Hydro-Electric Power Commission, so constituted as to give the city a majority. The construction of three trunk radial entrance lines, with necessary yards and terminals. Until 1921 the radial railways should be restricted to the use of the water-front terminal. The future will demonstrate the advisability of a down-town loop operated initially as a surface line, pending the time traffic warrants other construction.

The engineers say that the construction of a rapid transit system in the strict meaning of the term is not justified in the city. They recommend that the radial railway trunk line entrances be used for a semi-rapid transit system. The policy should be declared at once, and immediate steps taken for acquiring the Toronto Railway in 1921. The reduction of the present gage of the rails to the standard gage is recommended. Present traffic conditions, the engineers point out, could be improved by rerouteing. It is estimated that the city will have a population in 1927 of 750,000, in 1936 of 1,000,000, and in 1950 of 1,500,000. A rapid transit system, the report explains, has never been provided in cities with less than 1,000,000 inhabitants, mainly because the initial cost is so large. In this connection the engineers say:

"Toronto is not in a position to construct a rapid transit system in the strict sense of the term, but may, when conditions demand, institute a semi-rapid transit service by using the radial railway entrance lines. We have developed the radial entrance plan so as to permit of such joint use. By so doing, adequate and rapid service may be furnished that portion of the population living outside of what we have termed the thirty-five-minute zone. We assume that persons who travel from the central area to their abode, or vice versa, in the space of thirty-five minutes do not require more rapid transit."

McCALL REMOVED — OSCAR S. STRAUS APPOINTED

Chairman of New York Commission, First District, Dismissed by Governor on Charges Preferred by Legislative Investigating Committee

Edward E. McCall has been removed as chairman and member of the Public Service Commission of the First District of New York by Governor Whitman. The Governor filed his order of dismissal on Dec. 6, after having had under consideration the plea made in his own behalf by Mr. McCall on Dec. 3. The charge of which the Governor found Mr. McCall guilty is that he violated Section 9 of the public service commissions law, which forbids a commissioner to hold stock in a corporation subject to the supervision of the commission. Chairman McCall held 387 shares of stock of the Kings County Electric Light & Power Company, and his defense was that he transferred this stock to his wife just before he was appointed to the commission. In his opinion Governor Whitman said there was no evidence before him of the transfer except the commissioner's unsupported statement, and that while he had no desire to question the truth of Mr. McCall's statement he "did not believe that a transfer within the meaning of the law ever was made." The Governor dismissed entirely the other charges made against Chairman McCall by the Thompson legislative committee. They comprised six charges and twenty specifications, and have been published previously in the *ELECTRIC RAILWAY JOURNAL*.

On Dec. 9 the Governor announced the appointment of Oscar S. Straus to succeed Mr. McCall as chairman. A personal reviewing the career of Mr. Straus is published elsewhere in this issue.

Mr. McCall answered the charges before the Governor late on the afternoon of Dec. 3. In his brief of more than 100 printed pages he dealt at length with his ownership of 387 shares of the Kings County Electric Light & Power Company stock. Mr. McCall said he would stand on the records of the commission. He also denied the charge that he had accepted a retainer from and rendered legal services to a corporation seeking to avoid the payment of State taxes. He pointed out that the Governor dismissed this charge against him once before, and that as to the committee's motive for bringing it up again he would not stoop so low even to refer to it.

Mr. McCall was appointed to the commission on Feb. 3, 1913, by Governor Sulzer. He has been in public life since 1902 when he was elected to the Supreme Court. He was an unsuccessful candidate for Mayor of New York City in 1913.

The Thompson committee was appointed by the Legislature last January and empowered to investigate the workings of both Public Service Commissions. The committee in the spring filed charges of neglect of duty and misconduct in office against four of the commissioners for the First District, Mr. McCall, J. Sergeant Cram, G. V. S. Williams and Robert C. Wood, but after a hearing before him, the Governor dismissed the allegations as not sustained. Last summer the committee resumed its investigation of the commission for the First District and the subsequent hearings disclosed Mr. McCall's alleged ownership of stock of the Kings County Electric Light & Power Company. The formal charges against him were filed with the Governor on Nov. 15. The investigation of the commission for the First District has not been finished, and a few days ago Senator George F. Thompson, the chairman of the legislative investigating committee, announced that it would be rushed to completion and the inquiry into the workings of the Public Service Commission for the Second District would be resumed.

LIVE AND LET LIVE PLEA IN LITTLE ROCK

Four proposals, the adoption of which, in the belief of the Little Rock Railway & Electric Company, Little Rock, Ark., would aid materially the growth of Little Rock and increase the usefulness and the value of the street railway property, have been submitted to Mayor Taylor and the

members of the finance and the public utilities committees of the city.

According to D. H. Cantrell, president of the company, the first thing that is necessary in order to insure a complete protection of the company's investment is a proper regulation of the jitneys so as to put them as nearly as possible on the same basis with the street railway company, as common carriers. Second, President Cantrell, in view of all of the facts and the circumstances surrounding the granting of the Merchants Lighting Company's franchise and its injustice to the railway company, and also, in view of the very doubtful liability of the railway for the annual tax of \$500, asks that the city abandon any further claim for this tax. Third, President Cantrell asks that an investigation be conducted into the actual cost to the city of Little Rock of its municipal lighting plant, in order to determine the feasibility and desirability of a contract being entered into between the city and the railway, whereby the utility company would supply electricity for the municipality's needs; provided, that the railway could supply current more cheaply than the municipal plant could manufacture it. President Cantrell's fourth proposal is one looking toward the elimination of the provision in the company's present franchise which requires it to sell six tickets for a quarter when the population of Little Rock reaches 100,000.

President Cantrell's communication, directed to Mayor Charles E. Taylor and the members of the finance and of the public utilities committees, is concluded as follows:

"It would not be good policy for the city to seriously hamper and embarrass an institution which is yielding and will yield so much revenue to the city, and will pay so much for improvement of the streets. In other words, it would not be good policy 'to kill the goose that lays the golden egg.' Rather should the city aid and assist the company in all reasonable ways to carry out its obligations to the city."

PRESIDENT ON THE RAILROADS

In his address to Congress President Wilson referred to the railroad problem as follows:

"In the meantime may I make this suggestion? The transportation problem is an exceedingly serious and pressing one in this country. There has from time to time of late been reason to fear that our railroads would not much longer be able to cope with it successfully, as at present equipped and co-ordinated. I suggest that it would be wise to provide for a commission of inquiry to ascertain by a thorough canvass of the whole question whether our laws as at present framed and administered are as serviceable as they might be in the solution of the problem. It is obviously a problem that lies at the very foundation of our efficiency as a people. Such an inquiry ought to draw out every circumstance and opinion worth considering, and we need to know all sides of the matter if we mean to do anything in the field of federal legislation.

"No one, I am sure, would wish to take any backward step. The regulation of the railways of the country by federal commission has had admirable results and has fully justified the hopes and expectations of those by whom the policy of regulation was originally proposed. The question is not what should we undo? It is, whether there is anything else we can do that would supply us with effective means, in the very process of regulation, for bettering the conditions under which the railroads are operated and for making them more useful servants of the country as a whole. It seems to me that it might be the part of wisdom, therefore, before further legislation in this field is attempted, to look at the whole problem of co-ordination and efficiency in the full light of a fresh assessment of circumstance and opinion, as a guide to dealing with the several parts of it."

In this connection Senator Newlands of Nevada is quoted as saying that legislation aiming to give the railroads of the country federal instead of State incorporation would be sought in the present term of Congress. Plans are also said to be under way to obtain federal supervision of railroad securities, to increase the membership of the Interstate Commerce Commission, and to divide the railroads into Eastern, Middle Western, and Far Western groups, each section to be under regulatory supervision of a separate branch of the commission.

NETWORK OF HYDRO-RADIALS PROPOSED IN ONTARIO

Details of the hydro-radial project, advocated by Sir Adam Beck and the Hydro-Electric Power Commission of Ontario in conjunction with certain municipalities in Western Ontario, were laid before the Toronto Board of Control on Dec. 3. Accompanying the details were the draft by-law, which the city is asked to indorse, and a copy of the agreement which the city will have to enter into with the Hydro-Electric Commission. The latter relates to the construction and operation of the lines. The entire project, as outlined, calls for an expenditure of \$13,734,155, of which the city of Toronto will have to contribute \$4,240,196, or slightly less than one-third of the total cost. This is the amount the people will be asked to authorize, provided the Council indorses the proposition and decides to submit it to the people on Jan. 1.

This will be a separate and distinct undertaking from the scheme for improving the transportation facilities within the city proper. The proposed undertaking is aimed to provide increased transportation facilities over a large area radiating from Toronto to Guelph, London and Sarnia. In addition to the heavy capital expenditure for construction of the lines, the municipalities affected will have to assume responsibility for the large operating and maintenance charges, should the revenue not suffice to meet the same. Further, the scheme now presented only makes provision for radials to the west of the city. Another scheme dealing with the eastern section of the province will be submitted at a later date. The eastern scheme, however, will not be such a serious undertaking for the city, as while no mention is made of it in the report presented on Dec. 3, it may be assumed that sufficient accommodation will be provided at the proposed central terminal station, which is to be erected at the foot of Yonge Street, to care for all traffic, both east and west.

In addition to the \$4,240,196, the city is to provide a free right-of-way for the railway and power lines of the commission over and through any property owned by the city, and to convey the same or to execute an agreement for its free use, as the commission shall deem advisable.

The initial cost will be divided between thirty-two municipalities, Toronto being the largest contributor with \$4,240,196, London coming second with \$1,109,303. It is also pointed out that the city of Toronto will be required not to grant any more franchises to railway or other transportation companies without the consent of the Hydro-Electric Power Commission. The commission will undertake to finance the scheme and to do the actual construction work. Debentures covering the amounts allotted to the several municipalities are to be issued and handed over to the commission, which will retain or hypothecate them as it considers desirable.

Mayor Church announced on Dec. 1 after a conference between Sir Adam Beck and the Board of Control that the question of submission of a by-law to guarantee \$3,000,000 bonds for these hydroelectric radials would be laid before Council at a special meeting on Dec. 8.

At a joint conference of the Port Credit Village Council and the engineers of the Hydro Commission held on Nov. 30 a resolution was passed by the Council indorsing the route selected by the commission for the Toronto to London line through the municipality. The deputation asked that facts as to cost, etc., be presented to Council in time for discussion at the next regular meeting, when a by-law will be put through to enable the people to vote on the question at the municipal election. Chief Engineer Gaby explained to the deputation that the line is to be the main power line that will link up scores of municipalities of western Ontario with a rapid transit system over a private right-of-way, coupling the speed of the steam roads with the frequency of a local street car service.

The outlook is not at all propitious for Federal assistance by way of subsidy to this scheme. Two years ago the largest delegation that ever went to Ottawa urged subsidizing these roads as a great movement for the benefit of the people. Nothing was done then, and the policy was laid down last session that because of the war there should be no railway subsidies of any kind.

EXPOSITION GATES CLOSE AFTER SUCCESSFUL AND PROFITABLE SEASON

The Panama-Pacific International Exposition officially closed its gates at midnight on Dec. 4 with ceremonies attended by record-breaking crowds. The closing day exercises began at high noon in the Court of the Universe, when President Moore of the exposition read a toast from President Wilson and a reply thereto. The several palaces were closed by President Moore's party making a tour of the grounds, meeting the chief of each department at the entrance to each palace, where there were a few words of official congratulations, after which a herald in the historic costume of the Town Crier announced the building closed. Prosperity week electrical parade, aeroplane flights, and a continuous illumination and fireworks display during the evening were features of the program. At midnight President Moore closed a switch in the Court of the Universe, turning off the lights and leaving the grounds in semi-darkness. This was a signal for a corps of buglers on the darkened Tower of Jewels to sound taps in requiem toward the four points of the compass.

After the gates closed on Dec. 4 the total number of admissions recorded was 19,876,000, of which approximately 13,000,000 were paid admissions. Reviewing the financial history of the exposition in a general way it may be said that the income during the operating period exceeded all operating expenses by \$2,572,000. The net earnings are estimated at \$1,360,000. The Municipal Auditorium, which cost \$1,086,000, was presented to the city by the exposition as a memorial. The disposal of the net profit from the operating period has not yet been decided upon, but efforts are being made to induce stockholders to assign it to the preservation of parts of the exposition, particularly a boulevard that would follow the present Marina and connect with the Ocean Highway.

GENERAL MANAGER WRIGHT ON WILKES-BARRE STRIKE SITUATION

Renewed riots marked developments in the strike of the carmen of the Wilkes-Barre (Pa.) Railway during the week ended Dec. 5. Additional men of the State Constabulary and many extra policemen have served to keep the semblance of order among the lawless element. The company is running cars over almost all of the lines.

In a statement issued by T. A. Wright, general manager of the company, the recent developments in the strike situation were summarized as follows:

"The Chamber of Commerce, for the purpose of settling the strike, appointed a committee which succeeded in bringing about a conference between the company's officials and the men. At the first meeting, on Nov. 27, the chairman of the committee proposed that the question of the validity and finality of the decision of July 10, 1915, be left with Charles E. Rice, judge of the Superior Court of Pennsylvania. National Organizer P. J. Shea, of the carmen, announced that the trainmen repudiated the award, and also the working agreement signed on Jan. 9, 1915. He declared that the men now demanded a new working contract containing a clause giving recognition to the national officers of the association and a protective clause. The protective clause, he said, must provide that whenever a man was discharged he should have the right, if the committee of Local No. 164 demanded it, to have his case decided by a board of three arbitrators, citizens of Luzerne County, to whose decision, if adverse to the general manager, the company must bow.

"The leaders of the men also demanded that the company take back all the men. This the company agreed to do, but refused the demand of the committee that an agreement be entered into in which the company would have no power to discharge an employee, as such action would be tantamount to turning over the control of the property to the employees. The company refused to abrogate the agreement of Jan. 9, on the grounds that such action, together with the refusal of the strikers to abide by the award of July 10, would mean that all agreements, no matter how solemnly entered into, would be subject to the sole interpretation of the men, enforced by their ability to strike at will.

"Evidence of the conciliatory attitude of the company is shown in its willingness to take back all of its striking employees, although the behavior of some of these men both during the strike and previous to it entitles them to absolutely no consideration.

"If the company had agreed to permit the Amalgamated Association to arbitrate every time an incompetent, inefficient or dishonest employee was to be discharged, it would virtually mean the passing of the control of the company from a responsible board of directors to a body of employees who have shown how little they regard a contract that was solemnly signed and sealed. To accept this provision would mean to make the general manager of the company, its president and board of directors mere puppets in the hands of the trainmen.

"It was evident that the question uppermost in the minds of the men was how far they could go to take the control of the company out of the hands of its directors. To have accepted their impossible demands would have been to permit the Amalgamated to decide what men should work for the company, what they would be paid, how long they should work, and where they would work, leaving the owners of the property only the prerogative as to what men it might employ."

CHICAGO COUNCIL IGNORES SMOKE REPORT

By a unanimous vote the report of the committee of the Chicago Association of Commerce on smoke abatement and electrification of railway terminals was ignored by the Chicago City Council at its regular meeting on Dec. 6. Mayor Thompson submitted the report at this meeting, and soon after its presentation an order was introduced and passed unanimously that the committee on railway terminals, an independent body of which John F. Wallace is the chairman, consider immediately the subject of electrification of steam railroads within the city of Chicago. The order states that the committee is to report to the Council at an early date such ordinances as may be necessary to bring about the adoption of electricity as a transportation power where steam power is now employed. It was suggested that the committee begin its work with the passenger facilities, considering first the electrification of the Illinois Central Railroad and the Northwestern Railroad. The permanent railway terminal committee is composed of Walter Fisher, Bion J. Arnold, Edward H. Bennett, L. E. McGann, J. W. Beckwith, Ellis Geiger and John F. Wallace, who is chairman.

OHIO COMPENSATION LAW INTERPRETED

Judge Oppenheimer of the Superior Court at Cincinnati, in a decision handed down on Dec. 1, ruled that the payment of an award by the State Industrial Commission to the dependent of a man killed by accident cannot be construed as preventing the dependent from bringing suit against and recovering damages from a third party to whom the accidental death is due. He holds that the compensation required by the State is a kind of social life insurance and has nothing to do with damages that may be recovered from a third party who causes a death.

The decision was handed down in the case of Mathilda H. Kenning against the Interurban Railway & Terminal Company, Cincinnati. Her husband was an employee of the Fairmount Brewing Company and while driving his wagon was killed by one of the railway's cars. The brewery company was a contributor to the State workmen's compensation fund and the State Industrial Commission granted Mrs. Kenning an award of \$3,744. She then brought suit against the railway for damages for her husband's death.

The attorneys for the Interurban Railway & Terminal Company argued that she was estopped from bringing suit against the company to recover damages because she has been granted an award from the State fund and because the railway was a contributor to the fund. Judge Oppenheimer said the compensation law disavows any claim that sums paid by virtue of its provisions shall be full compensation and that Mrs. Kenning was entitled to sue for recovery. He also said that this company is contributing to the State fund for insurance on its own employees only and that the brewery made the contributions which furnished the insurance for Kenning and all its other employees.

AMERICANS TO OPERATE BRAZILIAN STATE RAILWAYS

Negotiations are admitted to be under way whereby the operation of the Brazilian State Railways will be assumed by American interests, displacing the management by English and French interests. The negotiations have been carried on through the Latin American Public Works Corporation, a concern started eight months ago by interests associated with the J. G. White Management Corporation. The head of the corporation is J. W. McCroskey. He is in Brazil in charge of the negotiations with the Brazilian Government and the English and French interests which now operate the Brazilian State Railways. The Brazilian Government has leased its railways to English and French capitalists for a period of years, and it is understood that the Latin-American Public Works Corporation merely plans to take over the lease for the unexpired term. The project, however, will carry with it the necessity of financing for new equipment and possibly for new construction. All the lines are operated by steam but it is stated that electrification of certain lines is being agitated. At the office of the J. G. White Management Association in New York inquirers were referred to Mr. McCloskey.

PROGRESS WITH CINCINNATI TRANSIT MATTERS

The members of the Rapid Transit Commission of Cincinnati, Ohio, made a tour over the proposed route of the rapid transit loop on Nov. 30. A meeting will be held at an early date at which the commission will decide definitely whether "modified route No. 4" will be adopted as it is or further modifications made. The estimate of the cost of construction of the line on this route is \$6,000,000. Should no further changes be made the proposition would be ready for submission to a referendum vote at the Presidential primaries in April.

The proposed franchise of the West End Rapid Transit Company, Cincinnati, was approved by all the business organizations in the city at a delegate meeting held on Nov. 30. This road would bring into the city the interurban lines from Anderson's Ferry. The terminus would be at Third and Walnut Streets. The city may purchase the property any time after ten years at a bonus of 25 per cent on the sum invested. Provision is made for the division of the earnings with the city after the guaranteed return has been made to the company.

All trains are to be operated by electricity or other approved motive power. Provision has been made in the franchise which will prevent its interfering in any way with the municipal rapid transit proposition or any other improvement that may be undertaken.

NEW YORK INVESTIGATION CONTINUED

The first witness on Dec. 7 before the legislative committee which is inquiring into the work of the Public Service Commission for the First District of New York was Ashley T. Cole, of counsel for the Kings County Lighting Company. He said that William F. Sheehan, as a partner in the firm of Hatch & Sheehan, attorneys for the company, is custodian of certain books and papers of the concern. Mr. Sheehan was thereupon subpoenaed to bring before the committee all the books and records of the lighting company.

Commissioner Williams was then called. He was asked what part of his opinion regarding the Kings County Lighting Company's rate case was written from the report of Mr. Semple. He said Mr. Semple prepared his report dealing with these four matters after he had conferred with himself and Commissioner Hayward. There was very little difference of opinion between himself and Commissioner Hayward on the points involved. Commissioner Hayward told of his connection with the Kings County Lighting Company's rate case. He took charge of the case after Commissioner Maltbie's term of office expired, but owing to pressure of work he had the case assigned to Commissioner Williams. He admitted he had not written his own opinion in the case until after he had seen Commissioner Williams's. He was asked about his talk with Mr. Semple regarding the oil contract of the company which, it is alleged, was made at a price above that which other companies were paying, and at a time when oil prices were on a decline.

Gas-Electric Car Tested on Muscatine-Iowa City Line.—The initial trip of the first gasoline-electric motor passenger car over the Muscatine & Iowa City Railway, Muscatine, Iowa, was made on Dec. 1, 1915. A. D. Bowen, president of the company, and about forty members of the Muscatine commercial club made the trip to test the equipment. Additional passenger motor cars and freight locomotives have been purchased and full operation will be inaugurated as soon as this equipment is received.

Strike Suspends Service.—No efforts have been made by William B. Cutter, president of the Buffalo & Depew Electric Railway, to operate cars on the line between the Buffalo and the Depew city lines since the strike was called more than three weeks ago. A committee of citizens of Depew has been trying to effect a settlement of the differences between the men and the company, but the officers of the company say the line has never paid and that it cannot increase the wages of the men. This is the only request made by the men.

Effort to Secure Common User Rights in Seattle.—The City Council of Seattle, Wash., has passed a resolution directing Corporation Counsel James Bradford to make application for common user privileges over the Fourth Avenue tracks of the Seattle, Renton & Southern Railway in order that Division "A" of the Seattle Municipal Railway can derive benefits accruing from business at the transcontinental depots on King Street. This is a move on the part of the city to bolster up the earnings of the Municipal Railway, which is being operated at a loss.

Report on Grade Elimination in Dallas.—The Board of Commissioners of Dallas, Tex., has received final recommendations of John Findlay Wallace, the engineering expert retained to investigate and report on the elimination of grade crossings within the city. Mr. Wallace recommends the construction of a belt line around the city and the complete removal of all railroad tracks within the city limits or the use of such intra-city switch tracks only during restricted hours at night. The carrying out of the belt line plan would involve an expenditure of \$900,000.

Street Railway Department for Pekin.—The City Council of Pekin, Ill., has introduced an ordinance to establish a street railway department, of which the commissioner of public property and the commissioner of public affairs shall be the heads. Pekin has a 2-mile municipally owned street railway, and the ordinance provides that not less than three nor more than five motormen shall be employed; that their wages shall be fixed by the department; that one of the motormen or conductors shall be appointed foreman; that a watchman and a general repair man be employed; and that the motormen and conductors shall give bond in the sum of \$1,000 each with at least two sureties.

Extension Under Subway Car Replacement Order.—The Public Service Commission for the First District of New York has extended the time limit under which the Interborough Rapid Transit Company is required to replace with steel cars all the wooden or composite cars now in use in the subway. Early in November the company asked the commission for an extension of time. The commission referred the subject to its electrical engineer, C. W. Wilder, and on his recommendation it granted an extension to April 1, 1916. From Mr. Wilder's figures it appears that about 195 of the 478 cars had been converted up to the time of his report. The car bodies which are replaced are to be used on the elevated lines.

Chicago Traction Commission Ordinance Delayed.—The ordinance authorizing the creation of a commission to report on the operating, engineering and financial questions involved in the proposed consolidation of the Chicago surface and elevated lines, and the construction of a subway was brought up for passage at the meeting of the Chicago City Council on Dec. 6. A number of important amendments were offered at that meeting and the ordinance was referred back to the local transportation committee for further consideration. It was contemplated that the committee would act on the amendments at a meeting on Dec. 8, so that the ordinance can again be reported to the Council at its next meeting.

Opponents of Milroy Plan Heard.—At a meeting of the sub-committee of what is known as the Milroy street rail-

way committee, held in the Council Chamber at Toledo, Ohio, on Nov. 30, men who voted against the franchise proposition at the polls were again asked for suggestions as to the kind of settlement they wish made. All agreed on municipal ownership and most of them were in favor of a valuation of the street railway property as a going concern. As to the method of paying for the property a variety of suggestions were made. Some of the speakers thought the city could easily float a bond issue that would cover the cost, while others contended that only part payment should be made and the company should take a mortgage on the property for the balance due and remaining under the contract after the initial payment.

Mission of Fort Wayne Conciliatory Board Fails.—The committee of eight business men of Fort Wayne named by Governor Ralston early in November as a "conciliatory board" to try to adjust the differences between the Fort Wayne & Northern Indiana Traction Company and its former employees, announced on Dec. 6 that it had failed in its efforts to effect a settlement of the difficulties which would be acceptable to both parties, and that the committee had, therefore, automatically expired. Travel on the cars in Fort Wayne is increasing despite the efforts of union labor organizations and sympathizers to divert travel to the jitneys. With the advent of cold weather several jitneys have dropped out of service. Some of the men who went out on strike in September have returned to work, starting in as new men and working through the extra list. Efforts are still being made to raise money by popular subscription to stock at \$10 per share for the organization of a motor bus company to compete with the street railway.

Commission Upheld in Case Involving New Construction.—The Public Service Commission for the First District of New York has received notification from Albany that the Court of Appeals, without opinion, had decided in its favor a case involving the double tracking of the Castle Avenue surface railway of the Richmond Light & Railroad Company, in the borough of Richmond. After investigation the commission in 1913 ordered the company to construct and operate such extra tracks as may be necessary to provide a complete double-track railroad on this line between St. George, New Brighton and Broadway, West New Brighton; the work to be begun by June 1, 1913, and to be completed by Nov. 1, 1913. The company took the matter into the courts, and by appeal from each lower division to the Court of Appeals. The decision of the commission was upheld by all the courts. The company contended that the evidence before the commission did not warrant the issuance of the order; that its franchise permitted either a single or double-track line, and that the enforcement of the statutory penalty of \$5,000 a day for violation of the order would deprive it of its property without due process of law, and therefore be a violation of the State and national constitutions.

Wage Arbitration Decided Upon in Charleston.—The differences between the Charleston Consolidated Railway & Lighting Company, Charleston, S. C., and the motormen and conductors employed by it will be referred to arbitration. The following statement has been issued by the company: "The committee of the motormen and conductors called on the president and advised him that at a meeting of the men, held after his talk to them, the proposition of the company had been rejected and that the motormen and conductors, in accordance with the terms of the contract with the company, propose that the differences in the matter of wages be settled by arbitration. Section 23 of the contract with the local union provides that all matters in regard to wages * * * shall be submitted to arbitration, said board of arbitration to consist of one man to be named by the company and one man to be named by the association, and the two arbitrators chosen shall name a third arbitrator, provided the first two fail to agree. Either side failing to name its arbitrator within five days forfeits the case. Mr. Gadsden told the committee that the company was, of course, prepared to abide by the arbitration provision as contained in the agreement with the men, and that he will appoint the arbitrator on the part of the company within the time prescribed by the agreement. It is the disposition of both parties to name their respective arbitrators as soon as practicable."

Financial and Corporate

ANNUAL REPORT

Bay State Street Railway

The statement of income, profit and loss of the Bay State Street Railway, Boston, Mass., for the year ended June 30, 1915, as presented in the annual report of the controlling company, the Massachusetts Electric Companies, follows:

Operating revenue	\$9,538,406
Operating expenses	6,897,752
Net operating revenue	\$2,640,654
Taxes	653,380
Operating income	\$1,987,274
Non-operating income	66,459
Gross income	\$2,053,733
Deductions from gross income:	
Rent leased roads	\$182,228
Interest funded debt	1,039,076
Interest unfunded debt	104,279
Miscellaneous	25,599
Total deductions	\$1,351,183
Net income	\$702,550
Dividends:	
First preferred stock at 6 per cent.	\$164,916
Common stock at 2½ per cent.	512,930
Total dividends	\$677,846
Net income less dividends	\$24,704
Surplus, June 30, 1914	213,532
	\$238,236
Profit and loss debits	\$253,481
Miscellaneous profit and loss credits	20,996
Net debit	\$232,485
Surplus, June 30, 1915	\$5,751

The operating company felt the depression in business conditions during the year. The passenger earnings, instead of the usual increase, showed a loss for the year of \$133,535, a result undoubtedly brought about in part by jitney competition. Other branches of the business, however, were not so seriously affected, so that the year resulted in a decrease of \$75,746 or 0.78 per cent in total operating revenues. The expenses, owing to increases in wages and commission rulings, showed a heavy increase of \$469,888 or 7.3 per cent. As a result the net operating revenue decreased \$545,635 or 17.1 per cent. Taxes increased \$10,057, and non-operating income decreased \$14,637, so that the gross income of the company fell off \$570,329 or 21.3 per cent. Deductions from income increased \$42,392 during the year and helped the net income to drop from \$1,315,270 to \$702,549, a decrease of \$612,721.

To offset this falling off in business dividends were reduced \$564,223, which left a balance for the year of \$24,703, a decrease of \$48,498 from the previous year. This with the company's surplus on June 30, 1914, gave a surplus of \$238,235. Of this amount the company was forced to spend for sinking fund appropriation, \$5,090; for loss on property retired, \$23,067; for miscellaneous debits, \$9,339, and reconstruction, \$215,984, the last figure alone being an increase of \$109,984 over the previous year. Total debits amounted to \$253,481, an increase of \$135,138, which with a credit of \$20,996 left a surplus on June 30, 1915, of only \$5,751, a decrease of \$207,780.

The arbitration of the wage dispute between the Bay State Street Railway and its employees was decided June 21, 1915. The award was for the period between Sept. 30, 1914, and Oct. 1, 1916. By that award increases in wages, from Oct. 1, 1914, to July 1, 1915, amounting to \$46,000, were granted. From June 30, 1915, to July 1, 1916, the estimated increase in wages under the award will amount to \$247,000. From July 1, 1916, to Sept. 30, 1916, both inclusive, the estimated increase will amount to \$80,000 more than for the corresponding period of the previous year.

During the last year the Interstate Commerce Commission ruled that the non-betterment part of reconstruction work must be charged to operating expenses in the year in which the work is done, and the accrued amount must be charged off in three years. The company had formerly charged the

balance after betterment to a suspense account until such time as net income would permit it to be wiped out. As a result of the new rule the estimated non-betterment part of the reconstruction completed during the year, amounting to \$182,851, was charged to operating expenses, and one-third of the non-betterment part of reconstruction completed prior to the beginning of the year, amounting to \$215,984, was charged off to profit and loss account, leaving \$431,969 to be charged off during the next two years. During the last year the commission also ordered companies to estimate the amount of depreciation of equipment. As a result, \$120,000 was charged to expenses last year.

Jitney competition first appeared at Fall River, and gradually extended to such an extent that on Nov. 1 there were 655 jitneys and jitney buses licensed in twelve cities and one town in the company's territory, and seventy-one were being operated in cities where no licenses are required. In November this competition caused an estimated loss to the company of about \$700 per day. In view of this and other conditions the directors decided that the rates of transportation must be increased in order to secure a reasonable return on its investment and attract new capital, and hearings to this end are now being held before the Massachusetts Public Service Commission.

During the year an amount of \$1,052,308 was spent for new property and reconstruction. A total of 3.77 miles of new track was constructed, 18.94 miles were reconstructed and 2.26 miles of reconstruction were in progress at the close of the year. About \$40,000, out of a total requirement of \$110,000, was spent in lowering car steps in compliance with the orders of the commission. No new capital was issued during the year by the Massachusetts Electric Companies. The Bay State Street Railway received authority to issue 12,819 shares of first preferred stock, but none has yet been issued.

EMPIRE UNITED READJUSTMENT PLAN

Clifford D. Beebe, president Empire United Railways, Inc., Syracuse, N. Y., recently announced that the directors had considered a readjustment of the company's finances and particularly the situation of the Rochester, Syracuse & Eastern Railroad first mortgage 5 per cent bonds. As a result they decided to recommend to the bondholders the following plan:

(1) That they accept a reduction in interest from 5 per cent to 3 per cent for a period of five years from Nov. 1, 1915, in connection with settlement of the Nov. 1, 1915, coupons either in securities, or, if possible for the company, in cash.

(2) That the holders of the securities of the Empire United Railways, Inc., and its indebtedness should accept in place of what they now have, securities without a fixed charge or on an income basis.

(3) That there should also be provided, without calling upon the underlying bondholders for assistance, between \$300,000 and \$400,000, to be used in taking care of capital expenditures for the next two years, particularly the forced capital expenditures in the way of paving and other requirements in the villages along the line which would affect the bondholders; also to take care of the car trust obligations outstanding as they mature.

(4) That there should be provided sufficient other funds for the company to be left free of all other indebtedness and with no fixed charge outside of the underlying bonds, so that all the net income which the company might earn on the different divisions would be first applicable to the underlying bonds, which would insure prompt payment of the semi-annual interest thereon.

Previous items regarding the recent receivership of this company under H. S. Holden and C. Loomis Allen were published in the *ELECTRIC RAILWAY JOURNAL* of Nov. 13 and Dec. 4.

Atlantic City & Shore Railroad, Atlantic City, N. J.—The Atlantic City & Shore Railroad being unable, owing to jitney competition, to pay the interest due Dec. 1 on its \$950,000 of first mortgage 5 per cent bonds, the following bondholders' committee has been organized: G. Burmham, Jr., Harry C. Francis, Frank H. Bachman of Philadelphia, T. Johnson of Wilmington and David Fitzsimmons of At-

lantic City. A call for deposit of the bonds will probably be made in a short time. The appointment of Clarence C. Cole as receiver of the company was noted in the *ELECTRIC RAILWAY JOURNAL* of Dec. 4.

Birmingham-Tuscaloosa Railway & Utilities Company, Tuscaloosa, Ala.—The Birmingham-Tuscaloosa Railway & Utilities Company has filed papers in the Probate Court showing that at a recent meeting of the stockholders and directors the name of the company was changed to that of Tuscaloosa Railway & Utilities Company, and the capital stock of the company reduced from \$3,500,000 to \$3,000,000. The president is authorized to refund and retire outstanding collateral trust notes, and retire the trust agreement with the Girard Trust Company and mortgages with the Fidelity Trust Company. He is also authorized to issue \$1,000,000 of first mortgage 6 per cent twenty-five-year gold bonds and complete arrangements with the Republic Trust Company, Philadelphia, as trustee. The company owns and operates the 14-mile street railway through Tuscaloosa to Holt, and does a lighting business in Tuscaloosa.

Brooklyn (N. Y.) Rapid Transit Company.—Holders of the \$59,699,000 of 5 per cent six-year gold notes of 1912, due on July 1, 1918, of the Brooklyn Rapid Transit Company have been reminded that their option will expire with the close of business on Dec. 31 to exchange their notes, with all unmatured coupons attached, for an equal face amount of first mortgage 5 per cent sinking fund gold bonds of the New York Municipal Railway Corporation. These bonds are in coupon form with all unmatured coupons attached, and bear the endorsement of the Brooklyn Rapid Transit Company and of the New York Consolidated Railroad Company agreeing to pay principal and interest thereon. To exercise the option the notes must be presented, in bearer form with all unmatured coupons attached, at the Central Trust Company of New York. The New York Municipal Railway Corporation pays the normal income tax on these bonds and the corporation has also paid the tax on the mortgage securing the same, so that the bonds are exempt from local taxation as provided by the laws of the State.

Buffalo & Susquehanna Railroad, Buffalo, N. Y.—The abandoned property of the Buffalo & Susquehanna Railroad between Buffalo and Wellsville has been bought by a syndicate consisting of C. A. Finnegan and Theodore Hofeller, Buffalo, and Abraham Weber, of S. Weber & Son, Louisville, Ky. The purchase price was \$800,000, the obligations outstanding being assumed. Martin Bogue, of Bertron, Griscom & Company, New York, acted for the committee of bondholders in making the sale. The new owners will operate the road, and it is understood experts will make a study of the traffic and transportation problems with a view of recommending the installation of electrical equipment. Included in the purchase is a 25-acre plot, fronting on the inner harbor of Buffalo and possessing 2000 ft. of dockage space suitable for grain elevators. Previous notes referring to an option held on this section by interests connected with the Western New York & Pennsylvania Traction Company were published in the *ELECTRIC RAILWAY JOURNAL* of July 17 and Oct. 2.

City Railway, Los Angeles, Cal.—The City Railway of Los Angeles has filed with the California Railroad Commission an application for authority to issue 349 bonds, face value of \$349,000, to the Los Angeles Railway Corporation in payment of money advanced and used for betterments and improvements.

Grand Valley Railroad, Brantford, Ont.—At a special meeting of the Brantford City Council it was decided to give ratepayers of the city a chance to vote on the ratification of the sale of the section of the Grand Valley Railway between Paris and Galt to the Lake Erie & Northern Railway, which railway is controlled by the Canadian Pacific Railway. The price set, as noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, was \$30,000, with a promise of the electrification of the Lake Erie & Northern Railway from Galt to Port Dover. C. H. Hartman, chairman of the Brantford Municipal Railway Commission, is the only one opposed to the transaction. The general manager of the Galt, Preston & Hespeler Railway, who is acting for the Canadian Pacific Railway in the matter, had given the Council

until Dec. 4 to act, but later it was decided to wait until the people had had a chance to approve the sale. It was asserted that the line would be in operation within a month under electric power.

Interborough Consolidated Corporation, New York, N. Y.—Out of the surplus of the Interborough Consolidated Corporation the directors have purchased for investment \$500,000 of Interborough-Metropolitan Company 4½ per cent collateral bonds on a 6 per cent basis. The Interborough Consolidated Corporation has also anticipated the sinking fund requirements on the \$3,000,000 of 6 per cent ten-year Interborough-Metropolitan notes by purchasing \$500,000 of the notes, or \$200,000 in excess of sinking fund requirements for the year. At this rate the notes will all be retired considerably before their maturity.

Interborough Rapid Transit Company, New York, N. Y.—The Interborough Rapid Transit Company has sold to J. P. Morgan & Company \$20,000,000 of first and refunding 5 per cent bonds, making a total of \$30,000,000 of the bonds sold under the agreement with the bankers to provide money this year for new subway construction. The bonds are a part of the \$300,000,000 mortgage authorized in 1913, and \$128,658,000 of the bonds are now outstanding. Under the agreement the bankers can take more bonds of this issue to the amount of \$27,342,000. It is understood that the same group of investment houses that placed previous bonds of this issue will distribute the amount now purchased.

Mansfield Public Utility & Service Company, Mansfield, Ohio.—The Ohio Public Utilities Commission on Nov. 30 authorized the Mansfield Public Utility & Service Company to issue \$3,500 of common stock at not less than par. The proceeds are to be applied to the payment of the purchase price for the property and assets of the old Mansfield Railway, Light & Power Company, acquired at public sale last September, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16.

Memphis, (Tenn.) Street Railway.—The \$30,000,000 mortgage of the Memphis Street Railway recently filed with the Guaranty Trust Company, New York, as noted in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, secures an issue of general mortgage bonds bearing interest at not more than 6 per cent, dated Nov. 1, 1915, and due on Nov. 1, 1935. The immediate issue of \$492,000 (6 per cent) is pledged as part collateral for the \$1,500,000 of two-year 6 per cent collateral notes sold last October for refunding purposes and working capital. The total authorized issue of general mortgage bonds is \$30,000,000, but \$10,000,000 of this amount is reserved to retire a like sum of consolidated (now first) mortgage 5 per cent bonds, including the \$1,416,000 of the latter pledged under the aforesaid note issue. In addition to the two-year note issue there were sold last October \$600,000 of one-year 6 per cent guaranteed gold notes, and it was agreed that so long as these guaranteed gold notes are outstanding the company shall not issue its general mortgage bonds in an amount to exceed a total of \$650,000, except with the consent of the holders of two-thirds of the collateral notes and of the holders of three-quarters of the guaranteed notes, and then for only 80 per cent of the cost of new construction. The general mortgage bonds are redeemable on any interest date at 102½.

New York (N. Y.) Railways.—John C. Cobb, Charles P. Howland, George B. Leighton, William H. Remick and Richard H. Swartwout have been elected directors of the New York Railways to represent the company's adjustment income bondholders. These men, elected as a result of a successful proxy campaign, are said to be pledged to fight for the payment of full 5 per cent interest on the income bonds. The directors displaced by the above-named five men were mostly representatives of large insurance companies that some time ago withdrew from suits for payment of back interest. They included Darwin P. Kingsley, president New York Life Insurance Company; Henry Olshesheimer, president Metropolitan Bank and director Metropolitan Life Insurance Company; Frank S. Witherbee, president Witherbee, Sherman & Company and director Equitable Life Assurance Society, and Francis L. Leland, president New York County National Bank and director

United States Life Insurance Company. The election of the five new directors, however, cannot result in their controlling the board and changing the company's policy in regard to the payment of interest on the income bonds, for the stockholders are allowed to elect six members of the board. Their ticket, elected without opposition, included August Belmont, Edward J. Berwind, Thomas De Witt Cuyler, Theodore P. Shonts, Cornelius Vanderbilt and W. Leon Pepperman, the last named taking the place of the late Andrew Freedman.

San Francisco (Cal.) Municipal Railways.—The total receipts of the San Francisco Municipal Railway system for November are reported to be \$233,520, the estimated net being \$115,000. The receipts are the second largest in the operation of the system, being exceeded by August, 1915, when a total of \$234,159 was reached with one day more of operation. During October, 1915, the total receipts were \$214,029.62.

San Joaquin Light & Power Corporation, Bakersfield, Cal.—The San Joaquin Light & Power Corporation has received permission from the California Railroad Commission to renew three promissory notes for a term not exceeding two years from July 15, 1915. Of these notes \$100,000 is payable to the Bank of California and \$200,000 to the Savings Union Bank & Trust Company. The new notes at 6 per cent are to be to the Hibernia Savings Bank of Los Angeles for \$100,000; to the Security Trust & Savings Bank, \$150,000, and to the Security National Bank, \$50,000. The money from the original issue was expended in construction, extensions and improvements.

Seattle (Wash.) Municipal Street Railway.—The report of A. L. Valentine, superintendent of public utilities, on the operation of the Seattle Municipal Street Railway for October shows that the revenue of Division A amounted to \$1,622. The expenses were \$2,125, giving a loss of \$503 from operation. The revenues of the Lake Burien Line, Division C, amounted to \$1,514, with expenses of \$2,286, or a loss of \$772. The total loss for both lines for the month was \$2,868, this figure including \$1,593 for interest on bonds.

Syracuse & South Bay Electric Railroad, Syracuse, N. Y.—Justice Andrews on Dec. 4 ordered the foreclosure sale of the Syracuse & South Bay Electric Railroad and the Syracuse, Watertown & St. Lawrence River Railroad. These two companies, which are financially distinct but are operated under one management, were some time ago placed in the hands of Ernest Gonzenbach as receiver, as noted in the *ELECTRIC RAILWAY JOURNAL* of May 29. The purpose was reported to be a friendly readjustment having in view the consolidation of the two properties. It has not been announced when the sales now ordered will take place or whether they will be made together, but notice of sale must be published for six weeks. The reports of the referees appointed by the court to compute the amounts due trustees of the mortgages were presented to Justice Andrews by E. I. Edgcomb. Referee Carl E. Dorr, who acted in the case of the Bankers' Trust Company, New York, against the Watertown road, reported that the amount due on the mortgage of this company was \$236,353. Referee Thomas W. Dixon, who acted in the case of the South Bay line, reported that \$591,250 was due on the mortgage held by the Equitable Trust Company, New York.

United Gas & Electric Corporation, New York, N. Y.—A dividend of 3 per cent has been declared on the \$9,284,800 of first preferred stock of the United Gas & Electric Corporation, payable on Dec. 30 to holders of record on Dec. 20. This is the first payment since April, 1914. President George Bullock is quoted as saying: "I have every reason to believe that with a continuation of the present prosperity of the company the payment of current dividends from now on will be resumed on our first preferred stock, as the operating results of all the subsidiaries for the past six months have been very gratifying, and substantial increases in both gross and net are being shown by practically all the companies."

United Light & Railways Company, Grand Rapids, Mich.—It is announced that the United Light & Railways Company will on Jan. 1 redeem \$500,000 of outstanding notes.

DIVIDENDS DECLARED

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., quarterly, 1½ per cent, preferred.
 Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., quarterly, 1½ per cent, preferred.
 Continental Passenger Railway, Philadelphia, Pa., \$3.
 Interstate Railways, Camden, N. J., 30 cents, preferred.
 United Gas & Electric Corporation, New York, N. Y., 3 per cent, first preferred.
 United Light & Railways Company, Grand Rapids, Mich., quarterly, 1½ per cent, first preferred.
 United Traction & Electric Company, Providence, R. I., quarterly, 1¼ per cent.
 West End Street Railway, Boston, Mass., \$2, preferred.

Traffic and Transportation

ACCIDENTS IN NEW YORK DECREASE

Near-Side Stops in Use Since 1914 Said to Be Responsible for Good Showing

Surface cars in Greater New York have been making the near-side stop since Sept. 1, 1914. There has never been a month during this period in which there has not been a decrease in the number of street accidents. Frequent reports have been issued by the Safety First Society during the past year containing statistics bearing out the contention of the organization's official that it would prove to be one of the greatest factors in reducing the number of accidents and fatalities in Greater New York. A tabulation of street accidents for the five months from June 1 to Oct. 31 of this year as compared with the same months last year follows:

	1914	1915
Car collisions	582	366
Persons struck	1,489	1,251
Vehicles struck	5,973	5,744
Boarding	3,236	2,685
Alighting	4,831	4,038
	16,111	14,084

This statement contains both fatal and non-fatal accidents, but for ascertaining the success of the ordinance as regards fatalities, the following compilation has been made for the same periods:

	1914	1915
Car collisions	0	0
Persons struck	31	25
Vehicles struck	12	2
Boarding	4	1
Alighting	8	7
	55	35

In Manhattan, where there are more congested sections, the success of the ordinance remains indisputable. The Safety First Society particularly requested the Public Service Commission to compile a tabulation of the accidents involving the operation of street cars during June, July, August, September and October when the schools are closed and the children are using the streets more than at any other time in the year. In Manhattan the figures show a decrease of 1219 accidents, with fatalities reduced from twenty-nine a year ago to seventeen this year. The Brooklyn and Queens statistics have been combined, as there are several companies operating in both boroughs. The decrease in this section shows a total of 482, there having been 7096 accidents during the period indicated last year as compared to 6614 this year. The fatalities have almost been cut in two, there having been twenty deaths recorded last year as compared to eleven this year.

There have been no increases, either in fatal or non-fatal accidents, in the Borough of Manhattan during the present year, while in the Brooklyn-Queens section there has been an increase of 111 accidents involving persons boarding cars, and an increase in the number of accidents wherein people were killed while alighting from street cars. This tabulation, showing a general average decrease in street car accidents, offers conclusive proof of the successful operation of the near-side stop ordinance, and the Safety First Society officials also contend that the installation of the "car stop-safety zones," have been of much assistance in providing better safeguards for the patrons of the surface lines.

PENALTIES CLAIMED IN MILWAUKEE

Violations Charged of the Railroad Commission's Service Order Issued in 1913

The State of Wisconsin, in an action begun on Dec. 6 in the Circuit Court for Dane County, charging violations of the order of the Railroad Commission issued on Dec. 25, 1913, fixing standards for street railway service in Milwaukee, has sued The Milwaukee Electric Railway & Light Company for penalties aggregating \$186,000. The State's complaint comprises a document of over 225 pages, and is based on data furnished by City Attorney Hoan, who was elected on the Socialist ticket. The company has twenty days in which to answer, which will bring the case on for trial at the January term of the Dane County Circuit Court.

The complaint charges specifically 186 separate violations

of the commission's order. It is charged, in each instance, designating the time and place and the number of passengers carried, the number of seats furnished and the number of seats required under the order, that the street railway "failed, refused and neglected" to furnish the number of seats required, "all in violation of said order and contrary to law." It is alleged in each instance that "the defendant thereby became indebted to the State of Wisconsin in the sum of \$1,000, whereby a right of action accrued to the State of Wisconsin for the recovery thereof, by virtue of and pursuant to the provisions of Secs. 1797-27 and 1797-31, Wis. Stat." The statutes referred to prescribe a penalty of \$100 to \$10,000 in the discretion of the court for any neglect, failure or refusal by a railway company to obey any lawful requirement of a service order of the commission.

After the service order on which the suit is based was issued by the commission the company complained that it was vague and impracticable of application in its existing form and applied to the commission for an interpretation and modification of the order. At its request a hearing was granted on these points, and testimony was presented to justify its claims by the company about a year ago, but no decision has been handed down by the commission. The violations which are alleged to have been committed occurred after the company had applied for this interpretation of the order.

Lexington Employees' Publication.—Employees of the Kentucky Traction & Terminal Company, Lexington, Ky., have begun publication of *The Employees' Bulletin*.

Hoboken Fare Hearing on Jan. 12.—The application of the city of Hoboken to require the Public Service Railway to operate for a 3-cent fare in Hoboken will be heard by the Board of Public Utility Commissioners of New Jersey in the court house in Jersey City on Jan. 12.

St. Louis Skip Stop Report to Be Filed Dec. 15.—The time of filing the report on the stop elimination test by the United Railways, St. Louis, Mo., has been extended until Dec. 15, on an order made by the State Public Service Commission. John M. Atkinson, chairman of the commission, said that a hearing would be held in St. Louis before the report is filed by the company.

Jitney Measure Before Newark Council.—The Newark, N. J., jitney ordinance, referred to in the *ELECTRIC RAILWAY JOURNAL* of Nov. 20, was approved by the license committee of the Common Council on Dec. 2. On Dec. 3 the measure was passed on first and second reading and ordered to a third reading and then recommitted to the license committee.

Prize Contest by Elevated in Chicago.—The Chicago (Ill.) Elevated Railroads has announced through *Elevated News*, its official publication, a contest to close on Dec. 31, in which the person sending in the best letter on "An Experience with 'Elevated Service' (telling how the elevated has helped him in some way) will be awarded a cash prize of \$25; the person sending in the next best letter, a cash prize of \$15; and the third, a cash prize of \$10.

New Orleans Jitney Ordinance Held "Ultra Vires."—The Supreme Court of Louisiana has annulled the New Orleans ordinance on the ground that while the municipality had the power to regulate jitneys, along with other vehicles, a measure that is in fact prohibitory is *ultra vires* and void. The court held that the city had no power to interdict the use of the streets to vehicles such as are commonly operated in cities any more than it had the power to interdict their use by pedestrians.

Fresh-Air Car for Texas Line.—The Bryan & College Interurban Railway, Bryan, Tex., has ordered what it describes as "a large windowless electric car." In order to induce travel for health and pleasure the company will operate the car every Sunday from 4 p. m., to 7 p. m., between Villa Maria and College Station at 10 cents for the round trip, a rate less than 1 cent a mile. This arrangement will not affect the regular schedule or the regular rate of 25 cents between Bryan and College and 10 cents between Bryan and Villa Maria.

Change in Route of Washington Jitneys Allowed.—The Public Utilities Commission of the District of Columbia

has granted the application of the District Jitney Bus Company for permission to discontinue operation over the route authorized by the commission's order No. 166, dated Oct. 27, 1915, and hereafter to operate from Eighth Street and Pennsylvania Avenue, N. W., west on Pennsylvania Avenue to Fifteenth Street, north on Fifteenth Street to Massachusetts Avenue, west on Massachusetts Avenue to Sixteenth Street, north on Sixteenth Street to U Street, and return.

Reduction in Fare Ordered.—The Public Service Commission of Washington has ordered the Gray's Harbor Railway & Light Company, Aberdeen, Wash., to reduce to 5 cents the single-trip fare between Cosmopolis and Aberdeen. The fare heretofore has been 10 cents. The commission finds that since the Cosmopolis line is only 0.625 miles long, and most Cosmopolis patrons ride only to the mill section of Aberdeen, the average trip from Cosmopolis to Aberdeen actually is shorter and less expensive to the company than the average trip within the city limits of Aberdeen, for which only 5 cents is charged.

Route Changes Ordered in Los Angeles.—In order to relieve traffic congestion in the business district, the Board of Public Utilities of Los Angeles, Cal., has issued an order, effective on Dec. 1, which calls for a complete revision of the car routing plan in the down-town system of the Los Angeles Railway Corporation. Ten existing car lines are to be discontinued and twelve new lines established, while the practice of turning cars back is to be discontinued. The plan does away with curves as far as possible, and in the main only straight line crossings are to be permitted. However, the present service on Broadway and Hill Streets, two of the busiest thoroughfares, will not be disturbed.

Jitney News from Fort Worth and Austin.—The jitney ordinance of Fort Worth, Tex., has again been held constitutional and the right of the city to regulate the jitneys upheld in a decree handed down by the Court of Civil Appeals for the Second Supreme Judicial District, which affirms the judgment of the Sixty-Seventh District Court in the case of the Auto Transit Company of Fort Worth versus the city of Fort Worth. The case was filed in the form of an application for an injunction to prevent the enforcement of the ordinance. Jitneys in Austin, Tex., ceased operating on Nov. 30, with the enforcement of the regulatory ordinance which has been upheld both in the Corporation Court and the Court of Criminal Appeals. The operators claim that the Austin law is too stringent to render the business profitable.

Voluntary Reduction in Interurban Fares.—L. H. Bean, manager of the Seattle-Tacoma interurban line of the Puget Sound Electric Railway, Tacoma, Wash., has announced a voluntary reduction in passenger fares between Seattle and Georgetown, including points south in the Duwamish Valley. The new rates to become effective on Nov. 25. A. W. Leonard, president of the Puget Sound Traction, Light & Power Company, in speaking of the reduction, said: "The company in making the reduction in fares on the Seattle-Tacoma interurban system, including the Renton line, does so in the belief that its service, which will be as good as can be found on similar lines in this country, will receive the patronage and support it deserves. The move is in the nature of an experiment. It is expected that the people of the valley will prefer our dependable service to disjointed, irresponsible and unreliable jitney service. The service will be of high order, and it will be made permanent if the patronage warrants it. There will be transfer privileges on all fares." The round-trip fare between Georgetown and Renton has been reduced from 54 cents to 28 cents.

Only Twelve Fatal Accidents in New York City in October.—The engineers of the Public Service Commission for the First District of New York have made a report upon the accidents occurring on railroads and street railroads in that district for the month of October, 1915. The report shows that only twelve persons were killed during the month. This is the smallest total in the history of the commission. The largest number of fatalities ever reported was in the month of September, 1907, when sixty-three persons lost their lives. When the commission was created the number of persons killed ranged from 500 to 600 a

year. This has been practically cut in two, notwithstanding the greatly increased traffic. The report for October shows a decrease in the number of accidents as well as in the fatalities. The total number of accidents was 5395 against 5519 for October of last year. Of the total 3920 accidents occurred on surface lines, 950 on subway and elevated lines, 509 on railroad trunk lines, twelve on railroad terminal lines and three on motor bus lines. Of the killed six met death on the surface lines, four on the subway and elevated lines, one on railroad trunk lines and one on a railroad terminal line.

Chicago Company Seeks Relief from Wagon Traffic.—Underneath a line cut showing a heavily-loaded dray broken down on the car tracks the Chicago (Ill.) Surface Lines in a recent daily newspaper advertisement said: "Were you late for work this morning? How many times have you been late this year owing to delays in street car traffic caused by wagons and trucks whose drivers refuse to get out of the car tracks, or by breakdowns of vehicles in the car tracks? We want to improve our service. Our problem is one of track capacity. With the limited number of outlets from the loop we can move only so many cars in a given time. We can move the maximum number of cars only if we can have the maximum use of our tracks. We can do nothing to correct present conditions until the City Council passes an ordinance giving us the use of our tracks—at least during rush hours. The present ordinance permits the obstruction of traffic by vehicles. If you want better service, write a letter to your aldermen, or to the local transportation committee, telling them that you want such an ordinance, and why. The City Council will respond to your wishes if you will take the trouble to express them. Write your letter to-day."

Schenectady Service Questions Before Commission.—James F. Hamilton, general manager Schenectady (N. Y.) Railway, agreed before the Public Service Commission of the Second District on Dec. 1 to have the Schenectady cars east-bound make the regular stops between the city line and Watervliet Avenue for the accommodation of local passengers. The hearing was on the complaint of residents of Albany against the Schenectady Railway and the United Traction Company as to the transfer situation between the two lines on local traffic. The officials of the road assured the commission that if east-bound cars refused to stop it was probably due to a misunderstanding on the part of the crews and that the matter would be remedied. The company still refuses, however, to carry local west-bound passengers. Recently the commission ordered transfers to be issued and accepted by the two lines for all local passengers, whereupon the Schenectady Railway posted a notice that it would carry no local passengers west. Reuben S. Calkins for the complainants raised anew the question of universal transfers between the two companies. The companies were allowed ten days in which to file any briefs they may wish supplemental to those filed some time ago when the case was up before.

Seeking to Correct Transfer Abuses in Columbus.—A change in the method of issuing and receiving transfers on the cars of the Columbus Railway, Power & Light Company, Columbus, Ohio, has been announced, to be effective at an early date. S. G. McMeen, president of the company, said recently: "The transfer system that has been in use in Columbus for several years has brought about certain practices that have curtailed the legitimate and expected revenues of the company. Whatever the loss to the company may be through the abuse of transfer privileges, it is an earning that not only the company is entitled to, but one that should be counted since it is of benefit to the car riders of the city, to the end that fare reductions may not be precluded or fare increases may not be exaggerated. The company realizes that so great a change from present habits to something radically different, no matter what the necessity, ought not to be made in a moment nor without proper discussion. The mere fact that the company has the power to make these new rules is not sufficient for undue haste. Therefore, we have determined to discuss this whole matter with the people of Columbus before we even set the date for the change. We invite the frankest discussion, criticism and comment."

Personal Mention

Mr. Frank A. Spies has been elected president of the Menominee & Marinette Light & Traction Company, Menominee, Mich., to succeed Mr. Augustus Spies.

Mr. W. E. Nemits, chief clerk to the general claim agent of the Chicago (Ill.) Surface Lines, has been appointed assistant general claim agent.

Mr. Frank J. Gatrell, formerly chief adjuster of the Chicago (Ill.) Surface Lines, has been appointed acting general claim agent to succeed Ralph S. Rowley, deceased.

Mr. Charles Smeeth has been appointed superintendent of the Ironwood & Bessemer Railway & Light Company, Ironwood, Mich., to succeed Mr. F. L. Blackhurst, resigned.

Mr. Frederick B. Van Vorst of New York has been elected to the office of vice-president of the United Railways Investment Company and not to that of secretary, as mentioned in a recent issue.

Mr. W. Leon Pepperman, assistant to the president of the Interborough Rapid Transit Company and the New York (N. Y.) Railways, has been elected a director of the latter company to succeed the late Andrew Freedman.

Mr. George Caywood has been appointed engineer of the power station of the Twin City Rapid Transit Company, Minneapolis, Minn., to succeed Mr. Donald Goodrich, who is superintendent of the Minneapolis division of the company.

Mr. C. K. Minary, president and treasurer of the Benton Harbor-St. Joe Railway & Light Company, Benton Harbor, Mich., has also been appointed manager of the company to succeed Mr. H. C. Mason, whose resignation, effective Dec. 1, was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 30.

Mr. A. J. Klatte has been appointed acting electrical engineer of distribution of the Chicago (Ill.) Surface Lines to succeed Herbert M. Wheeler, deceased. Since the consolidation of the Chicago City Railway and the Chicago Railways as the Chicago Surface Lines Mr. Klatte has served as assistant engineer of electrical distribution.

Mr. Harry H. Hanson, the newly appointed superintendent of Division 7 of the Boston (Mass.) Elevated Railway, entered railroad work in 1889 as conductor on the old Brattle Street line. After three years he was made starter and later became inspector. In 1901, on the opening of the elevated, he was appointed to the position of district supervisor and stationed at Dudley Street. In February, 1913, he was promoted to be superintendent of Division 2, with headquarters at Lenox Street. The approaching completion of the extension of the East Boston tunnel to Bowdoin Square, connecting with Cambridge lines at that point, brought about the consolidation of Division 4 (East Boston) and Division 7 (Cambridge), all under one head, Division 7, and Mr. Hanson was placed in charge.

Mr. W. B. Saunders, formerly consulting engineer of Minneapolis, and previous to that a member of the field staff of H. M. Byllesby & Company, Chicago, has been appointed engineer for the Railroad and Public Service Commission of Montana. Mr. Saunders received his professional education at the University of Wisconsin and first engaged in engineering work on the forces of the Union Pacific Railway in 1901. He served with the Rocky Mountain Bell Telephone Company from 1903 to 1904, and with the Salt Lake Route for a short period in 1905. From the latter year until 1906 he was engineer and construction supervisor for the Michigan State Telephone Company, leaving that work to become assistant engineer in the United States Reclamation Service. He joined the forces of H. M. Byllesby & Company in 1910 and continued with them until 1913. In 1914 he opened offices in Mankato, Minn., to engage in consulting practice.

Mr. George Lorne Guy has been appointed engineer of the Manitoba Public Utilities Commission, Winnipeg. Mr. Guy was born at Portage du Fort, Que., on April 14, 1883, and was educated at Camden East, Newburgh, and Queen's University, Kingston, Ont. From 1899 to 1902 he was armature, transformer, meter and test operator with the Canadian General Electric Company at Peterborough, Ont. From 1902

to 1907 he was chief electrician with Graves, Bigwood & Company, at Byng Inlet, Ont., and during the winter months of these years attended Queen's University. From 1907 to 1908 he was engaged in contract construction work at Camden East, Yarker and Newburgh, Ont. From 1903 to 1910 Mr. Guy was engineer of rolling stock with the Winnipeg (Man.) Electric Railway. From 1910 to 1912 he was engineer with the electrical department of the city of Winnipeg, and from 1912 to 1914 was sales manager of the electrical department of the Canadian H. W. Johns-Manville Company at Winnipeg. Since March 1, 1914, he has been engaged in private practice as a consulting electrical engineer.

Mr. G. Sabin Brush, chief clerk of Division 8 of the Boston (Mass.) Elevated Railway, has been appointed superintendent of the railway department of the Cumberland County Power & Light Company, Portland, Me. Mr. Brush was born at Stillwater, Minn., in 1884. In 1903 he entered the Massachusetts Institute of Technology, taking the course in mechanical engineering, and during vacations he was employed by the Middlesex & Boston Street Railway at Newtonville, Mass. Here Mr. Brush did much original work in the direction of publicity for traffic stimulation, and in 1908 entered the employ of the Boston Elevated Railway in the transportation bureau. He was later transferred to the president's office, then to the claim department, and in the fall of 1910 was appointed chief clerk of Division 6, with headquarters at Sullivan Square Terminal, Charlestown. Shortly afterward Mr. Brush became chief clerk of Division 8, which comprises the entire business section of Boston and includes all surface car subways and tunnels. Mr. Brush is a brother of Mr. Matthew C. Brush, second vice-president of the Boston Elevated Railway. He is a member of the New England Street Railway Club. On the afternoon of Dec. 4 he was presented with a chest of silver at the main offices of the company in Boston on behalf of starters, inspectors, office and other employees. A farewell dinner was held in his honor on the same evening at the Engineers' Club, Boston, at which many officers of the company were present. In his new position, which he assumed this week, Mr. Brush will have charge of the operation of 107 miles of track in Portland and vicinity.

Mr. Oscar S. Straus, New York, ex-Ambassador from this country to Turkey and Progressive candidate for Governor in 1912, was named by Governor Whitman on Dec. 9 as member and chairman of the Public Service Commission for the First District, to succeed Mr. Edward E. McCall, who was removed from office on Dec. 6. The Governor said that Mr. Straus had accepted the position, and expected to qualify soon. Mr. Straus was born in Bavaria on Dec. 23, 1850. He lived in Talbotton, Ga., and afterward went to Columbus Ga., where he resided until 1865, when he moved to New York. He was graduated from Columbia University with the degree of A.B. in 1871. In 1873 he received the degree of LL.B. and in 1874 was granted an A.M. degree. He practised law in New York from 1873 to 1881. He was a member of the firm of L. Straus & Sons, importers of pottery and glassware, in New York from 1881 to 1906. He was Envoy Extraordinary and Minister Plenipotentiary to Turkey from 1887 to 1889 and again from 1898 to 1901. He was appointed a member of the Permanent Court of Arbitration at the Hague in 1902 to fill the vacancy caused by the death of former President Harrison. Ex-President Roosevelt appointed Mr. Straus Secretary of the Department of Commerce and Labor, and he served in that capacity from Dec. 17, 1906, to March 4, 1909. For the third time he was appointed Envoy Extraordinary and Minister Plenipotentiary to Turkey and served from May, 1909, to December, 1910. He was formerly president of the New York Board of Trade and Transportation; also of the National Primary League

and of the American Social Science Association. He was vice-president of the National Civic Federation and the International Law Association. In 1914 he was appointed chairman of the arbitration commission selected to decide the wage dispute between the Eastern railways and their engineers. In 1912 he was the Progressive candidate against Mr. Sulzer for Governor of New York. The appointment of Mr. Straus as chairman of the commission was announced after the first editorial page of this issue had gone to press. This paper considers the appointment of Mr. Straus a good one and extends its congratulations to Governor Whitman on his selection.

OBITUARY

William H. Bache, retired manager of the Graphite Lubricating Company, Bound Brook, N. J., died on Nov. 12.

James Carrigan, who completed fifty years of continuous service with the Union Railway, New York, N. Y., died on Dec. 1. At the time of his death Mr. Carrigan was actively associated with the Union Railway as general superintendent. Mr. Carrigan, who was seventy-six years of age, began his railroad career with the old Huckleberry line in The Bronx in 1864, driving a street car between Harlem Bridge and Morrisania.

John H. Studley, for thirty-seven years identified with street railway service in eastern Massachusetts, died at Malden, Mass., on Dec. 5. Mr. Studley was born in Charlestown, Mass., sixty-three years ago. He was formerly treasurer of the old Middlesex Street Railway and of the Boston & Chelsea Street Railway. For many years he was employed by the Boston Elevated Railway in connection with transfer work. He is survived by his widow and a married daughter.

George W. Bruce, for twenty-three years claim agent of the street railway lines in Indianapolis, Ind., died at his home in that city on Nov. 28. He was seventy years old. Mr. Bruce was born in Dearborn County, Ind., on Sept. 8, 1845. He was educated at Moores Hill College, and, after he was graduated, taught school for about two years. He then went to Cincinnati and became connected with the Adams Express Company. Later he was appointed agent for this company at Indianapolis. After nearly fifteen years' service with the Adams Express Company, Mr. Bruce was chosen bailiff in the Superior Court at Indianapolis and held that office for about twelve years. In 1892 he was appointed claim agent for the Citizens' Street Railroad, which then operated the street railway lines in Indianapolis, and he continued as claim agent for the Indianapolis Traction & Terminal Company when that company leased the street railway properties. Mr. Bruce is survived by his widow, two sons, a sister and two brothers, one of whom, Joseph G. Bruce, is connected with the claim department of the Indianapolis Traction & Terminal Company.

Andrew Freedman, financier, director of many corporations and a silent power in Democratic politics in New York, died on Dec. 4. Mr. Freedman was born in New York City on Sept. 1, 1860. He attended the public schools and later the College of the City of New York, from which institution he was graduated. His first business connection was with a wholesale dry goods house. In 1885 he entered the real estate business and became a specialist in this field. In 1898 Mr. Freedman became interested in the Fidelity & Guarantee Company, Baltimore. He left that company in 1903 to organize the Casualty Company of America. The formation of the Interborough Rapid Transit Subway Construction Company was largely due to his efforts. It is said that it was to him that Mr. John B. McDonald came with the idea of the New York subway, and together they interested Mr. August Belmont in the project. As the owner of the New York Baseball Club Mr. Freedman came into national prominence in the world of sports. In 1902 he sold his interest in the Giants to the late John T. Brush. Mr. Freedman was a director of many companies, among them the Interborough Rapid Transit Subway Construction Company, the New York Transportation Company, the Fifth Avenue Coach Company, the New York Consolidated Company, the New York & Queens County Railway and the New York Railways. Mr. Freedman was also a trustee of the New York & Long Island Railroad. He was unmarried.

G. SABIN BRUSH

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Consolidated Utilities Company, Wilmington, Del.—Incorporated in Delaware to lease, own and operate electric railways. Capital stock, \$3,300,000. Incorporators: Herbert E. Latter, Norman P. Coffin and Clement M. Egner, all of Wilmington.

*Youngstown & Niles Railway, Youngstown, Ohio.—Incorporated in Ohio with a capital stock of \$10,000. R. P. Stevens, president of the Mahoning & Shenango Railway & Light Company, has stated that the new line will extend from the Mahoning Avenue line to Niles, along the south side of the Mahoning River. Incorporators: James P. Wilson, U. C. DeFord, Fred J. Heim, Richard Wilson and J. W. Blackburn.

*Green Bay & Eastern Railway, Green Bay, Wis.—Incorporated in Wisconsin to construct a line from Green Bay to Sheboygan via Manitowoc, 70 miles. Capital stock, \$50,000. Among the incorporators are Charles Frazier and Rude Stockinger, Manitowoc, and R. P. Mattern, Milwaukee.

FRANCHISES

*Los Angeles, Cal.—Henry. M. Dennison has received from the Council a one-year extension of time on a franchise to construct a line on Main Street between Slauson and Manchester Avenues.

Sacramento, Cal.—The Oakland, Antioch & Eastern Railway has received a franchise from the Council to construct a double-track line on M Street, extending westerly to the Sacramento River, thence easterly along M Street to Third Street, along Third Street to I Street, the portion of the line to be constructed on the M Street bridge to be single track.

St. Louis, Mo.—The East St. Louis & Suburban Railway has asked the Board of Public Service for a franchise to operate cars over the free bridge and around a loop which they propose to build in St. Louis.

Niles, Ohio.—The Cleveland, Alliance & Mahoning Valley Railroad has asked the Council for a franchise to extend its tracks through Niles.

Youngstown, Ohio.—The Youngstown & Southern Railway has asked the Council for a ten-year extension of time on its franchise, making the concession good for twenty-five years from the date of its passage.

Barrie, Ont.—The Toronto, Barrie & Orillia Railway has asked the Council for a one-year extension of time on its franchise to construct a line in Barrie.

TRACK AND ROADWAY

Little Rock Railway & Electric Company, Little Rock, Ark.—As a counter proposal to the city, this company offers the extension of several lines at a cost of \$310,683 if the city will abandon the use of its electric light plant, purchase power from the company, regulate jitneys and make other concessions.

Central of Florida Railway, Daytona, Fla.—This company plans to build about 2 miles of single track during 1916.

*Ocala, Fla.—Citizens of Ocala are interested in a proposition to construct an electric line between Ocala and Silver Springs. A committee comprising Jake Brown, J. H. Taylor and J. M. Thomas was elected to confer with the Council with a view to calling a bond election to raise funds sufficient to construct the line.

Lula-Homer Railroad, Lula, Ga.—A report from this company states that it expects to build 110 miles of new line during 1916, as follows: From Winder to Jefferson, 15 miles; from Jefferson to Commerce, 14 miles; from Commerce to Cinesville, 18 miles; from Cinesville to Bowerswell, 14 miles; from Hartwell to Anderson, 23 miles; from Belton to Homer, 14 miles; from Homer to Cinesville, 21

miles. The contract for the construction of one section from Belton to Homer has been awarded to W. J. Redmond, Atlanta. D. G. Zeigler, engineer. [Sept. 25, '15.]

*Pocatello Transportation & Interurban Company, Pocatello, Idaho.—Prominent business men and capitalists of Pocatello are interested in a proposed line to be built by this company. It is expected that articles of incorporation will be filed at once. The company has opened offices in the Kane Building and preliminary arrangements are being made for the organization of the company.

Alton, Granite & St. Louis Traction Company, Alton, Ill.—The city of Alton has asked this company to extend its line 1 mile east of Alton to the State Hospital site.

Gary, Hobart & Eastern Traction Company, Hobart, Ind.—This company reports that during 1916 it plans to build about 12 miles of track between Hobart and Valparaiso.

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa.—This company reports that during 1916 it expects to build about 6 miles of new line from Swanwood Junction to Des Moines, over which section the company is now using leased tracks.

Charles City Western Railway, Charles City, Iowa.—This company has completed the construction of an extension of its line from Charles City to Colwell, 8 miles.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—Operation on this company's line has been extended to Linwood, half-way between Bonner Springs and Lawrence. It is expected that operation to Lawrence will be begun within a few weeks.

Cumberland & Manchester Railroad, Barboursville, Ky.—The contract for the construction and track-laying of this company's line from Barboursville to Manchester has been awarded to the Read Construction Company, Philadelphia and Hazleton. [Nov. 27, '15.]

Springfield (Mass.) Street Railway.—Announcement has been made by this company that operation on the new East Street line into Chicopee Falls will be begun within the next few days.

Detroit (Mich.) United Railway.—This company will extend its South Dearborn line from River Rouge to Ecorse and operation will be begun about Dec. 25. The extension will carry the company's city lines 3 miles southwest of the Detroit limits.

Kansas City, Lawrence & Topeka Electric Railroad, Kansas City, Mo.—A report received from this company states that it expects to build 52 miles of single track between Zarah and Topeka during 1916.

Moncton Tramways, Electricity & Gas Company, Ltd., Moncton, N. B.—This company reports that during 1916 it expects to construct about 1½ miles of track in the city and suburbs of Moncton and to Sunny Brae.

Public Service Railway, Newark, N. J.—Operation has been begun by this company on its extension from Roosevelt Junction, on the Trenton fast line, to Carteret and Chrome, 1½ miles.

International Railway, Buffalo, N. Y.—This company has submitted plans to the Ontario Railway Board of alternative changes in the line from Queenstown Heights to the level of Lake Ontario, on which a serious accident occurred last summer. Recently the Ontario Railway Board submitted plans proposing a new down-grade, single-track line which would take one long, continuous curve, leaving the present line for up-grade traffic. The alternative proposed by the company's engineering experts is a reconstruction of the present double-track line to lengthen the curves and ease the grade. It is expected this plan will be acceptable to the board.

Jamestown & Buffalo Street Railway, Buffalo, N. Y.—Clarence G. Mead, who is securing the right-of-way for the proposed electric railway from Jamestown to Buffalo, is now working in the vicinity of Eden. The rights-of-way from Jamestown are mostly secured. As proposed, the line from Gowanda will extend east of the Erie until near Lawtons, when it will change to the west and from Hamburg will extend to Athol Springs, connecting there with the tracks of the Buffalo & Lake Erie Traction Company. [Jan. 10, '14.]

Interborough Rapid Transit Company, New York, N. Y.—The contract for the installation of tracks on the White Plains extension of the Lenox Avenue branch of the existing subway has been awarded by the Public Service Commission for the First District of New York to the Coast & Lake Contracting Corporation, the lowest bidder, at \$53,-930.50. Bids were opened Dec. 7 for construction of the tunnel under the East River from Fourteenth Street, Manhattan, to North Seventh Street, Brooklyn. The two lowest bidders were Booth & Flinn, Ltd., \$6,631,000, and Holbrook, Cabot & Rollins Corporation, \$6,907,000.

Long Island Railroad, New York, N. Y.—All tracks of the Long Island Railroad are now in use over the new \$1,000,-000 Woodside-Winfield cut-off, which eliminated a dangerous curve and ten grade-crossings, including the one at Queens Boulevard, where thousands of automobilists have been compelled to use a steep wooden bridge. This will be removed in a few weeks, permitting the double-tracking of Manhattan & Queens Traction Corporation, and the old tracks of the Long Island Railroad will be removed and the land sold for building sites.

Manhattan & Queens Traction Corporation, New York, N. Y.—Efforts of the property owners in the southern section of Jamaica, Queens, to compel the Manhattan & Queens Traction Corporation to extend its lines from the Jamaica station to the city line, at Rosedale, have been defeated by the Board of Estimate. A resolution has been adopted directing that the line be constructed as soon as possible to the junctions of Sutphen Road and Lambertville Avenue and that the construction to St. Albans be completed only upon an order from the borough president of Queens with the sanction of the Board of Estimate.

Rochester (N. Y.) Connecting Railway.—The Public Service Commission at Albany on Dec. 1 heard further testimony in behalf of the application of the Rochester Connecting Railway for a certificate of public convenience and necessity. The new road, which is designed to afford a connection at Rochester with the Erie and the Pennsylvania Railroads for the Buffalo, Lockport & Rochester Railway, together with the other projects designed to connect the Buffalo, Lockport & Rochester Railway with the Canadian Northern and other roads at its western terminus, is being opposed by the New York Central. Testimony was not concluded when the hearing was adjourned to a future date.

***Champlain & Sanford Railroad, Sanford, N. Y.**—It is reported that this company has secured right-of-way for the construction of a line from Sanford Lake to Fort Ticonderoga, about 60 miles.

Dover, Millersburg & Western Railway, Canal Dover, Ohio.—Bids are being received by this company for the construction of its proposed line between Canal Dover and Millersburg via Sugar Creek. The line will cross the Wheeling & Lake Erie Railroad at grade and the Baltimore & Ohio and Pennsylvania Railroads on an overhead line. Benjamin George, Canal Dover, is interested. [Nov. 13, '15.]

Cleveland, Alliance & Mahoning Valley Railroad, Cleveland, Ohio.—It is reported that this company is considering plans to build a double-track extension from Warren to Youngstown, via Niles. Local real estate dealers are said to be much interested in the new project and are assisting in securing the needed right-of-way.

East Liverpool Traction & Light Company, East Liverpool, Ohio.—According to a statement made by C. A. Smith, general manager of the East Liverpool Traction & Light Company, at a recent meeting of the Council, about \$250,000 will be expended within the next few months in improving the lines and property of the company. Of this amount between \$75,000 and \$100,000 will be required in the construction of the new "safe route" to Grandview, while approximately \$20,000 will be necessary for the improvements in the West End. The improvements of the property of the company on Harvey Avenue would also involve an expenditure of several thousand dollars.

Hershey (Pa.) Transit Company.—Operation has been begun by this company on its extension from Hershey to Elizabethtown.

Montreal & Southern Counties Railway, Montreal, Que.—This company's extension from St. Cesaire to Abbotsford and Granby has been completed and W. B. Powell, general manager, has announced that the line will be placed in operation from Montreal to Granby during the early part of this month.

Chattanooga (Tenn.) Traction Company.—Grading has been begun by this company on its extension to Hixon. Rights-of-way have been acquired for practically the entire distance. It is stated that the grading will be completed within ninety days when the work of laying track will be begun. An order was placed some time ago for the rails and it is expected that they will be delivered by the first of the year.

Richmond, Rappahannock & Northern Railway, Richmond, Va.—The contract for the construction of this company's line from West Point to Urbanna, 17 miles, has been awarded the Central Construction Company, Harrisburg, Pa. C. L. Ruffin, 514 American National Bank Building, Richmond, chief engineer. [Nov. 20, '15.]

Princeton & Bluefield Electric Railway, Princeton, W. Va.—It is reported that construction on this company's line between Princeton and Bluefield is nearing completion and it is expected that operation will be begun by Jan. 1. The Princeton Power Company, of which S. J. Evans is president, is building the road.

Sheboygan Railway & Electric Company, Sheboygan, Wis.—During 1916 this company expects to build 1 mile of track in Sheboygan.

SHOPS AND BUILDINGS

Holyoke (Mass.) Street Railway.—This company has provided material for two waiting stations, which the people of South Amherst will set up at the junction of West Street, Bay Road and Potwin Lane.

Northern Texas Traction Company, Ft. Worth, Tex.—The Board of City Commissioners of Dallas has been notified by Edward T. Moore, representing the Northern Texas Traction Company, of the acceptance of the ordinance granting a franchise for the erection of a union interurban passenger station which is to cost approximately \$2,000,000. Work will be started on the structure by Dec. 20.

Petersburg & Appomattox Railway, Petersburg, Va.—Plans are being made by this company to build a carhouse and power house at Plant Street and Tenth Avenue, Hopewell.

POWER HOUSES AND SUBSTATIONS

Richmond Light & Railroad Company, New York, N. Y.—This company has petitioned the Public Service Commission for permission to make improvements and additions to its electric plant.

Dover, Millersburg & Western Railway, Canal Dover, Ohio.—This company, which plans to build a line between Canal Dover and Millersburg, via Sugar Creek, will build a power house at or near Sugar Creek.

Lake Shore Electric Railway, Cleveland, Ohio.—This company will build an extension to its power house at Fremont. Contract has been awarded.

Toronto (Ont.) Suburban Railway.—The new substation of the Toronto Suburban Railway in Lambton Park is now nearly completed. A large water tower has been erected at the east side of the building.

Quebec Railway, Light & Power Company, Quebec, Que.—This company is building an extension to its power house at Montmorency Falls and it is expected that construction will be completed about Dec. 15. It will add 15,000 hp. to the power at present at the company's disposal.

Texas Traction Company, Dallas, Tex.—The substation of this company, 1½ miles south of Sherman, was destroyed by fire on Nov. 29, entailing a loss of \$35,000. Three transformers and three modern rotary converters were lost. The fire was caused by the high-tension wire carrying 33,000 volts breaking and falling across the dispatcher's telephone wire. A portable substation was rushed out from Denison, and the traffic was resumed within five hours.

Manufactures and Supplies

ROLLING STOCK

Ogden, Logan & Idaho Railway, Ogden, Utah, expects to purchase during 1916 three motor cars.

Southern Oregon Traction Company, Medford, Ore., expects to purchase during 1916 one four-motor car.

Reading Transit & Light Company, Reading Pa., has completed the remodeling of one of its double-truck cars in its shops.

Lehigh Valley Transit Company, Allentown, Pa., expects to issue specifications in about a week for eighteen new center-entrance interurban cars.

Northern Ohio Traction & Light Company, Akron, Ohio, expects to purchase during 1916 ten 53-ft. interurban cars and fifteen 50-ft. city cars, both types semi-steel.

Covington & Oxford Street Railway, Covington, Ga., expects to purchase next year two light single-truck trailers 18 to 20 ft., and second-hand for temporary service.

United Railways & Electric Company, Baltimore, Md., it is reported, will equip with vestibules and improved steps 560 of its cars. New wheelguards and improved fenders will also be provided. The work is to start next spring.

Pittsburgh (Pa.) Railways, noted in the ELECTRIC RAILWAY JOURNAL of Nov. 27, 1915, as having ordered 175 city cars, has an option of increasing the St. Louis Car Company order from 100 to 150 cars and the Cincinnati Car Company order from seventy-five to 100 cars.

Interborough Rapid Transit Company, New York, N. Y., noted in the ELECTRIC RAILWAY JOURNAL of Nov. 27 as having ordered 311 subway car bodies from the Pullman Company, has ordered the trucks also from this company. The order for electric equipment will be equally divided between the General Electric Company and the Westinghouse Electric & Manufacturing Company.

Wilmington & Philadelphia Traction Company, Wilmington, Del., noted in the ELECTRIC RAILWAY JOURNAL of Nov. 6 as having ordered thirty-one prepayment semi-convertible cars from The J. G. Brill Company, has specified the following details for this equipment:

Seating capacity	44	Curtain fixtures,	
Weight of car-body,		Cur. Sup. Co., No. 89	
	15,000 lb.	Curtain material..	Fabrikoid
Bolster centers, length,		Destination signs,	
	17 ft. 4 in.	Elec. Ser. Sup. Co.	
Length of body.....	29 ft.	Fenders	Parmenter
Length over vestibule..	40 ft.	Gears and pinions.....	G.E.
Width over sills...8 ft.	2 in.	Gongs	Brill
Height, rail to sills..	26½ in.	Hand brakes,	
Height, sill to trolley base,		National Brake Co.	
	9 ft. 1¾ in.	Heaters..	Peter Smith Electric
Body construction,		Headlights	Esterline
T-iron posts, sheet steel		Motors.....	G.E., 258-A,
sheathing, wood roof			4 per car, inside hung
Interior trim,		Paint...Chicago Varnish Co.	
cherry, stained mahogany		Registers..	International R-7
Head-lining	Agasote	Sanders.....	Brill "Dumpit"
Roof	plain arch	Sash fixtures	Brill
Underframe	metal	Seats,	
Air brakes	G.E.	Brill "Winner,"	pressed steel
Bumpers..Hedley anti-climber		Seating material.....	cane
Cables	G.E.	Trolley catchers,	
Car trimmings.....	Brill	Elec. Ser. Sup. Co.	
Conduits and junction boxes,		Trolley base.....	G.E.
	Brill	Trucks.....	Baldwin 62-18c
Control	G.E.	Varnish..Chicago Varnish Co.	
Drawbar	portable	Ventilators.....	Ry. Utility

TRADE NOTES

Elyria Iron & Steel Company, Cleveland, Ohio, announces the removal of its general offices from Elyria, Ohio, to 232 East 131st Street, Cleveland, Ohio, where the company just completed an additional plant.

Woodmansee & Davidson, Chicago, Ill., engineers, announce their removal, effective Dec. 15, from the First National Bank Building to Suite 782-788, Continental & Commercial National Bank Building.

H. L. Lewenberg has been appointed engineer of estimates of the St. Louis Car Company, after having been in its service for several years. Mr. Lewenberg was formerly with the Standard Steel Car Company and the Pressed Steel Car Company, and is a graduate of the Massachusetts Institute of Technology.

Krehbiel Company, Chicago, Ill., engineers and constructors, announce the appointment of Edward N. Lake, formerly in charge of the Chicago office of the Stone & Webster Engineering Corporation, as a partner in this company with offices in the Marquette Building, Chicago. The business will be continued under the present firm name. Mr. Lake will be treasurer and manager and Fred A. Krehbiel will continue as president. Both were connected with the Arnold Company and Bion J. Arnold for a number of years. Mr. Lake has also been connected in turn with the Western Electric Company, Chicago-Edison Company and Board of Supervising Engineers.

The J. G. Brill Company, Philadelphia, Pa., on Dec. 1 instituted direct representation on the Pacific coast with offices at 907 Monadnock Building, San Francisco, this arrangement taking the place of the relationship formerly existing between The J. G. Brill Company and Pierson, Roeding & Company. The establishment of its own Pacific coast offices and representatives has been deferred for years by reason of the very satisfactory association with Pierson, Roeding & Company. However, the new course, because of its certain desirable features, was an inevitable eventuality. The present time seemed best for all parties concerned in the consummation of the change and therefore the sales organization of The Brill Company has been extended to the Coast.

Kelly, Cooke & Company, Philadelphia, Pa., have recently opened offices in the Drexel Building, to conduct a general engineering practice in the public utility and industrial fields. Their work includes design and supervision of construction for railways, light and power properties and industrial plants; engineering reports, appraisals, and rate developments for public utilities. William F. Kelly, senior member, received the degree of Mechanical Engineer from the University of Pennsylvania in 1893. For several years thereafter he was on the engineering staff of the Union Traction Company of Philadelphia and from 1901 to 1915 was a member of the staff of Ford, Bacon & Davis, acting as engineer-in-charge of several of their larger operations including the construction and reconstruction of the properties of the Knoxville Railway & Light Company and the Birmingham Railway, Light & Power Company. Charles B. Cooke, Jr., was also graduated from the University of Pennsylvania and entered the shops of the Westinghouse Machine Company at East Pittsburgh, working up finally to the position of assistant commercial engineer of the company, which position he occupied for two years prior to joining the staff of Ford, Bacon & Davis. During his connection with the latter firm Mr. Cooke specialized on financial engineering reports and also had personal charge of a number of important rate developments and reports for public utility companies.

ADVERTISING LITERATURE

St. Louis (Mo.) Car Company has issued a folder describing the new light-weight car built for the Albuquerque (N. M.) Traction Company, seven of which are now in service.

Railways Accessories Company, Seattle, Wash., has issued a bulletin describing the supported and suspended types of the Wightman rail joint and base plate. These joints are claimed to be in no way dependent on bolt pressure, thus eliminating track-way expense pertaining to bolt renewals and tightening. It is also stated that these joints minimize the breaking strain on angle bars, minimize vibration at rail ends, eliminate tie pounding and prevent the settling of ties, known as "low joints." It is also said that they eliminate all relative motion of rail ends, either vertical or lateral, prevent rail breakage resulting from the accumulation of longitudinal strains and maintain positive and permanent contact between angle bars and rails, thus rendering electrical bondings unnecessary in block signal circuits.

NEW YORK COMMISSION ON TRIAL

Events in connection with the investigation being conducted on the New York Public Service Commission, First District, have followed fast during the past week. As our issue of Dec. 11 went to press, the appointment of Oscar S. Straus as chairman of the commission was announced, and this week charges of a serious nature have been brought against another member of the commission. Until the accused has had a chance to answer them, it would be unfair to pass judgment, but if the charges are sustained the setback to commission regulation will be severe. The event certainly illustrates the necessity of great care in the appointment of men to positions of such responsibility as that of public service commissions. The commission form of regulation is on trial in the community, and its future is dependent upon the character of men selected. The public utility companies have a vital interest in this matter because they have come to learn that it is better to place the responsibility for proper regulation upon a regularly appointed commission which gives its time to a study of the questions which arise, than to have these questions left to a large political body like the Legislature. That the proper kind of men can be secured is shown by the records of a large number of conspicuously capable commissioners whose rulings have gained the confidence of both the public and the utilities. The intrusion of politics has complicated matters in some instances to the detriment of the service.

PURCHASED POWER FOR THE NEW HAVEN

Except for the high guaranteed load factor the contract under which the New Haven Railroad is purchasing power from the New York Edison Company and the Electric Light & Power Company does not differ materially from others in its class. The load factor clause, however, is quite an important element in this contract. The West Farms substation operates in parallel with the railroad company's Cos Cob power plant. It draws a load of minimum load factor of 70 per cent. The substation, therefore, gets the "cream" of the load, leaving the skim milk for Cos Cob. Consequently, the energy generated in the power plant will cost much more per kilowatt-hour than it would if the power plant supplied the entire demand. In return, however, the railroad is able to buy energy at a low rate, it avoids the necessity for making a very large capital investment at a time when the management is struggling to put the property upon its feet, and, best of all, it secures insurance against interruption of power supply. The single-phase railway does not by any means call for an ideal kind of a load from the stand-

points of either generation or transmission. The ideal condition would be a three-phase, balanced load. The three-phase generating unit has now become so well established as standard that it is used even for single-phase supply, but it is naturally not working under the best conditions as to capacity and regulation when it is forced to furnish single-phase power. These fundamental facts are mentioned as explaining the reason for the requirement of a high load factor by the electric company, especially when a power factor as low as 70 per cent is permitted.

EVOLUTION OF THE NEW HAVEN ELECTRIFICATION

The execution of the contract referred to in the above paragraph is significant as an event in the development of this famous electrification. While the extension of electrical operation on the New Haven system has not been as rapid as was expected some years back, there has been "something doing" most of the time since the inception of the electrification ten years ago. First came the 11,000-volt Woodlawn-Stamford section with double catenary support for a copper contact wire, which soon had to be supplemented with a steel wire. Next the Harlem River branch was electrified with a compound-catenary overhead construction, giving increased flexibility. Coincidentally, the design of column was improved, and, during this period, also the New York, Westchester & Boston Railway was constructed with similar overhead work. Then the Stamford-New Haven section was completed, somewhat along the same lines but with a novel distribution scheme for eliminating inductive interference with telephone and telegraph lines. This involved the use of auto-transformers, which raised the transmission voltage to 22,000, with one terminal connected to the feeders, the other to the contact wires, and the mid-point to the rails. Simultaneously the distribution of the section originally electrified was remodelled in accordance with the same scheme. While the system was expanding the Cos Cob power plant was doubled in size. Meanwhile many interesting although minor developments have been tried out in the New Haven electric zone. Crane-type column overhead construction was installed on a small scale and found unsatisfactory. The mercury-vapor converter locomotive has had a long and severe test, and series motors of the repulsion type have had service trials previous to their adoption by the Pennsylvania Railroad for the Philadelphia electrification. The latest step in the evolution of the New Haven electrification is the contract, already referred to, for the supply of a large amount of power. The railroad thereby avoids the necessity for increasing its own power gen-

erating capacity by utilizing the capital and operating staff of the electric service company to this extent.

DISCUSSION ON WORKINGMEN'S COMPENSATION

The Pennsylvania Street Railway Association did well to devote an entire session to the discussion of

workingmen's compensation laws as applied to electric railway companies. Statutes embodying the principle of workingmen's compensation by employers in case of accident as a substitute for the old common law master and servant doctrine are of very recent origin in this country, but the idea of their desirability has spread so rapidly that laws of this character are now on the statute books of a great many States. An examination of recent decisions on the subject shows that there is not only a great variation in the laws in force in the different States but also that the judicial interpretation of even precisely similar words or clauses is different in different States. In one State (Kentucky), it has even been held that full payment under the law to an injured workman was not a bar to his further recovery under the common law because the limitation in amount imposed by the law was in violation of the State constitution. The court, however, made specific suggestions as to points to be modified in order to make such a law constitutional. Other questions upon which judicial interpretation is needed, as it has varied according to the State in which it was rendered, are in the definitions of the word "accident," of the expression "growing out of and incidental to the employment," what constitutes "regular employment," "dependency," "incapacity," "partial disability," etc. Practically all of President Tingley's address was devoted to this subject, and the papers contributed to the discussion, devoted as they were principally to the electric railway aspects of the case, made them of especial interest to electric railway companies.

"THREE-WIRE" SYSTEM IN SPRINGFIELD

The announcement in the news columns of this issue to the effect that the "three-wire" system will

be used in Springfield, Mass., for the purpose of mitigating the evils of electrolysis compels more than passing attention. This scheme must not be confused with the double trolley wire plan which has been used to some extent. The latter plan involves two collecting devices on the car and a complicated distribution system. It is used mainly on conduit roads and in heavy traction abroad. It has not proved popular for overhead construction. The "three-wire" plan is similar to the familiar Edison system for electric lighting plants, the third "wire" being the rail return. Alternate sections are positive and negative, and if the load is balanced, that is, if the cars under the negative trolley wire are drawing the same total current as those under the positive wire, no current returns to the power station through the rails. The only current in the rails in such an installation is that necessary to supply the locally unbalanced loads, and that incident to connecting the positive and negative sections in series. In this case, the plan has the approval of the Bureau of Standards

and the engineers of Stone & Wester. The willingness of the Springfield Railway to try this experiment will be appreciated by railway men generally. The plan has been tried several times before in this country and abroad. In this country it has been abandoned on account of overhead complications, while abroad the use has been on a small scale only. One such installation, in Brisbane, Australia, was described in a communication printed in the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 22, 1914, page 348. In this, J. S. Badger, manager Brisbane Tramways, said that the scheme had proved practicable there while undesirable under most conditions. The fact that the principle has been understood for a long time and has not been generally adopted where electrolysis difficulties existed indicates that the complications have been found serious. For these reasons the results of the service test in Springfield will have great reference value.

THE DEMAND FOR SPEED

What has become of our old friend the 100 m.p.h. railway? It is now some time since we have welcomed a definite project to our columns, and we are beginning to have some serious doubts as to whether extreme speed, upon rails at least, would fill any long-felt want. The 100 m.p.h. automobile has already appeared, as witness the results of the last great race, and aeroplanes have pushed the pace even considerably higher than this for fairly long flights. If mankind really wants to devour space at 100 m.p.h. or thereabouts it is pertinent to inquire why none of the various projects for fast electric railways has proceeded beyond the conversational stage. It has been fairly well understood for more than a decade that suitable equipment for such a performance is not in the least a difficult matter. Indeed, more than one electric manufacturing company would take an order guaranteeing the result without raising an eyebrow, and undoubtedly track construction could be provided sufficiently strong to accommodate this speed.

Yet if there were really strong demand for 100 m.p.h. it seems altogether likely that at least one project of the kind between important centers would have come nearer to the stage of realization than anything at present indicates. It looks very much as if mankind were fairly well satisfied with a mile a minute or less and might not be willing to pay the price for anything considerably in excess of such speeds. Indeed, if one looks back both at the list of railway records for pace it is notable that some of those made nearly forty years ago still stand, and that on the whole the more powerful engines of the present day have been devised and operated more with the idea of handling heavy trains than for the purpose of quickening the schedule.

It would be entirely practicable to-day, using merely steam locomotives, to decrease the time between New York and Chicago by five or six hours at considerable increase of expense and some added risk. Electrification of a suitable through line would very likely do even better than this, but are there any definite indications

that there is a sufficient demand now for such service or that one is likely soon to arise? On the face of the evidence up to date we doubt the existence of enough public desire for that kind of accommodation to encourage the promoter. The possibility has stood out boldly in the public eye for a good many years, and the public seems to have smiled genially upon it and turned the back of distrust. As a rule, sooner or later, the public gets what it is willing to pay for, and this is one of the things for which it is apparently not willing to reach deep into its pocket.

To look at the matter quite seriously, all ordinary needs of traffic seem to be met by running speeds of somewhat less than a mile a minute, even for the fastest express trains, and this sort of schedule can be maintained month in and month out in all sorts of weather with very few noticeable delays. Considering the fact that over haste is one of the banes of our national life it is somewhat doubtful whether the gain of added speed is worth while. It certainly is not conspicuous enough to give encouragement in undertaking radical and complete change from the existing order of things. If conditions so alter as to cause an acute demand for quickened service it will probably come, along both on steam and electric lines, somewhat gradually, feeling its way to more sensational achievements. It is now more than twenty years since the first well-organized plan for a 100 m.p.h. electric road was formulated, time enough certainly to have brought it to fulfillment had it really been a thing of large commercial importance. We are sorry to say a fond good-bye to our old friend, the 100 m.p.h. road. It may return some day to find a fresh welcome, but for the present it seems to have departed to that indeterminate limbo which has already engulfed many another sensational project for readjusting human affairs.

A LARGER OUTLOOK FOR THE MANUFACTURERS' ASSOCIATION

One of the recommendations made by President Allen at the San Francisco Convention was that the relations between the Manufacturers' Association and the American Association should be changed so that the former should be "co-equal and recognized in all ways, the same as the Engineering, Accountants, Transportation & Traffic and Claims Association." There is no doubt, as we said editorially in the same issue in commenting on this suggestion, that the interests of the manufacturers of electric railway apparatus and of the companies engaged in electric railway operation are essentially the same. The former prosper with the prosperity of the latter, and depression in the railway business is felt acutely in the loss of orders by the manufacturers. Up to this time there has been, officially, no bond in the way of organization between these two essential parts of what is really the same business except a single clause in the constitution of the American Electric Railway Association. This clause simply authorizes the executive committee of the Railway Association to assign to its "allied" association, the American Electric Railway Manufacturers' Association, the management of the

exhibit features at its annual conventions, and to arrange with it the details of such entertainments as may be given in connection with these annual conventions. At the time this constitution was drafted, these duties seemed to be the principal way, if not the only way, in which the manufacturers could help the railway companies. At that time, the idea of general publicity on the part of the American Association had not been considered. Each company was dealing with its public in the way which seemed best to itself alone, and the problem of public relations, as that problem is now understood, was practically unknown.

It is needless to say that conditions have vastly changed in this respect since 1905, and it is the part of wisdom that as times change people should change with them. The Manufacturers' Association has faithfully performed the work which was assigned to it by the constitution. It has managed the exhibit features of the annual conventions admirably, and it has acceptably arranged the details of the entertainments given in connection with those conventions. It has also from time to time, through convention arrangements and in other ways, been of help to the association financially. But if anyone should say now that he believed the opportunities for usefulness to the electric railway industry of the country by the manufacturers should be limited to those duties only which were assigned to it at the time of the 1905 convention, he would greatly minimize the possibilities. The manufacturers of steam railway apparatus do much more than this to assist the steam railroads in their problems, as the excellent record of the Railway Business Association proves, and there is no reason why the manufacturers of electric railway apparatus should not have the opportunity of being equally helpful. There is still another phase of the situation which has to be considered. Although the manufacturers are as much interested in the progress of the industry and also in the science of railroading, they have been able to attend the conventions only as associate members, and as such, have at least officially not been on the same basis as the delegates from member companies.

To meet this situation the executive committee voted in New York this week to recommend to the membership at large a revision of the constitution which will place companies engaged in the manufacture of electric railway apparatus on the same basis as railway companies, in other words, the manufacturing companies would be "company members." The details of this plan, so far as the schedule of dues, direction of exhibits, etc., remain to be determined, but if the principle is settled, these matters can be worked out easily and in justice to all concerned, including the small manufacturer. This was the principle for which the manufacturers contended in 1905 and ever since many of the manufacturers have said that they did not see why they were not recognized as having as much interest in the objects for which the American Association stood as the railway companies. This contention is now admitted. The plan adopted by the executive committee, in our opinion, should be generally endorsed.

Purchased Power for the New Haven

The New York End of the Main Line and the Harlem River Branch and the New York, Westchester & Boston Railway Are Now Drawing Power From a New Substation Erected by the United Electric Light & Power Company at West Farms Station

Under a contract which became operative on Sept. 1, 1915, the New York, New Haven & Hartford Railroad is purchasing a minimum of 40,000,000 kw.-hr. annually from The United Electric Light & Power Company. This energy is generated in the 201st Street power station of the lighting company in New York and transmitted in underground conduit to a substation at West Farms, at the junction of the New York, Westchester & Boston Railway and the Harlem River branch of the New Haven Railroad.

The functions of this substation are to adapt the three-phase current from The United power station for the several requirements of the railways, which are as follows:

11,000-22,000 volt, 25-cycle, single-phase power for train operation.

2300-volt, 60-cycle, single-phase power for signaling purposes.

The substation is operated by the lighting company.

The contract under which power is supplied to the railroad provides for primary and secondary charges. The minimum maximum demand is 6500 kw. with a minimum load factor at this demand of 70 per cent, and a minimum power factor for the single-phase service except momentarily of 70 per cent. For loads above the minimum demand the limit of load factor is 50 per cent.

The maximum demand is the sum of the average kilowatts taken by the two classes of service separately during their respective highest sixty-minute intervals in each service year. These intervals are specified not to be those of abnormal demand due to service interruptions.

The substation and the equipment are the property of The United Company. The site belongs to the railroad

company and is leased by The United Company. Provision is made for the terms under which the railroad may take over the building and contents on termination of the contract.

GENERAL LAYOUT OF THE SUBSTATION

The substation is of the semi-outdoor type, the transformers being located outside of the building and the switching apparatus and auxiliaries inside. The building is 98 1/3 ft. x 49 ft. outside, and a concrete transformer platform about 19 ft. wide extends the length of the building on one side.

Inside the building the most important equipment, much of which is shown in the accompanying illustrations, is as follows:

A switchboard for controlling the incoming power and the distribution of three-phase power, etc. This contains the recording measuring apparatus.

A switchboard for controlling the anchor-bridge switches.

Rows of busbar and switch compartments for 11,000-volt and 22,000-volt service.

A two-gallery, screen-inclosed, grid-resistor compartment, 66 ft. x 11 ft. in size. The grid resistors are used, here as in the Cos Cob power plant of the railroad company, to limit the current flow under short-circuit.

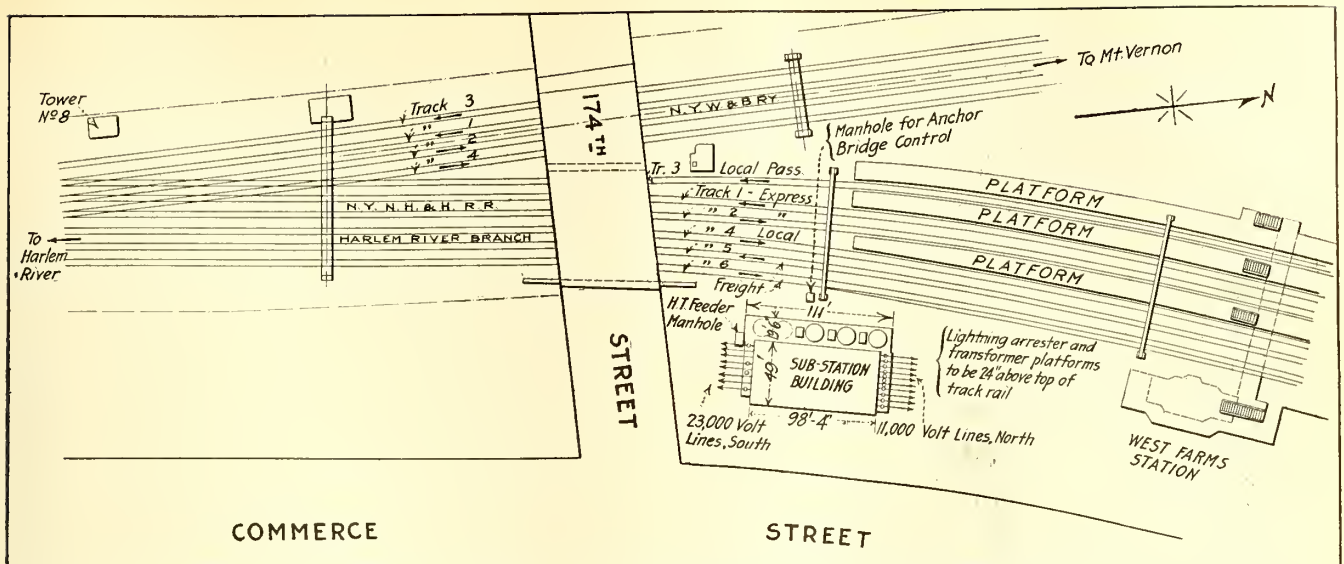

A motor-generator set and storage batteries for supplying switch control current.

THE OUTDOOR TRANSFORMER

Outside the station are the transformers and the electrolytic lightning arresters. There are three transformer units in operation at present with provision for additions. Each unit consists of a main, 5000-kw. West-

WEST FARMS SUBSTATION—VIEW FROM PASSENGER STATION PLATFORM SHOWING 5000-KW. AIR-COOLED TRANSFORMERS, LIGHTNING ARRESTERS AND FEEDER SUPPORTING STRUCTURES

inghouse oil-insulated, self-cooled transformer, and a 1000-kw. teaser transformer, the pair taken together being connected to receive unbalanced three-phase supply and to deliver balanced three-phase voltage and single-phase voltage. The connections for the purpose are explained later in this article.

The radiator construction of the self-cooled transformer units at the West Farms substation is an evolution of the tubular oil-cooled construction used by the New York, New Haven & Hartford Railroad for auto transformers of 2000-kva. rating along the tracks of

their system, a description of which is given in the issue of the *ELECTRIC RAILWAY JOURNAL* for May 2, 1914, page 961. The cooling of the oil results from natural circulation due to the thermal head, or difference of temperature of the oil at the top and the bottom of the radiators.

Taps are provided in the windings of the transformers to permit loading to full capacity, at high-tension voltages to 10 per cent above or below normal in 2 per cent steps.

SOME DETAILS OF THE CONDUCTOR SYSTEM OF WHICH THIS SUBSTATION IS A PART

For the supply of propulsion current to the railroad the West Farms substation produces single-phase current. The transmission system is known as a semi-balanced one. The plan was adopted in January, 1914, to minimize inductive interference in telephone and telegraph wires and at the same time to improve transmission economy. The contact wires are at the same potential, 11,000 volts above the rail. There are two

WEST FARMS SUBSTATION—LIGHTNING ARRESTER CHOKE COILS, LINE "DISCONNECTS" AND GROUNDING CLAMPS ON HANDRAIL

WEST FARMS SUBSTATION—BUSBAR COMPARTMENTS, SHOWING "DISCONNECTS" AND INSTRUMENT TRANSFORMERS

WEST FARMS SUBSTATION—REAR OF 11,000-VOLT SWITCH-BOARD AND SOME GRID RESISTORS

feeders on each side of the railway tracks with auto transformers distributed along the line. The contact wires are connected together and to one terminal of each auto-transformer, while the feeders in parallel are connected to the other with the middle points of the transformers connected to the track. This transmission scheme is similar to the Edison three-wire system except that the direct load is on one side of the circuit, the other receiving its share through the auto transformer which performs the same function as balancer sets in a direct-current distribution system. Complete details of this arrangement were published in the issue already referred to.

Power is received at the substation from the 201st Street power plant of The United Company over 350,000-

circ. mil triplex cable laid in the underground ducts. It is transmitted by the three-wire, two-phase system, with 24,600 volts between outer wires and 17,394 volts between each outer wire and the third wire. The three-wire, three-phase plan is used on account of the desirability of efficiently transmitting power for single-phase and three-phase distribution over the same line.

As shown in the large substation wiring diagram the triplex cable, emerging from the pothead, is fanned out for connection, through instrument transformers, to the main and teaser transformers. The two cable terminals between which is the higher voltage are connected across the main transformer primary. The other is connected to one terminal of the teaser transformer primary. The other teaser primary terminal is joined to the mid-point of the main transformer primary.

Single-phase power at 22,000 volts is taken off from the secondary of the main transformer which has a 1:1 ratio of transformation, except as adjusted by use of the regulating taps.

Three-phase power at 11,000 volts is taken off from one terminal of the teaser secondary and two points midway between the center and the terminals of the main transformer secondary. The other teaser terminal is tapped in at the center referred to.

PROVISION FOR CLEARING RAILWAY SYSTEM OF GROUNDS

On account of the importance of the part played by the grid resistors and their control switches in the reliable operation of the railway system, the details of the sequence of operation of the several relays and switches have been determined with great care. An accompanying diagram is reproduced to make these clear. In this the sequence is indicated by consecutive numerals in small circles. With a short on the contact wire (indicated by the cross) the following operations occur consecutively: (1) The double-ratio current transformer energizes its corresponding coil of the selective relay and also the overload and restoring relay. (2) Current passing through the lower coil of the selective relay separates the lower contacts, thus selecting the feeder switch to be tripped. (3) At the same time the overload and restoring relay closes the upper contactor circuit of the selector relay, actuating the trip coil of the feeder resistor switch and energizing the

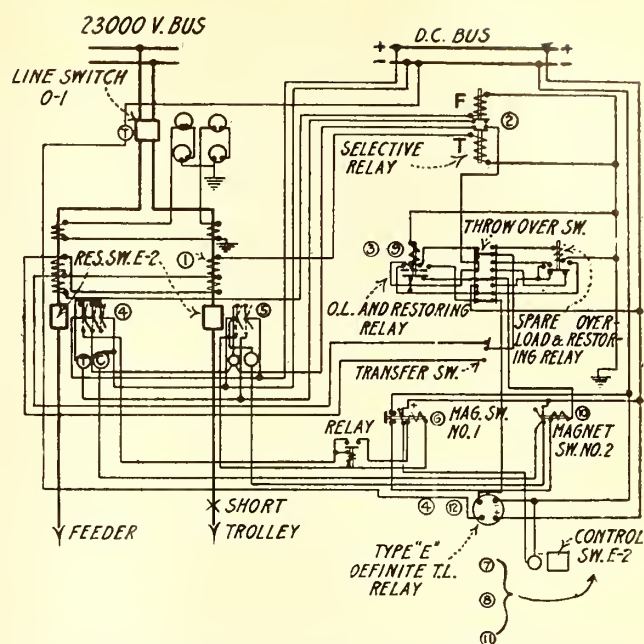

WEST FARMS SUBSTATION—LIGHTING COMPANY'S SWITCH-BOARD FOR INCOMING LINES, OUTGOING THREE-PHASE LINES, AND LOCAL LIGHTING AND POWER, WITH RECORDING INSTRUMENTS

WEST FARMS SUBSTATION—RAILROAD COMPANY'S SWITCH-BOARD, SHOWING ANCHOR BRIDGE SWITCH CONTROL, RELAYS AND INDICATING INSTRUMENTS

Type E definite time limit relay. (4) When the resistor switch opens, the pallet switch is thrown into the dotted position, energizing the trip coil of the trolley resistor switch. (5) The latter on opening throws the pallet switch into the dotted position, energizing magnet switch No. 1. (6) On operating, this switch closes its contactors, as shown by dotted lines, thereby preparing the coil of magnet switch No. 2 for energizing current and allowing energy to flow through the closing coil of bridge control oil circuit breaker. (7) On closing, the control switch energizes the bridge control circuit. (8) The bridge switch, if still overloaded with the resistors in series, then opens and removes the "short." (9) When the ground is cleared the contact bar on the overload and restoring relay drops onto the contacts, energizing magnet switch No. 2. (10) This in turn moves its contactor into the dotted position, thereby closing both of the resistor switches. (11) Simultaneously with the closing of the resistor switches the bridge control switch opens and normal conditions are restored. (12) In case the "short" remains and the bridge switch fails to open, however, the definite time limit relay energizes the tripping coil of the Type 0-1 line circuit breaker, opening same, in which case it has to be closed by hand. Signal lamps on the switchboard indicate the position of all switches.

WEST FARMS SUBSTATION—DIAGRAM SHOWING SEQUENCE OF OPERATIONS IN CLEARING GROUNDS

PROVISION IN THE POWER PLANT FOR GENERATING RAILWAY POWER

The problems involved in carrying the railway load from the standpoint of the electric service company included provisions for handling single-phase loads in the steam generating station and the operation of this station through the West Farms substation in parallel with the Cos Cob plant of the railroad company.

In The United Company station there are two three-phase, 20,000-kw., 6600-volt 25-cycle turbo-generators. These have the highest rating to date of generators operating single-phase. They supply power to T-connected air-blast step-up transformers, the main units of which are rated at 5500-kva., also the largest of their kind yet made. The winding connections of the transformers in the generating station and substation are shown in the wiring diagram on the following page. The new turbine equipment was added without increase in the boiler plant which had been installed to provide for future demand.

When the turbo-generators are operating three-phase at 100 per cent power factor, with 185 lb. pressure and 100 deg. superheat, the steam consumption will not

exceed 14.3 lb. per kilowatt-hour with a load of 5000 kw., 12.07 with 11,000 kw., and 12.63 with 20,000 kw. When using a manually-operated supplementary valve, the steam consumption is guaranteed not to exceed 12.1 lb. per kilowatt-hour with a load of 13,000 kw. and 12.13 with 15,000 kw. The consumption when operating single-phase at 70 per cent power factor will not exceed 14.37 lb. with a load of 5000 kw. and 12.14 lb. with 11,000 kw.

Air for cooling the generators is chilled, humidified and washed by Metropolitan air washers and is then forced into the end bells of the units by motor-operated blowers. Each blower is capable of supplying 60,000 cu. ft. of air per minute, and is driven by two three-phase 440-volt motors, each capable of running the blower alone. The generators can be excited from any exciter in the station in conjunction with an automatic voltage regulator.

A 3750-kva. single-phase frequency changer set has been installed to permit the 60-cycle equipment to reinforce the 25-cycle supply if necessary.

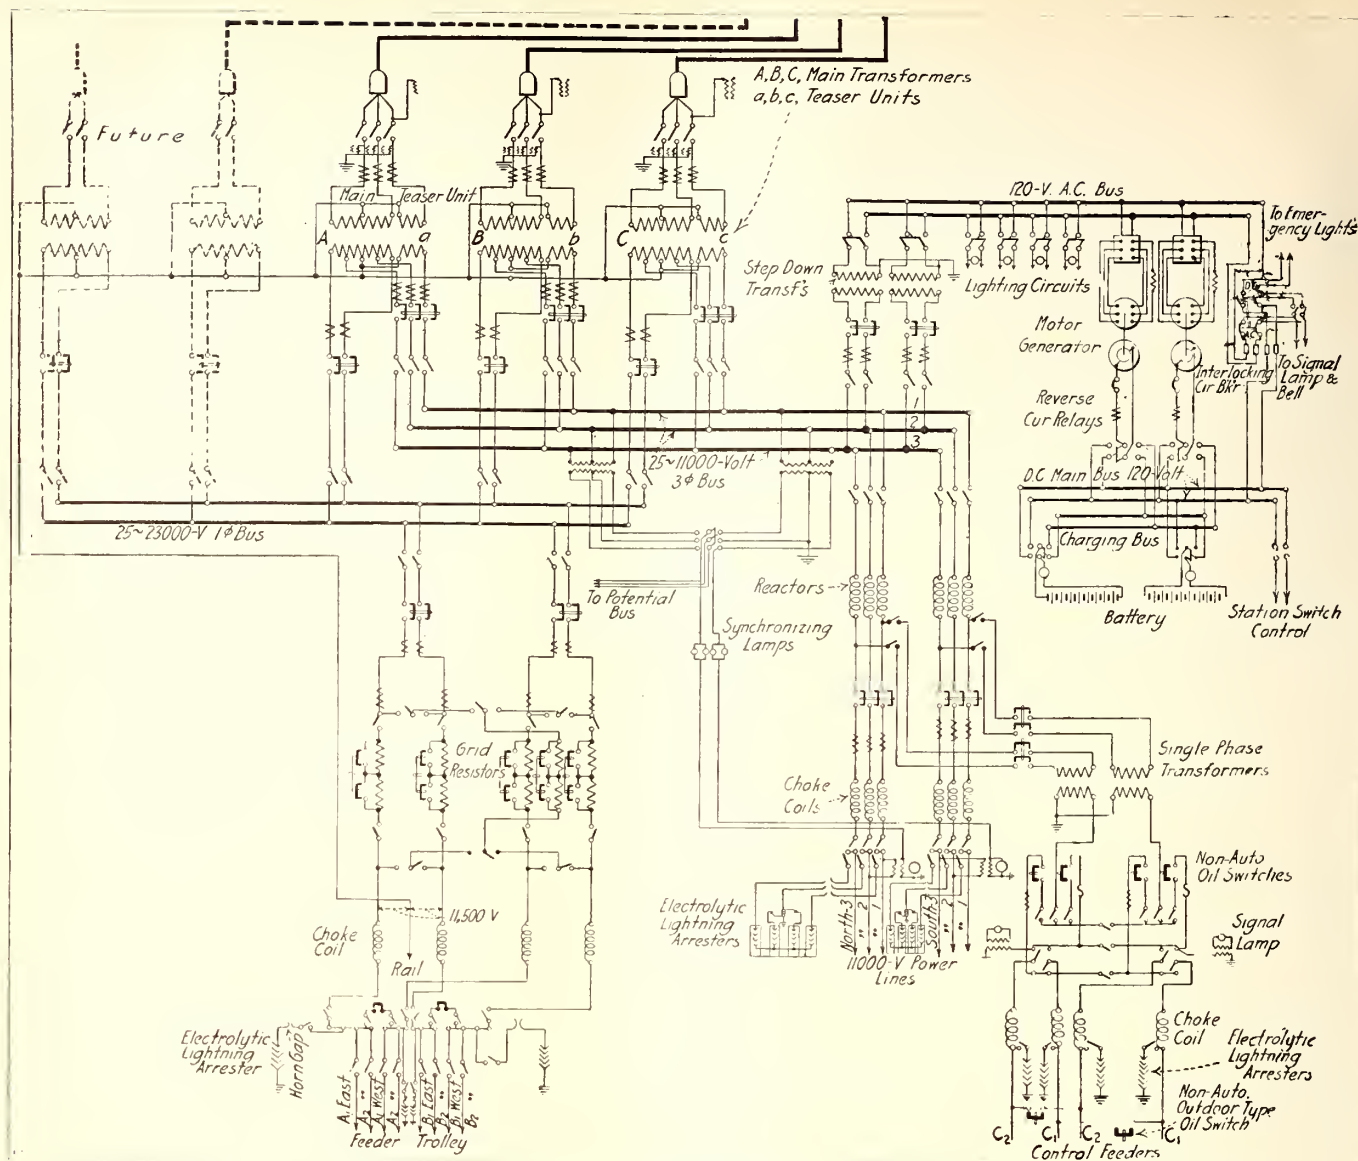

Each of the main 5500-kva. air-blast transformers at The United Company generating station is operated with

WEST FARMS SUBSTATION—NORTH SIDE, SHOWING 11,000-VOLT LIGHTNING ARRESTERS AND RADIATORS OF 5000-KW., SELF-COOLING TRANSFORMERS

WEST FARMS SUBSTATION—SOUTH SIDE, SHOWING TEASER TRANSFORMERS, 23,000-VOLT LIGHTNING ARRESTERS AND FEEDER SUPPORTING STRUCTURE

WEST FARMS SUBSTATION—GENERAL ELECTRIC CIRCUIT DIAGRAM OF SUBSTATION WIRING AND EQUIPMENT

a 1000-kva. teaser transformer through T-connections, the reverse of the arrangement described for the substation. The bank steps up the generator voltage from 6600 three-phase to the values already stated. Two low-tension leads and a low-tension neutral are brought out through the top of the main transformer case, as well as two high-tension leads and neutral leads. The high-tension neutral is grounded to the case but the low-tension neutral is not. The high-tension neutral is capable of carrying the full current of the winding. The regulation of these units is specified at 11 per cent when carrying 13,750-kva. load at 60 per cent power factor. A separate winding, which has a rating of 20 kva. at 210 volts, is connected permanently to the air-blast motor, so the latter will start as soon as the transformer is energized. The inherent reactances of both the main and teaser transformers are 5 per cent.

Report-Writing Course

An important addition to the curriculum of the Massachusetts Institute of Technology has recently been made in the shape of a course in report writing. Instruction in this desirable direction is given to students in engineering administration, with the object of strengthening what is at present a weakness in the qualifications of technically trained men for the broadest field of useful-

ness. The technique of the course consists largely in the solution of problems, followed by reports thereon from two points of view: First, that of the magazine article or popular presentation, and, second, a more concise story, in which details are included in appendices so that the report itself may be the more direct.

Some of the problems have been highly practical, the first assigned being a written application for a position, with statement of individual qualifications. Next the students received a letter from a chauffeur who had saved money and desired to start an auto-truck sight-seeing business. The students, as engineers, weigh the different aspects of the matter, competition, demand, condition of business in general and present their conclusions. Another problem was the benefits of the fare-collecting equipment used on the Boston Elevated Railway, with the expediency of extending its use, and following a lecture on the dye situation in America, a report was presented on the practicability of establishing a plant for the manufacture of dyes. Finally, the students have investigated the desirability of an electrically operated blue-printing outfit for the new buildings of the institute at Cambridge, reporting to President MacLaurin. The reports are examined and criticised by the professors. About eighty juniors are now engaged in this work, which is under the immediate direction of William Green of the English department.

Pennsylvania Association Meets

Electrification, Shop Methods, and Proposed Safety Rules and Code Form Topics of Discussion at Scranton Meeting on Dec. 14—At Meeting on Dec. 15 Delegates Consider Problems Arising Under New Pennsylvania Workmen's Compensation Law

The winter meeting of the Pennsylvania Street Railway Association was held on Dec. 14 and 15 at the Hotel Jermyn, Scranton, Pa. The first session, on Tuesday afternoon, was devoted generally to the subjects of railway electrification and shop methods and to the committee report on the proposed safety rules and code of the Bureau of Standards, while the concluding session was given over to addresses on workmen's compensation for accidents. This subject was of particular interest on account of the new Pennsylvania law going into effect on Jan. 1, 1916.

The first meeting was opened by President C. L. S. Tingley, second vice-president American Railways, whose address is abstracted elsewhere in this issue. In connection with his remarks President Tingley brought to the attention of the delegates the fact that a campaign has already been started for the passing of laws affecting electric railways by the next Legislature. He said that at the second annual conference on welfare and efficiency, recommendations were made in favor of automatic instead of linked couplings; for the use of air brakes as the standard instead of hand brakes; for the requiring of vehicles operating between sun-down and sun-rise to display lights on the front, the rear and the sides; and for the use of vestibules on summer cars and the abolition of running boards. President Tingley also cited the model health insurance bill of the American Association for Labor Legislation, this bill providing for a commission similar to the new compensation commission and requiring the industry to bear the burden of sickness of, as well as accidents to, employees.

ELECTRIFICATION AND SHOP METHODS

After the reading of the treasurer's report by Henry M. Stine, the questions referred to the Question Box were presented by W. A. Heindle, superintendent Southern Pennsylvania Traction Company, Chester, Pa., for later discussion. N. W. Storer of the Westinghouse Electric & Manufacturing Company then gave a general talk on railway electrification, and J. F. Layng of the General Electric Company read a paper on "Shop Methods." Mr. Storer's remarks are published elsewhere this week in abstract form, while Mr. Layng's paper will appear in a later issue.

In the discussion on Mr. Layng's paper W. B. Rockwell, manager Eastern Pennsylvania Railways, Pottsville, Pa., said that city and interurban operation differ widely on the question of maintenance, and that the operating costs on interurban lines would run way up if city practices were followed. Mr. Heindle thought that Mr. Layng's remarks referred to inspection and not to general overhauling and wanted to know what would be the figures for maintenance when cars were taken out of service at stated intervals and generally overhauled.

Mr. Layng explained that on account of the size of the subject his remarks had been confined only to city service. The system from which his figures had been taken had moderately new equipment, and there would undoubtedly be systems where twice as many men would be required for the shop work on the cars. Local condition, the lay-out of the country and the type of motor used would make a great difference.

Mr. Rockwell said that a manager should make sure that every car was in first-class condition before letting it go out of the carhouse, and Mr. Layng felt that companies which put money into inspection saved much on material.

PROPOSED SAFETY RULES AND CODE

The report of the committee on the proposed safety rules and code of the Bureau of Standards was then read by Chairman Gordon Campbell, president York (Pa.) Railways. On behalf of the committee on this subject, Mr. Campbell made a progress report. He traced the development of Circulars 49 and 54 issued by the Bureau, with the title, "Safety Rules to be Observed in the Operation and Instruction of Electrical Equipment and Lines" and "Proposed National Electrical Safety Code" respectively. These have been discussed from time to time in this paper.

The "Suggested Standard Safety Rules for Electrical Apparatus" which were offered at the second annual industrial welfare and efficiency conference conducted by the Department of Labor and Industry of the State of Pennsylvania were also mentioned. It was stated that Dr. E. B. Rosa of the Bureau of Standards had presented a paper at that conference urging the adoption of a single set of safety rules by the several states. This suggestion was approved at the 1914 annual meeting of the Pennsylvania Street Railway Association.

Mr. Campbell then explained what had been done recently by way of co-operation with the A. E. R. A., the C. E. R. A. and the N. Y. E. R. A. in formulating suggestions for improvements in the proposed rules of the Bureau of Standards. In conclusion the members were urged to forward suggestions to reach the A. E. R. A. office not later than Dec. 20, 1915.

After the report Mr. Campbell read a letter from Dr. Rosa to the effect that the Bureau of Standards is continuing the study of the variations in the strength of construction as required by the weather conditions in various sections and also the study of the separation of transmission lines of high voltage. In the ensuing discussion the point was raised that the proposed code will prove burdensome on account of the necessary expenditures involved. Mr. Storer thought that a factor of safety of two was not excessive and the companies should not oppose it. As for the added labor required by the code, that was a different question. President Tingley stated that while he did not desire to criticize the Bureau of Standards, he felt that it was not sufficiently acquainted with the working conditions of small properties, on which the proposed rules bear with great weight, and that the association should protect such companies.

It was next announced that on account of the storm in eastern Pennsylvania E. C. Spring, assistant to president Lehigh Valley Transit Company, Allentown, Pa., was unable to be present to read his paper on "Efficiency Through Conservation in Time in Interurban Traffic." His paper, however, is released to the members through the ELECTRIC RAILWAY JOURNAL, as shown elsewhere.

Committees on nomination of officers, auditing and resolutions were then appointed, and the session adjourned. Trips in special cars had been arranged for

after the session to the shops of the Scranton Railway and the power plant of the Scranton Electric Company. At 8 p. m. an informal dinner was served to members of the association and guests at the Hotel Jermyn.

WEDNESDAY'S SESSION

In opening the session on Wednesday morning President Tingley referred to the importance of safety work in connection with workmen's compensation laws, and mentioned the slogan "Be careful first" as being less selfish than "Safety first." He said that railways should not object to compensation laws on the ground of the safety devices that would be necessitated, for such devices should have been put on machines in the beginning, and he pointed out to the manufacturing companies the desirability of designing machines with safety appliances as integral parts thereof.

H. P. Megargee, assistant to vice-president American Railways, Philadelphia, Pa., then gave a talk on safety methods and devices, with illustrations from the shops of the Chicago & Joliet Electric Railway, Joliet, Ill. This talk will be abstracted in a later issue. In the ensuing discussion the fact was emphasized that the hazard of new employees is a vital point in safety work to be overcome through a proper training and cautioning of new men, and C. B. Fairchild, Jr., executive assistant Philadelphia (Pa.) Rapid Transit Company, told of the experience of his company in combining safety inspection work with fire prevention inspection without any increase in the force used for the latter or in the cost thereof.

The remaining addresses were devoted to different phases of workmen's compensation legislation, as follows: "Some Practical Questions Arising Under Workmen's Compensation Law," by Lefferts S. Hoffman, general attorney Public Service Corporation of New Jersey, Newark, N. J.; "Workmen's Compensation Liability in Pennsylvania," by H. A. Mackey, chairman Workmen's Compensation Board, Harrisburg, Pa.; "Mutual Insurance Against Workmen's Compensation Liability," by Walter S. Bucklin, president Massachusetts Employers' Insurance Association, and "Stock Company Insurance," by R. H. Keffer, general agent Aetna Life Insurance Company, Scranton, Pa. The addresses by Mr. Hoffman and Mr. Mackey are abstracted elsewhere in this issue.

MUTUAL INSURANCE

Mr. Bucklin brought to the delegates a message from large employers in Massachusetts who had had four years' experience in compensation work. The Massachusetts law at first proposed provided that all insurance should be carried by one large mutual co-operative company managed and controlled by the employers themselves, on the basis of modern efficiency and economy, but in the final draft passed the State was thrown open to the competition of private commercial companies. The State helped to introduce a mutual company controlled by the policy-holders, however, and under the guidance of the best actuary obtainable rates were prepared and published three weeks prior to the effective date of the act. The stock companies withheld their rates until three days before this date, so that the mutual company was compelled to get 100 employers to join it without knowing whether or not the new stock company rates would be as high. Later the stock companies cut their rates 25 per cent and finally as much as 30 or 40 per cent.

Mr. Bucklin said that the organization of this mutual company, the Massachusetts Employers' Insurance Association, provides for different groups, as one for man-

ufacturing companies and one for street railways, each working out its own experience. A few very large companies are carried, each in a group by itself. The company has charged lower rates, paid compensation in full and returned an average annual cash dividend of 30 per cent to the member employers, besides accumulating a surplus of \$400,000. There is no stock, the only income being the premiums that would otherwise be paid to the commercial companies. Mr. Bucklin said that State fund insurance is really a mutual plan conducted by the commonwealth, but that the most desirable plan is one mutual company to be controlled by the employers themselves, managed by competent insurance men and fully equipped with safety and claim departments conducted on a humanitarian rather than a profit-making basis.

Of all preventable injuries, said Mr. Bucklin, 50 per cent can be prevented only by the education of the employee. The Massachusetts mutual company has recognized the importance of the growing science of safety engineering. It has a specialist for analyzing the problems of street railways and making recommendations along safety lines, and it conducts a wide safety campaign through such media as lectures, views, bulletins, payroll slips and the like. The company has in Boston an out-patient hospital for the employees of the Boston Elevated Railway and the Bay State Street Railway. Where these companies formerly paid \$5 for first aid and frequently the same charge for subsequent treatments, the mutual company is now giving these services in each case for an average of \$1.80.

To Mr. Bucklin's mind one of the most valuable features of his company has been the condition whereby the street railways have been freed from the responsibility of adjusting claims with employees. It is his experience that when injured employees are told by the railway that arrangements have been made whereby their compensation will be adequately handled by the mutual company, both the employees and the labor unions are fully satisfied. In closing, Mr. Bucklin stated that the Mutual Compensation Insurance Company of Pennsylvania was being formed to apply the Massachusetts plan to Pennsylvania, and it was possible that a separate group would be made in this company for street railways. The experience already gained in Massachusetts would enable the company to work out the problems so as to save more money to the street railways and foster better relations with the employees than possible in any other way. In Pennsylvania the rates had to be the same as those of the stock companies, but the saving would be in the cash dividends returned.

STOCK COMPANY INSURANCE

Mr. Keffer said that the companies desiring protection had only to consider the solvency of stock companies. All large stock companies had more experience data than mutual companies, and they maintained costly inspection services for the benefit of the policy-holders. All in all stock companies could give cheaper insurance than mutuals on account of the service rendered and the value of the business done. State funds in operation were said to be showing losses, and in view of the fact that the Pennsylvania law requires the State fund rates to be "adequate," the danger of an assessment disguised under increased rates was hinted at. As to compensation liens on real estate, which, it was said, would not receive the necessary certification by the commission for filing against State fund subscribers, Mr. Keffer maintained that these liens were permitted by the act to be relieved by the stock companies and that his company was pledged in its policies

to take care of such liens so as not to have them stand against the property. Hence the asserted superiority of the State fund plan on this basis was a negligible point.

DISCUSSION ON WORKMEN'S COMPENSATION

H. W. Foster, chief engineer Independence Inspection Bureau, Philadelphia, Pa., believed that self-insurance for street railways was feasible under certain conditions. In adopting this method the employer would face the responsibility for medical attention, claim service, accident prevention service and compensation payments, in all of which respects the street railways by virtue of their established practices for handling injuries to the public should in general be competent also to take care of employees' injuries. A point of danger, however, arose in connection with extraordinary claims for catastrophes, and for this reason there was an opportunity in Pennsylvania for insurance against special risks. Mr. Foster then mentioned the Excess Inter-insurance Exchange organized in Philadelphia and said that insurance against catastrophes under some such organization when the rate is fairly proportioned to the whole insurance rate and accident inspection service is rendered, might prove a wise plan for the railways leaning toward self-insurance.

E. W. Heilig, secretary of the welfare committee Public Service Corporation of New Jersey, then described some of the features of this company's welfare plan, the spirit of which the New Jersey compensation act follows. In the last four and one-half years 27 per cent of the 10,000 accidents had come under the act. The cost to date for compensation had been \$2.62 per man, with outstanding claims not included, while the welfare plan had cost \$5.96 per man. It was found, upon investigation of the probable compensation for all cases under the compensation act the first year, that the payments required would be about the same as under the old common law plan. President Tingley said that for the accidents of the last five years on the Scranton Railway the amount expended under the old plan and the amount required under the compensation act differed less than \$100, the claim and legal department costs being excluded because of the maintenance of these at no less efficiency for public accident service.

Mr. Rockwell said that he had favored self-insurance because his company had practically been doing this for several years. He was impressed, however, with the mutual plan but feared that the extension of such companies into other than the original states where incorporated indicated a money-making desire. Mr. Bucklin explained, however, that the co-operation of different mutual companies or the extension of work with common inspection and claim service made for increased efficiency and lowered costs, just as in the case of the mutual fire insurance companies. Mr. Mackey explained how stock companies spend 43 per cent of the premium for overhead and how the State fund rates had been put about 10 per cent below the stock rates because of the lessened overhead. Mr. Rockwell asked why it would not be better to adopt self-insurance and avoid paying rates covering any overhead, and Mr. Mackey, while disclaiming any desire of the compensation board to favor any insurance plan, said that probably every big going concern that could show satisfactory financial responsibility could do better by insuring itself. As to what would constitute proof of such financial responsibility, Mr. Mackey remarked that the board had no fixed rule and wanted to cut all the red tape possible. While a form had been prepared, the board desired any showing in a company's own way that would prove its responsibility. The steam railroads had already been allowed to strike out the questions on the form and

submit the latest annual report. Mr. Mackey then mentioned the point that the board preferred parent companies to report for their subsidiaries and to assume the compensation therefor. As for examinations of employees, he said that the board was not concerned with the real duty of companies in starting out right under the act, but for obvious reasons discrimination among employees would prove unwise. Mr. Bucklin then added that the annual overhead expense of the Massachusetts mutual company was only 15 per cent of the premium. The matter of catastrophes was handled by mutual companies through providing re-insurance policies whereby the first loss up to a certain figure was handled by the mutual companies and any higher loss fell on inter-insurance companies.

A motion by A. E. Wildt, engineer of power and equipment Scranton Railway, providing for an improvement in the safety-first slogan, "certainty first" being mentioned, was referred to the executive committee. The Question Box was passed over on account of the lateness, and the questions will be answered by mail by the chairman. Mr. Fairchild moved that the meetings of the association be held on the third Tuesday and Wednesday in May and the third Tuesday and Wednesday in November, so as to secure better weather conditions, and the question was referred to the executive committee.

The meeting then closed with the election of the following officers and executive committee: President, T. A. Wright, vice-president and general manager, Wilkes-Barre (Pa.) Railway; vice-president, Gordon Campbell, president York (Pa.) Railways; secretary and treasurer, H. M. Stine, Harrisburg, Pa.; executive committee: T. A. Wright; Gordon Campbell; T. B. Donnelly, claim agent West Penn Traction Company, Pittsburgh; C. L. S. Tingley, second vice-president American Railways, Philadelphia, Pa.; C. B. Fairchild, Jr., executive assistant Philadelphia (Pa.) Rapid Transit Company, and Thomas Cooper, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

PRESIDENT'S ADDRESS

BY C. L. S. TINGLEY, SECOND VICE-PRESIDENT AMERICAN RAILWAYS, PHILADELPHIA, PA.

The general business depression beginning to be felt at the time of the meeting a year ago was aggravated for electric railways by the advent of the jitney, which, in the cities where it became prevalent, made—for the time being at least—great inroads into the receipts of the electric railways. This is a subject upon which all member companies should place before the public the fullest information, confident that the public, in possession of the facts, will realize the necessity in its own interest of regulating a condition which not only threatens the prosperity and so the usefulness of an instrumentality of transportation essential to all communities but which brings in its wake effects most harmful to the public itself.

The association, through its executive committee, authorized the president to take such steps as he might deem necessary to bring this question before the Pennsylvania Public Service Commission. In pursuance of this authority, he appeared with counsel before the commission on June 18 and prayed them to take jurisdiction over the whole jitney situation on the ground that the jitneys were common carriers and therefore were operating in violation of the public service commission law when they failed to get certificates of public convenience before beginning operation and when they failed to file their tariffs. After some time the commission requested the association to withdraw its petition, which it did.

After a careful search of the State for a case against some man of property who would let a case go through to decision, the Scranton (Pa.) Railway made three complaints against M. J. Walsh, W. H. Owens and S. Wilson, and F. Williams, these three cases being heard in Scranton on Oct. 14. It was either proved or admitted that these men were performing the service of carrying passengers for hire by trips over fixed routes on more or less definite schedules, and it was therefore asserted by the complainant that they were common carriers. The attention of the commission was called to the fact that the regulatory law includes all common carriers and that common carriers include persons engaged in the transportation of passengers for profit. In support of this contention the following citations were made: An act of the State of Georgia, approved on Aug. 22, 1907; *Georgia Railway & Power Company vs. Jitney Bus Company, et al.*, Public Utility Reports 1915-C, page 928; an order of the Public Utilities Commission of the District of Columbia made on Aug. 28, 1915; an order of the Illinois Public Utilities Commission in the case of *Jacksonville Railway and W. B. Miser vs. L. F. O'Donnell*,* and *Charleston Interurban Railroad vs. Clyde Smith et al.*, Public Utility Reports 1915-E, page 177. For a suitable definition of the word "common carrier" the following cases were cited: *Lloyd vs. Haugh*, 223 Pennsylvania 148; *Donnelly vs. Philadelphia & Reading Railroad*, 53 Superior Court 78; *Primrose vs. The Casualty Company of America*, 37 County Court Reports 441; *Dwight vs. Brewster*, 18 Massachusetts 50; *Gordon vs. Hutchinson*, 1 W. & S. 285, and *Fuller vs. Bradley*, 25 Pennsylvania 120. The decision of the commission has not yet been handed down.

The legislature had before it during its last session many bills of interest to the industry, which were reported from time to time in the bulletins issued from the secretary's office. Unquestionably the most important of the enactments was the workmen's compensation act, which goes into effect on Jan. 1, 1916. This is revolutionary, for it is an entire change in the economic aspect of injuries to employees. This is well pointed out in a decision of the Supreme Court of Washington in which it uses this language:

"To say with appellant that the intent of the act is limited to the abolishment of negligence as a ground of action against an employer only is to overlook and read out of the act and its declaration of principle the economic thought sought to be crystallized into law, that the industry itself was the primal cause of the injury and, as such, should be made to bear its burdens. The employer and employee as distinctive producing causes are lost sight of in the greater vision that the industry itself is the great producing cause and that the cost of an injury suffered in any industry is just as much a part of the cost of production as the tools, machinery, or material that enter into that production."

In view of this radical change in the relationship which companies bear to their employees, it has seemed wise to place this subject upon the program for a full discussion. One or two phases of the question, however, which have not found a place upon the program should be mentioned. For example, instead of State, mutual or stock company insurance, the employer may carry the risk himself. This possibly can be safely done by large concerns, but in arranging to do so the catastrophe hazard must not be overlooked.

Furthermore, it is to be regretted that the definitions

contained in the act are not perfectly clear, so that there will be many questions arising which will have to be determined by the courts. For instance, the term "employee" as used in the act is declared to be synonymous with "servant," but in seeking a definition of the word "servant" it is found to have been construed in almost every way that one can possibly wish. It has been suggested by counsel, however, that the working of the act with respect to the compensation being based on "daily or weekly" wages confines its operation to subordinate employees. Who is omitted from the operation of the act, however, under the term "casual employees"? Cases do not give much help here. It is also to be regretted that the act does not specifically provide for the exemption from its operation of carriers who are engaged in interstate commerce and who therefore come under the federal liability law. The decisions of the courts in this class of cases have been quite contradictory, but seem to be settling down to a holding which would warrant the assumption that practically any employee of an interstate carrier is engaged in interstate commerce.

It is unfortunate that the words "arising out of and" have been omitted from the act. As it is, companies are called upon to make compensation for all accidents in the course of employment whether or not they arise out of the employment. There are a long line of decisions, both in this country and in England, in which the distinction is clearly drawn, and it can be readily seen that in many cases the absence of these words will work a hardship and injustice upon the employer. Out of eighty-five enactments of this character that have been examined—thirty-two of the United States and fifty-three foreign—only seventeen omit the words "arising out of," and only six of these are in the United States—namely, the state acts of Pennsylvania, Ohio, Texas and Washington, the federal employees' act of May 30, 1908, and the canal zone act, the latter two being more in the nature of pension acts than compensation acts. Ohio and Pennsylvania are the only industrial States which omit these words. West Virginia's original enactment omitted them, but they were inserted in the amended act approved on Feb. 26, 1915. Of the foreign countries excluding this language the only important ones are Austria, Germany and Hungary, the others all being comparatively small countries with the possible exception of Japan. It is unfortunate also that the words "willful disobedience of orders or rules, and intoxication" are omitted from the bars to recovery.

There is another serious matter to be carefully guarded against, and that is the question of hernia. This has been found so serious in West Virginia that the Legislature amended the act, and the radical language used shows that there must have been a very serious abuse of the compensation law on this point. It would seem that the only safeguard for an employer in this State is to require a medical examination before employment. If the prospective employee refuses to submit to such examination, the company should either refuse employment or compel him to reduce such refusal to writing. Then this refusal can be presented to the compensation board in case claim is made for disability arising from hernia or other organic defects.

There also arises under these laws a class of cases which affect electric railways as carriers as distinguished from employers, viz., an accident to an employee of a third party in the course of his employment, his employer being subrogated to his right of action against the carrier. A good example of this class of cases is *Newark Paving Company vs. Klotz* (91 At. Rep. 91), although at that time in New Jersey the employer was not subrogated to the right of the employee. In this case

*In this case the commission held:
"From the evidence in this case, the commission finds that the respondent owns, controls, operates and manages, within this State, for public use, a number of automobiles which he is using for the transportation of persons for hire between points within this State and that in the conduct of such business the respondent is a common carrier of persons and is a public utility within the meaning of the act. * * *

the administratrix of a workman of the defendant company sued to recover for his death (the decedent was struck by a street car and killed while fixing his wheelbarrow). Compensation was awarded, notwithstanding a prior release to the street car company upon payment by it of \$800. Now, since this act does not take negligence into consideration and since a man hurt in the course of his employment must be compensated by his employer, will not companies in a majority of cases of this class have the employer or his insurer assisting the man, if not actually suing on his behalf? And will not this interest of the third party make it more difficult to prove negligence?

EFFICIENCY THROUGH CONSERVATION OF TIME IN INTERURBAN TRAFFIC

BY E. C. SPRING, ASSISTANT TO PRESIDENT LEHIGH VALLEY TRANSIT COMPANY, ALLENTOWN, PA.

The interurban lines of the country are to-day confronted with the problem of giving greater speed of service. The question is not, as it was a few years ago, a matter of frequency of service. In meeting this new condition, many things must be taken into consideration.

What appeals most to the masses traveling is through service to distant points without transfer, and inter-traffic arrangements are being made by many companies so that passengers can go from one point to another without change. In cases of this character, a heavy increase in traffic has been the result. Where companies adjoin each other, physical connections and through service should be maintained. The use of this class of service has been most advantageously demonstrated in the Middle Western States and has done more to place the interurban lines in a position to compete with the steam railroad lines than any other factor.

The general minimizing of time demands serious thought. The elimination of curves, the replacing of tracks upon private rights-of-way wherever it is possible and the relocating of tracks outside of towns are all matters of serious import. In the past it was thought that lines must traverse every municipality and cover every street in order to get the business in the community, but it is being found that just as much traffic can be secured by going on the outside and around the towns. The Lehigh Valley Transit Company, at a cost of about \$250,000, has just taken 8 miles of its track off the public highway and eliminated more than sixty bad curves, thus reducing its track mileage only 1.6 miles but its operating time seventeen minutes. Between two certain stations the running time was reduced from twelve to five minutes. When it came to a question of going outside the towns, the cry was heard on every hand that the traffic would be killed, and mass meetings in protest were held in various municipalities. In every instance, however, where the tracks were taken away from the center of the town, the business has almost doubled. In these cases of abandonment of track in towns, the company established at a central point standard stations, with night and day agents and combined passenger, freight and express offices.

A system of stop numbers for local stops is more than essential in interurban operation, as it defines definitely every stop and facilitates the loading and unloading of passengers. The condensing or elimination of stops between towns forms a great factor in cutting down time. Although the public will at first think it cannot get along without such stops, it will enter into the spirit for faster service and the complaints will die a natural death. The Lehigh Valley Transit Company went over 45 miles of track and abolished twenty-two

stops. The letters and petitions received at that time would make the archives of the library at Washington blush with shame, but the company made it a point all along the line, through publicity of various kinds, to bring the public into a close appreciation of and co-operation with the work being done to give faster and more up-to-date service. The increased traffic and the building-up of the entire length of the lines has more than compensated this act.

The operating features also constitute a very potent factor in the time unit. The operation of two or more car trains minimizes the units in operation, getting away from the old system of operating two or three sections to each train, which in itself consumes a great deal of unnecessary time and has serious features from the accident standpoint. The operating of every other train as a limited and every other train as a local is working out well in many sections of the country. A service of less frequency works to as good advantage with less cost of operation, and the limited service, stopping only in municipalities, gives a double service where it is most needed. The Lehigh Valley Transit Company, in the inauguration of its through limited service from Philadelphia to Allentown, has carried out these ideas in a most satisfactory manner. The through limited trains cover a distance of 56 miles in one hour and fifty-seven minutes, and only nine regular stops and two flag stops are made. The local trains make all stops. Both classes of service operate hourly, thus giving to the municipalities a half-hour service.

The laying out of the operating schedule so that all local trains may have sufficient time, under various traffic conditions, to clear the limiteds at the passing points, is a problem to be worked out by the dispatching department. If the limited service is kept on schedule at all times, the local service as a natural consequence will also be so kept, and the greatest advertising feature of any service, namely, "Always on the dot," can be very easily maintained. It might be mentioned that in connection with the limited service, the Lehigh Valley Transit Company charges an excess fare of 10 cents for any traffic that originates or ends between the terminals. For traffic that originates or ends at either of the terminals, no excess is charged. This is done to relieve the limited service from local traffic, and the public at large is keen to appreciate this high-grade service and is willing to pay for its benefits.

Not only does the passenger service enter into the conservation of the time, but the freight and express service forms an equally important factor. The interurban roads are in the best of positions to solve the problem of quick delivery of perishable market garden products to municipalities. The Lehigh Valley Transit Company last year handled as one commodity alone about 42 tons of mushrooms, which class of shipment demands the best of service. This business was taken from one of the old-line express companies on account of the electric railway facilities for landing it in Philadelphia to make connections with Northern and Southern points in the quickest manner. For this traffic the company used the baggage compartment of the limited cars, operating every hour, so that the time factor would be reduced to a minimum. Another class of perishable shipments are the products of the Florex Greenhouses, located on the company's line. These greenhouses supply the Eastern markets with "American Beauty" roses and with carnations, and the company gets the major part of this business because it can place these goods in Philadelphia more quickly than the steam roads.

The matter of farm products is also entering very largely into the time factor of interurban lines. At

present there are no municipal markets in Philadelphia, but the present administration has lately taken up the question of the introduction of markets and has called the interurban people into their conferences, and the lines are affiliating themselves with the city government. The farmers are interested in the organization of a farmers' association or common pool, this pool to hire a representative in the municipal markets to whom goods may be shipped for disposal. The interurban lines are the ones that are going to accomplish this work, and the factor of speed plays an important part in the success of their endeavors.

In figuring out the various problems for the conservation of time, an interurban line should not for one moment neglect or in any way disregard its local riding. In all its arrangements it should protect the local traffic with the view that this, rather than being interfered with in any reorganization scheme, shall be materially benefited by a better and more efficient service.

It must be remembered that in all plans for the reduction of time, the interests of safety must be protected. The placing of tracks upon private rights-of-way, the elimination of curves, the establishment of definite stops, adequate protection of crossings by crossing bells and signs, the installation of automatic block signals, either track or overhead, and the physical examination of employees are all essential factors which enter into safety in operation. Along with its other safety work, the Lehigh Valley Transit Company has placed bells as well as warning signs at all dangerous crossings along its line, and at the present time is erecting warning signs 300 ft. from the crossings.

SOME PRACTICAL WORKMEN'S COMPENSATION QUESTIONS

BY LEFFERTS S. HOFFMAN, GENERAL ATTORNEY PUBLIC
SERVICE CORPORATION OF NEW JERSEY,
NEWARK, N. J.

The first question arising in connection with the Pennsylvania workmen's compensation act, effective on Jan. 1, 1916, is as to the advisability of accepting its compensation provisions. If the elective system of compensation is not accepted by the employer, and an action is brought against him by an injured employee, the three principal defenses of employee's negligence, assumption of risk and fellow-servant responsibility, which have heretofore been of great assistance in defending such damage suits, are taken away. With these defenses gone, the matter of establishing the employer's liability to respond in damages for injury by accident, on account of which a suit could be maintained at common law, would be a comparatively easy matter, particularly when it is considered how many accidents to employees are caused by the carelessness of fellow employees, the liability for whose acts is now placed upon the employer. This same question as to whether or not the act should be accepted arose with the Public Service Corporation of New Jersey under the law of that State, and after a thorough consideration of the matter, the elective compensation system was adopted.

EMPLOYEES' MEMORANDA OF ACCEPTANCE OF COMPENSATION

Having decided to adopt this system, the company drew up a memorandum for the employees to sign, showing whether they rejected or accepted the elective compensation provisions of the act. The Pennsylvania act provides, in Section 302, that every contract of hiring made after Dec. 31, 1915, and every contract of hiring renewed or extended by mutual consent, expressed or

implied, after that date, and every such contract in operation on Dec. 31, 1915, shall be conclusively presumed to continue subject to the provisions of the elective compensation system, unless either party shall have notified the other in writing to the contrary. As a copy of the notice has to be filed with the bureau of workmen's compensation of the Department of Labor and Industry, it would seem as though it were not necessary to have proof other than the files of the bureau of the status of the employees toward their employers in respect to the act.

In the section noted, however, there is a proviso to the effect that the provisions "shall not be construed as to impair the obligation of any contract now in force." If this raises any serious question as to whether or not it applies to the ordinary contract of hiring, then it would be advisable to obtain such signed memoranda from the employees as above described for the purpose of eliminating any question as to the application of the proviso to any particular case. On the other hand, the obtaining of such signed memoranda is quite an undertaking, gives rise to many discussions between the employees and the company as to the advisability of employees accepting or rejecting the provisions of the act, necessitates among employees a campaign of education relating to the act, and may, in view of the provisions of the act, prove to be more trouble than it is worth. Very likely the proviso in the section refers to hiring for definite lengths of time extending beyond Dec. 31, 1915, but it can easily be seen how the question might arise with many ordinary employees as to whether or not their contracts now existing did not extend beyond that date.

EFFECT OF BENEFIT ASSOCIATIONS

Section 204 provides that the receipt of benefits from any association or fund shall have no effect upon the operation of the law, and a release executed in consideration of such benefits shall be void. If any company has an association from which benefits are derived by the employees, this matter will require consideration.

The Public Service Corporation of New Jersey has a welfare plan, under which certain allowances are made to employees during a limited period of incapacity caused by accident or sickness, and a certain sum is paid to their families in case of their deaths. This plan was in operation prior to the passage of the workmen's compensation act of New Jersey. When this act was passed, however, the company modified its welfare plan so that the employees would not be paid under both systems. A rule was passed by the welfare committee to the effect that in the event of employees being incapacitated by an accident whereby the company was obligated to pay them under the workmen's compensation act, no payment would be made under the welfare plan unless the amount which they became entitled to under the workmen's compensation act was less than they would be entitled to under the welfare plan. In this event the company would make up to them the difference.

If any Pennsylvania company is in a similar position and intends taking a similar course, it would be well to bear in mind that in making the payments the first care is to see that the payments are made in accordance with the workmen's compensation act and in discharge of the liabilities thereunder, and that any balance that might be due under any other plan is paid to the employees as something entirely separate from the act. The New Jersey courts have held that any payment in excess of the amount called for by the act is a mere gratuity or gift, which cannot be recovered and to which no credit

can be given the employer. This is a matter of no great importance, but it sometimes has happened that under a mistaken view of the act the employee has each week been paid a larger sum than he was entitled to, and when disputes have arisen as to the length of time the employee was entitled to compensation, he has taken the matter to court. Perhaps he sustained the contention that he was entitled to payments for a longer period than his employer thought, but the court also found that he was entitled to payment at less than the rate at which the employer had been paying him. In such a case, the court has held that any excess payments that may have been made are mere gifts, and that the employer shall continue to pay at the rate fixed by the court during the period determined by it, with no credits for excess payments theretofore made.

LENGTH OF MEDICAL ATTENTION

In Section 306 of the Pennsylvania act there is a provision to the effect that during the first fourteen days no compensation is payable but that surgical, medical and hospital service, medicines, etc., shall be supplied. While, of course, it is quite necessary that the law should put a limit upon the time during which such service must be supplied by the employer, in the practical operation of the law it will many times be wiser to supply medical attendance beyond the mere statutory period of two weeks, for the reason that it is to the interest of both the employer and the employee for the injured man to recover and be able to return to work as speedily as possible. If the employer ceases promptly at the end of two weeks to furnish medical attention, it will happen in many instances that the employee will fall into the hands of unscrupulous or incompetent physicians and his incapacity will be unnecessarily prolonged. The Public Service Corporation of New Jersey does not hesitate to furnish free medical attendance for a long time after the expiration of the two weeks, not only because it feels that by so doing it actually saves money which it would otherwise be obliged to pay out on account of the prolongation of the period of recovery, but also because under the welfare plan the company has enough interest in its employees to see to it that those injured while in its employ should receive competent medical and surgical attention.

Sometimes employees are suspicious of treatment by doctors furnished by the company, but cases where employees refuse the medical and surgical service supplied are getting more and more rare. If Pennsylvania companies adopt this plan, there may at first be doubts and suspicions in the mind of the employees in using service which the law does not compel the companies to furnish, but when it becomes apparent that they are not trying to put the employees in a false position or to make testimony for use in the event of a trial, little difficulty will be had in the matter.

INJURIES CAUSED BY THIRD PARTY

Section 319 of the act provides that where an employee in the course of his employment is injured by a third person, the employer shall be subrogated to the rights of the employee against such third person. In order to preserve all the rights under this section, a company should, on the occurrence of an accident caused by the third person, immediately give notice of the occurrence to such third person, making a claim against him by way of subrogation. Otherwise the third party may settle with the employee on the assumption that the injured person was not an employee of anyone, or, at the time of the accident, was not in the discharge of his duties as an employee.

The person causing an injury to the employee of another could, in the absence of notice of the employer's rights, settle with such employee so as to relieve himself of any further obligation, irrespective of the provision of the statute. In fact, if the general principles of subrogation are to be applied, no reason is apparent why a settlement cannot safely be made with an injured person who is acting in the employ of another when injured, provided the settlement is made before the employer makes his settlement with the employee, as it is a general principle relating to subrogation that there can be no subrogation until the one who claims that right has discharged his obligation in full.

Of course, if a fair settlement is made by the third person with the employee, no harm is done the employer, because the amount paid the employee can no doubt be credited against the amount which the employer is obligated to pay him under the statute. Thus the chief object in giving notice would be to prevent settlements between the employee and the third person which are entirely inadequate and insufficient to offset the amount which the employer would have to pay under the statute, and also to prevent, so far as possible, settlements between the injured employee and the third person being kept secret.

The question of strict subrogation, as applied to the New Jersey act, has not arisen because this act provides that in the event of an employer wishing to claim reimbursement from a third person causing an injury to one of his servants, he shall file with the third person a statement of his claim. Until the statement is filed, the injured employee and the third person causing the injury are left free to act as they see fit regarding the employee's claim.

AGREEMENT UPON COMPENSATION

Section 410 of the Pennsylvania act provides that the employer and employee, or his dependents, may agree upon the compensation payable under the act. This agreement would be valid and binding, however, only when finally approved by the board. In the practical administration of the act, however, it will be found that such an agreement is seldom, if ever, necessary. The New Jersey act has a provision that a company may agree with its employee as to the amount of compensation due, but I do not know of a case where the Public Service Corporation of New Jersey entered into such an agreement. It has been found that the easiest way to administer the law is to begin payments in accordance with the law's provisions and continue them for such a period as the law provides. Where the period is indefinite, the company continues them until in the opinion of its physicians the employee is well and able to go to work. Very seldom, if ever, does a dispute arise as to when that period arrives, but if it does the company endeavors to get together with the employee and satisfy him. If he cannot be satisfied, he is left to his remedy by petition to the court.

In the New Jersey act, however, the agreement may be opened after the expiration of one year, so that it might not be of so much value as would be an agreement under the Pennsylvania act, which appears to make the agreement final, provided it is approved by the board. It is so rare that any disagreement as to the amount and the period during which compensation is payable arises between the employer and the employee, that it very likely would not be worth the time and effort spent, and the discussion which would necessarily follow, to procure an agreement with employees as to the amount of compensation to which they were entitled under the law. A possible exception would be special cases, as, for instance, death cases, where no doubt it

would be well to fix by inclusion in a binding agreement the names and ages of dependents, their relationship to the decedent, etc.

METHOD OF INSURANCE

The Pennsylvania act provides that companies must insure in the State workmen's insurance fund, or in some insurance company authorized to insure such liability, unless the employer is exempted by the bureau on an application showing his financial ability to pay compensation. This choice of method constitutes the most important questions to be decided. In New Jersey there is no State fund, but the New York law provides for such a fund. Where it is necessary to be insured, the question of insuring in the State fund or insuring in an insurance company is one depending merely on the cost and on the exercise of care in selecting an insurance company.

In insuring in the State fund the employer is relieved from all liability to pay compensation to its employees. In insuring in an insurance company, however, there is the possibility of the insurance company not being able to pay, in which event the employer would nevertheless have to make the payments required by the act. It therefore is important to look into the financial standing of the insurance company, if this method is adopted, for the liability to make payments in particular cases may be continued for a period of sixteen years. The law provides that the payments in death cases shall cover a period of 300 weeks, but if there are children of the decedent under sixteen years of age the payments shall continue until such children arrive at the age of sixteen years at the rate of 15 per cent for one child and 10 per cent for each additional child, but not in excess of 50 per cent. It appears by this that in the case of a child born at about the time of the father's death, or in the case of a posthumous child, the law continues to operate for the benefit of that child for a period of sixteen years. A company must, therefore, consider the future of any company with which it may insure.

What appears to be the most important question to be considered in connection with insurance, is whether the company cares to adopt either the State-fund or the insurance-company method, or be exempted from such methods and thus get the benefits of administering the law itself. The greatest benefit of compensation laws is the taking away of causes of friction, annoyances and misunderstandings between the employer and the employee. The Public Service Corporation of New Jersey has found in its experience of about four and one-half years that the greatest amount of benefit of this nature can be obtained through the administration of the law by the employer himself, for when the money is paid out by the employer his agent comes in personal contact with the injured employee, either at the paying office of the employer or at the home of the employee, and thereby can keep in close touch with him and his family and show a personal interest in their welfare. The benefit that a company derives from such close personal communication between the injured employees with their families and its executive officers is invaluable in preventing an unrest or antagonism between employer and employee which otherwise might well exist.

The point is that in insuring in the State fund a company is depriving itself of all benefit to be derived from the personal administration of the law, as the payments, when made by the State, must of necessity be more or less of an impersonal nature. If a railway insures in an insurance company, it should be provided that the railway itself, as employer, should have the right to administer the fund which is supplied by the insurance company under its contract.

STEAM RAILROAD ELECTRIFICATION

BY N. W. STORER, GENERAL ENGINEER WESTINGHOUSE
ELECTRIC & MANUFACTURING COMPANY,
EAST PITTSBURGH, PA.

In general it may be stated as an accepted fact that very few railroads will ever introduce electric operation unless they can see a profit resulting from it. Of course, some companies may be forced to electrify by city councils, a method that is greatly to be deplored; others may have certain portions of their line electrified to avoid the dangers and losses incident to smoke in tunnels or to increase the capacity of a terminal or congested division; and still others may desire to utilize cheap water power instead of paying exorbitant amounts for coal. When all these lines are electrified, however, there will still remain a large part of the railroad mileage in this country to be handled by the steam locomotive, which, by the way, is not the weak and inefficient machine that it was twenty years ago. Indeed, the high-speed passenger locomotive of to-day is capable of developing 3000 hp. at 70 m.p.h. for several hours at a time, and no electric locomotive has yet been built to equal this performance. Nevertheless, there is no doubt in the mind of anyone that this, or even greater power, can be easily supplied by an electric locomotive if such a machine is ordered.

The electric locomotive must make a large part of its showing in its incidental advantages, and one of the most important of these is that it may remain in service continuously for a week at a time, while the steam locomotive has to spend a large part of its time in the roundhouse. Potentially, the electric locomotive is able to start out with a train and take it clear through to its destination, whether this is 100 miles or 1000 miles away. In the future, annual mileages will be obtained with electric locomotives that are to-day undreamed of with steam machines. Electrification is going to result, therefore, in a more efficient handling of transportation. An electric locomotive designed for a normal speed of 14 m.p.h. and making a daily mileage of only 75 or 100 is not working up to its capacity in any respect, and a railroad president properly can, and no doubt will, inquire why the traffic cannot be arranged so as keep engines at work making 200 or 300 miles per day.

An incidental advantage resulting from the electrification of large terminals will come from the greater value of real estate owned by the railway companies. The cost of a right-of-way in a large city is enormous, but if the tracks are electrified, the entire area can be covered with buildings of all kinds. Covering the tracks with warehouses will be of particular advantage, because in such a case it will be possible to raise carloads of freight on elevators to higher floors in the warehouse, where the cars can be unloaded promptly or reloaded whenever the goods have been sold. The cost of handling freight will thus be enormously reduced, and demurrage charges will be eliminated.

Many other incidental advantages will be found when railroads are finally induced to electrify. They cannot appear all at once, and the best results from electrification cannot be obtained unless all of the details are worked out with the greatest care. I am, therefore, very much opposed to forcing the electrification of terminals before the railroads are ready for it. The cost of electrification is enormous, and the railroads must either save enough money in the cost of operation to pay for the interest on the investment or else the freight and passenger rates must be increased. I am a thorough believer in electrification, but until the best system for electrification is more definitely decided progress will be slow. Enough has been done, however, to show

that there is no class of service in the United States that cannot be handled at least as well by electricity as it is by steam.

WORKMEN'S COMPENSATION IN PENNSYLVANIA

BY HARRY A. MACKEY, CHAIRMAN WORKMEN'S COMPENSATION BOARD, HARRISBURG, PA.

The compensation plan in Pennsylvania is an optional one. The first question that an employer must decide between now and Jan. 1 next is whether he will accept or reject compensation. In order to reject the law it will become necessary to notify the employees to that effect in the manner prescribed by the act, file a proof of the same with the board at Harrisburg and then wait for the consequences. When Article III of the act is rejected, if an employee is injured under such circumstances that he can allege negligence with sufficient evidence that it will become a question for the jury, the company will not be able to set up contributory negligence, risk of employment or negligence of a fellow-employee. The only defense will then be a reckless indifference to safety appliances provided by the employer, or intoxication, both being questions for the jury. It seems, therefore, that not only the spirit of the times but a desire to protect their own interests would impel street railways to adopt compensation. In doing this they really have nothing to do, for silence will be considered acceptance.

After having decided to accept the act, then companies are brought face to face with the question of insurance. The compensation board does not advocate any particular form. The State is a wide field for competition. Many insurance companies are in the field, all having complied with the laws of the State, and all are entitled to fair play. At the time this act was passed the Legislature created two new means for the employer to effect insurance. Where twenty or more employers employ 5000 or more employees and have accepted the provisions of the act, they may form an incorporated employers' mutual liability insurance association for the purpose of insuring themselves. There is also the State insurance fund. Probably all these forms of insurance have their individual advantages.

There has been a very lively interest excited throughout the State because of the State insurance fund feature. The sponsors for the act never intended that it should monopolize the business or that it should be a serious obstacle in the way of good and lucrative business for the other insurance companies. It is intended as a regulator of rates—in fact, a State-managed mutual company. It has its limitations and its advantages. It cannot, under its act of creation, issue a policy to employers for complete coverage, indemnifying employers from liability to the general public, but it can give complete immunity to its subscribers because of employees injured during the course of their employment, and under such circumstances that there is a liability created under the workmen's compensation act. One of the advantages of State insurance under the act and the rules of the board is that subscribers are absolutely immune from the filing of a lien against their real estate for claims arising under the operation of the compensation law.

The act also provides that companies can make application upon forms furnished by the board, for the right of self-insurance. If they satisfy the board of their financial responsibility, it can place them upon the exempted class of those who are allowed to carry their own insurance, or it can make such orders as it thinks will inconvenience the companies the least and furnish their

employees with absolute and positive security against losses from injuries by accidents.

It is very essential that, having decided to accept compensation, the companies should determine the question of insurance and act upon it. If they do not do so and are notified that it is their duty to insure, and then fail after thirty days' notice thus given, the injured employees have the option of either suing at common law, with the three old defenses stricken out, or of claiming compensation under the act, just as they think their best interests will be served.

C. E. R. A. Accountants Meet in Detroit

Proceedings of Sessions Held on Dec. 7 and 8—Abstract of Paper on "Shop Orders"

The twenty-eighth annual meeting of the Central Electric Railway Accountants' Association was called to order at 1.30 p. m. on Dec. 7 at the Hotel Statler in Detroit, Mich., by President H. B. Cavanaugh, auditor Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio. About twenty-five members from Indiana, Ohio and Michigan were present, and members in other States in Central Association territory were represented by telegrams.

After the reading of the minutes of the previous meeting held at Indianapolis last June, President Cavanaugh called attention to the activities of the last year and the impression on general railroad accounting being made by the association. An abstract of his presidential address was published in the *ELECTRIC RAILWAY JOURNAL* of Dec. 11. The executive committee in its report presented the names of four new applicants for membership, who were unanimously elected.

W. H. Forse, Jr., secretary-treasurer Union Traction Company of Indiana, Anderson, Ind., then read a paper on "Depreciation and Appreciation," an abstract of which was published in the issue of Dec. 11. After a two-hour discussion of this paper it seemed to be demonstrated to all present that there was little hope of arriving at any definite rate to be used in accruing the charges for depreciation at the present time or in the near future. The many angles of the subject and the varying physical conditions of the companies were held to prohibit the association from taking any definite action on this subject. It was the consensus of opinion, however, that the Interstate Commerce Commission should furnish more definite instructions. One phase of the discussion related to the blanks furnished by the commission and used by the companies in making a report for the fiscal year ended June 30, 1915, and it was stated that these blanks seemed to fit in very well with the classification of accounts for electric railways issued in 1914.

The standing committee on passenger and freight accounting reported that it had nothing new to present. Only one question had arisen since the last meeting, and the answer to this would be made at a later date. The committee on forms presented a report stating that the filing system authorized at the June meeting had been installed, and an index of all forms on file had been sent out by the secretary of the association to all its members. It was requested that members forward any new forms. A nominating committee of three members was then appointed by President Cavanaugh, after which the announcement was made that Irwin Fullerton, auditor Detroit (Mich.) United Railway, had invited the delegates to a dinner at the Fellowship Club. The invitation was accepted with a rising vote of thanks.

The second session was called to order at 9 a. m. on Dec. 8, and it was announced that a trip to the Ford

Automobile Company's plant would be made at the end of the session under the auspices of the Detroit United Railway, as well as a trip to the freight stations and other property of the latter company if the members desired to go.

The first paper of the morning was on the subject of "Accrued Accounts," by A. E. Dedrick, auditor Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, which was abstracted in the issue of Dec. 11. In the discussion on this paper the most important item covered was the taxes accrued account. The Ohio tax law was quoted and its requirements discussed. This law and its application seem to be not very well understood by either the companies taxed or the tax commission. Other papers of the morning were that by B. H. Jacobs, assistant auditor Cleveland (Ohio) Railway, on the subject of "Shop Orders," which is published, in abstract, on this page, and that by E. L. Kasemeier, auditor Ohio Electric Railway, Springfield, Ohio, on the subject of "The Journal Entry Tickler," which was published in abstract form in the issue of Dec. 11.

The report of the nominating committee was unanimously accepted by the delegates, and officers were elected for the coming year as follows: President, F. T. Loftus, auditor Indianapolis & Cincinnati Traction Company, Rushville, Ind.; first vice-president, J. B. Hooper, auditor freight accounts Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich.; and second vice-president, T. P. Kilfoyle, auditor Cleveland (Ohio) Railway. The executive committee for next year consists of the following: Oren A. Small, auditor Benton Harbor & St. Joseph Railway & Light Company, Benton Harbor, Mich.; A. C. Van Driesen, chief accountant Toledo Railways & Light Company, Toledo, Ohio; A. E. Dedrick, auditor Mahoning & Shenango Railway & Light Company, Youngstown, Ohio; P. C. Reinking, auditor Fort Wayne & Springfield Railway, Decatur Ind., and B. H. Jacobs, assistant auditor Cleveland (Ohio) Railway.

After the meeting of the delegates had been adjourned, the new executive committee held a meeting at which A. L. Neereamer, secretary Central Electric Railway Association, was unanimously re-elected for the year as secretary of the Accountants' Association. Mr. Neereamer is also treasurer of this body, by virtue of being treasurer of the parent association, in accordance with the revised constitution and by-laws. It was decided that the June meeting would be held in Toledo at a time to be determined later.

SHOP ORDERS

BY B. H. JACOBS, ASSISTANT AUDITOR CLEVELAND (OHIO) RAILWAY

The shops of the Cleveland Railway have had to assume an exceptionally important part in the rehabilitation of a property that was run down to a very low state of upkeep by several years of continuous municipal warfare waged against it. The part played by the shops in the reconstruction and remodeling of obsolete and inefficient cars, the installation of fare boxes and changes in platform and doorways incident thereto, alterations in motor cars made necessary by the use of trailers, and the construction and contributing construction of additional rolling stock, pertinently suggested the need and the value of more shop-cost details. More recently it has also been found advisable to keep an account of the cost of repairing cars damaged in collisions separate from the account for repairs made necessary by the ordinary wear and tear resulting from car operation and use.

The accounting department has attempted to meet and control these conditions by the use of shop orders. On receipt of advice from the general manager that alterations are to be made in a certain lot of cars, or that an order has been placed for a stated number of new car bodies, the installation of the electric equipment, air brakes and other accessories thereon to be done in the shop, the master mechanic issues a shop order with the proper consecutive number. This outlines the nature of the alteration or character and extent of the construction work required, together with such other instructions as may be deemed necessary. Copies of the order are sent to the foreman of each department likely to have a hand in the work prescribed, and to the auditing department.

From then on the job is known as "S. O. No. —," and all invoices, time reports and requisitions for material used in connection therewith show distribution to the particular order. When such orders included work to be done on both the car bodies and the electrical equipment as well, the order is made to read, for example, "S. O. 112 car bodies, 112a electric equipment," to enable the auditing department to make the proper distribution of charges, when the various shop orders are charged out at the end of each month to the maintenance or capital accounts that are affected by the work accomplished.

The use of letters in this manner provides a flexible system that will admit of almost unending details. It has not been found practicable, however, to go into detail necessitating the use of more than three or four letters except in one or two instances. Four letters provide the necessary segregation of expenses, such as those in connection with the bodies, the motors, the air brakes and some special accessories in the cost of installation of which the management may be especially interested.

An itemized account of every charge to each shop order is kept in a shop-order ledger, from which a summary is carried monthly to the appropriate capital and maintenance accounts. Only the total amount of the shop order is transferred to the corresponding account in the betterment ledger, in posting from the shop-order ledger, but such totals are supported by a summary sheet immediately following each account, giving the quantities as well as the amounts of the various parts for which the charges were made. Thus when a shop order is complete, the summary sheet affords a very ready means of discovering any discrepancies in either quantities or amounts charged, and provides, with other things, a complete inventory of all the parts involved in the carrying out of the order.

Chicago Surface Lines Club

The first dinner meeting of the Chicago Surface Lines Club was held at the Morrison Hotel on Dec. 14, 1915. Two hundred and sixty members of the club attended and addresses were made by H. M. Webber, superintendent of relief and safety Chicago Telephone Company; W. A. Sauer, assistant superintendent of accounting department Peoples' Gas, Light & Coke Company; George B. Foster, assistant to vice-president Commonwealth Edison Company, and E. J. Blair, electrical engineer Chicago Elevated Railways. L. A. Busby, president Chicago Surface Lines, also addressed the club, and incidentally announced the fact that the membership had now exceeded 600. A. R. Peterson, trial attorney Chicago Surface Lines, acted as toastmaster. The dinner was purely a social affair, and the speakers from the other Chicago utilities companies outlined the work their employees' clubs were doing.

St. Paul Locomotive Tests

Two of These Locomotives Have Handled Larger Trains than Three Steam Locomotives at Speeds More than 50 Per Cent Higher

Details of the tests upon the electric locomotives for the Chicago, Milwaukee & St. Paul Railway, which have been conducted on the first electrified division of that railroad between Three Forks and Deer Lodge, Mont., show that the electrical equipment has met every expectation of its sponsors. The tests began on Dec. 2, shortly after power was cut in on the line and on Dec. 6 two of the electric locomotives took a freight train weighing 2800 tons from Butte to Piedmont across the continental divide, some 16 miles east of the former city, making the total distance of 39 miles in two hours and fifteen minutes. This run includes an up grade of approximately 10 miles in the vicinity of the Janney substation with maximum gradients of 1.66 per cent, and a down-grade of 21 miles on the eastern slope of the continental divide with maximum gradients of 2 per cent. This train made an average speed up grade of 14 m.p.h., and it descended the 2 per cent grade into Piedmont at a practically uniform speed between 17 m.p.h. and 18 m.p.h., the average speed for the entire run being 17 m.p.h.

On Dec. 8 a competitive test between the electric locomotives and steam engines took place under the observation of a large party of officials of the Chicago, Milwaukee & St. Paul Railway, including A. J. Earling, president; C. A. Goodnow, vice-president; R. Beeuwkes, electrical engineer, and J. J. Murphy, superintendent, together with A. H. Armstrong and W. B. Potter of the General Electric Company. In this test a train of forty-eight cars, aggregating 3000 tons in weight, was made up in Butte and run over the mountain to Piedmont with two electric locomotives. The inspection party observed the test from Janney substation, and at that point the train hauled by the electric locomotives was operated at a speed of 16 m.p.h., apparently without taxing the power of the electric machines, the rating of the two engines on the 1.66 per cent grade being 3700 tons based on a rolling friction of 6 lb. per ton. Following the electrically-operated train was another in which there were thirty-seven cars approximating 2200 tons in weight, and this was hauled by three steam locomotives, two of which were of the Mikado type, with the third, a Mallet locomotive, acting as a pusher. This train was able to ascend the hill at a speed of only about 10 m.p.h., in marked contrast to the electrically-operated train that had preceded it.

The special train for the party of inspection was made

ST. PAUL LOCOMOTIVE TESTS—SPECIAL TRAIN AT JANNEY SUBSTATION

up of six Pullman cars and this also was drawn by an electric locomotive. It was operated over the divide to Piedmont substation and then ran back to Janney, going up the 2 per cent grade west of Piedmont with greatest ease at a speed of about 22 m.p.h. During the return to Butte the train was operated over the relatively level track approaching that city at a rate of about 31 m.p.h. No attempt at great speed was made, however, because the engine was geared for freight service, none of the passenger engines having yet been delivered. The latter engines are expected to make 60 m.p.h. with an 800-ton trailing load, and judging from the smooth-riding qualities of the freight engine in the test outside of Butte, it is said to be certain that no difficulties will be experienced at the higher speeds.

No troubles of any kind have appeared in connection with the operation of the locomotives, either in regard to their ability to haul trains up grade or in regard to the operating features of the regenerative system on the down grades. In consequence, the four locomotives that are on the 113-mile electrified division, which is at present completed between Three Forks and Deer Lodge, have been placed in actual service and are doing pusher work on the grades to help out the steam locomotives. During the month of December three and possibly four more locomotives will be delivered, and if the railroad company has received a total of eight freight locomotives by Jan. 1, electric freight transportation between Deer Lodge and Three Forks will be established during the first week of the new year. The initiation

ST. PAUL LOCOMOTIVE TESTS—PASSENGER TRAIN ON 2 PER CENT GRADE WEST OF PIEDMONT

of electric operation of passenger trains will depend upon the delivery of the passenger locomotives, which are similar in every respect to the freight engines except for the gearing. However, it is expected that shipments of these units will be made some time after the first of the year.

In connection with this it is of interest to note that some time ago the purchases of steam locomotives for the divisions under electrification were limited by the railway company. In consequence, there is a scarcity of steam motive power at the present time which is being supplied by the electric machines, and this fact would indicate that the steam locomotives which are to be retired are going to be credited to the electrification at their full value. Another item of interest in connection with the electrification was recently made public in a speech delivered at the inauguration of electric operation by John D. Ryan, who is one of the directors of the Chicago, Milwaukee & St. Paul Railway. In this Mr. Ryan said "it was the foresight of the management of the St. Paul road that made its route run close to those water powers and made possible the development of them. The fact is that the development of these great water powers of Montana was possibly largely through the practical assurance that the St. Paul road would take a part of that power. It was through this that we have made possible for all, little and big, to secure the best and cheapest power. It makes no difference whether they use 1 hp. or 10,000. They are able to get it because of the railroad taking this power.

Cost of Motor Buses

Figures Based on Actual Operation of Motor Bus Line in Richmond, Va.

Statements have been made from time to time in this paper about the fleet of motor buses operated last summer in Richmond by the Virginia Railway & Power Company. This company owns the electric railway system in Richmond and found last spring, in common with many other companies, that its receipts were being adversely affected by a large number of jitneys. The company decided if the jitney was a real improvement in methods of city transportation it was in a better position than anyone else to conduct this service. Consequently, it purchased some forty cars in April and operated them on regular schedules in that section of the city where jitney service was being rendered. The test with these cars showed that the business could not be conducted without a loss, and it was discontinued in September. Through the courtesy of C. B. Buchanan, general manager Virginia Railway & Power Company, the following statement of jitney operation is published:

STATEMENT OF RICHMOND JITNEY OPERATION, APRIL 17, 1915, TO SEPT. 14, 1915.

Gross earnings	\$30,501.28
Taxes	\$671.00
Operation	24,043.79
Maintenance	9,758.70
General expense	1,856.77
	*\$36,330.26
Deficit	\$5,828.98
Bus-hours operated	62,080
Earnings per bus-hour	\$0.491
Expenses per bus-hour	\$0.585
Loss per bus-hour	\$0.094

*Expenses do not include any charges for depreciation, or for rent of garage.

As will be noticed, the earnings per bus-hour were less than the operating expenses, not including depreciation or rent for the garage. The company first undertook to keep a record of its expenses on the bus-mile basis but had to abandon this plan on account of numer-

ous errors in the mileage recorders, so that the statement was prepared on the bus-hour basis. The average miles per hour made by the buses were approximately 12 miles. The company owned the garage where the buses were stored, and in the statement given above no allowance is made for the rent of the garage. No attempt was made to estimate the depreciation on the buses, but Mr. Buchanan says, "It was very great for the short time they were operated." The buses used were five-passenger touring cars of the usual kind. Part of them were Fords and the others Briscoes.

COMMUNICATION

Chicago Smoke Abatement Report

WATERTOWN, N. Y., Dec. 14, 1915.

To the Editors:

The synopses of the Chicago smoke abatement and terminal electrification report, published in the issues of the ELECTRIC RAILWAY JOURNAL for Dec. 4 and 11, while omitting details, are nevertheless complete enough to demonstrate the cosmic dimensions of the whole field of inquiry, and the conscientious and scientific manner in which the task was performed by the engineers, who did the real work. Local atmospheric and combustion conditions have been examined, every railroad electrification in the world analyzed, and the various proposed substitutes for the steam locomotive subjected to engineering scrutiny. It would therefore seem that engineers, at least, can accept conclusions which have been reached with such painstaking care, being based upon a wide survey of the state of the art. There is an impression that the people of Chicago have been encouraged to believe that if the steam locomotive could be banished from their railroad tracks, the city would be relieved from the stigma of atmospheric pollution for which it has so long been proverbial. The writer recently saw a clipping from a Chicago newspaper's editorial column, arguing seriously that because railroad electrification had succeeded elsewhere it would be bound to succeed in Chicago, and cynically impugning the good faith of the committee and the railroads for undertaking the investigation of the matter with a negative answer as a foregone conclusion.

The engineering fraternity, however, is quite prepared for a presentation that shows the problem to be a many-sided one, and can appreciate the difficulty of trying to convince the molders of public opinion of the real nature of the disease and the proper course of treatment for its eventual cure.

The impression one gains from the synopsis is that of inclusive breadth of treatment, applied to a problem that could be stated about as follows: What is the railroads' share of Chicago's atmospheric pollution, and what will it cost to substitute smokeless for smoky railroad operation? And the answer has propounded a still harder problem, how to remove the causes, other than steam locomotives, that produce 95 per cent of the atmospheric pollution? That which interests us primarily is the engineering aspect of electrification as a substitute for the steam locomotive.

Here, two things stand out prominently; first, the economic futility of electric motive power when applied on a tremendous scale to the Chicago terminal system as a whole, under conditions where it is not a physical necessity for train haulage; second, the mechanical inadequacy of the proposed self-propelled substitutes.

Electrical engineers will be impressed not only by the heavy cost of electric rolling stock as given in the estimates, but also by the heavy cost of delivering the electric power to the rolling stock; and are also re-

minded that the full benefits of electrification involve such radical changes in layout that the non-electrical features cost nearly the same as the electrical.

Using round figures, from the published summaries, the entire cost is about \$274,000,000, of which only \$82,000,000, net, is for new smokeless rolling stock. About \$59,000,000 must be spent on the power supply system and related accessories. This is an addition of about 72 per cent to the net cost of new rolling stock. On top of this comes \$37,000,000 for transplanting the locomotive terminal facilities to the outer edge of the electric zone—this item is not peculiar to the electric system but would have to be provided for any other smokeless substitute. Finally, there is the \$96,000,000 "precipitated" charge, required to get the full benefit of all the rest of the money. The last two items, which are entirely non-electrical, amount to 48½ per cent of the whole.

The switchyard problem undoubtedly has inherent peculiarities which make its electrification more expensive or less remunerative than straightaway trunk line or suburban electrification, though of course such considerations are not self-evident to newspaper writers, and, in fact, can only be properly grasped by technical experts after careful analysis. For instance, it has been an accepted principle of railroad electrification that it can only succeed economically, when the traffic is sufficiently dense. On the face of it, this means train-miles per mile of track as a unit of comparison. The synopsis does not elucidate how the annual saving by electric operation over 3500 miles of track comes out at so low a figure as \$2,333,000; but it may well be that the actual car-miles or train-miles per any one mile of railroad yard track, even at Chicago, do not approach the density that is shown by economically successful main line electrifications now operating. The complete report doubtless contains figures that betray not only this but other underlying conditions equally important. It would indeed be presumptuous, if not impossible, for an outsider to criticise the financial conclusion, without having had the opportunity to study the conditions very carefully and with trained insight. Electrical engineers may confess to a sense of disappointment, but they are no doubt open to conviction by the broad and careful reasoning of the engineers who have made the estimates. They will at least be saved the trouble of controversy over the system question, for it seems hardly worth while to waste words over the manner of creating an annual deficit of nearly \$15,000,000, particularly when the net costs of the three systems proposed differ by such small percentages. It may be fortunate in the long run, that the state of the art (which has progressed somewhat since 1912) was not such as to give electric power the decision.

There is a hint in the synopsis published Dec. 4 that some consideration has been given to the possibility of a few railroads electrifying separately. Presumably, such roads would be those having the heaviest suburban traffic, and if electrifications were carried out upon these roads with an eye to financial economy, it might well happen that only such tracks would be equipped as would permit a favorable economic result. The fact that electrification of Chicago's tracks as a whole means a financial deficit does not necessarily mean anything of the kind for such individual roads as have favorable conditions. It may turn out, when once the public is convinced that the railroad smoke is responsible only for a very small fraction of the total pollution, that the possible willingness of some one or more roads to electrify their suburban lines will be treated by the public as a matter of economics, and

not as a pretext for attempting to force all the others into it, regardless of financial consequences.

It seems surprising in the abstract, that, after all the mechanical, electrical and chemical developments of the past few years, no self-propelled substitute for the steam locomotive has become available that can be applied to heavy traction duty on a large scale. The internal-combustion engine has done wonders in recent years. It has in many instances won such an economic victory over electric traction in the lighter passenger service, that its invasion of the heavy traction field has evidently been anticipated as a possibility. Its mechanical limitations, however, have proved a bar to its progress in this direction, while electric power, though mechanically feasible, is financially impracticable in the present instance. It may be questioned whether carrying of liquid fuel on locomotives, in large quantities is a greater risk than that due to the presence of thousands of gasoline-carrying automobiles in congested city streets.

Within recent months it has become known that powdered coal fuel has been successfully used on steam locomotives, not only with great reduction of visible smoke, but also resulting in actual financial savings in operating cost. One of the roads entering Chicago is now experimenting with it, and reports encouraging results. This is another instance of what intensive engineering has done for the steam locomotive, in raising its operating economy, and in narrowing and sometimes obliterating or even reversing the margin by which electrification might render it obsolete. The enormous costs of wholesale electrification have prompted some of the larger railroad companies to pay for economical improvements in the steam locomotive which they would have scoffed at a dozen years ago. George Stephenson's iron horse has been bred up to a much higher degree of efficiency, with possibilities not yet exhausted.

Engineers familiar with the subject know very well that it takes a particularly special traffic situation to make electric power attractive financially. There are doubtless such situations in Chicago and elsewhere, but it is not likely that extensive switchyards conduce to electrical economy.

The committee lays down the proposition that, on the face of the facts, atmospheric pollution can be cured only with the aid of the entire fuel-burning community, and not by the railroads alone. It will probably require several more years of study to work out practical means for bettering domestic and manufacturing fuel combustion, and some more years thereafter to get them adopted.

Huge quantities of fuel have to be burned in Chicago. The question is one of handling the products of combustion with the least detriment to the general public. It is to be hoped that Chicago's citizens may be guided in the conclusions, not by public spokesmen of the type whose perspective is limited by self-interest, but by the constructive and judicious opinions of impartial engineers, whose value as trustworthy guardians of the public interest is now beginning to be recognized.

W. N. SMITH, M.E.

The Royal Commission of Norway has recently prepared a remarkably complete report dealing with the question of State waterfalls and their exploitation and with the whole question of Norway's supply of energy from hydroelectric power stations. The commission recommends that the large waterfalls which the State owns in northern Norway may be early dealt with, as they are well suited both for large industrial undertakings and for the electrification of a northern railway.

MID-YEAR MEETING

American Association News

MID-YEAR MEETING
CHICAGO
FEBRUARY 4, 1916

Reports of Meetings of the Executive, Public Relations, A. E. R. A. Advisory Committees, Also Committee on President's Recommendations—Activity Among the Company Sections—Detailed
Appendix of Committee Subject Assignments for 1916

EXECUTIVE COMMITTEE OF THE AMERICAN ASSOCIATION

A meeting of the executive committee of the American Electric Railway Association was held at New York on Dec. 16. Those in attendance were: Charles L. Henry, president; L. S. Storrs, first vice-president; T. S. Williams, second vice-president; John J. Stanley, third vice-president; T. P. Kilfoyle, president Accountants' Association; John Lindall, president Engineering Association; H. A. Nicholl, president Transportation & Traffic Association; George Carson, president Claims Association, and past presidents C. S. Sergeant, H. H. Vreeland, James F. Shaw, Arthur W. Brady and C. Loomis Allen.

The report of the meeting of the committee on recommendations on the president's address was received and adopted. The committee also received a report from B. I. Budd, chairman committee in charge of arrangements of the mid-year meeting, recommending Friday, Feb. 4, as the date of meeting of the mid-year convention. This was adopted. All of the meetings will be held at the Congress Hotel, and the dinner in the evening will be held at the same hotel. It was decided to devote the technical meetings during the day to considering the subjects of "rate of return" and "valuations." There will be a paper on each of these subjects, and each paper will be followed by short addresses from four speakers to be selected in advance. For the dinner in the evening it was decided to have only four addresses. One will be made by the president of each association, and the other two addresses will be made by speakers of national reputation. Their names will be announced as soon as the speakers are selected. The price per plate will be \$10. The committee on arrangements consists of B. I. Budd, chairman; Leonard A. Busby and Henry A. Blair, representing the American Association, and Charles C. Peirce, L. E. Gould, E. F. Wickwire and M. B. Lambert, representing the Manufacturers' Association.

The executive committee also considered but did not approve the changes in organization of the affiliated associations suggested by the standards committee of the Transportation & Traffic Association at the San Francisco convention. The suggestion was that the American association should appoint a committee from its own members or a joint committee from the four affiliated associations to consider various changes in the constitution and by-laws of the several associations by which the following changes, among others, would be brought about. (a) that the president should have charge of the finances, (b) that there should be but one vice-president for each of the affiliated associations, (c) that there should be an executive committee of nine consisting of the three officers and six elected members, with past presidents as honorary members. Under this plan the vice-president would be instructed to keep especially in touch with committee work and would submit to the president on June 1 a recommended list of appointments for the new committee on subjects, to be appointed not later than Aug. 1, and would submit to the executive committee at its last meeting at the convention a tentative list of recommended committee appointments for the ensuing year.

COMMITTEE ON PUBLIC RELATIONS

A meeting of the American Association committee on public relations was held at the Metropolitan Club in New York on Wednesday, Dec. 15, 1915. Those in attendance were C. Loomis Allen, chairman, H. C. Bradlee, A. W. Brady, E. B. Burritt, J. K. Choate, H. C. Clark, S. M. Curwen, H. C. Donecker, C. L. Henry, J. R. Lovejoy, J. H. McGraw, J. D. Mortimer, C. C. Peirce, L. S. Storrs, Guy M. Tripp, H. H. Vreeland, T. S. Wheelwright and T. S. Williams.

The sub-committee arrangement made last January was changed by combining the sub-committees on the dissemination of literature and lectures on Chautauqua circuits and elsewhere, under the chairmanship of Mr. Tripp. Messrs. Lovejoy, Vreeland and McGraw were appointed a sub-committee on co-operation with similar committees of other public service associations, with the last-named as chairman. Messrs. Brady, Wheelwright and Williams were appointed as the sub-committee on the preparation of popular articles for publication in magazines and periodicals, with Colonel Williams as chairman. The sub-committee on newspaper advertising was discontinued. Reports on the work which was done by last year's committees were received.

"AERA" ADVISORY COMMITTEE

A meeting of the American Association "Aera" advisory committee was held in New York, Dec. 15, for general discussion regarding contributions to the association magazine. Those present were H. C. Donecker, Newark, N. J., chairman; George Carson, Seattle, Wash.; H. C. Clark, New York, N. Y.; T. P. Kilfoyle, Cleveland, Ohio; John Lindall, Boston, Mass.; H. A. Nicholl, Anderson, Ind., and C. C. Peirce, Boston, Mass.

COMMITTEE ON PRESIDENT'S RECOMMENDATIONS

A meeting of the committee of the American Association to consider the recommendations made by Mr. Allen at the San Francisco convention was held at the office of the association on Wednesday, Dec. 15. Those present were Arthur W. Brady, Anderson, Ind., chairman; General George H. Harries, Louisville, Ky.; Thomas N. McCarter, Newark, N. J.; J. R. Lovejoy, representing E. W. Rice, president of the General Electric Company, and Guy W. Tripp, chairman board of directors Westinghouse Electric & Manufacturing Company. In addition, the following representatives of the executive committee of the American Electric Railway Manufacturers' Association were in attendance: E. H. Baker, W. L. Conwell, C. R. Ellicott, C. S. Hawley, B. A. Hegeman, Jr., W. H. Heulings and C. C. Peirce.

The principal subject considered by the committee was the recommendation made in San Francisco by President Allen in regard to a change in the relations between the Manufacturers' Association and the American Association. The sentiment was expressed that a closer relationship should exist, and it was finally agreed to recommend that manufacturing com-

panies should be admitted as company members of the American Electric Railway Association, with all of the privileges now possessed by railway companies as company members, including the right to vote and of their delegates to hold office. This recommendation was later approved by the executive committee of the American Electric Railway Association.

PUBLIC SERVICE SECTION

The annual smoker of the section was held in Newark, N. J., on Dec. 16, 1915, with a large attendance. Good entertainment, plenty of smoking materials and a substantial supper served in the company dining room were the features.

CONNECTICUT COMPANY SECTION

As was announced in last week's issue company section No. 7 was formed amid great enthusiasm on Dec. 7, 1915. It is expected that the enrollment will reach 175 by the date of the January meeting. The membership includes general officers, office employees, local managers, superintendents, store keepers, master mechanics, general foremen, line foremen, chief engineers of power stations and others.

The election resulted as follows: President, W. J. Flickinger; vice-president, I. A. May; secretary, W. E.

Jones; treasurer, G. H. Crosson; director for one year, P. W. Ripple; director for two years, C. H. Jones; director for three years, C. R. Harte, and company representative, W. P. Bristol.

MANILA COMPANY SECTION

At the October meeting, held on the fifth, a safety-first program was carried out. C. H. Van Hoven read the introductory lecture on accident prevention furnished by the N.E.L.A. lecture bureau, and this was repeated in Tagalog. Safety-first slides were shown and described by W. A. Smith. An open discussion followed.

The meeting was held in the "Meralco" palm garden and it was attended by a large number of guests and employees, many of the Filipino employees being accompanied by their families.

COMMITTEE SUBJECT ASSIGNMENTS FOR 1915-1916

The subject committees of the various affiliated associations have now completed the work of assignments to the different committees appointed for 1915-1916. These subjects have been approved by the executive committees of the various associations interested, and a list of them is published below:

Committee Subject Assignments for 1915-1916

ENGINEERING ASSOCIATION

BUILDINGS AND STRUCTURES

- 1.—Review of association's existing standards and recommendations.
- 2.—Design of shelters (considering 1912 report), bridges, culverts, fences, etc., looking to their adoption.
- 3.—General specification and form of contract for railway structures.
- 4.—Proper provision for expansion and contraction in restrained concrete structures, consideration to be given to both plain and reinforced concrete, with provision made to properly waterproof and protect such arrangement.
- 5.—Oil houses and their equipment.
- 6.—Consideration of tentative safety code of the United States Bureau of Standards in so far as it applies to the work of this committee.

ELECTROLYSIS

Co-operate with the association's representatives on the national joint committee on electrolysis, continuing a study of the general subject.

EQUIPMENT

- 1.—Review of association's existing standards and recommendations, with special reference to the following:
 - (a) Revision of steel wheel design covering both 2½-in., 3-in. and 3½-in. tread, and wheel from 21 in. to 37 in. in diameter.
 - (b) Revision of contour of tread and flange of wheel.
 - (c) Revision of standard design of brakeshoes, brakeshoe head and keys.
 - (d) Revision of standard design of axles, with a view toward including smaller sizes to take care of recent development in motor design for low-floor cars.
- 2.—Standardization rules of the A. I. E. E. (July 1, 1915, edition) in so far as they apply to the work of this committee.
- 3.—Car ventilation.
- 4.—Lighting of electric street cars.
- 5.—Standard sizes of carbon brushes for street railway motors.
- 6.—M. C. B. brass for heavy electric traction.
- 7.—Design of limit of wear gage for association's standard flange contours.
- 8.—Design of trolley catcher socket which will permit of using any make of catcher without necessitating change of socket.
- 9.—Painting cars, including consideration of the various so-called "quick drying" methods that have been suggested within the past few years, also the enameling of cars, with the idea of providing specifications for the application of same.
- 10.—Consideration of tentative code of safety rules of the United States Bureau of Standards in so far as they apply to the work of this committee.
- 11.—Investigation of rail corrugation in its relation to the use of rolled or forged steel wheels versus the use of chilled cast-iron wheels.

HEAVY ELECTRIC TRACTION

- 1.—Review of association's existing standards and recommendations, with special reference to:
 - (a) Change in designing line for equipment in standard clearance diagram for third-rail working conductors. (Co-operating with American Railway Engineering Association and American Railway Association.)
 - (b) Consideration of standardization rules of A. I. E. E. (July 1, 1915 edition) in so far as they apply to the work of this committee.
- 2.—Study of modern electric locomotives, including safety devices. (To cover electric locomotives that are used in interurban service.)
- 3.—Co-operation with committee on block signals and power distribution in preparing clearance diagram for block signals.

- 5.—Consideration of tentative safety code of United States Bureau of Standards in so far as it applies to the work of this committee.

POWER DISTRIBUTION

- 1.—Review of existing standards and recommendations.
 - (a) Revisions of specifications for overhead crossings of electric light and power lines, if completed by the national joint committee on overhead and underground line construction.
 - (b) Revision of standard stranding table.
 - (c) Revision of standard specification for rubber insulated wire and cable for power distribution purposes as suggested by W. A. Delmar of Association of Railway Electrical Engineers.
- 2.—Consideration of standardization rules of A. I. E. E. (July 1, 1915 edition) in so far as they apply to the work of this committee.
- 3.—Clearance diagram for semaphore signals. (To be considered jointly with committee on heavy electric traction and committee on block signals.)
- 4.—Further consideration of the subject of concrete poles, including deflection formulas and tables for tapered sections.
- 5.—Further specifications for overhead line material, including especially a standard thread for pins and insulators (this subject to be taken up in connection with other associations), and specification for structural steel cross-arms and fittings.
- 6.—Consideration of various types of third rail construction with description, and with a view to preparation of specifications.
- 7.—Collection of data preparatory to possible standard specifications for high-voltage d.c. and catenary trolley construction.
- 8.—Consideration of tentative safety code of United States Bureau of Standards as it affects line construction.

POWER GENERATION

- 1.—Review of association's existing standards and recommendations.
- 2.—Consideration of standardization rules of the A. I. E. E. (July 1, 1915 edition) in so far as they apply to the work of this committee.
- 3.—Advantages and disadvantages of 60-cycle apparatus, with particular reference to rotary converters for railway service.
- 4.—Collect and, if practicable, publish data and information that may be available in regard to operating performances of railway power systems.
- 5.—Report on good practice in regard to smoke abatement from the standpoint of smoke observations and appliances and devices used for determining smoke density.
- 6.—Consideration of the boiler code of the A. S. M. E. looking to its adoption by this association.
- 7.—Specifications for the purchase of fuel.
- 8.—Consideration of tentative safety code of the United States Bureau of Standards in so far as it affects the work of this committee.

STANDARDS

- 1.—To approve new sections for insertion in Engineering Manual.
- 2.—To consider further the standard form for drafting specifications.

WAY MATTERS

- 1.—Review of association's existing standards and recommendations.
 - (a) Specifications for special work. (These specifications to be revised and corrected grammatically and be re-drafted to conform to the proposed standard of the committee on standards.)
 - (b) Revision of recommended design of 7-in. and 9-in. joint plates with special reference to sizes of bolt holes and fits. (Recommended that title of this subject be changed to read "Designs for Drilling of Rails and Joint Plates and Their Application.")

(c) Recommended symbols for recording surveys. (Committee of 1915 on way matters recommends title be changed to "Conventional Signs for Recording Surveys." To confer with such other committees as in the opinion of the committee would be affected by the symbols suggested.)

- (d) Recommended designs for layouts for switches, mates and frogs.
- 2.—Ballast for suburban and interurban lines.
 - 3.—The use of rolled manganese and other alloyed steel rails.
 - 4.—Investigation of the use of high elastic steel machine bolts $1\frac{1}{4}$ in. diameter, ream or driving fit in connection with mechanical joints of standard design in curves.
 - 5.—Pavement for use in connection with girder grooved and plain girder rails to cover:

(a) The formulation of a specification covering the manufacture and installation of the various types of paving which might be used in connection with the car tracks.

(b) The matter of proper foundation should also be incorporated in such specification as well as the type of filler and cushions.

6.—Consider for approval specification for preservatives and treatment of woods for inclusion in the engineering manual.

7.—Preparation of specifications with definitions for sundry track materials such as ties, track spikes, bolts, tie rods, tie plates, etc., such investigation to be through co-operation with the A. S. T. M. in accordance with the procedure prescribed in the instructions to the committee.

8.—Report upon the most efficient types of hand track tools.

TRANSPORTATION & TRAFFIC ASSOCIATION

CONSTRUCTION OF SCHEDULES AND TIMETABLES

- 1.—Co-ordinate work of past committees.
- 2.—The skip-stop development and what it means, particularly from the community standpoint. Study influence of frequency of stops on schedule speed and the influence of schedule speed on operating costs.
- 3.—Revise the standard interurban timetable as adopted in 1911.
- 4.—Study of traffic regulations.
- 5.—Exhaustive study of running time as affecting scheduled methods of determining same, together with variable effect of traffic on same, as well as effect on other elements, such as power, etc.

EXPRESS AND FREIGHT TRAFFIC

- 1.—Co-ordinate past work of previous committees.
- 2.—To make further effort to ascertain which style of contract is the most favorable from a revenue standpoint with old line express companies, "a tonnage basis," "a mileage basis," or "a pro-rate of the rates."
- 3.—To make an effort to secure a form of contract which the committee may recommend for the use of traction lines in contracting with old line express companies.
- 4.—Further information tending to show the growth of interchange business with steam railroads.
- 5.—Study motor truck operating costs, etc.

FARES AND TRANSFERS

- 1.—Co-ordinate work of previous committees.
- 2.—Recommendation for a method of interchange of passengers by means of paper transfers, or otherwise, with the idea of preventing abuse:
 - First, on the part of passengers.
 - Second, exchange of transfers by conductors.
 Recommendation for an efficient method of checking transfers with a view to discovering irregularities in either of the above ways.
- 3.—Collection of fares in congested areas and terminals, including fare collectors, etc.

PASSENGER TRAFFIC

- 1.—Co-ordinate work of previous committees.
- 2.—Interline passenger traffic arrangements between interurban and steam roads, with particular reference to collecting data from member companies who have such traffic agreements with steam lines.
- 3.—Ascertain basis of participation of interurban lines in through rate, where the interurban line is the original carrier, and where tickets read to points beyond the next connecting line.
- 4.—Financial aspects of the operation of open cars.
- 5.—Special car methods and results.

RULES

- 1.—Co-operate on block signal rules.
- 2.—Rules for two or more car unit operation.

TRAINING OF TRANSPORTATION EMPLOYEES

- 1.—Co-ordinate work of previous committees.
- 2.—Eyesight and hearing standards. Watch inspection methods. (These to be given additional study with recommendation as to definite standards.)

JOINT COMMITTEES

BLOCK SIGNALS

Engineering Association Subjects

- 1.—Review of association's existing standards and recommendations.
- 2.—Consideration of standardization rules of A. I. E. E. (July 1, 1915 edition) in so far as they apply to the work of this committee.
- 3.—Digest of block signal laws and rulings. (This to cover the period from June 1, 1914, to June 1, 1916.)
- 4.—Bibliography of block signal installation from June 1, 1915, to June 1, 1916, following the same plan as started by the 1915 committee.
- 5.—Designs of additional block signal apparatus looking to its adoption.
- 6.—Clearance diagram for semaphore signals. (As the committee did not consider this subject jointly with the committees on heavy electric traction and power distribution, the 1915 committee

on standards referred it back for further consideration so there would be no conflict with existing recommendations.)

7.—Block signal rules. Continuation of the subject as considered by the 1915 committee.

8.—Study of block signal operation, covering maintenance cost, efficiency of operation and effect on traffic. This subject includes definition of signal failure.

9.—Highway crossing protection, including aspect for highway crossing signals that can be adopted by the association.

10.—Light signals for interurban railways. (Should be given further consideration with a view to the adoption of definite sizes of lenses.)

11.—Consider tests for contactor type of recording signals.

12.—Consideration of tentative code of safety rules as prepared by the United States Bureau of Standards in so far as it applies to the work of this committee.

Transportation & Traffic Association Subjects

13.—Co-ordinate past work of the committees on block signals.

14.—Bring up to date recommendations for the committee on standards.

15.—Study methods of highway crossing protection.

16.—Study methods of drawbridge protection.

17.—Develop form of contract for signal installation.

18.—Study of operating without dispatchers.

CLAIMS TRANSPORTATION

Transportation & Traffic Association Subjects

1.—Co-ordinate past work of the committees on claims transportation.

2.—Investigate the applicability of moving pictures to safety first work in its three phases, namely, training of employees, education of school children, and education of the general public.

3.—Co-ordinate safety first movement.

4.—Safety advertising on cars.

Claims Association Subjects

Not yet assigned.

ENGINEERING ACCOUNTING

Engineering Association Subjects

1.—Inter-departmental charges.

2.—Consideration of the sub-division of accounts covering steam power station costs as submitted by the 1915 committee on power generation.

3.—Development of a property ledger looking toward the maintenance of a continuous inventory. (This to be considered as applying to the entire physical property.)

Accountants' Association Subjects

Not yet assigned.

LIFE OF RAILWAY PHYSICAL PROPERTY

Engineering Association Subjects

Should co-operate with committee on valuation and continue the work of compiling an up-to-date bibliography on valuation.

Accountants' Association Subjects

Not yet assigned.

TRANSPORTATION ACCOUNTING

Transportation & Traffic Association Subjects

1.—(a) Investigation of cost of handling baggage free to determine whether it brings business to the line, and if so, whether the cost of handling this baggage wipes out the profit resulting from the fare received.

(b) Investigation and subdivision of power cost between construction, maintenance and operation.

2.—Graphic presentation of transportation data and statistics.

Accountants' Association Subjects

Not yet assigned.

TRANSPORTATION ENGINEERING

Engineering Association Subjects

1.—Train operation in city service. (It is understood there have been recent developments which would warrant further consideration at this time.)

2.—Economics of one-man car operation. (To carry on work started by committee on passenger traffic of T. & T. Association.)

3.—Two or more car operation, interurban service:

(a) Passenger service.

(b) Freight service.

(Investigation to cover cost of operation and comparative figures for single car operation.)

4.—Effect of car and equipment design on duration of stops for both passenger and freight service. (Car design to be studied from a traffic standpoint in all its phases, first standardizing the method of determining results, i.e., having identical formulae and practice for obtaining observation and data from which conclusions are drawn. Investigation to include specimen data sheet showing information which should be obtained in order that member companies who desire to follow the recommendations may have full information before them.)

5.—Investigation of braking distance on interurban cars with special reference to location of block signals.

6.—Study of electric current saving devices, including summary showing results obtained, together with costs including maintenance, etc.

Transportation & Traffic Association Subjects

7.—Train operation in city service—trailer versus motor cars.

8.—One man car operation—comprehensive study—regulations in different localities—increase in, etc.

9.—Consider rules and regulations for interchange of equipment between interurban lines and between interurban and steam lines. Submit report for further consideration from accounting, operating and mechanical standpoints.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Reinforcing High-Speed Interurban Cars

BY W. J. BOWMAN, MASTER MECHANIC AURORA, ELGIN & CHICAGO RAILROAD, WHEATON, ILL.

Excessive racking throughout the bodies of some of the cars on the high-speed Aurora, Elgin & Chicago Railroad, Aurora, Ill., has been overcome with 712 lb. of steel reinforcement at a cost of approximately \$390 per car. An unfortunate combination of 60-ft. rails with staggered joints and approximately 30-ft. truck centers made car-body torsional strains especially severe on this road. These conditions, together with the high rates of acceleration and maximum speeds of more than 66 miles per hour required an unusually strong body structure to withstand the strains without movement ultimately developing in the framing. An exceptionally interesting series of experiments in car reinforcement was necessary

do this properly all inside finish had to be removed and at first wooden diagonals were placed at all possible points in the body. Tie rods also were provided at the intermediate partition and the end bulkheads, and the underframe was braced by laying diagonal flooring. A test of the car reinforced in this manner showed that while racking had been materially relieved the wooden bracing was insecure and, therefore, not permanent.

A continuous steel inside sheathing, bolted to the side sills and the window posts and extending up to the window stools, was then tried. This with tie rods at the two end posts and at the intermediate partition, was found insufficient. While it greatly reduced movement in the body it was not reinforcement enough to make the roof and the side plates as rigid as they should be. To stiffen this point $\frac{3}{8}$ -in. x 10-in. plates were provided on the window posts, which extended to the side plates,

REINFORCED INTERURBAN CARS—FIRST TYPE OF REINFORCING IN FRONT END OF CAR

REINFORCED INTERURBAN CARS—FIRST TYPE OF REINFORCING IN REAR END OF CAR

before the final form was adopted. These tests passed from the simple substitution of wooden knee braces to steel reinforcement weighing 2600 lb. and costing approximately \$765 to install. By a process of elimination and simplification, however, both the weight and the cost were brought down to the amounts before mentioned.

In the beginning one of the cars needing reinforcement was stripped of the seats and operated over various sections of the road to determine the points in the car structure where movement occurred. Some movement was observed in the underframe, which was of composite wood and steel construction, but the excessive racking and wearing was found to be in the body superstructure. Both at starting and stopping there was a tendency for the body above the side sills to move forward or backward, with the bottoms of the window posts as the pivotal points. After this test a decision was reached that the only way to correct the trouble was by cut-and-try methods, too many factors entering to make it a strictly engineering problem. Diagonal bracing in all three planes was found to be necessary to counteract completely all movement in the car body. To

thence along the roof of the deck sill. Similar plates were through bolted to the side plates and extended from the end bulkheads to points inside the body bolsters. A third longitudinal plate of the same section was bolted to the underside of the deck sill and also extended from the end bulkheads to points inside the body bolsters. All of these longitudinal plates were riveted to the vertical plates at the corner and window posts.

Transverse diaphragms consisting of angles, continuous from side sill to side sill and conforming to the car-body section, were introduced at the two end bulkheads and at the intermediate partition. Heavy gusset plates were riveted to these angles, and they were further reinforced to resist torsional strains by being riveted to the $\frac{3}{8}$ -in. x 10-in. window post plates. A view of this type of reinforcement is shown in an accompanying illustration. It will also be noted that the wooden diagonal brace extending from the double window posts at the window stools to the single window posts at the side sills were retained as side stiffeners.

All of this reinforcing steel weighed approximately 2600 lb., and the cost of material and labor to reinforce a car was approximately \$765. While this type of re-

REINFORCED INTERURBAN CARS—FRONT END OF CAR WITH GUSSET REINFORCING IN PLACE

REINFORCED INTERURBAN CARS—REAR END OF CAR WITH GUSSET REINFORCING IN PLACE

inforcement solved the problem, it was considered unsatisfactory because of its high cost and excessive weight. Tests were then made to determine how the weight and the cost of installation could be reduced without diminishing the effectiveness of the reinforcement. The first step was to reduce the $\frac{3}{8}$ -in. metal to $\frac{1}{8}$ in. and to substitute unit structures for the heavy plates at the alternate double window posts, at the intermediate partition and at the end bulkheads. The three types of these unit reinforcements are shown in one of the accompanying illustrations. With these the weight was reduced to 1420 lb. and the cost of installation was approximately \$500.

Essentially these unit reinforcements were made up of 6-in. 11 $\frac{1}{4}$ -lb. channels with flanged gussets at the side sills and at the side plates. At the double window posts the gussets extended 2 ft. 8 $\frac{1}{2}$ in. each side of the post, and the channels filled the space between the two posts. At the corner posts the gussets were set at right angles to each other and extended 3 ft. 1 $\frac{1}{2}$ in. along the car sides and 2 ft. 7 in. into the bulkheads at the floor line and completely across the car at the roof line. At the intermediate partition longitudinal and transverse gussets were required. The transverse gusset at the floor line extended 2 ft. 7 $\frac{1}{2}$ in. toward the center of the car body, and that at the roof, 2 ft. 10 $\frac{1}{2}$ in. All of these reinforcements were through bolted to the side sills and plates and to the window posts and cross-bearers. Two types of cars are being reinforced,

and for the one 53 ft. long, 8 ft. 8 $\frac{1}{2}$ in. wide with 34 ft. 3 in. truck centers the unit reinforcement was considered to be the simplest form because of the window-post construction.

The third stage in simplifying the reinforcement and reducing the weight included the elimination of the 6-in. channel members along the double window posts, and changing somewhat the dimensions of the gusset plates. As a substitute for this the double window posts which were made up of two members were provided with oak filler blocks continuous from the side sills to the side plates. These were through bolted to make them serve as a single member. The gusset plates were through bolted to the side sills and plates and to the cross-bearers. All gussets were also securely fastened to the faces of the window posts with wood screws. Movement in the roof between the side plates and the deck sills was eliminated by adding $\frac{1}{2}$ -in. x 1 $\frac{1}{2}$ -in. metal carlines to the wooden carlines over the double window posts. Bolted to each side of these were two angle braces of the same section, which were also through bolted at the side plates and the deck sills. Tie rods $\frac{5}{8}$ in. in section also extend between the side plates at the intermediate partition, and just over the door openings in the bulkhead two $\frac{1}{4}$ -in. x 2-in. tie rods were installed. The gusset plates at the end bulkheads were through bolted to the corner posts, side and end sills.

Reinforcing in the underframe in both types of cars consisted of diagonal braces between the cross-bearers in the floor system. The underframes of the original cars consisted of 9-in. I-beam side sills and two 6-in. I-beam center sills, and the transverse floor system was made up of all wooden members. A view of this type of reinforcement at the front and rear ends of a car 47 ft. 4 in. long, 8 ft. 8 in. wide and with 28-ft. 11-in. truck centers is shown in two of the accompanying illustrations. It will also be observed that the space between the two center sills was completely closed with 2-in. material to produce the same result as the diagonal bracing in the remainder of the floor system. The blocking between the center sills was secured by tie rods and spiked, and the diagonal floor braces were wedged down by separate blocks and spiked, to make them secure. This construction made the floor system very rigid and eliminated the weaving. In all twenty-five cars will be reinforced either with the gussets or with the unit system, depending upon the character of framing.

REINFORCED INTERURBAN CARS—UNIT TYPE OF REINFORCEMENT

Change from Half to Full Flanged Brakeshoes

BY R. E. HEWITT, MASTER MECHANIC SOUTHERN PACIFIC COMPANY ELECTRIC LINES, WEST ALAMEDA, CAL.

The standard brake shoe for motor cars used on the Oakland, Alameda and Berkeley electric lines of the Southern Pacific Company was a partially flanged shoe known as Y-1 manufactured by the American Brake Shoe & Foundry Company.

The trouble with this shoe was that if one of the flanges at the top or the bottom of the shoe broke off the shoe was apt to override the sides of the tire, which naturally shortened the shoe life and slightly reduced the braking power. This condition also had a detrimental effect on the tires, as the shoe at the point where the flange broke off had a tendency to wear into the throat of the wheel flange and caused the flange to wear sharp quite rapidly.

Last May a test was made of the K-280 diamond, steel-back, full-flanged brakeshoes manufactured by the same company, and the results obtained with this type of shoe were so satisfactory that it was deemed advisable to adopt them as standard for our motor cars.

At that time eight shoes of Y-1 type made a total of 16,592 miles, with an average mileage per shoe of 2074. Eight shoes of the K-280 type gave a total mileage of 34,195, with an average mileage per shoe of 4274.

The advantage of the full-flanged shoe is that it adheres to the contour of the tires at all times, causing the tires to wear more evenly and lessening the percentage of sharp flanges.

One-Man, Two-Man Cars for Spokane

Confronted by the problem of competing with the privately-owned automobile and the public jitney, the Washington Water Power Company, Spokane, Wash., has remodeled its large four-motor Brill cars which are in service in the "Falls City" for operation as near-side, pay-as-you-enter, one or two-man cars. Operating tests covering thirty days have shown the cars to be a great success from the public and the company's stand-

SPOKANE CAR—GENERAL PLAN OF CAR

points. The cost of the remodeling has been about \$300 a car, and a considerable decrease in operating cost has accompanied their use.

One of the problems in making over pay-as-you-enter cars into near-side cars is taking care of the long overhang at the rear end. This was overcome in the present case by reversing the car and changing the entrance and exit doors from one side to the other, leaving the longer overhang on the front. The motorman can thus watch for pedestrians and vehicles who might be in danger on account of the sweep of the car. The change leaves very little overhang on the rear.

In remodeling, the steps were lowered in all about 3 1/2 in., making the distance from the ground to the first step, 14 in.; the next step 13 in., and the step from the platform to the car 11 1/2 in. Two sliding doors are provided, the one where passengers enter being next the motorman. The other door serves as an exit. There is a small reflector light between the two front doors on the outside, which illuminates the steps. The sliding doors operate separately or in combination so that people getting off do not interfere with those getting on, each door sliding into a pocket between the entrance and the exit.

The rear portion of the car is divided off by means of a partition with a sliding door placed immediately in front of the rear longitudinal seat. This portion of the car is reserved for smokers. Many patrons who work in offices and stores where smoking is not allowed are taking advantage of this smoking compartment. The controller was allowed to remain at the rear end of the car for switching purposes. At the rear end of the car an emergency door with folding step was provided. This door is for use in case of accident only, and is held in place by a spring pin. A safety device was arranged so that if the pin is removed and the door opened a

SPOKANE CAR—CAR REMODELED FROM REAR-ENTRANCE PAY-AS-YOU-ENTER TYPE FOR NEAR-SIDE, ONE OR TWO-MAN OPERATION

SPOKANE CAR—REMODELED VESTIBULE, INTERIOR LOOKING TOWARD THE REAR, INTERIOR LOOKING FORWARD

quarter of an inch, an alarm gong rings near the motorman warning him to stop the car immediately.

There are two hangers for the trolley catcher at the back of the car; one located above the rear windows and the other in the regular position. The top one is used in case mischievous boys attempt to pull down the trolley. The cars are equipped with Esterline Golden Glow headlights, and Mazda lamps are used throughout. The lighting in the front vestibule is automatic. When the door opens to admit a passenger, one lamp in the car is switched off and another lights near the motorman to give him illumination for making change. The entrance and exit is equipped with white enamel grabhandles, which are conspicuous by night as well as by day.

In the distribution of labor with these cars shifts are arranged so as to provide two men on each car when traffic is heavy. In the preliminary tests of the system it was found that two and one-third men can do the work of four on lines with average travel, without loss of efficiency. Motormen and conductors break in for both ends of the car. The shifts are arranged so that there is an overlap between 7 and 9 a. m.; 11.30 a. m. and 1.30 p. m. and 4.30 and 7.40 p. m., making two runs of about nine hours each and a swing shift of about seven and one-half hours.

A scheme has been adopted by the company to curb the activities of "hold-up" men who might consider the late one-man cars, at the lonely ends of the line, as easy prey. A steel safe was placed in the basement of the company's bank, which fortunately is located at the traffic center of the system, to which a steel tube was run from the starter's booth. After 6 o'clock in the evening, when the conductors have accumulated an excess of money they deposit this in individual sacks bearing their names, when they come in from the ends of their lines. These sacks are returned to them at the receiver's office when they turn in at the end of their runs. The hold up men who "stick up" conductors in the outskirts hereafter will be able to secure only a few loose nickels and a bundle of cancelled tickets and transfers.

The remodeling of the cars as described above and the adopting of operating conditions to utilize them effectively have been carried out under the direction of R. A. Willson, general superintendent of railways Washington Water Power Company, who has furnished the above interesting particulars.

Telephone Dispatching Eliminated by Signals at Portland, Me.

By the installation of eight blocks of Chapman automatic signals on the Westbrook division of the Cumberland County Power & Light Company's Portland (Me.) lines, telephone dispatching has been eliminated and a saving of five to eight minutes has been made in the running time when a car has been delayed between Portland, Westbrook, South Windham and Gorham. The signals are of the standard illuminated semaphore type made by the Electric Railway Signal Company, Charles N. Wood Company, agents, Boston, Mass.

The Westbrook division consists in the main of a system of interurban tracks over which cars are operated on different routes at headways ranging from sixty minutes to fifteen minutes. About $2\frac{3}{4}$ miles out of Portland, at a junction designated as Rosemont, two main lines from the city are joined, the remainder of the route to Westbrook and beyond being by single track with the exception of an unsignaled double-track section in Westbrook 1.5 miles in length and 500 ft. of double track opposite the Westbrook carhouse.

The distance between turnouts on the division varies from 1000 ft. to 4000 ft. There are three railroad crossings on the single-track lines and two crossings of the

TYPICAL SIGNAL NEAR PORTLAND, ME.

local electric railway belt line. Certain cars are routed in or out of Portland via Woodford's and others via Brighton. In general a headway of fifteen minutes is maintained on the main line and the Brighton and Woodford branches into the city and the same interval is maintained out of town as far as the Westbrook carhouse. Under normal conditions one car an hour is run to South Windham and one to Gorham, from Portland, with a similar service inward. The distance from Westbrook carhouse to Portland is about 6.5 miles via either Woodford's or Brighton. A telephone is installed at every turnout, but is seldom needed. In general, the setting and restoring contacts are located in the trolley wire about 90 ft. inside the switch point, on both the siding and the main line. The signals include the usual counting-in feature, and while the installation is standard in general arrangement, it illustrates the convenience of automatic equipment of this kind in facilitating the movement of traffic over single-track routes with and without branches.

Operating Cost of Forced Draft Heaters Less than 2 Mills Per Car-Mile

Through the courtesy of the Empire United Railways the following data on the cost of operating Peter Smith hot-air heaters have been made available for the winter ending Feb. 23, 1915:

Fuel:	
Coal—68,642 lb.....	\$214.22
Unloading coal, 68,642 lb. at 10 cents per ton..	3.43
	\$217.67
Maintenance:	
Two armatures, at \$24.....	\$48.00
Twelve motor brushes at \$0.25.....	3.00
Eight grates at \$1.50.....	12.00
Six brush-holder springs at \$0.05.....	.30
One commutator-end ball bearing.....	3.50
Total material.....	\$66.80
Labor on repairs, estimated.....	10.00
	76.80
Total cost	\$294.47
Mileage made by cars from date of installation of heaters	
	170,937
Cost per car-mile.....	\$0.00172
Cost per car a day, averaging 300 miles.....	\$0.517

The heaters used are of the Peter Smith type, and are equipped with $\frac{1}{2}$ -hp. blower motors.

They are employed in cars formerly equipped with as much as $15\frac{1}{2}$ kw. capacity in electric heaters.

A Thermostatic Time Element

A device designed to operate in connection with a relay and intended for use with any electrical circuit where it is desired to operate a time element for any specified time interval of from thirty seconds to five minutes has recently been placed on the market by the Protective Signal Manufacturing Company, Denver, Col. This operates upon the principle that a rod of metal when heated by an electric current of a certain amperage will increase its length by a given amount in a given time, and will thus make possible the closing of a pair of contacts at any desired time after current is first applied to the heating coil.

In the device there is an operating rod that is wound

ELECTRIC TIME ELEMENT

with high-resistance insulated wire through which a current of electricity is passed, thereby generating heat and causing the rod to expand. After a known time interval the end of the rod makes contact with an adjusting screw. As soon as the contact is made the relay is energized and the outside controlling circuit is closed. The thermostatic circuit is thereby opened, allowing the thermostat to cool and the operating rod to return to its normal position.

The heating or operating unit is inclosed within a dustproof and moisture-proof casing and is protected from the outer casing by an insulated heat-resisting tube. It is not affected by the surrounding temperature of the atmosphere, owing to the fact that the two basic metals that are used in the construction are of the same density and of similar characteristics so that expansion and contraction due to atmospheric changes is the same for both metals. The device can be wound for any voltage from 6 to 110. Adjustment of the time interval is determined by the distance between the contact points at the end of the operating rod and at the end of the adjusting tube, depending primarily, of course, upon the amount of current applied which is constant in any particular installation. The adjusting screw is equipped with a micrometer thread and the screw can be withdrawn, increasing the space between the two contacts until the desired time is consumed between the application of current and the closing of the contact. The over-all dimensions of the unit are 8 in. x $2\frac{1}{2}$ in. x $2\frac{1}{2}$ in., and it weighs 2 lb. complete.

A Simplified Trolley Catcher

The "Q-P" trolley, manufactured by the Q P Signal Company of Needham Heights, Mass., now being sold exclusively by the Lord Manufacturing Company, New York City, is a simplified device that has been perfected to reduce the maintenance costs that have frequently been involved with such devices. There are actually only four principal parts that are essential to the operation of the apparatus, these being a rope reel that is cast integral with the square centrifugal hub and the ratchet, the housing, the pawl, and the involute tension spring. The ratchet teeth are deep and substantially

GENERAL VIEW OF SIMPLIFIED TROLLEY CATCHER AND PHANTOM VIEW
SHOWING MECHANISM

designed, and the open rope reel affords easy access to the trolley rope, eliminating the chance of interference by snow and ice. Among the distinctive features are the quick action of this device (catches after a rise of only $4\frac{1}{2}$ in. above the trolley wire), the weight of only $10\frac{1}{2}$ lb., the simplicity that accompanies the use of only four principal parts, and an automatic lock which operates when the catcher is removed from its socket, thus preventing any possibility of injury to passengers or employees or damage to the trolley catcher or to other parts of the car equipment.

Single-Truck, Center-Entrance, Low-Step Car at Glens Falls, N. Y.

Through the courtesy of A. E. Reynolds, general manager Hudson Valley Railway, Glens Falls, N. Y., the Laconia Car Company, Boston, Mass., is demonstrating the operating advantages of its stepless center-entrance car. This car was placed in service on Nov. 30, and it is planned to have it remain in Glens Falls for about one month during which period it will be operated over one of the lines, at all times of the day and night, to demonstrate its ability to meet all kinds of physical and service conditions.

The low-step doorway, the center-entrance feature and the thoroughly modern equipment of this car has attracted very favorable notice among the Glens Falls public. The car is especially popular with the old and infirm, many of whom have told the conductors that they would be willing to travel downtown regularly if the car were to continue in operation in their district.

The principal dimensional figures on this car may be summarized as follows: Length over all, 33 ft.; width, 8 ft. 2 in.; height, only 10 ft.; wheelbase, 15 ft.; wheel diameter, 28 in.; clear width of doorways at center of car, 3 ft. 3 in.; step from pavement to car well, 14 in.; inside step to longitudinal aisle, $11\frac{1}{4}$ in.; number of seats, 44; width of cross-seat, $35\frac{1}{2}$ in. The present weight of the car at Glens Falls is 26,000 lb., but even with the present motor and air brake equipment the weight can be brought to 24,200 lb., or less than 550 lb. per seated passenger. Reductions are possible in the weight of the trucks by omitting the emergency doors at the ends of the car, which are not required, and also by omitting the pockets for the center-entrance doors. In ordering cars of this type it will be optional

with the purchaser to use double outside folding doors or outside sliding doors.

The radial-axle truck, which is built under license from the Philadelphia Holding Company, has a 15-ft. wheelbase and is of forged steel throughout. One of its most important features is the care taken to make

NEW LOW-STEP CAR—FIG. 1—GENERAL LAYOUT OF TRUCK

use of standard double-truck car parts such as journal boxes, wedges, bearings, brakeshoes, wheels and axles. The brake applications also are made just as on a double-truck car with no tendency to throw the axles out of alignment. As shown in Fig. 1, this truck is really a pair of single-axle trucks because the diagonal bar which connects them is simply a safety appliance with a reciprocating joint therein to allow for uneven action in going over special work, in and out of curves, over rough track and the like. Each truck is capable of throwing the axle 18 in. out of its normal center line.

Attached to each truck on the pivot side is a swing link fitted on the bottom with a half-ball joint on the end of a suspension hanger. The upper end of this swing link is pivoted to the car body and the lower end is pivoted directly under the journal box on the pedestal tie. On the opposite end is the pivot which is connected to the car body. Under this pivot is a spring acting in conjunction with a frictionless bearing to allow free radiation of the truck without bringing any torsion on the springs. Fig. 2 shows the pivot side of this truck

SINGLE-TRUCK, CENTER-ENTRANCE, LOW-STEP CAR AT GLENS FALLS, N. Y.

in side elevation and an end view or section through the link. The heavy line in the diagram shows this link in its normal running position on tangents, while the dotted line shows its position when the truck is in the middle of a 35-ft. radius curve. In the section the link is represented by the letter *E*, the suspension hanger

second pair of helical springs parallel to and outside of the first pair of helical springs. The inner helical springs take the jar or impact of wheel movement, which is absorbed finally by the semi-elliptic springs; the outer helical springs are designed to care for the ordinary vibration of the car body.

The motors are hung as on standard trucks so that they have no other duty than to propel the car. They are not required to take the thrust of operating around curves or the stresses due to braking.

On the whole, the motion of the car is found to be non-galloping and non-nosing. The wheels have an easy, natural movement, which does not cause abnormal binding on the rail or special work.

The following equipment is included on this car:

Air brake (Featherweight).....	Westinghouse
Anti-climbers.....	Hedley
Buzzers.....	Consolidated
Curtains.....	Curtain Supply
Hand straps.....	Rico Sanitary
Headlights.....	Neal
Heaters.....	Consolidated
Heat deflectors.....	Consolidated
Motors, 40 hp. with P. K. control.....	Westinghouse
Sand boxes.....	Kilburn
Seats.....	Heywood-Wakefield
Stanchions.....	Ellcon
Starting signal.....	Consolidated
Thermostat.....	Consolidated
Ventilators.....	Automatic
Wheels.....	Griffin

NEW LOW-STEP CAR—FIG. 2—DETAILS OF SUSPENSION AND LINK

by *C*, the half-ball joint by *F*, the nut at the top by *G* and the spring follower on the top of the spring, working in conjunction with *G*, by *H*. This section shows the relative position of link and hanger on a maximum curve.

The frictionless ball joint is represented by *B* and the sliding fulcrum point on the car body by *D*. Casting *D* is lubricated by means of an oil well similar to that used on the later type of motors. The swivel or pivot is shown at *A*. The bearing casting is secured to the cross-member of the car as in the case of an ordinary center plate.

The movement set up between the body spring hanger and the frictionless pivot when the car enters and leaves a curve is shown in an accompanying drawing, Fig. 3.

The spring system is another most original feature. On each side of a journal box is a pair of helical springs which carry a saddle upon which a semi-elliptic spring is mounted. From the ends of this saddle extend a

Cost of Roadway Machinery and Tools

In the cost sheets filed by the Bay State Street Railway of Boston, Mass., with the Massachusetts Public Service Commission in connection with the pending fare case are given the company's investments in roadway machinery and tools, as of Nov. 1, 1914. Extracts from these costs are tabulated below, the figures representing the cost of the equipment in the field, exclusive of overhead charges during installation.

Item	Unit Cost
Wharton portable crossover, 110-lb. rail.....	\$825
Wharton portable crossover, 60-lb. rail.....	385
No. 4 Duntley electric track drill.....	254

No. 14 Ransome motor-driven concrete mixer.....	740

A point worthy of note in connection with the testing of cables having large thicknesses of dielectric is the difficulty of determining with certainty whether or not some water has entered through a flaw or other damage to the lead covering. The hydraulic test at 100 lb. per square inch reduces the risk, but the whole matter is one of degree. An amount of water that would ruin many yards of low-tension cable may be distributed among a few of the outer layers in a thick dielectric, and its path of least resistance will be longitudinal rather than radial. Under these conditions it is a matter of actual experience that electrical tests may entirely fail to indicate the presence of water, although this may exist in sufficient amounts to cause trouble when it has had time to distribute itself.

NEW LOW-STEP CAR—FIG. 3—DIAGRAM SHOWING DIS-PLACEMENT OF AXLE ON CURVES

News of Electric Railways

COMMISSION INQUIRY TAKES NEW TURN

Story of Attempt to Influence Signal Contract Awards for the New Rapid Transit Lines

The Legislative investigating committee inquiring into the workings of the Public Service Commission for the First District of New York took up during the week ended Dec. 18 the connection of Commissioner Wood with the letting of the contracts for signals for some of the new rapid transit lines.

On Dec. 15 the investigation took an unexpected turn. On that day Walter D. Uptegraff, president of the Union Switch & Signal Company, of Swissvale, Pa., testified that the board of directors of his company had refused in July, 1914, to pay \$5,000 to Sidney G. Johnson, vice-president, in charge of sales of the Union, which sum Mr. Johnson is said to have told Mr. Uptegraff he wanted to give to Commissioner Wood in order to induce Mr. Wood to vote for the Union system of signals on the Center Street loop of the new subway. Following this incident, Col. H. G. Prout, then president of the company, and Mr. Johnson resigned. Mr. Uptegraff also testified that shortly before Commissioner Wood became a member of the Public Service Commission the Union Switch & Signal Company, at Mr. Johnson's suggestion, paid him \$1,500 for helping the company to secure a contract with the Kansas City, Clay County & St. Joseph Railroad. The cancelled check that figured in this transaction was entered in evidence.

On the same day Travis H. Whitney, secretary of the commission, testified as to the proceedings in the letting of the signal contracts, their dates, the conferences on the subject, etc., the questions asked Mr. Whitney being directed toward building up the case against the commissioner.

On Dec. 16 Mr. Johnson, who is now vice-president of the General Railway Signal Company, was a witness. He accused Mr. Wood of demanding \$5,000 from the Union Switch & Signal Company for using his influence as commissioner to give that company the contract for installing the signal system in the Center Street Loop. Mr. Johnson said that he told Mr. Wood that he (Johnson) had no authority to talk with Mr. Wood on a matter of that kind and that on this account he could not say what could be done. Mr. Johnson said that he merely transmitted to the directors the proposal that had been made of a payment in the interest of Mr. Wood. The directors promptly rejected it. Mr. Johnson and Mr. Uptegraff have been subpoenaed to appear before the grand jury and tell their stories.

Colonel Prout would not discuss the matters in anticipation of his appearance before the committee as a witness.

Commissioner Wood denied to the newspapers the story as told by Mr. Johnson. He said:

"Johnson's story is absolutely false. It is all news to me, and I know nothing about it."

MR. BAMBERGER'S TRIP EAST

Julian Bamberger, president Salt Lake & Ogden Railroad and vice-president Salt Lake Terminal Company, Salt Lake City, Utah, returned recently to Salt Lake from a visit of more than a month in the East. In anticipation of the erection in the near future of a joint terminal depot for the Orem and the Bamberger electric lines in Salt Lake, Mr. Bamberger spent a goodly portion of his time inspecting the terminal facilities of the interurban systems in the larger cities. His report will be considered by the directors of the terminal company.

While away Mr. Bamberger placed an order for six all-steel passenger coaches for the Salt Lake & Ogden Railroad, especially for the travel to the Lagoon summer resort, which is located on the line. These cars will have a seating capacity of eighty passengers. They are expected to be delivered not later than May 1.

Mr. Bamberger also made a study of block signal systems, as the company of which he is president expects some time during the coming summer to install automatic block signals on the sections of single track still remaining between Salt Lake and Ogden.

THREE-WIRE DISTRIBUTION FOR SPRINGFIELD

The Springfield (Mass.) Street Railway has decided to convert its present overhead trolley circuits to the three-wire system, following an investigation of electrolysis conditions in the city by the United States Bureau of Standards. The bureau advised the change and upon receipt of its report the company employed the Stone & Webster Engineering Corporation, Boston, Mass., to study the situation and discuss the recommendations of the government engineering experts. Stone & Webster agreed with the conclusions of the bureau. In announcing the company's plan to change over the system, Clark V. Wood, president, said:

"Instead of sending current out from the power station to the trolley wire and returning it through the tracks and negative return, that is, making the trolley positive and the track negative, the trolley is split up into insulated sections, connected alternately with the positive and negative side of the system. With this system the current is delivered from the power station to the positive sections of the trolley and returned through the negative sections of the trolley and the feeders to the power station. The main current does not return to the power station through the rail, the only current in the rail being from the rail in the positive trolley sections to the rail in the negative trolley sections, so that the only current returned to the power station through the rail would be a small one due to the load on the positive sections being greater than the negative, or vice versa. The effect of this arrangement is much the same as would be obtained by a large number of small substations. This system has been in operation for a number of years in Europe, especially in Germany. This work will be done in conjunction with the Bureau of Standards. Mr. McCollum of that bureau recently said before the Western Massachusetts Association of Electrical Inspectors that the three-wire system possesses some very attractive features."

Work on the reconstruction of the overhead system will begin immediately. The exact cost of making the change and the length of time that will be required to complete the work are not known.

I. C. C. REPORT PRESENTED

Commission Wants to Enlarge—Recommendation Renewed Regarding Control Over Capitalization

The annual report of the Interstate Commerce Commission, made public on Dec. 13, contains, in addition to complete details of decisions rendered and court cases involving its decisions during the year, a comprehensive statement on the progress being made in the work of valuation of railroads throughout the country. The commission, in its recommendations, calls attention to the fact that the variety and volume of work already devolved upon it necessitate early enlargement of its membership and express statutory power to act through subdivisions.

The commission renews its recommendations that there should be provided by law one period, preferably three years, for the beginning of all actions relating to transportation charges subject to the commission act; that the commission should have right of access to carriers' correspondence files; that there should be appropriate and adequate legislation upon the subject of control over railway capitalization; that the minimum penalty for violation of the hours of service act be fixed at \$100, and that the use of steel cars in passenger service be required and the use in passenger trains of wooden cars between or in front of steel cars be prohibited.

The progress and character of the work of the commission on the valuation of railroads is dealt with exhaustively. The last report stated that eight roadway and track parties had been organized in each of the five districts into which the country has been divided for the purpose of valuation work and that the total mileage covered was from 1500 to 1700 miles per month. It was further stated that the number of parties would probably be increased to sixteen or twenty. It was believed that the overhead organization

should handle approximately 50,000 miles per year and that this number of parties would be required to accomplish that mileage.

BALTIMORE COMPANY REPLIES TO COMMISSION

Letter of President House to Commission Discussing Wheelguards, Vestibules, Etc.

The United Railways & Electric Company, Baltimore, Md., through William A. House, the president, has addressed the Public Service Commission of Maryland with respect to the recent report of Bruce W. Duer and Charles E. Phelps, Jr., transportation expert and chief engineer, respectively, of the commission. Except for the salutation the letter of Mr. House follows in full:

"I wish to state that this company has given the fullest consideration to the recommendations made in the report of Messrs. Duer and Phelps. While we have endeavored to make clear the position heretofore taken by the company with respect to the wheelguards with which its cars have been equipped—this type of wheelguard being the best adaptable to the character of paving (cobblestone) prior to the operations of the paving commission, upon the streets traversed by its cars—we are now willing and prepared to install upon the cars one of the latest approved types of wheelguard, and will proceed with this installation at first upon those lines throughout which the improved pavement has been laid, completing the work by Dec. 31, 1916.

"With respect to the fenders, to which Messrs. Duer and Phelps refer, while the minor alteration suggested by them is considered by the company's officials as more or less of a refinement, we will be pleased to meet their wishes and make the changes suggested coincident with the work of installing the wheelguards.

"As to inclosing the platforms of the semi-convertible, open platform equipment, you, of course, are aware that this company purchased and placed in service, during the latter part of 1914, upon its St. Paul Street, Linden Avenue and West Arlington lines, the inclosed platform type of semi-convertible cars.

"You also doubtless recall my statement before your honorable commission, at the time this company obtained permission for the issuance of its \$1,000,000 of 5 per cent notes, in June, 1914, that it was the company's purpose gradually to inclose the platforms of its cars, and that part of the proceeds of this note issue was to be used for this purpose, beginning in 1915.

"In view of the industrial, financial and commercial depression, however, which 'set in' in the fall of 1914, it was deemed advisable by the management to curtail any expenditures other than those necessary to maintain the physical condition of its property and equipment at the highest standard of efficiency. It, therefore, deferred taking any steps looking to the prosecution of this work.

"In view of the encouraging business outlook and as Messrs. Duer and Phelps, in their report above referred to, have recommended that these platforms be inclosed, and, further, as it is the desire of the management again to take this question up, the company will proceed to inclose all the vestibules of its semi-convertible, open platform cars.

"We regret, however, that we do not agree with Messrs. Duer and Phelps as to the time within which this work may be accomplished, particularly in view of the fact that it must be done at the company's shops in conjunction with the general maintenance and repair work of equipment, and we find, after most earnest and careful consideration of the matter, that it is impossible to make the alterations in these cars faster than twelve a month. Moreover, to comply with the recommendation of Messrs. Duer and Phelps would require the withdrawal of too many cars from the service at one time, with resultant inconvenience to the traveling public. We will, therefore, beginning April 1, 1916, the interval between the present time and the date named being necessary to organize shop forces, prepare patterns, and work out incidental details, take in hand the work of vestibuling all the semi-convertible, open platform cars and prosecute it at the rate per month above stated. We trust that the above will meet with your approval and that we shall be so advised."

HYDRO-RADIAL BY-LAW BEFORE TORONTO VOTERS ON JAN. 1

After discussing the subject for nine hours, the City Council of Toronto, Ont., on Dec. 8, by a vote of eighteen to four, decided to submit the hydro-radial by-law to the people on New Year's Day. If the taxpayers are content to allow the city to guarantee bonds to the amount of \$4,240,000 and other municipalities do likewise for their respective share of the cost of the proposed undertaking, estimated at \$13,734,155, the Hydro-Electric Power Commission of Ontario will proceed to construct an electric radial railway from Toronto through western Ontario.

The principal point at issue, so far as Toronto is concerned, according to the discussion, is whether that section of the radial line within the city limits should be under the control of Toronto or the Hydro Commission. This point became especially prominent owing to the fact that the proposals of the Hydro Commission conflicted with the recommendations made by the engineers who prepared the local Toronto transit report referred to in the *ELECTRIC RAILWAY JOURNAL* of Dec. 11, page 1183. Works Commissioner Harris, in addressing the Council regarding the recommendations of the local traffic commission, said it was of paramount importance that the city should have absolute control over all electric railway lines within the limits of the city. If the hydro-radial plan were adopted the recommendations made by the local engineers would have to be considerably modified. Instead of the city having control over the radials entering its borders, that power would be in the hands of the Hydro Commission.

F. A. Gaby, the hydro engineer, explained that the Hydro Commission would secure a right-of-way along the water front sufficient for four tracks, and adequate for the accommodation of the civic lines. There would be absolutely no need for duplication. The only difference would be that the Hydro Commission would control the radial lines as trustees for the owners, the people residing in all municipalities served by the lines. So far as the initial cost was concerned, the estimates in both reports were identical. Toronto would have to pay the cost of the lines and terminals constructed within its borders and its proportionate share of the cost of the main lines. The only point of difference was that of control, and the Hydro Commission desired that Toronto should have absolute control over its own transportation system and leave the radials to the commission.

Regarding the existing radials, Sir Adam Beck stated that the owners of all of them, from Windsor on the west to Prescott on the east, had approached the Hydro Commission with reference to buying them out. If it was the desire of the people of Toronto to acquire the Toronto & York Radial Railway, Metropolitan Division, they should seek the co-operation of the outside municipalities and request the Hydro Commission to endeavor to acquire the line. He further stated that should the commission acquire the Guelph line of the Toronto Suburban Railway, there would be no necessity to construct the line along the water front at the present time, as the owners of that line had the right to enter the city by way of Bathurst Street. The commission, however, would have to build the water front line when it constructed a radial line to Hamilton.

During the discussion it was disclosed that the traffic report prepared by Messrs. Harris, Gaby and Couzens for Toronto would cost the city approximately \$50,000. The decision of the Council to support the hydro-radial scheme means that this report will probably be shelved for some time. It was decided to refer the city report to the special committee on transportation, but in view of the fact that no action can be taken on any of the recommendations made until after January it is unlikely that anything more will be heard of the city report until some time next year.

Final details in connection with the hydro-radial by-law were dealt with at a special meeting of the Mimico Village Council on Dec. 7. Everything was explained to the satisfaction of the Council and the by-law was passed on second reading. In Stratford the by-law has had the first two readings and been sent on to the ratepayers. The Berlin City Council and Waterloo Town and Waterloo Township have voted in favor of submitting similar by-laws.

ALBANY ARBITRATION DECISION RENDERED

Arbitration Board Refers to Differences as Trivial and Condemns Strike as Unwise

The committee composed of Lynn J. Arnold, Cornelius F. Burns, Mayor of Troy, and William E. Woollard, which was appointed to settle the dispute between the United Traction Company, Albany, N. Y., and its employees, rendered its decision on Dec. 11. The committee declared unanimously that, under the disputed section of the agreement, the company had the right to dispose of complaints through a general superintendent or division superintendent; that the method of C. A. Coons, the general superintendent, did not violate the agreement, except that in cases involving suspension of employees it was established that the men had been denied the right of a personal hearing before the general superintendent.

The arbitrators concluded their finding as follows:

"We find from the agreement and from the evidence and statements before us:

"1. That under Sec. 6 of the agreement the company had the right to dispose of all complaints against its employees in the first instance, through a hearing and determination by the general superintendent or by a division superintendent.

"2. That the new method of procedure in discipline cases instituted by Mr. Coons did not violate the provisions of Sec. 6, except as stated in the third finding.

"3. That in the cases heard by a division superintendent, reported by him to the general superintendent and decided by the general superintendent, directing suspension, there was a violation of the provisions of Sec. 6 in that the employee was denied the right of a personal hearing before the general superintendent. In other words, we hold that each employee has the right to be heard in person and with counsel, by the official of the company who is to give judgment of suspension, before such judgment is passed.

"The public interests require that we should say this in conclusion:

"There was no necessity for a strike. The calling of a strike was unwise. It caused great inconvenience to the general public. If the trivial differences could not have been settled by conferences between the parties directly interested, they should have been settled by arbitration before calling a strike. Public service corporations and their employees must remember that they are not the only parties in interest. There is a third party to be considered, the public, who, by their nickels, support the transportation corporation, and thereby support the employees of such a corporation."

FASTER SCHEDULES IN BUFFALO—OTHER IMPROVEMENTS

As the result of a recent conference between E. G. Connette, president of the International Railway, Buffalo, N. Y.; E. J. Dickson, vice-president; N. H. Brown, general superintendent of transportation, and T. W. Connette, general superintendent of the Buffalo city lines, a faster car schedule has been put into effect and seventy cars have been added to the various lines throughout the city.

Two new substations are now in course of construction, and \$150,000 will be spent to increase the capacity of the five substations now in operation. In the spring three more plants will be added to the equipment of the International Railway, making ten substations located in widely separated parts of the city.

A new heating system has already been installed in 360 cars. Heaters are being placed near the conductors, who stand just inside the car in the near-side type of pay-as-you-enter cars, and in the front vestibule. Since April 1 the company has spent more than \$1,250,000 in bringing the service, roadway and equipment up to the highest possible standard of efficiency.

Commenting on the comprehensive plan for the improvement of the service, Mr. Dickson said:

"Between April 1 and Dec. 1 much track was reconstructed, new paving laid, single tracks made double and other improvements carried out. Service on these streets has been greatly improved: Linwood Avenue; Grider Street, new double tracks; Harvard Place; Delavan Avenue; Abbott Road; Niagara Street; West Ferry Street;

Allen Street; Military Road, and Elmwood Avenue. Improvements have also been made at Niagara Falls, N. Y., and at Tonawanda, North Tonawanda and Lockport. In all we have spent more than \$1,250,000 in bringing the service, roadway and equipment up to the highest possible standard of efficiency."

The company is seeking permission from the Council to construct an extension across the southerly half of Kenmore Avenue between Kenmore Avenue and Main Street.

PRESIDENT LILIENTHAL'S COMMANDMENTS

Jesse W. Lilienthal, president of United Railroads, San Francisco, Cal., has adopted five commandments which he says must rule dealings of himself and his employees with the public. They are:

Accept loyally and without reservation the now universally proclaimed doctrine that a public utility is the servant of the people. Our courts of last resort have so declared.

Give affairs of the public utility the widest publicity. The public is entitled to know what you are doing and how you are getting along.

Treat your employees fairly and, so far as your resources will permit, generously.

Keep out of politics. I realize how great the temptation is to do just the contrary, for the public utility is the target for the politician.

Appeal to the public for fairness and justice. Deem it your right and duty to influence public opinion. Complain of the wrongs done you. Expose the methods of corrupt or unfair politicians. Combat the arguments of muckrakers and pseudo-reformers. Never allow an untrue charge to remain unchallenged. Circularize the public.

STORM DELAYS TRAFFIC

New Haven's Electric Zone Prostrated—Many Suburban Trolleys Suspend

The storm which prevailed over the Central West and the Great Lakes district during the latter part of the week ended Dec. 12 moved eastward and extended over almost the entire Atlantic coast on Dec. 13 and 14. It seems to have spent its fury, however, in the Hudson River Valley between Albany and New York and in the New England States west of Springfield, Mass.

The storm was ushered in with rain and a falling temperature. Then followed snow and an increase in wind velocity so that very unusual conditions were presented. On Dec. 14 Albany reported 20 in. of snow. In New York the fall averaged only 7 in. On the morning of Dec. 14 New York, Brooklyn, Staten Island and suburban New York reported practically all lines in operation.

The most complete suspension of service in New York was on the lines of the New York, New Haven & Hartford Railroad. This company did not begin to return to normal conditions until after noon on Wednesday. The electric zone was practically out of business, the few trains that were run being hauled by steam locomotives. The storm seemed to be the most severe between New Rochelle and Stamford, or 20 to 25 miles along the electrified main line of the New Haven. Here many poles carrying telegraph and telephone wires were blown down. Heavy transmission lines for electric current and contact wires were either burned in two or grounded in five places. Signal wires at many places were down, requiring trains to move slowly. Between New Haven and Boston the storm was not quite as heavy and the line was more nearly in a normal condition. On the other hand the New York Central Railroad succeeded in keeping open its electric zone to Harmon, and the New York, Westchester & Boston Railway was affected only for a few hours through the failure of its power supply from the New Haven road.

In Albany trolley traffic was blocked during the rush hours on the evening of Dec. 13. Electric railway traffic from Albany to Troy was stopped shortly before midnight on Dec. 13. The Cohoes, Green Island and Lansingburg lines also were stalled. Traffic on the Schenectady-Albany line was intermittent. The Albany Southern Railway had to cancel several trains. In Rensselaer the cars were kept running but nowhere near schedule time.

Reports from Troy, Schenectady, Gloversville, Poughkeepsie, Glens Falls, Pittsfield and other cities indicate conditions in those places varying for the most part but slightly from those experienced in Greater New York and Albany.

TERMINAL IMPROVEMENT PLANS FOR LOS ANGELES COMPLETED

Plans for elevated tracks and terminal improvements for the Pacific Electric Railway have been completed and the scheme has been approved by the Board of Public Utilities, which had previously ordered the company to execute, on or before July 1, 1916, whatever work was deemed necessary to relieve congested interurban traffic. An elevated steel structure approximately 2000 ft. long, carrying three tracks, will be erected along Sixth Street from the station at Main Street to San Pedro Street. Elevated loading and unloading platforms will parallel these tracks for about 1100 ft. These will support steel and reinforced concrete umbrella sheds, will have reinforced concrete decks and will be connected to the elevated tracks by steel and reinforced concrete bridges. Extensive alterations to the passenger station will be necessary to carry out the scheme. Exclusive of signal systems and tracks the cost is estimated at \$166,000. It has not been decided whether the general structural work will be done by contract, but bids for steel and other materials are now being taken. For immediate relief of the congestion of traffic temporary tracks and sheds to cost about \$7,000 will be constructed near the station. Plans are also being prepared for an umbrella shed and rearrangement of tracks at the western division station on Hill Street near Fourth Street.

MORE PEACE TALK IN WILKES-BARRE

Continued efforts to arrive at some definite solution acceptable to both sides in the Wilkes-Barre (Pa.) Railway strike have marked the work of the peacemakers. No attempts at violence have been made recently, except an attack by twenty armed men on the power plant of the company which has been used as a barracks for the men replacing the strikers. The disturbance took place in the dark of early morning, and while a shower of lead was poured into the building no serious damage was done and no one was injured. A number of policemen were quickly on the scene and dispersed the mob. No arrests were made.

The latest development in the peace proposals was a conference of two hours between T. A. Wright, general manager of the Wilkes-Barre Railway, and W. D. Mahon, president of the Amalgamated Association. This meeting was later followed by two others, and it is said that much progress was made toward settling the strike. It is understood that the company insists that the legality of the repudiation of the wage award by the arbitrators be adjudicated by a court, a judge or a lawyer. The men in return are asking, it is said, for a discipline clause which will protect the strikers from discrimination if peace comes.

PHILADELPHIA TRANSIT LOAN ELECTION ON FEB. 8

Ninety million dollars will be borrowed by the city of Philadelphia, Pa., subject to the approval of the people, to finance municipal improvements and developments to be inaugurated or continued during the next two years, under the terms of a loan ordinance introduced into Councils recently and favorably reported by the finance committee. A special election will be held on Feb. 8, 1916, when the citizens will vote upon the proposed loan, which will greatly increase the city's indebtedness. Of the total amount to be borrowed, \$45,000,000 will be applied to the construction of the Broad Street subway and the Frankford elevated line, "and the construction of such other subway and elevated railways as shall be authorized by Councils."

To expedite the passage of the loan bill Councils unanimously adopted resolutions calling for stated sessions each Thursday until the end of the present year. Should any change be decided upon, the bill will be amended at one of the meetings. It was expected that on Dec. 16 the loan bill would pass both chambers. It is expected that Mayor Blankenburg will sign it without delay, and the thirty-day period for advertising will be ended in time for the election. In a message to Councils, sent before the loan bill was

reported, Mayor Blankenburg transmitted a request from Director of City Transit Taylor that a special election be held to consider a \$50,000,000 transit loan. The incorporation of \$45,000,000 in the \$90,000,000 will be satisfactory, it is believed. A. Merritt Taylor, director of city transit, says that with the amount asked it will be possible to complete the Broad Street, Frankford, Woodland Avenue and Parkway lines.

TENTATIVE SUBWAY PLAN IN PITTSBURGH

The City Council of Pittsburgh, Pa., has adopted a tentative plan for proceeding with the proposed downtown subway loop. A committee of the Council, in conference with the city law department, has prepared the following suggestions which, in the form of a resolution, will be presented to the newly-organized Council early in January:

1. Shall the city treat first with private corporations with the view of having the project undertaken by private capital on the basis of giving the municipality reasonable compensation for the franchise?

2. Shall we have an act prepared for introduction in the Legislature in 1917 authorizing the municipal ownership plan, and in the meantime seek to unite sentiment upon a measure and get through with as many of the preliminaries as possible?

3. Shall we, in the event of deciding upon municipal ownership, proceed at once to hold conferences with private corporations which might lease the subway with the view of securing agreements as to rental, etc.?

This discloses that the city does not have sufficient law now to build the subway itself and that a year's time, at least, would be saved by the private enterprise plan. There is ample authority now, of course, for building the tube privately.

It has been estimated that the proposed subway would cost about \$5,000,000. It is regarded as time for general recognition that the downtown subway is the first thing to be provided in any system for the relief of the traffic congestion. Differences over the plans for the building of a subway by the city resulted in the Governor vetoing two measures for that purpose passed at the last session of the Legislature.

CONVENTION OF AMERICAN ASSOCIATION OF ENGINEERS

At the first national convention of the American Association of Engineers held in Chicago, Dec. 10 and 11, 1915, Arthur Kneisel, secretary, reported that the membership had grown to 330 since the association's inception six months ago. F. H. Newell, professor of civil engineering, University of Illinois, and a former director of the United States Reclamation Service, addressed the association on the constructive work which an organization of all the engineers of this country could do. Other speakers were W. D. Wilcox, president of the association, G. Willard Rich of Rochester, N. Y., and J. H. Prior, chief engineer of the State Public Utilities Commission of Illinois. A banquet was held on the evening of Dec. 10.

FURTHER FRANCHISE DISCUSSION IN TOLEDO

Frank E. Seagraves, who has had forty years of experience in the construction and operation of city and suburban railways, spoke before the subcommittee of Mayor-elect Milroy's street railway committee at Toledo, Ohio, on Dec. 7. He declared that he had voted against the Dotson franchise because he believed it would have settled only one question, namely, the length of the grant. Mr. Seagraves urged that any franchise granted be put into language that can have but one interpretation, and that experienced railway builders be employed to make the valuation on which the fare shall be based. He urged a fair franchise for a term of twenty-five years, but expressed the opinion that the property was worth less than \$14,000,000, for which it is bonded. He thought that seven tickets for a quarter would be adequate. The Central Labor Union has adopted a resolution not to act in the street railway matter until the Milroy committee makes its report. A committee has been appointed by the City Council to communicate with the State Public Utilities Commission in regard to making an appraisal of the street railway property for franchise purposes.

Operation Begun by Portland & Oregon City Railway.—Operation has been begun by the Portland & Oregon City Railway, Portland, Ore., between Milwaukee and Carver.

New Florida Line Opened.—The Miami (Fla.) Traction Company has placed in operation the first section of its line. The system as at present proposed provides for 3½ miles of line.

Can't Give Railway Away.—The voters of Port Vue, Pa., have rejected the proposal of Gilbert F. Myer, general manager of the Port Vue Street Railway, who offered the 1-mile line of the Port Vue Street Railway to the borough with all equipment if the borough would agree to operate the line for five years.

Appraisals for Rate Purposes Only in Ohio.—The Public Utilities Commission of Ohio will make no more appraisals of public utility properties unless it is necessary to do so in order to determine rate contests. Under a law enacted last winter the commission may use its judgment as to making appraisals.

Hearings Before Whole Commission in New York.—On motion of Commissioner William Hayward, hearings before the Public Service Commission for the First District of New York will hereafter be set down for conduct before the whole commission, instead of being assigned to individual commissioners.

Abandonment of Short Line Permitted.—On an opinion by Commissioner Frank Irvine the Public Service Commission for the Second District of New York has permitted the Binghamton Railway to abandon its line on Glenwood Avenue between the intersection of Downs and Glenwood Avenue and Prospect Street in Binghamton. The track to be abandoned is about 600 ft. long.

Lincoln Company Seeks to Suspend.—The Lincoln Railway & Heating Company, Lincoln, Ill., has applied to the State Public Utilities Commission for permission to discontinue all street railway service in the city, upon the grounds that it is working under a daily loss and that debt is accumulating. No date has been set as yet for the hearing of the case by the State Public Utilities Commission.

Strike on Depew Line Still in Progress.—U. L. Upson, superintendent of the Buffalo & Depew Railway, Buffalo, N. Y., is acting as motorman and conductor on a car operating over the line between certain hours of the day. As previously reported in the *ELECTRIC RAILWAY JOURNAL*, the employees of the company are on strike for increased wages. Traffic has been abandoned for several weeks. No disorder has been reported.

Extension of Time for Installing Signals on New York Elevated.—The Public Service Commission for the First District of New York has adopted an order extending the time during which the Interborough Rapid Transit Company is to make an experimental installation of a system of signaling on the elevated railroads operated by it. The order directs the company to make such an installation by Feb. 1, 1916, and to report the result of the test to the commission by Aug. 1, 1916.

Interurban Interested in Cincinnati Rapid Transit System.—The receivers of the Interurban Railway & Terminal Company have requested permission to study the plans and reports pertaining to the proposed rapid transit belt line in Cincinnati. On Dec. 10 City Engineer Krug replied to a criticism made by W. L. Woodward of the plans now under consideration. Mr. Woodward contended that persons in certain parts of the outskirts would be forced to go down-town in order to reach other outlying points. Mr. Krug said that the surface lines, which are to be a part of the belt, will take care of this matter.

Company Wins Brooklyn Third-Tracking Case.—A decision favorable to the Brooklyn (N. Y.) Rapid Transit Company was rendered on Dec. 9, by ex-Judge Charles F. Brown, who sat as referee in the Fulton Street elevated railway third-tracking case, which was brought before him on the protest of property owners along the line of upper Fulton Street. Under ex-Judge Brown's opinion the railroad's solid girder type of construction is entirely legal, and the way is thus opened for the Public Service Commission to approve the plans for the third-tracking of the Fulton Street elevated line of the company below Nostrand

Avenue with the same type of construction as that used north of that point. All this work had been held up pending the decision of the referee.

Report on Cleveland Railway Funds Requested.—The Council of Cleveland, Ohio, has adopted Councilman Wood's resolution requesting a report from Street Railway Commissioner Peter Witt on the status of the Cleveland Railways operating, interest and maintenance funds, together with funds available for paying over-expenditures. According to the company the interest fund had shown an increase of \$200,036 for the last ten months, and by Jan. 1, 1916, about \$100,000 more will be added to it. Since March 1, 1913, a deficit of \$558,876 has accumulated in the maintenance fund. This is in the shape of over-expenditure and will have to go over to the new administration.

Hot Springs Prosperity Week Celebration.—The celebration that attended Electrical Prosperity Week at Hot Springs, Ark., the national health and pleasure resort, was perhaps the most elaborate of its kind ever held there. Stephen Mather, assistant secretary of the Interior, and Dr. W. P. Parks, superintendent of the United States Reservation, represented the government. The Business Men's League, the Merchants Association and all lines of trade took part in the parade on the night of Dec. 2. One of the features of the parade was the exhibition of the Hot Springs Street Railway, which had in line a mule-drawn street car used thirty years ago followed by a modern, double-truck car brilliantly illuminated with colored electric lights and occupied by young girls who sang patriotic songs.

Seattle Litigation Ended by Court Decision.—Judge Charles E. Claypool, in the United States District Court, in Seattle, Wash., has found judgment of \$41,700 against the city of Seattle, in favor of the Seattle, Renton & Southern Railway for the changing of the grades on Rainier Avenue. The plaintiffs, represented by William R. Crawford, former president of the Seattle, Renton & Southern Railway, claimed damages of more than \$400,000 as a result of the regrading. Judge Claypool also finds that the company should be required to adjust its tracks to the new grades of Rainier Avenue, without further payment from the city, and that the company is not entitled to any judgment for the paving of the 18 ft. of the center of Rainier Avenue, from Jefferson Street to the south city limits, but that under the provisions of its franchise it may be required to pave that 18 ft., with the same material and at the same time that the city paves the remaining portions of the street. The court held further that the Seattle, Renton & Southern Railway has no right to the exclusive use of the right-of-way on Rainier Avenue, between Jackson Street and Ryan Street, with the exception of that portion lying between Kenyon and Thistle Streets. This decision ends litigation that has been in progress for six years.

Franchise Problems in San Francisco.—M. M. O'Shaughnessy, city engineer of San Francisco, Cal., in a statement to the Board of Supervisors on Dec. 9 declared that there is no probability of an agreement being reached between the city and the United Railroads for the use of upper Market Street by the proposed Church Street municipal car line. Mr. O'Shaughnessy recommends that litigation be started to compel the company to give the city line the right to use this thoroughfare, as in the event of a different routeing being necessary the additional cost will amount to approximately \$110,000. The matter was taken up with the United Railroads by the Mayor and the city attorney early this year, but no satisfactory arrangement could be made. In response to an inquiry sent the United Railroads by the city on Nov. 3, it is reported that Jesse W. Lilienthal, president of the company, replied that the proposed method would mean a loss of \$157,935.50 per annum to his company; that his company is advised that the franchise under which it is operating forbids the use of United Railroad tracks, or the construction of parallel tracks by a foreign company for a distance of more than five blocks on any street; and that the very life of his company depends on the correctness of this view. The same issue will be brought up again when the Twin Peaks Tunnel is completed, the city engineer points out. He proposes that the city purchase the lines of the United Railroads where future municipal extensions are planned.

Financial and Corporate

ANNUAL REPORTS

Chicago Elevated Railways Collateral Trust

The income statement of the Chicago (Ill.) Elevated Railways Collateral Trust for the year ended Dec. 31, 1914, follows:

Dividends	\$1,109,798
Interest	718,250
Gross income	\$1,828,049
Interest on notes and debentures	\$1,310,000
General expense	33,350
Total disbursements	\$1,343,350
Net income	\$484,698
Dividends on preferred	480,000
Surplus income	\$4,638

The report states that the \$30,000,000 of the three-year 5 per cent notes of the trustees, issued under date of July 1, 1911, matured and were paid on July 1, 1914. In order to raise the funds to make this payment the trustees sold the following securities: (1) \$12,500,000 of the first mortgage 5 per cent bonds of Northwestern Elevated Railroad, due in 1941, being part of the total issue of \$25,000,000 held by the trustees; (2) \$14,000,000 of two-year 5 per cent notes issued by the trustees under date of July 1, 1914, secured by a pledge of substantially all the capital stock of the Northwestern Elevated Railroad, the Metropolitan West Side Elevated Railway and the South Side Elevated Railroad; (3) \$7,000,000 of ten-year 6 per cent debentures issued by the trustees under date of July 1, 1914.

In connection with the sale of \$12,500,000 of bonds of the Northwestern Elevated Railroad above mentioned, the remainder of that issue (\$12,500,000) was deposited in escrow with the Central Trust Company, New York, under an arrangement whereby they can be released only against permanent improvements upon the property of the Northwestern Elevated Railroad and that company is relieved from paying interest on them until released.

The refinancing of July 1, 1914, together with the decrease in net earnings of the subsidiary companies (caused largely by decreased traffic and increased operating expenses), resulted in a diminished income to the trustees, and they felt obliged to discontinue payment of dividends on the preferred participation shares until conditions should improve. No dividends have been paid on those shares since June 1, 1914.

During the year the trustees acquired the following securities (exclusive of bills receivable of the subsidiary companies), which are included among the current assets: \$16,000 of Chicago & Oak Park Elevated Railroad equipment 6 per cent notes; \$504,000 of Chicago & Oak Park Elevated Railroad receiver's certificates; \$174,000 of Metropolitan West Side, Northwestern and South Side Elevated Railroad 5 per cent equipment trust certificates dated Aug. 1, 1914, Series "B," and \$1,000 South Side Elevated Railroad 4½ per cent bond.

The income statement of the trust above submitted does not indicate the full amount of the net earnings of the subsidiary companies, but only that portion which was received by the trustees by way of dividends from those companies. The combined income statement of the Metropolitan West Side Elevated Railway, the South Side Elevated Railroad and the Northwestern Elevated Railroad was published in the ELECTRIC RAILWAY JOURNAL of Dec. 4. The Chicago & Oak Park Elevated Railroad continues to be operated by Samuel Insul, as receiver, for the United States District Court.

Eastern Pennsylvania Railways

According to the consolidated statement of income, profit and loss of the Eastern Pennsylvania Railways, Pottsville, Pa., and its subsidiary companies for the twelve months ended June 30, 1915, the gross earnings for the year were \$825,455, and operating expenses and taxes, \$486,570, leaving net earnings from operation, \$338,885. Interest and rental charges were \$227,783, giving a net profit for the year of \$111,102.

Compared with the year ended June 30, 1914, the gross earnings showed a decrease of \$960 or 0.12 per cent. The operating expenses decreased \$16,917 or 3.36 per cent, and the net profit for the year increased \$12,192 or 12.33 per cent. The earnings of the railway department decreased \$26,469 or 4.84 per cent, which was caused by the general depressed business condition prevailing throughout the territory served by the company, curtailment of mining operations, and jitney competition. This decrease was slightly more than offset by an increase of \$26,609 or 9.82 per cent in the earnings of the electric department, which is accounted for by an increased number of lighting and power contracts made during the year. The earnings of the gas department increased \$99 or 1.56 per cent, while the revenue from the park department decreased \$1,199 or 50.41 per cent.

During the year there was expended for maintenance \$123,437, of which \$82,485 was for the railway department, \$39,896 for the electric department and \$1,055 for the gas department. There was also charged to capital account during the year \$107,376 for the railway department and \$33,733 for the electric department, making a total of \$141,110.

SECURITIES TO BE DISTRIBUTED

Bondholders' Protective Committee of Trenton, Bristol & Philadelphia Street Railway Will Divide Bonds and Stock Among Holders of Deposit Certificates

The bondholders' protective committee of the Trenton, Bristol & Philadelphia Street Railway, Philadelphia, Pa., composed of John Redwood, Grier Hersh, S. C. Rowland, W. F. Sadler, Jr., C. N. Martin, W. A. House, C. T. Crane and Robert Toland, has concluded that the time has arrived to distribute the securities of the company among the holders of certificates of deposit representing bonds of the predecessor company. In August, 1909, the property and franchises of the Philadelphia, Bristol & Trenton Street Railway were purchased at public sale for the bondholders' committee. The committee then organized the Trenton, Bristol & Philadelphia Street Railway to take over the property, the members of the committee, with one or two exceptions, being the directors.

When the present company acquired the property it issued \$350,000 of notes to the committee, to be later refunded by bonds. On March 1, 1913, an issue of \$750,000 of first mortgage bonds having been authorized, \$406,000 of bonds were issued in temporary form to the committee to refund the above-mentioned notes, together with \$56,000 of accrued interest thereon to Jan. 1, 1913. The company further issued its note for \$4,200 to refund the interest on the \$350,000 of notes from Jan. 1, 1913, to March 1, 1913. Since that date no interest has been paid on the bonds or note, the earnings being required for improvements, and the interest has simply been carried on the company's books as a liability. It is proposed now to cancel this liability, exchange the \$406,000 of temporary bonds for permanent engraved bonds, and issue \$4,800 of additional bonds to refund the above-mentioned note and accrued interest to March 1, 1915. This will give the committee \$410,800 of first mortgage bonds for distribution among those who are holding the certificates of deposit.

The present stock is \$325,000 in \$50 shares. Nearly \$90,000 of earnings has been spent for new construction and permanent improvements. It is proposed to increase the authorized stock to \$500,000 and to issue \$85,800 of additional stock to capitalize a like amount expended for permanent improvements. This will give the committee \$410,800 of stock for distribution among the holders of certificates of deposit.

Since there are outstanding \$632,000 of certificates of deposit, the foregoing plan of distribution will entitle the holder of each \$1,000 face amount of certificates of deposit to receive \$650 in first mortgage bonds and \$650 in stock of the present company. The new securities will be exchanged for the certificates of deposit on this basis at the Union Trust Company of Maryland, Baltimore, Md., on and after Dec. 15. Funds for the payment of the first semi-annual interest coupon on the new bonds, dated

Sept. 1, are now on deposit with this trust company.

When the present company first took over the property and franchises of the Philadelphia, Bristol & Trenton Street Railway, extensive repairs were necessary to keep the line going, and as the company had little or no credit of its own it was necessary to use all of the earnings for upkeep, new construction and permanent improvements. During the last five years the roadbed has been largely rebuilt with new ties and rail, the overhead line overhauled and power house additions made. Practically every bridge has been rebuilt, either by the company alone or in conjunction with the public authorities. The break in the line at the Borough of Bristol requiring the operation of two separate lines was connected about two years ago, which has resulted in increased traffic and a decrease in operating expenses. The earnings for the five years are said to show gratifying results.

Aberdeen (S. D.) Railroad.—The Aberdeen Railway, which was sold at receiver's sale last August, is now succeeded by the Aberdeen Railroad. Of authorized issues of \$250,000 of stock and \$100,000 of bonds, \$100,000 and \$12,000 respectively have been put out.

Barcelona Traction, Light & Power Company, Barcelona, Spain.—Arrangements have been made in Toronto and London to exchange interim certificates representing 5 per cent ten-year notes for the interest coupons of Dec. 1, 1914, and June 1, 1915, on the 5 per cent first mortgage bonds of the Barcelona Traction, Light & Power Company. The discharge of the interest in this manner is in accordance with a resolution previously adopted by the bondholders, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 17.

Brooklyn (N. Y.) Rapid Transit Company.—The New York Stock Exchange has listed \$20,000,000 of six-year 5 per cent secured gold notes of the Brooklyn Rapid Transit Company sold last October, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9.

Central Park, North & East River Railroad, New York, N. Y.—Judge Dickinson, in the United States District Court at Philadelphia, on Dec. 1 dismissed the \$2,000,000 suit of Richard B. Kelly, a minority stockholder, against George W. Elkins and the estates of P. A. B. Widener and Thomas Dolan, for alleged neglect of duty as directors of the defunct Central Park, North & East River Railroad in New York City. The court held that recovery was barred by the statute of limitations. Permission was granted the plaintiff, however, to move within thirty days to amend his statement in an effort to bring it within the six-year statutory period.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—Federal Judges Landis and Geiger have ordered the Chicago & Milwaukee Electric Railroad sold at receivers' sale on April 1. This company, which has been in the hands of receivers for several years, was sold in 1912, but a resale was ordered on account of the suppression of bids.

Detroit (Mich.) United Railway.—The Detroit United Railway has received authority from the Michigan Railroad Commission to issue \$3,500,000 of 5 per cent collateral trust notes, dated Feb. 6, 1916, and maturing on May 5, 1918. A part of the proceeds will be used to retire \$2,000,000 of collateral trust two-year notes due on Feb. 5, 1916, and for betterments and extensions. The notes had been sold to William A. Read & Company, subject to the approval of the commission.

Eastern Pennsylvania Railways, Pottsville, Pa.—The Pottsville Union Traction Company, which is owned and operated by the Eastern Pennsylvania Railways, recently filed with the Pennsylvania Public Service Commission a certificate of notification regarding the proposed issuance of \$56,000 of second mortgage thirty-year 6 per cent gold bonds dated Feb. 1, 1913. The bonds will be delivered to the Eastern Pennsylvania Railways to reimburse that company for betterments and additions made by it to the lines of the subsidiary company.

Eastern Texas Electric Company, Beaumont, Tex.—The Eastern Texas Electric Company has called for payment on Jan. 1, at par and interest, its \$500,000 of three-year 6 per cent notes due on July 1, 1916. The holders of these notes have taken the larger part of a new issue of \$500,000

of three-year 6 per cent gold coupon notes dated Dec. 1, 1915, and due on Dec. 1, 1918, but callable as a whole at 100 and interest on thirty days' notice. Stone & Webster, Boston, Mass., are offering these new notes at 99 and interest, to yield 6.37 per cent.

Empire United Railways, Inc., Syracuse, N. Y.—A new committee representing holders of Rochester, Syracuse & Eastern Railroad first mortgage 5 per cent bonds has been formed to further the proposed reorganization plan described in the *ELECTRIC RAILWAY JOURNAL* of Dec. 11. The members are: W. L. Smith, A. N. Ellis, D. R. Cobb and E. F. Brown. The Central City Trust Company, Syracuse, and the Equitable Trust Company, New York, have been appointed depositaries for the bonds.

Fort Wayne & Springfield Railway, Decatur, Ind.—The property of the Fort Wayne & Springfield Railway was sold on Dec. 2 at receiver's sale to Charles H. Worden, trustee, Fort Wayne. Mr. Worden is vice-president of the First National Bank, Fort Wayne, and in his purchase represents his bank and other interests which held receiver's certificates of the company. For the present the road will continue operation on practically the same basis as when operated by the receiver, French Quinn, for the last three years. Just what will ultimately be done by the new owners has not yet been determined. The trustee has appointed Sam W. Greenland as general manager of the property, the road to be operated by Mr. Greenland in connection with his present office of general manager of the Fort Wayne & Northern Indiana Traction Company.

Illinois Traction System, Peoria, Ill.—It is reported that the board of directors of the Illinois Traction System has authorized the issuance of \$257,000 of 5 per cent debentures, due in 1925, the proceeds being required for discharging obligations of the company. The Bloomington, Decatur & Champaign Railroad has applied to the Illinois Public Utilities Commission for an order authorizing the issue of \$500,000 of its Series A preferred stock. The St. Louis, Springfield & Peoria Railroad has applied to the commission for an order authorizing the issue of \$1,000,000 of its Series A preferred stock. Both companies are controlled by the Illinois Traction System.

Interborough Rapid Transit Company, New York, N. Y.—Lee, Higginson & Company and N. W. Harris & Company, Boston, and Kissel, Kinnicutt & Company, New York, are offering \$25,000,000 of first and refunding mortgage 5 per cent gold bonds of the Interborough Rapid Transit Company, dated 1913 and due on Jan. 1, 1916. These bonds are callable at 110 and interest on any interest date in any amount for the sinking fund, or at the option of the company either as a whole or in blocks of not less than \$500,000. It is estimated that about \$32,000,000 of additional bonds will be issued to provide for the completion of the rapid transit construction authorized between the city and the company, and of these additional bonds \$5,000,000 are included in the \$25,000,000 now being offered.

Kansas Electric Utilities Company, Lawrence, Kan.—It is now announced that the Kansas Electric Utilities Company will take over in fee the properties owned and operated as the Parsons Railway & Light Company, the Emporia Railway & Light Company and the Lawrence Railway & Light Company, and these companies will be dissolved after the transfer of properties. A previous note referring to the amalgamation was published in the *ELECTRIC RAILWAY JOURNAL* of Nov. 27. The Kansas Electric Utilities Company has an authorized stock issue and an authorized bond issue of \$1,750,000. This company will be controlled by the Consolidated Utilities Company, a holding company being organized under the laws of Delaware, and it will be operated by the Albert Emanuel Company, Dayton, Ohio, Mr. Emanuel being the new president.

Norton & Taunton Street Railway, Norton, Mass.—Pursuant to a decree of the Supreme Court of Massachusetts for the County of Suffolk the property of the Norton & Taunton Street Railway will be offered for sale under foreclosure on Jan. 7, 1916, at Norton to satisfy a first mortgage, under which the American Trust Company is trustee for the bondholders. The upset price is fixed at \$75,000 and the purchase must be made subject to taxes, unpaid current liabilities of the receiver, etc.

Petaluma & Santa Rosa Railway, Petaluma, Cal.—The Petaluma & Santa Rosa Railway has applied to the California Railroad Commission for authority to issue additional 6 per cent coupons to be attached to second mortgage bonds payable on April 1 and Oct. 1, 1916, and April 1, 1917. There are 250 of these bonds outstanding, of the denomination of \$1,000 each.

Philadelphia Company, Pittsburgh, Pa.—The New York Stock Exchange has authorized the listing of an additional \$1,400,000 of common stock whenever issued and paid for in full. The total amount listed is now \$39,900,000. The stock in question has been sold for general purposes, since the notes for the conversion of which it was reserved have been paid.

Public Service Corporation of New Jersey, Newark, N. J.—The Bergen County Board of Freeholders having voted to take over the 7½-mile Bergen Turnpike between Hackensack and the Hudson County line, the Public Service Corporation of New Jersey has turned this over to the county for \$1, and will give a bond to assure the payment of \$1,000,000 of 5 per cent bonds issued in 1901 by the Bergen Turnpike Company. The Jersey City, Hoboken & Paterson Railway, now merged with the Public Service Corporation of New Jersey, owned a majority of the stock of the turnpike company and guaranteed its bond issue.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The July 2, 1915, coupons on the \$2,134,000 of "Oakland Traction Consolidated" general consolidated mortgage gold 5 per cent bonds of 1905, due in 1933, of the San Francisco-Oakland Terminal Railways may be now cashed from funds deposited with the Wells Fargo Nevada National Bank, San Francisco, and the National Park Bank, New York. Previous items with reference to deferred coupon payments of this company appeared in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11, Oct. 23 and Oct. 30. Funds for the payment of all matured coupons are now on deposit with the agents of the company, with the exception of those on the \$3,177,000 of Oakland Traction Company general consolidated mortgage sinking fund 5 per cent bonds of 1907, due in 1935, and the \$1,587,000 of San Francisco, Oakland & San José Consolidated Railway general consolidated mortgage sinking fund 5 per cent bonds of 1908, due in 1938. The company will continue as heretofore the accumulation of daily deposits to pay interest.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—The Cities Service Company has called for payment on Dec. 27 at par and accrued interest the outstanding \$718,000 of St. Joseph Railway, Light, Heat & Power Company 6 per cent sinking fund stock trust certificates. On Dec. 1, 1914, \$1,118,000 of these certificates were issued and sold, with the Guaranty Trust Company as trustee, a certain amount being retired each month by a sinking fund. The last of the certificates is due May 20, 1917.

Syracuse & South Bay Electric Railroad, Syracuse, N. Y.—The sale of the Syracuse & South Bay Electric Railroad and the Syracuse, Watertown & St. Lawrence River Railroad is to take place on Jan. 21. These two companies were placed in the hands of Ernest Gonzenbach as receiver earlier in the year, as noted in the *ELECTRIC RAILWAY JOURNAL* of May 29.

United Railroads of San Francisco, San Francisco, Cal.—The United Railroads of San Francisco has applied to the California Railroad Commission for authority to issue \$1,800,000 of 6 per cent two-year promissory notes, and \$2,250,000 of 5 per cent gold bonds to mature in 1924 as security for the notes. The notes are to redeem the balance due on the Market Street Cable Railway bonds issued in 1882 for \$3,000,000, of which sum \$1,200,000 has been paid.

Utah Securities Corporation, New York, N. Y.—The Utah Securities Corporation has deposited with the Guaranty Trust Company, New York, \$3,000,000 to purchase for retirement as many of the company's ten-year 6 per cent notes as can be obtained with that sum. Tenders of the notes will be received up to Dec. 22. The deposited cash was secured by the sale of \$3,000,000 of 7 per cent first preferred stock of the Utah Power & Light Company to the Electric Bond & Share Company. The tenders in the case of the \$1,000,000 cash deposited for notes up to Dec. 2 ran as high as 93.5 and interest.

Vera Cruz Electric Light, Power & Traction Company, Vera Cruz, Mex.—The net earnings of the Vera Cruz Electric Light, Power & Traction Company for 1914, converted at the parity of exchange, leave a balance, after meeting all expenses and debenture interest, of £34,980. Owing to the heavy loss of £33,960 in exchange, however, the available balance of profit is reduced to £1,020, to which should be added the balance of £12,997 brought forward, making £14,017. This, owing to the present conditions in Mexico, the directors propose to carry forward. The directors report that, notwithstanding the continued political disturbance in Mexico, the property of the company has suffered no damage. The supply of power from the Puebla Tramway Light & Power Company commenced in January, 1915, and practically the whole of the company's power is now obtained from that company. The extension of the tramway system has now been completed and is working satisfactorily.

Wellsville & Buffalo Railroad, Buffalo, N. Y.—The Wellsville & Buffalo Railroad was incorporated on Dec. 10 with \$850,000 of capital stock. Its purpose is stated to be the operation of 85 miles of steam, gasoline or electric railroad from Wellsville to Buffalo. The directors include C. A. Finnegan, Theodore Hofeller and Abraham Weber, who recently purchased the abandoned line of the Buffalo & Susquehanna Railway between Buffalo & Wellsville. This purchase was mentioned in the *ELECTRIC RAILWAY JOURNAL* of Dec. 11 as being made from the Buffalo & Susquehanna "Railroad," but this company has been reorganized as the Buffalo & Susquehanna Railroad Corporation and is quite distinct from the Buffalo & Susquehanna "Railway," which was the property sold to the syndicate above mentioned.

Winona Interurban Railway, Warsaw, Ind.—A protective committee composed of J. D. Mortimer, S. J. Straus, M. W. Babb and S. C. Hubbell is asking for deposits of the \$750,000 of twenty-year first mortgage 5 per cent gold bonds of 1905 of the Goshen Division of the Winona Interurban Railway on or before Jan. 15 with the Central Trust Company of Illinois, Chicago, as depository under an agreement dated Dec. 4, 1915. A plan for the readjustment of the bonded indebtedness of this company, so as to insure the payment of interest on the present income, was described in detail in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9. Pending negotiations under this plan, the Oct. 1 interest on the \$1,593,700 of bonds of the Peru Division was not paid.

York (Pa.) Railways.—The York Railways has issued a notice calling for the surrender of all dividend scrip on Jan. 30, 1916. Payment at par and accrued interest will be made by Brown Brothers & Company, New York. The company also has purchased, it is said, about all of its \$500,000 of one-year 6 per cent notes maturing on Feb. 1, 1916 (renewed from Feb. 1, 1915), and after that date will be practically without debt except as to first mortgage bonds. The company has increased the number of directors from seven to nine and elected John E. Zimmermann and Charles H. Bean to the newly-created places.

DIVIDENDS DECLARED

American Cities Company, New York, N. Y., 1½ per cent, preferred.

Boston & Worcester Electric Companies, Boston, Mass., \$1, preferred.

Capital Traction Company, Washington, D. C., quarterly, 1¼ per cent.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Duluth-Superior Traction Company, Duluth, Minn., quarterly, 1 per cent, preferred.

Eastern Power & Light Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

El Paso (Tex.) Electric Company, 3 per cent, preferred; quarterly, 2½ per cent, common.

Manila Electric Railroad & Light Corporation, Manila, P. I., quarterly, 1½ per cent.

New Orleans Railway & Light Company, New Orleans, La., quarterly, 1¼ per cent, preferred; one-half of 1 per cent, common.

New York State Railways, Rochester, N. Y., quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Springfield Railway, Light & Power Company, Springfield, Mo., quarterly, 1¾ per cent, preferred.

Toronto (Ont.) Railway, quarterly, 2 per cent.

Twin City Rapid Transit Company, Minneapolis, Minn., quarterly, 1¾ per cent, preferred; quarterly, 1½ per cent, common.

Union Traction Company, Philadelphia, Pa., \$1.50.

West India Electric Company, Ltd., Kingston, Jamaica, quarterly, 1¼ per cent.

Traffic and Transportation

COMPANY LOSES TRENTON FARE CASE

Commission Disapproves Withdrawal of Six-for-a-Quarter Tickets—Appeal to Supreme Court

The Board of Public Utility Commissioners of New Jersey on Dec. 14 handed down its decision in the case in which the city of Trenton sought to prevent the Trenton & Mercer County Traction Corporation from withdrawing from sale its six-for-a-quarter tickets. The board holds "that the proposed withdrawal of the sale of six tickets for 25 cents by the Trenton & Mercer County Traction Corporation, and the increase, change or alteration in charge, rate or classification which would result therefrom is not just and reasonable and disapproves the same."

Under date of Aug. 13, 1915, the company notified the board that it proposed to discontinue the sale of the tickets and charge a 5-cent fare, and in a later communication advised the board that the change would become effective on Aug. 20. On Aug. 17 the board entered an order suspending the increase. The company then appealed to the United States District Court for an injunction to restrain the commission and the city from interfering with the elimination of the six-for-a-quarter tickets. Meanwhile the commission on account of the court action continued its hearing without taking testimony. Subsequently the court recognized the jurisdiction of the commission in the case. The commission then proceeded with the hearings. These hearings were reviewed briefly in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30, page 931, and Nov. 20, page 1058. The company expects to take the case to the Supreme Court for review.

CONTENTION THAT ILLINOIS UTILITIES ACT IS UNCONSTITUTIONAL

In a cross-bill filed in the Circuit Court in the suit commenced by the city of Chicago questioning the jurisdiction of the Illinois Public Utilities Commission, the attorneys for the surface railways in Chicago contend that the commission act is unconstitutional. The filing of this cross-bill puts the railway companies and the city in the position of complainants and the Public Utilities Commission as defendants. The complainants in the cross-bill include the Chicago City Railway, the Chicago Railways, the Calumet & South Chicago Street Railway and the Southern Street Railway. The bill sets forth that the provision of the utilities act giving the commission control over the street railways of Chicago, violates the section of the State constitution, which confers this jurisdiction upon cities. It also declares that the legislative, executive and judicial powers conferred upon the commission are contrary to the constitution. A question is also raised as to the validity of the provision which constitutes the Circuit Court of Sangamon County a court of appellate jurisdiction. The cross-bill states further that the enforcement of the commission's service order would prevent the companies from meeting traffic demands during the rush hours and would cause intolerable delay, annoyance and inconvenience to the traveling public. The bill finally asks the court to decree that the order of the commission is null and void.

The salient features of the order issued by the commission fixing service standards in Chicago were referred to in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, page 775.

WESTERN RAILROADS GRANTED RATE INCREASE

Substantial increases in the interstate passenger fares for the railroads operating in the western territory were granted by the Interstate Commerce Commission on Dec. 11, 1915. While this advance in rates does not entirely meet the formal application filed by the carriers, the increases range from 0.25 cent to 1 cent per mile. The railroads affected by this order were instructed to file new passenger tariffs on Jan. 15, 1916. The findings of the commission were as follows:

1. In the States of Illinois, Wisconsin, Michigan, Minn.

sota, Iowa, Nebraska, Missouri, north of the Missouri, and in Kansas north of the main line of the Union Pacific, a basis of 2.4 cents a mile for interstate fares is justified.

2. In Missouri south of the river and in Kansas south of the Union Pacific, a basis of 2.6 cents a mile is justified.

3. Increases in mileage prices of one-fourth of a cent a mile are allowed in the territory north of the Missouri River and the Union Pacific, and one-half of a cent south of the river and the railroad.

4. Proposed increases from Illinois, Michigan, Iowa, Minnesota, Wisconsin, Nebraska, Missouri and Kansas to points east are allowed.

5. Increases allowed on fares to far west from points in western territory.

OPERATING STATISTICS IN SAN FRANCISCO AND LOS ANGELES

A detailed comparison of street car traffic in San Francisco and in Los Angeles has recently been made by the California Railroad Commission. The figures for San Francisco railways include the United Railroads, Municipal Railway and the California Street Cable Railway, but those for Los Angeles do not include the Pacific Electric Railway, as that road handles interurban business almost exclusively and the comparison is intended to include local traffic only. The operating statistics for the two cities for the year ended June 30, 1915, are as follows:

	San Francisco	Los Angeles
Passenger car-miles	30,587,629	29,261,200
Passenger car-hours	3,591,611	3,128,042
Regular fare passengers	201,574,155	125,939,865
Revenue transfer passengers	1,517,360	125,939,865
Total revenue passengers	203,089,515	42,965,583
Free transfer passengers	79,234,452	168,905,448
Total all passengers	282,323,967	\$6,203,161
Passenger revenue	\$10,044,930	\$0.04925
Average fare, revenue passengers	\$0.04946	\$0.03558
Average fare, all passengers	\$0.03558	\$0.21195
Revenue from transportation per car-mile	\$0.32839	\$1.98308
Revenue from transportation per car-hour	\$2.79677	

One-Man Car in North Ballard.—The Loyal Railway, operating a 2-mile street railway in North Ballard, Wash., has been authorized by the Public Service Commission to operate a one-man car.

Application to Charge 2 Cents a Mile.—After a hearing in Pittsburg, the Public Utilities Commission in Kansas gave the Joplin & Pittsburg Railway ten days in which to file an inventory of its physical property for use in determining rates. The company has asked permission to charge 2 cents a mile.

Proceed Signal by Whistle.—A new detail of the safety-first campaign of the Dallas (Tex.) Consolidated Electric Street Railway is the adoption of whistles for signals to be used by conductors when preceding cars across railroad crossings. The motorman has been signalled in the past by the conductor waving his arm.

Traffic Circulars in New York.—The Fifth Avenue Coach Company, New York, has published a guide to Central Park in New York. The important features of the park are described and many of them are illustrated. The booklet is being sold to the public for 10 cents and the net proceeds, so the company announces, will be turned over to the Public Schools Athletic League of New York City.

Skip-Stop Agitation in Richmond.—Many patrons of the Virginia Railway & Power Company, Richmond, Va., have written to the company recommending that the skip stop be tried in Richmond. In its publication, *Public Service News*, the company says that the adoption of the skip stop on Richmond lines serving residential sections would save passengers from five to ten minutes in either direction.

Ontario Board's Order Set Aside.—The Toronto & York Radial Railway's project of crossing the sidewalk on the west side of Yonge Street at Farnham Avenue, Toronto, Ont., so as to provide a southern terminal at this point has been decided in favor of the city of Toronto by the decision of the First Divisional Court delivered on Dec. 8, in which the Ontario Railway Board's order authorizing the deviation is set aside.

Electric Holidays Reduce Fares for Holidays.—In order to stimulate holiday travel the Texas Traction Company, the

Southern Traction Company and the North Texas Traction Company have put into effect a passenger tariff providing round-trip rates to the chief shopping centers of slightly less than one and one-third fare. This is the first time the electric railways have met the customary reduction of the steam roads during such rush seasons.

Commission Refuses Pittsburgh Transfer Request.—The renewed request of the Twenty-seventh Ward Progressive Club, Pittsburgh, Pa., that the Pittsburgh Railways be compelled to extend transfer privileges has been refused by the Public Service Commission of Pennsylvania on the ground that the transfers would do no more than save a walk of one or two city blocks, whereas granting the privilege asked might seriously congest traffic.

Auto Feeder in Hot Springs.—The Hot Springs (Ark.) Street Railway has established permanent auto-bus transportation between the city and the Golf and Country Club. Hot Springs has, perhaps, the finest full course golf links south of the Mason and Dixon line, and the increased patronage made it necessary to provide some permanent and satisfactory form of transportation. In a year or so the street railway will probably be extended to the links.

Chicago "Fresh-Air" Cars Off During Winter.—During the extremely cold weather of the winter months the "fresh-air" cars operated by the Chicago surface and elevated lines will be discontinued at the request of Commissioner of Health John Dill Robertson. The commissioner stated that the "fresh-air" cars had been a success; that they had stirred up public opinion in favor of fresh air, and that they had encouraged citizens to sleep out of doors. It is planned to restore the "fresh-air" car service next spring.

Municipal Railway-Bus Agreement Unsatisfactory.—According to reports the arrangement entered into by F. M. Peterson with the city of Seattle, Wash., for the operation of a motor bus 1.3 miles from the north terminus of Division "A" of the Municipal Railway to Ballard, a suburb of Seattle, has not proved a success. Mr. Peterson alleges that for the short period of operation from Nov. 4, his receipts have not exceeded \$5 a day. The contract allowed the operator of the motor bus 3 cents on every transfer from the railway. The provisions of the contract were referred to at length in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23, page 889. The agreement when drawn was regarded as very favorable to the bus operator.

Jitney Insurance Prospects.—The jitney insurance feature continues to be an important one. The hesitancy of the stock companies and the lack of State laws giving interinsurance exchanges the privilege of doing business, combine to prevent jitneys getting insurance in many cities. Ordinarily, too, the stock company rates are much beyond the reach of the jitney owners. The rates of the stock company which is said to be writing the largest number of jitneys are \$35 to \$85 above those of the interinsurance exchanges. The National Indemnity Exchange at Kansas City is accumulating much valuable experience in the operation of its contracts which, when it reaches a point justifying announcement, will probably shed much light on the jitney business and its prospects. The exchange insures jitneys in five States, covering fire and theft, passenger and public liability, and property damage.

Fare Complaint Settled.—The complaint against a proposed increase of fares by the Syracuse & Suburban Railroad, Syracuse, N. Y., has been settled. The company has agreed to provide in its new tariffs a coupon book, non-transferable, and containing eighty-three 5-cent coupons, to be sold for \$2.50. It has also agreed that its \$5 coupon book can be used by the purchaser or any member of his or her family. In addition the road has promised to decrease, if possible, the running time between the terminals of the main line, to install an automatic signal system to be approved by the Public Service Commission, and to stone ballast a portion of the roadbed, all of these changes to be effected during the coming spring and summer and to be completed by Jan. 1, 1917. The company has further agreed to rebuild or replace car No. 18 during 1916 and to provide another new car in 1917, and to widen the track centers on East Fayette Street, Syracuse, between Beech Street and Syracuse city line junction when that portion of East Fayette Street is being repaved.

Personal Mention

Mr. Safford K. Colby, formerly one of the vice-presidents of Allen & Peck, Inc., has been appointed assistant general sales manager of the Aluminum Company of America. Mr. Colby was previously associated with this company and has recently returned to it after a period of about ten years, during which time he was engaged in other capacities.

Mr. E. B. Katté, chief engineer electric traction with the New York Central & Hudson River Railroad, was announced as the speaker before the Worcester Polytechnic Institute branch of the American Institute of Electrical Engineers on Dec. 17. The subject upon which Mr. Katté spoke was "Electrification of the Grand Central Terminal," illustrated by lantern slides.

Mr. Sam W. Greenland, general manager of the Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has been appointed general manager of the Fort Wayne & Springfield Railway, Decatur, Ind., by Mr. Charles H. Worden, Fort Wayne, trustee of the latter railway, which was sold on Dec. 2 at receiver's sale to Mr. Worden. The road will be operated by Mr. Greenland in connection with his present position with the Fort Wayne & Northern Indiana Traction Company.

Mr. E. C. Ryder, who has been a director of the Bangor Railway & Electric Company, Bangor, Me., for several years and its general counsel, has been elected president of the company. Mr. Ryder is a well-known Maine attorney. He is general counsel in that State for the Canadian Pacific Railroad and the Eastern Trust & Banking Company. He has been closely associated with the growth and development of the Bangor Railway & Electric Company and its subsidiaries for nearly ten years. Mr. Ryder was born in Readfield, Me., in 1854, attended Colby College and was admitted to the practice of law in Maine in 1882. He has lived in Bangor since 1894. Mr. Ryder has served in the State Legislature and was elected to the House and the Senate. He served as solicitor for the city of Bangor for two terms. Mr. Ryder is a member of the law firm of Ryder & Simpson. He proposes to continue his law practice. Mr. Ryder succeeds the late John R. Graham as president of the company at Bangor.

Mr. Harry C. Kendall has resigned as traffic engineer with the Portland Railway, Light & Power Company, Portland, Ore., as noted briefly in the *ELECTRIC RAILWAY JOURNAL* of Dec. 4, to become efficiency and traffic engineer with the Denver (Col.) Tramway, a new position created by General Manager F. W. Hild, formerly of the Portland Company. Mr. Kendall was graduated in electrical engineering from the University of Missouri in 1904 and from the Massachusetts Institute of Technology in 1905. He was in the employ of the Westinghouse Electric & Manufacturing Company from 1905 to 1909, first as an engineering apprentice and later in the railway engineering department. For the following two years Mr. Kendall was instructor in electric railway engineering at the University of Illinois. Mr. Kendall was next engaged in making special engineering investigations for industrial concerns and for the Illinois Traction System. In 1912 he resigned his position with the Illinois Traction System to make a traffic survey and work out rerouting plans for the Portland Railway, Light & Power Company.

Mr. J. Kappeyne, who has been appointed engineer to the Public Utilities Commission of the District of Columbia, was born in Amsterdam, Holland, in 1882, and was graduated as mechanical and electrical engineer from the Polytechnical School of Zurich, Switzerland. Immediately after completing his education, Mr. Kappeyne came to the United States and was naturalized as soon as the requirements of the law would permit. Before becoming connected with the Public Utilities Commission of the District of Columbia he was engaged with the New York State Public Service Commission for the First District, on the valuation of the street railways of greater New York. For the last year he has been connected with the valuation of the utilities in the District of Columbia ordered by Congress. Previous to this Mr. Kappeyne was employed on the design and installation of the equipment of the subaqueous tunnels of the Hudson

& Manhattan Railroad between New York and New Jersey and of the subways now in course of construction in New York.

Mr. F. T. Loftus, auditor of the Indianapolis & Cincinnati Traction Company, was elected president of the Central Electric Railway Accountants' Association for the year 1916,

F. T. LOFTUS

at the recent meeting in Detroit. Mr. Loftus has been in the electric railway field since June, 1907. He was born at Anderson, Ind., in November, 1881, and attended the schools there until his family moved to Chicago, in 1898. After reaching Chicago, Mr. Loftus found it necessary to secure employment and attended night school, taking up a general business course but specializing in accounting with that in view as a future business. From 1899 to 1907 he held positions in the offices of photo-engraving, real estate and retail

dry goods companies, but being impressed with the future which promised for the electric railway business, he secured employment as passenger and freight agent with the Indianapolis & Cincinnati Traction Company at Shelbyville, Ind., on June 1, 1907. In September, 1908, he was promoted to cashier of the company with headquarters at Rushville, Ind. He held this position until July, 1909, at which time he became general bookkeeper. On Aug. 1, 1910, he was appointed acting auditor of the company, continuing as bookkeeper until a year later. He was appointed auditor in October, 1911, and has held that position since. Mr. Loftus has been a member of the Central Electric Railway Accountants' Association since 1911. He has served on various committees of the association, as secretary for 1913 and 1914 and as first vice-president during 1915.

Mr. Edward M. Graham, son of the late John R. Graham, Bangor, Me., has been elected vice-president and general manager of the Bangor Railway & Electric Company, the

E. M. GRAHAM

Bangor Power Company and the Orono Water Company and general manager of the Bar Harbor & Union River Power Company, succeeding his father in the active management of these properties, in which E. W. Clark & Company, Philadelphia, are interested. Mr. Graham is only twenty-six years old, and is one of the youngest general managers in charge of so extensive a property. Since his father's death last August, Mr. Edward M. Graham has been in active charge of the Bangor Railway & Electric

Company properties, having been fitted for the position through an experience of several years under his father. He began his career with the Bay State Street Railway, Boston, which he served in various capacities. At the age of twenty-two he was made superintendent of the Portland & Brunswick Street Railway and after that was made assistant to the general manager of both the Lewiston, Augusta & Waterville Railway and the Cumberland County Power & Light Company, these being among the largest public service corporations in Maine. He went to Bangor in 1913 as assistant to his father, the president of the properties, and has been with the companies there since. The companies of which Mr. Graham is now vice-president and general manager provide sixteen municipalities with light and power, six with water and nine with street railway service, and own 65 miles of track.

Mr. Delos Emmons Parsons has been appointed general manager of the East St. Louis & Suburban Railway, East St. Louis, Ill., a new office, the duties in connection with which have in the past been attended to by the vice-presidents and the general superintendent. Mr. Parsons will assume his office with the company on Jan. 1. His appointment is in no sense a substitute for any present officer of the company, but was made because the president of both the East St. Louis & Suburban Company and the president of the East St. Louis & Suburban Railway and the other properties at East St. Louis under the management of the E. W. Clark & Company Management Corporation decided that the best interest of both the public and the stockholders would be enhanced by the appointment of a general manager who would devote his entire time to the supervision of the heads of the various departments and of the work of each and make a constant study of means and methods of improving service to the public and of promoting co-operative efficiency among officers and employees. Mr. Parsons was born at Huntington, W. Va., on Oct. 29, 1882. In 1903 he received the degree of bachelor of science in mechanical engineering at West Virginia University. In 1904 he entered the technical two-year apprenticeship course in the works of the Westinghouse Electric & Manufacturing Company at East Pittsburgh, Pa. At the end of the two years he accepted a position in the sales department at the works of the company, and in 1906 he was promoted to the position of head of the export department at the company's works. In 1908 he represented the sales department of the Westinghouse Company in its branch office at Fairmont, W. Va., handling the sale of the company's product to the coal mining companies in that district. In 1909 he joined the sales force in the railway and lighting department of the company.

D. E. PARSONS

OBITUARY

William Andrew Conner died suddenly on Dec. 6. Mr. Conner was born in Baltimore on Sept. 12, 1859. He began his business career in 1876, in Pittsburgh, in the oil refining business. In 1885 he took charge of the first plant built by the Standard Underground Cable Company in Pittsburgh, and from then to the time of his death he was the head of the manufacturing business of that company. He was a director of the company for ten years, and had been first vice-president since 1909.

George W. Linch, receiver of the Second Avenue Railroad, New York, N. Y., died on Dec. 15. Mr. Linch was born on Nov. 27, 1847, in New York. After graduating from public school, he became a clerk in a New York wholesale house, of which he later became manager. Upon the retirement of his employer from business, Mr. Linch entered the furniture business, in which he continued until 1872. In that year the Christopher & Tenth Street Railroad, New York, was completed and Mr. Linch became general manager of the company and later secretary and treasurer, which position he held at the time of his death. About 1889 Mr. Linch became the general manager of the Dry Dock, East Broadway & Battery Railroad, New York, and remained as its general manager until about 1900, when the control of the company passed to the Metropolitan Street Railway. Mr. Linch then built and operated the Morton Stables in New York City. After this business had been sold Mr. Linch became general superintendent of the Varrick Realty Company. He was subsequently elected vice-president of the United States Casualty Company. On Aug. 1, 1908, Mr. Linch resigned from the Casualty Company to become general manager of the Central Park, North & East River Railroad, which position he held until he was appointed receiver of the company by the Supreme Court. He was acting as receiver of this company at the time of his death. On Sept. 19, 1908, he was appointed receiver of the Second Avenue Railroad.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Pocatello Traction & Interurban Company, Pocatello, Idaho.—Incorporated in Idaho to construct a line in Pocatello. Capital stock, \$100,000. Officers: Richard Douglas, president; John Fraser, vice-president and Clark Gibson, secretary and treasurer. [Dec. 11, '15.]

***Wellsville & Buffalo Railroad, Buffalo, N. Y.**—Incorporated in New York to operate steam, gasoline or electric railroad from Wellsville to Buffalo. Capital stock, \$850,000. The directors include C. A. Finnegan, Theodore Hofeller and Abraham Weber, who recently purchased the abandoned line of the Buffalo & Susquehanna Railroad between Buffalo and Wellsville, as noted in the ELECTRIC RAILWAY JOURNAL of Dec. 2.

***East Tennessee Railroad, Benton, Tenn.**—Incorporated in Tennessee with a capital stock of \$20,000. Incorporators: F. W. Hoover, Richard Stiles, Henry Crumbliss, Jr., George D. Lancaster and J. A. Longley.

FRANCHISES

Los Angeles, Cal.—The Pacific Electric Railway has asked the Council for permission to abandon a part of its elevated railway franchise from the rear of the Main Street station eastward to San Pedro Street, so that it may comply with the recent order of the Board of Public Utilities to improve its terminals. The request was referred to the Board of Public Utilities for investigation and report.

San Diego, Cal.—The San Diego Electric Railway has asked the Council for permission to abandon that portion of its line on University Boulevard from University Avenue to El Cajon Avenue as soon as the new line up Park Boulevard from University Avenue to El Cajon Avenue is in operation.

Buffalo, N. Y.—The Council has denied the application of the International Railway for a franchise to lay tracks and operate cars in Washington Street between Perry and Ohio Streets so as to loop cars around the new Lackawanna Railroad passenger terminal via Main, Perry, Washington and Ohio Streets. The company has modified this application and now seeks to operate cars through Illinois Street from Perry to Ohio Streets. The Council is favorable to this project and a hearing on this application will be held on Dec. 23. The company's application for a franchise on Ohio Street from Washington to Main Street to connect directly with the new Lackawanna Railroad terminal has been approved.

Dayton, Ohio.—The Dayton & Troy Electric Railway has received a twenty-year extension of its franchise in Dayton. The company agrees to build an extension on Clark Avenue, to improve its local service, to pave its freight yard and to pave within the rails and 18 in. outside when any street is ordered paved.

East Liverpool, Ohio.—The East Liverpool Traction & Light Company has received from the Council a ten-year extension of its franchise. The franchise, which was to have expired in 1930, now extends to 1940.

Dallas, Tex.—The Northern Texas Traction Company has accepted the franchise granted by the Council to construct an extension on Jefferson Street.

TRACK AND ROADWAY

Phoenix (Ariz.) Railway.—It is reported that this company will double track its line on West Washington Street to the Capitol.

Fresno (Cal.) Interurban Railroad.—A report from this company states that during 1916 it expects to build 18½ miles of new electric line between Fresno and Clovis and Fresno and Centerville.

Pacific Electric Railway, Los Angeles, Cal.—Plans for elevated tracks and terminal improvements for this company have been completed and the scheme has been ap-

proved by the Board of Public Utilities which had previously ordered the company to execute whatever work necessary to relieve congested interurban traffic on or before July 1, 1916. Further details regarding the plan are published on page 1231 of this issue.

Municipal Railways of San Francisco, San Francisco, Cal.—Now that the early commencement of construction of the Church Street branch of the Municipal Railway has been assured, the executive committee of the Mission Promotion Association is devoting its efforts to securing extensions to the rest of the Municipal Railway system. Property owners and improvement clubs in the various sections of the city have been submitting plans for proposed extensions. As yet, however, the association has taken no action upon the proposals, as its intention is to consider each of the applications individually and then to prepare a report which will be submitted to the Board of Supervisors in which the association will request extensions in various parts of the city.

Tidewater Southern Railway, Stockton, Cal.—Grading has been begun by A. G. Chatan on this company's extension from Modesto to Turlock.

Miami (Fla.) Traction Company.—Operation has been begun on this company's line in Miami. The cars are operated from Twelfth Street and Avenue O, Riverside Heights, to Twelfth Street and Avenue C. Track has been laid on Avenue C from Twelfth Street to Waddell Street, 1 mile, and this will soon be placed in operation. The entire line is $3\frac{1}{2}$ miles long.

Alton, Granite & St. Louis Traction Company, Alton, Ill.—L. C. Haynes, president of this company, has answered the communication from the Mayor of Alton, in which the company was asked to build an electric line from Alton to the State Hospital. President Haynes says the line will be built if Alton and Wood River Townships guarantee to adjust all possible claims for damages arising from the building of the line and make arrangements for such adjustments before the line is built.

Illinois Traction System, Peoria, Ill.—It is reported that this company plans to construct a line between Jefferson City and Columbia.

Chicago, Lake Shore & South Bend Railway, Michigan City, Ind.—A movement is under way among residents of the south and southwest sections of Gary to urge this company to build a 4-mile loop through that portion of the city. The proposed route would extend south on St. Joseph Street to Twenty-first Avenue, east to Virginia Avenue, thence north to connect with the company's line just north of Fifth Avenue.

Iowa Railway & Light Company, Cedar Rapids, Ia.—The electric light plant at Zeoring, owned by Belden & Son, has been purchased by this company. Next summer the system will be connected with the high-tension line being erected from Marshalltown to Colo and Ames.

Tri-City Railway Company, Davenport, Iowa.—This company is being urged to build an extension in the extreme southwestern part of the city, the line to be an extension of either the Third Avenue or the Fourth Avenue track.

Manhattan City & Interurban Railway, Manhattan City, Kan.—This company expects to build 1 mile of city line during 1916.

Kentucky Traction & Terminal Company, Lexington, Ky.—In order to obviate interruptions to service from storms or accidents, the Kentucky Traction & Terminal Company is completing arrangements for the construction of new high tension lines to connect all of the present termini by loop systems. The new lines will include power circuit construction from Georgetown to Frankfort, about 25 miles in an air line, and connecting up other high tension lines already completed. At present one line of power wires runs to Versailles and Frankfort and another to Georgetown. It is planned to manage the new construction so that in the event of a break at any point service can be continued by bringing in the power from another direction. There is now a loop between Georgetown and Paris. Rights-of-way have been secured for practically the entire construction which, it is believed, will be sufficient to prevent delays encountered heretofore on account of local storms.

Bar Harbor & Union River Power Company, Bangor, Me.—This company contemplates the construction of an electric railway from Bluehill Falls to Brookline and Sedgwick, 14 miles. C. M. Tolman, chief engineer.

Boston (Mass.) Elevated Railway.—Plans for a change of location of a portion of the proposed extension of the elevated road to Everett have been filed with the Public Service Commission by this company. The change affects the route between Mystic Street and Bernard Avenue, Everett. It is proposed to extend the elevated structure over the Mystic River and reach the grade of the street opposite Langdon Street and any further extension of the line will be through a subway.

Springfield (Mass.) Street Railway.—This company will change its present system to the three-wire plan to eliminate electrolysis. This is in accordance with the recommendations of the Bureau of Standards at Washington. The work of making the changes will be begun immediately.

***Detroit, Mich.**—Having obtained the necessary franchises shortly before the November annexation election, Robert Oakman, Detroit, is now preparing to build an electric line which will take care of the territory between Hamilton Boulevard and Grand River Avenue and between the old city limits and Highland Park. Mr. Oakman has announced that before the end of next summer he would complete a line from Oakman Boulevard south to the corner of Twelfth Street and Elmhurst Avenue. Plans are being made to extend this line south to the city limits to connect with the Trumbull, Fourteenth and Grand Belt lines when these are extended.

Minnesota-Northwestern Electric Railway, Thief River Falls, Minn.—A report from this company states that it expects to build 20 miles of new line during 1916.

St. Louis & Jennings Railway, St. Louis, Mo.—It is stated that this company's extension south on Helen Avenue from Florissant to Melrose Avenues, Edgewood, will be completed in about three weeks.

***Fort Benton, Mont.**—The Commercial Club of Fort Benton has appointed a committee consisting of L. D. Sharpe, C. O. Vowell, C. W. Hudson and D. G. Browne, to proceed to make investigations and secure data on the construction of a trolley line to the depot, a distance of more than a mile.

Brooklyn & Jamaica Bay Railway, Brooklyn, N. Y.—The Public Service Commission for the First District of New York has denied the application of the Brooklyn & Jamaica Bay Railway for a certificate of public convenience and necessity for the construction and operation of a proposed trolley line in Brooklyn, extending from a point at about the intersection of Montauk and Liberty Avenues and in a general southerly direction over numerous streets and avenues to a point where Montauk Avenue would end if extended to Jamaica Bay.

Southern Power Company, Charlotte, N. C.—It is reported that this company plans to construct an electric railway from Greensboro to Reidsville and Spray, about 30 miles. W. S. Lee, vice-president and chief engineer.

Durham (N. C.) Traction Company.—During 1916 this company expects to build 2.6 miles of single track in Durham.

Pictou County Electric Company, Ltd., Sellerton, N. S.—It is reported that this company will not build its proposed extension to Parkdale until next spring.

Northern Ohio Traction & Light Company, Akron, Ohio.—This company expects to build 0.7 mile of city extension. The company also proposes to construct 9.4 miles of double track between Akron and Cleveland for cut-offs.

Dayton & St. Mary's Traction Company, Covington, Ohio.—Promoters of the Dayton & St. Mary's Traction Company held a meeting on Dec. 10 and appointed the following committee to consider plans of financing the company: H. S. Shelton, W. J. Focke, I. G. Kumler, C. E. Jones, O. B. Brown and J. W. Downer. Right-of-way in Miami County has been donated and much in Shelby. The plan provides for the purchase or lease of the 10 miles of Western Ohio Railroad tracks between St. Mary's and Minster, use of the 6-mile line between Minster and Fort Loramie and construction of 16.6 miles from Fort Loramie on. [Aug. 7, '15.]

Mount Vernon (Ohio) Railway.—A report from the company states that it expects to build 2 miles of city line during 1916.

Henryetta, Oklahoma & Western Railway, Henryetta, Okla.—The contract for grading this company's line has been awarded to Ally Brothers. The road is being built from Henryetta to Kusa, via Dewar, with a branch to Colton and Pleasant Valley and from Henryetta to Creek Mines, a total of about 10 miles. One bridge and one viaduct will be built. The contract for track laying has not yet been awarded. W. T. Croslen, Oklahoma City, president. [Nov. 13, '15.]

Southern Oregon Traction Company, Medford, Ore.—This company, which on July 1 purchased the Rogue River Valley Railway, consisting of about 6 miles of track, has built a connecting line of track about 1½ miles between the two railways, along the main street of Medford, and electrified it. About Jan. 1 the company expects to place in operation 6½ miles of electric railway extending from the Opp Mine through the cities of Jacksonville and Medford to the city reservoir. The company also expects to build 30 miles of extension southwest to the California-Oregon lines as soon as the project can be financed.

Portland & Oregon City Railway, Portland, Ore.—Operation has been begun by this company between Milwaukie and Carver, the present terminus of the line, which is near Baker's Bridge. It is expected that the line will be completed from Milwaukie to the North Bank Station, Portland, by Jan. 10.

Milford, Pa.—It is reported that announcement has been made by J. A. Vandergrift & Company, New York, the engineering firm which is to build the proposed railway between Port Jervis and Milford, that arrangements are so well advanced as to permit actual work to begin very shortly. [Nov. 6, '15.]

Philadelphia, Pa.—The two lowest bids received for the construction of concrete column foundations for the elevated railway on Frankford Avenue from Unity to Dyre Street were Edwin H. Vare at \$17,700 and Peoples Brothers, Inc., \$18,499.

West Chester (Pa.) Street Railway.—This company is considering the extension of its lines to accommodate the people at the Chester County Home, Mortonville and Modena.

Manila Electric Railroad & Light Company, Manila, P. I.—It is reported that this company has been awarded the contract for lighting the entire city of Manila, with the exception of the Paco district, for a period of ten years. The contract provides for ultimately increasing the street lighting units from the present total of 1300 to about 2400.

Charleston-Isle of Palms Traction Company, Charleston, S. C.—This company reports that during 1916 it expects to build 1½ miles of 60-lb. T-rail track.

Columbia Railway, Gas & Electric Company, Columbia, S. C.—Plans are being made by this company to extend operation to the Wales Gardens section in the near future. Tracks have already been laid.

Carolina, Greeneville & Northern Railroad, Greeneville, Tenn.—Announcement has been made by LeRoy Parks, field agent of this company, that plans have been perfected for the beginning of construction work on one section of the proposed railway from Bristol to Knoxville, via Kingsport and Newport. The project has been underwritten by New York financiers, it is stated, and work will be begun at an early date. [Oct. 16, '15.]

Abilene (Tex.) Street Railway.—Work has been begun by this company improving the north end of its line. As soon as the north end is repaired work will be begun on the south end. About \$3,000 will be spent on these improvements.

***Buena Vista, Tex.**—Plans are being considered by the Pecos Valley Railroad Association for the construction of a gasoline-electric interurban railway from a connection with the Kansas City, Mexico & Orient Railway northwest via Buena Vista for 35 miles up the Pecos Valley.

Corpus Christi Railway & Light Company, Corpus Christi, Tex.—This company expects to build 1 mile of new track during 1916.

Houston, Richmond & Western Traction Company, Houston, Tex.—The contract for grading the first 100 miles of this company's line between San Antonio and Houston will be awarded within the next sixty days. A branch line will be built from Seguin to New Braunfels. A hydroelectric power plant will also be constructed. E. Kennedy, president. [Nov. 20, '15.]

Ogden, Logan & Idaho Railway, Ogden, Utah.—This company reports that during 1916 it expects to build 22 miles of new line from Ogden to Harrisville and from Hot Springs to Brigham City.

Appalachian Power Company, Bluefield, W. Va.—A report from this company states that it is contemplating the construction of a 1-mile extension to its line.

Merrill Railway & Lighting Company, Merrill, Wis.—Preparations are being made by this company for the erection of a high-tension transmission line from Merrill to Wausau. The plans provide for the development of the Trappe Rapids water-power, owned by the Wausau Street Railroad.

SHOPS AND BUILDINGS

International Railway, Buffalo, N. Y.—The city authorities of Lockport and the International Railway have come to an agreement for better passenger station facilities and have withdrawn their complaint from the Public Service Commission. The company will construct an additional story for the offices of the company and enlarge and otherwise improve the passenger waiting room.

New York, N. Y.—Plans are being made for the construction of a new amusement building to occupy the site of the carhouses of the New York Railways on Eighth Avenue between Forty-ninth and Fiftieth Streets. Negotiations for the property have been going on for more than a month between the Panama Canal Exhibition Company and Theodore P. Shonts, representing the railway. The property will be taken on a lease of twenty-one years, with an option of renewing the lease for an equal term of years. The walls of the present structure will be utilized and most of the work of reconstruction will consist of interior changes.

Eastern Pennsylvania Railways, Pottsville, Pa.—Work has been begun by this company on the construction of a new carhouse to be located at the rear of the Lansford ball park. The carhouse will be of steel and brick construction and fireproof throughout. It will be large enough to accommodate all the rolling stock on the division. A shop will also be connected with the carhouse.

Dallas, Tex.—As announced in the ELECTRIC RAILWAY JOURNAL for Dec. 11, construction will begin about Dec. 20 on the terminal station and office building at Wood, Browder and Jackson Streets, to be used by the Dallas Electric Light & Power Company, Texas Power & Light Company, Southern Traction Company, Texas Traction Company and Northern Texas Traction Company. The structure will be 210 ft. x 85 ft., eight stories, with provision for three additional stories. The building will be of reinforced concrete frame, faced with brick and terra-cotta. Concrete platforms from the waiting-room to the tracks with steel frame overhead coverings will be provided. The terminal yard will contain seven tracks arranged in three pairs with single track and loading platform between. An emergency loop will be constructed from Lane Street through Jackson and Browder Streets to Commerce Street.

POWER HOUSES AND SUBSTATIONS

Des Moines (Ia.) City Railway.—A contract has been placed with the Des Moines Bridge & Iron Company for the construction of a steel water tower for the powerhouse of this company. The tower will cost about \$4,800.

International Railway, Buffalo, N. Y.—Two new substations are now in the course of construction by this company and \$150,000 will be spent to increase the capacity of the five substations now in operation. In the spring three more plants will be added to the equipment of the International Railway, making ten substations located in widely separated parts of the city.

Reading Transit & Light Company, Reading, Pa.—Improvements are being planned by this company to its West Reading power plant at a cost of about \$300,000.

Manufactures and Supplies

ROLLING STOCK

Water, Light & Transit Company, Carrollton, Mo., expects to purchase during 1916 one passenger car body.

Piedmont Railway & Electric Company, Charlotte, N. C., expects to purchase during 1916 two single-truck passenger cars.

Minnesota-Northwestern Electric Railway, Thief River Falls, Minn., expects to purchase during 1916 one 60-ton gas-electric locomotive.

Dominion Power & Transmission Company, Ltd., Hamilton, Ont., is reported as expecting to purchase twelve or more cars in the near future.

Des Moines (Iowa) City Railway, it is reported, will order at once forty front-entrance, center exit cars from the McGuire-Cumming Manufacturing Company, Chicago, Ill.

Charleston-Dunbar Traction Company, Charleston, W. Va., expects to purchase during 1916 one express car, two inter-urban cars and two pay-as-you-enter city cars.

Long Island Railroad, New York, N. Y., noted in the ELECTRIC RAILWAY JOURNAL of Nov. 27, 1915, as having issued inquiries for twenty-five new trailer cars, has ordered this equipment from the Standard Steel Car Company.

Salt Lake & Ogden Railway Company, Salt Lake City, Utah, has ordered six large open steel trail cars from the Jewett Car Company, Newark, Ohio. The cars are being bought especially to provide service for the summer Lagoon excursion travel, and will have a seating capacity of eighty passengers.

Petersburg & Appomattox Railway, Petersburg, Va., R. H. Mann, president, has ordered through Stuart, James & Cooke, engineers, New York, ten second-hand motor cars and one work car which were formerly in operation on the system of the Cleveland Railway.

East Liverpool Traction & Light Company, East Liverpool, Ohio, is receiving fifteen center-entrance, low-level motor cars built by the G. C. Kuhlman Car Company, Cleveland, Ohio, which are being shipped on their own wheels and operated under their own power. The cars, eleven of which have been received by the railway, are sent from the plant of the Kuhlman Company at Collinwood, Ohio, over the lines of the Cleveland Railway to Miles Avenue and Broadway, Cleveland, thence over the Northern Ohio Traction & Light Company's property via Silver Lake Junction to Ravenna, Ohio, from there over the Stark Electric Railroad via Alliance to Salem, Ohio, and then over the Youngstown & Ohio River Railroad lines to East Liverpool, a total distance of 110 miles. The crews of the respective roads over which the cars are shipped handle the shipments en route.

TRADE NOTES

Signal Appliance Association, New York, N. Y., announces receipt of a letter from C. C. Rosenberg, secretary Railway Signal Association, extending thanks for the co-operation of the former association at the annual convention held at Salt Lake City on Sept. 16.

American Brake Shoe & Foundry Company, New York, N. Y., after Jan. 1, 1916, will have its Canadian business handled by the Dominion Brake Shoe Company, Ltd., the entire capital stock of which is owned by the American Malleable Company, a subsidiary of the American Brake Shoe & Foundry Company.

Pelton Water Wheel Company, San Francisco, Cal., announces that Benjamin B. Lawrence, a member of the class of 1878 of the Columbia School of Mines, has purchased the Pelton-Doble water wheel and the Pelton-Francis turbines which were exhibited by this company at the Panama-Pacific International Exposition and presented them to the school.

National Pneumatic Company, New York, N. Y., has received an order from the Interborough Rapid Transit Company for the pneumatic door control of the 311 recently ordered subway cars. This will include 1866 pneumatic door engines, six per car. They will be substantially the

same as the engines for the previous lot of 418 cars now being put in service.

Pressed Steel Car Company, Pittsburgh, Pa., announces the following changes in its organization, effective Dec. 1: N. S. Reeder has been elected vice-president, with headquarters at New York. J. B. Rider has been elected vice-president, with headquarters at Pittsburgh, Pa., and will continue to perform the duties of general manager in charge of operations. J. F. MacEnulty, formerly general sales manager, has been elected second vice-president with headquarters at New York. C. E. Postlethwaite, formerly manager of sales, central district, at Pittsburgh, has been appointed general sales manager of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, with headquarters at New York. H. F. Hoffstet has been appointed assistant manager of sales of the central district, with headquarters at Pittsburgh, Pa.

Western Electric Company, New York, N. Y., in outlining its various developments in telephones and telephone equipment made by this company during 1915, reports that further experimentation and development work on the loud-speaking telephones for railway train dispatching work have resulted in a loud speaker that is an unusual combination of distinct enunciation and large volume. A number of these instruments have been installed during the year on many of the lines of important railroad systems, where they are doing efficient work. An electro-magnetic circuit breaker, known as No. 12020, has been developed to replace the slower-acting fuses used on train dispatching circuits to limit the amount of battery current supplying the telephone and telegraph instruments. The quick-breaking action of the circuit breaker effectually prevents the burning of relay points. The point at which the circuit breaker operates is regulated by adjusting the air gap between the coil core in the armature. The operating range extends to 2 amp. A slate base is used instead of wood base instruments to prevent warping and arcing. A booth switch, No. 1-A, has been produced for use on telephone booths placed at railroad sidings. The switch is connected to the hasp of the booth lock so that it cuts out the siding telephone only when the door is locked. It does not cut out when the door is closed behind the man who is using the telephone. The switch is rugged in construction, has high insulation resistance and is provided with rubbing contacts which keeps the platinum contact points clean.

ADVERTISING LITERATURE

Newman Clock Company, New York, N. Y., has issued a catalog describing its Grille watch clock for watchmen. These clocks have a large number of users on the Pennsylvania Railroad, and many other railroads.

Railway & Industrial Engineering Company, Pittsburgh, Pa., has issued a folder describing and illustrating the Burke high-voltage horn gap switches and arrester, also its other types of electrical steel work and outdoor substations for all voltages and capacities.

Esterline Company, Indianapolis, Ind., has issued bulletin No. 365 describing an entirely new line of its graphic meters. These instruments are intended for checking up voltage and current on a.c. circuits and have been designed for use where the usual high price of graphic meters is prohibitive.

Kenneth H. MacArthur, Milwaukee, Wis., has issued a folder describing the Lake Superior wrench, which is especially adapted for working effectively in close corners or limited spaces. The jaws and teeth are made of extra hard steel, rendering it especially effective for handling badly disfigured nuts.

Canton Culvert & Silo Company, Canton, Ohio, has issued reproductions of letters of commendation and advertisements of "Acme" nestable culverts. Among the testimonial letters are included those from the Union Traction Company of Indiana, Kanawha Traction & Electric Company, and Cedar Rapids & Iowa City Railway.

Bryant Electric Company, Bridgeport, Conn., has issued a comprehensive and elaborate publication of 168 pages, describing and illustrating its large assortment and variety of wiring devices. The catalog is equipped with a special quick reference index, which is particularly useful in such a bulletin where so many materials and types are described.

Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK SATURDAY, DECEMBER 25, 1915

No. 26

INVESTIGATING RAILWAY REGULATION

After a period for absorbing details a wise teacher gives a student an opportunity for reflecting on what he has learned, for getting a general bird's-eye view of his progress. 'Tis a simple pedagogical theory—that of absorption and reflection—but, like other simple theories, it can be of real service in problems more complex than that of youthful education. Take, for example, the elusive and complicated question of railway regulation in this country. For more than the last two decades the study of the regulatory power has been in reality one of details. Lawmakers and commissioners in each State and for the nation as a whole have been making great strides in regulatory requirements and practices, but the development of the idea of regulation and the increase in the size and importance of the public utility field have been so rapid that no time has been spent in reviewing the progress made up to any date. It is well, therefore, that there should now be a general review of the field, and for this reason we welcome the resolution by Senator Newlands for the appointment of a joint congressional committee to investigate the regulation of railways from the beginning. Too much legislation affecting transportation lines has been passed without a clear conception of the value of existing laws and the goal to be reached by future enactments, and the present administration will perform a most valuable and essential service if out of the present regulatory maze it can formulate a constructive summary for future guidance.

COMPANY SECTION PROGRAMS

The program committees of the American Electric Railway Association company sections have an intricate problem on their hands in providing for continuity of interest and enthusiasm in section activities. This problem is complicated rather than simplified by the reduction in dues, which will bring into the membership many more of the rank and file of the industry. The work must consist of one or more of the following components: instruction in the elements of the business, social intercourse and entertainment for general culture, and technical discussion of departmental topics. In planning the work the committees must have clearly in mind the purposes which they wish to accomplish and the preparation, needs and desires of their audiences. They must have the hearty co-operation of the local memberships in their plans. Our observation leads to the conclusion that the sections in general are not as yet very definite in their ideas and plans. There are now company sections in Milwaukee, Denver, Newark, Wash-

ington, Manila, Chicago and New Haven, while a new one will be formed in Washington in January and undoubtedly others will follow shortly. The older sections have had experience in conducting meetings, and this is available for the younger ones. The principal incentive to the formation of local sections of a national society rather than independent local clubs or associations is the expected stimulation from other sections. To obtain this stimulation in the present instance the sections must exert themselves to obtain the results of each other's experience. Why would it not be well for representatives of these sections to get together, say at the Chicago mid-winter meeting, for the purpose of discussing their program problems? "How Best to Serve the Local Section" would be a topic well worthy of the best thought.

CLEARING HOUSE FOR SAFETY LITERATURE

The statement made by H. A. Bullock elsewhere in this issue indicates that the National Safety Council has had a remarkable growth during the past four years and is even yet in the period of rapid acceleration. The time was ripe for some agency or other to gather the results of the large expenditures of energy and money which had been made by hundreds of corporations individually, and to make these results generally available. Electric railways have been individually very active in safety work as is indicated by a glance through the issues of the ELECTRIC RAILWAY JOURNAL for a few years past. The movement which has taken form in this council began in the manufacturing industries, but the transportation interests were not slow in "getting on the band wagon" where they now take an active part in the music. There are at least two elements in this organization which appeal to us as worthy of commendation. First, it represents a spontaneous effort to provide a clearing house for safety ideas. As soon as the plan was formulated the corporations and individuals possessed of such ideas and wanting more gravitated to it as the natural nucleus of safety publicity. In the second place, it is an economical device for accomplishing its purpose, for it acts primarily as a means of communication among its members. The council works in co-operation with other agencies for the conservation of human life and endeavors to avoid duplication of energy and money expenditure. The fact that the electric railways are now to have special service, the first special service to be furnished, is evidence enough of the attitude of the council to our industry and its desire to bring about effective co-operation among electric railway companies.

ORDERS FOR 1916 SUPPLIES

A prominent manufacturer of electric railway apparatus recently called our attention to the existence of a certain skepticism on the part of some electric railway managers as to the necessity for slow deliveries on 1916 orders. There is no doubt, however, that deliveries of electric railway apparatus will have to be slow, and in all probability they will tend to become even slower as 1916 progresses, so far as the manufacturers of railway apparatus have to depend for part of the equipment upon the producers in the iron, steel and zinc markets. In the general steel market, for instance, orders are now being booked for delivery in the third quarter of 1916, and iron cannot be more plentiful than steel because steel manufacturers are prepared to utilize all of the iron that they can get. Statistics indicate that the present rate of steel production in this country is about 39,000,000 tons per annum, and that it cannot be substantially increased. Under these conditions both steel and iron are bringing big prices. Copper is easier, but the export demand has taken on new life within a few weeks past and domestic consumption in general industries is rapidly increasing. The long depression permitted the accumulation of large stores of copper, hence, while the price is high, there is no prospect of immediate shortage. Zinc occupies a position midway between steel and copper. The munitions demand has been heavy, but the galvanizing business has not called for its usual supply. Zinc can therefore be had somewhat more promptly than steel. The lesson in all of this for the electric railways is that 1916 orders must be placed early if disappointment regarding deliveries is to be avoided. The best interests of the industry demand foresightedness.

SKIP-STOP SITUATION IN ST. LOUIS

The peculiar turn that has been taken by the skip-stop campaign in St. Louis, as outlined on another page of this issue, is by no means creditable to the principle of regulation. The plan of eliminating stops, after being overwhelmingly approved by the railway passengers, appears now to be held up by the regulatory body that exercises legal control over the operations of the railway, and though the riders obviously want the introduction of the improved method of operation, and the railway company is equally willing to put it in force, there is a possibility that the plan is not going through. The reason is, plainly enough, opposition on the part of storekeepers and real estate holders at street corners, who fear the effect of the change, notwithstanding the fact that any number of successful retail businesses have been established in the middle of a block, where the cars never stop anyway. However, the most illogical feature of the proceeding is that the influence of outsiders can be exerted in such a matter in opposition to the wishes of the railway and its patrons. If both the passengers and the railway company are satisfied with the skip stop, one would imagine that this should settle the matter. They are the interested parties, and that a body of storekeepers and others who may never use the cars at all should be able by protesting vehemently

to interfere with their mutually satisfactory plans would be absurd if it were not so pathetic. Admittedly, the Public Service Commission is placed upon the horns of a dilemma. If the skip stop is not ordered the railway patrons will be angry, and if it is ordered the storekeepers claim that they will be peeved. No matter what is done some one will be displeased, and it takes a strong commission to act under those circumstances. But, incidentally, we wonder why the commission feels itself compelled to exert its jurisdiction in a matter that is so peculiarly one to be settled between the railway and its patrons. As a matter of fact, should it really have jurisdiction?

THE INDEX AS A SYNOPSIS

An index is undoubtedly a dry and most uninteresting looking piece of reading matter. Usually a person does not consult it except when searching for information on a definite and particular subject. For those periods of retrospection, however, which most of us use to mentally docket and arrange our ideas and conceptions, the hint is offered to pick up the half-yearly issues of this paper that contains the comprehensive indices of the preceding twenty-six numbers and go over the subjects listed therein.

The value of a review of any field of study is well known. In no other way can the salient points be fixed in their proper perspective, retained in the mind and the whole subject crystallized so effectually. The chief benefit from examinations in school and college is not the mere day-by-day study of the test nor the restoring temporarily to memory of a large volume of rules or facts or dates, but the real lasting benefit occurs from the broadened viewpoint and the crystallization in the student's mind of the essentials of the work done during the preceding year or half year. The formidable looking index of this paper (and to be of maximum value it must be complete and therefore voluminous) really performs this function. In this respect it is similar to the summary or digest that usually prefaces the detailed report of the expert on a problem in construction or finance or on an operating property, when submitted for the guidance of the man who must make the decision.

The electric railway industry is so many-sided and the problems before it are so numerous and varied that the hard-pressed official of a traction company can scarcely carry in his mind all phases of his chosen profession. We have been told by a busy man of this kind, active in railway work, that he has found the time well spent which is devoted to running over the index at the end of each half year and marking articles to be reread or noting subjects for further study. The relative importance and timeliness of the several topics will be indicated by the frequency of reference, and the geographical extent or distribution can also be determined to a degree. It happens at times also that owing to unusual demands of work some issues are not looked over completely. If there are such instances, a survey of the index will prevent important articles from being entirely overlooked. Again, a particular need or ques-

tion may suddenly have assumed large proportions on a property and by referring to the ever-helpful index the busy manager can promptly get hold of recent data and the practices of other companies. This is indeed one of the points of superiority of the general paper in any field, as compared with the periodical which is devoted to recording the events in a part of the field only. It gives the broad survey which is always helpful and usually necessary to a comprehensive and complete understanding of all of the important events in any industry and their correlation with each other.

In the columns of this paper are recorded the essential facts and latest available information and data on the progress of the business, whether it is financial, legal, managerial, engineering, transportation or accounting, and the semi-annual index is the skeleton key to this fund of reading matter. Therefore, in addition to its direct use as an index, it is appropriate for us to call the attention of readers in this issue to its supplementary use as outlined.

IT PAYS TO ADVERTISE THE OTHER FELLOW

How to stimulate passenger traffic is a live topic these days among both city and interurban railway managers. This fact was most forcibly emphasized at the Indianapolis meeting of the Central Electric Railway Association, and as a result general advertising as a means of increasing passenger traffic is to be investigated. The experience of some companies along this line clearly indicates that it pays to advertise, not only one's own service but the other fellow's, when it will induce travel. The Detroit United Railway passenger department has pursued this plan very profitably. Through the constant display of banners and car cards steam road excursions from different points on this company's lines are announced; attractions at theaters in the important cities along the route, circuses and carnivals are also advertised. In fact, any and every form of entertainment in which the passenger department believes the public will be interested is called to its attention. This practice has tended to make new patrons and increase the traveling propensities of the regular riders.

In preparing advertising of this kind the entertainment is first announced and then the public is urged to use the cars to reach the point where the entertainment is to be given. One needs only to compare the attendance at a circus side show where there is a widely advertised two-headed calf with that at the unadvertised museums of natural history to determine whether this form of advertising pays. Recently the Detroit United Railway had an opportunity to test the public's interest even in this direction. It called attention to the existence and location of an art museum where the attendance had dwindled because no form of advertising had been used, and the result was most profitable to the company. Electric interurban and street railway companies usually announce the dates of county fairs, circuses and other important events, but they often fail to keep constantly before the public the permanent points of interest to which regular travel may be maintained. One phase of the Chicago Surface Lines' ad-

vertising campaign has been along this line, and the results indicate that the constant use of all forms of advertising is certain to kindle the public's desire to travel and thus aid in increasing revenue.

WHEEL AND RAIL CONTACT AFFECTS WEAR LIFE

Unequal contact between the wheel treads and the rail which concentrates an enormous pressure on a limited area, is one of the causes of rail corrugation and tends to shorten rail life. This is the main conclusion evolved from R. C. Cram's study of this phenomenon. Curved heads for girder rails as a remedy, as the author states in an article published elsewhere in this issue, is not a new idea, but is a departure from accepted American practice. Several tramway companies in England and on the European continent have had convex rail heads on girder rails in service for the past five years. On the Leeds Tramways, for instance, a 7-in. girder-grooved rail with a convex head inclined slightly toward the groove, was adopted after comparing several hundred gagings of partly worn rail and tire sections. More than 6000 tons of this section of rail have been laid in Leeds since January, 1910, and the service results, so far, indicate that extrusion of the metal on the rail head has been eliminated, or at least 500,000 cars over one section of track have failed to develop this difficulty which is common to the flat-head rail sections. Furthermore, rail wear was found to be uniform across the head, and after five years of service the head retained its convexity. The experience in Leeds substantiates Mr. Cram's findings and points a way to prolong both rail and wheel wear life.

The principal lesson to be learned from the results of such an important study is that rail heads and wheel contours should not be designed independently of each other. The wear life of each is so dependent upon the character of contact made that it is vital to maximum life to have a uniform wheel bearing across the rail head. It is also our opinion that the character of wear on steel wheels bears a very intimate relation to the rail-head sections over which they operate. In other words, a change from the flat head to the curved head section is quite certain to change the character of wheel wear. Doubtless the design of a wheel contour and a girder-grooved rail head which would provide full contact from the fillet at the gage line to the outside of the wheel tread would produce still different results. Moreover, it appears that the proper contact between new wheels and new rails would make both wear more uniformly. If this result could be obtained it would be of little moment whether new wheels were operating over old rails or whether old wheels were operating over new rails, because the line of contact in either case would give practically a full tread bearing. In conclusion we are strongly of the opinion that Mr. Cram is working along the right line. Whether it would be well to await the service results of this experiment or whether further tests should be conducted are questions worthy of the immediate consideration of the committee on way matters of the American Electric Railway Engineering Association.

Curved Heads for Girder Rails in Brooklyn

The Author Demonstrates That, as Corrugation Is Caused by Excessive Pressure or Force per Unit Area at the Wheel Tread, Increasing the Tread Area by Conforming the Rail-Head Contour to That of the Worn Wheel Reduces Corrugation

BY R. C. CRAM, ASSISTANT ENGINEER WAY AND STRUCTURE DEPARTMENT, BROOKLYN RAPID TRANSIT SYSTEM

Rail corrugation is a never-failing subject for argument and speculation. Many theories have been advanced as to what may be its cause, but to date there is no agreement upon any one particular factor as being the principal or controlling agent in producing the phenomenon.

The description in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 3, 1915, page 26, of an experiment being made in England with a special differential gearing for car operation has created a renewal of interest in the study of the subject. In the meantime other study and experimentation has been going forward both in the United States and in Great Britain with respect to the design of the rail itself. Perhaps this has been induced, in the main, by the generally accepted fact that grooved and tram girder rails appear to be easy victims to corrugation while plain girder (high-T) and standard section rails do not.

our standard grooved girder section Lorain Steel Company's 105-433, the general head contour of which is shown in Fig. 14. The rails were laid with cast-weld joints on wood ties in natural soil ballast, and there was a general elevation in grade of about 6 in. over that of the old track which it replaced. The rails were of Class B grade (high carbon), treated with an alloy. The tracks were paved between outer rails with 5-in. granite, with cement-grouted joints on concrete base and with asphalt outside in the roadways and immediately in contact with the outer rails. As nearly as careful observation and inspection during installation could determine, there was no particular construction feature which differed from our standard as installed for the past three years. The street is wide, it has a grade between 1 per cent and 2 per cent and the car traffic is frequent and fast. The cars mainly are our new, comparatively light, center-entrance type.

CURVED RAIL HEADS—FIGS. 1 AND 2—TYPICAL RAIL CORRUGATIONS ON PLANE HEAD, DEPTH 0.001 IN. TO 0.005 IN.

A study of the numerous designs of modern grooved and tram girder rails shows that there are several elements in their design which are common to the type and which are not found in plain girder rail designs. These elemental differences may be found in (a) the head contour; (b) the groove or tram; (c) the relative position of the gage line and the center line of the web, and (d) the comparative thinness (in older sections at least) of the webs of the tram and grooved rail designs.

The second element is undoubtedly the most obvious, and a study of its influence would be interesting, particularly with regard to the effect of the grooved or tram portion as a stiffener against lateral movement of the rail head. A comparatively simple experiment could be made by planing off the tram in varying amounts on different rails until it was entirely eliminated and placing these rails in line under traffic jointly with others not so treated.

AN EXTREME CASE OF CORRUGATION

It is with the first element, however, that this discussion has to do, and our attention was drawn to it as the result of a case of very rapid corrugation which developed in a period of about five months on track laid with

Inasmuch as the development of corrugation to an equal degree had usually required from one to two years, it followed that more than ordinary interest in the matter was aroused. The surface and gage of the line were carefully checked and found to be as nearly perfect as could be expected. The mill inspection reports were examined for variations in chemical composition, and as the rails were located by heat numbers when installed this was a comparatively easy task. They were relocated and their positions in the track were indicated on the curbs of the street. The corrugation was found to be generally distributed over the entire section of track and was not confined to any particular line of rails nor to rails of any particular heat number. Other rails of the same heats were examined at the storage yard, and careful comparison was made with these and templet drawings of the rails. Figs. 1 and 2 illustrate the character of the corrugations, which, at the time the views were taken, had reached depths ranging from 0.001 in. to 0.005 in. Measurements taken in October at the same places now show depths averaging 0.01 in., which indicate a rate of increase in depth of about 0.001 in. per month. Figs. 3 and 4 illustrate the development five months later than Figs. 1 and 2 at the same places.

CURVED RAIL HEADS—FIGS. 3 AND 4—APPEARANCE OF CORRUGATION SHOWN IN FIGS. 1 AND 2, FIVE MONTHS LATER

The wave lengths are now fully defined at about 3 in. from crest to crest, and the corrugation has reached the depth at which we usually find it advisable to begin the work of removal by grinding. Figs. 5 and 6 are excellent views of the worst conditions at the present time.

MERITS OF CURVED RAIL HEADS

The investigation of the conditions found, along the lines mentioned, led to the discussion of the subject with the engineers of the rail manufacturers and the alloy manufacturers, and the whole matter was again gone over on the ground with them. The net result of these conferences was the suggestion made by the rail manufacturers that we investigate the merits of rails having curved heads, which they were prepared to roll without increase in cost provided the other features of our standard rails were kept as at present.

There was nothing novel in this suggestion, as such. An examination of rail catalogs shows that there have been some twenty-five girder rail sections rolled which had curved heads. In fact, most of the early stringer rails and succeeding shallow tram girder rails were so designed. Just what led to the general abandonment of this feature of girder rail design is not entirely clear, although it may be that when a depth of 9 in. was reached there were rolling troubles which were then hard to overcome in some mills without excessive costs. Another and probably the chief reason for the adoption

of the inclined plane head may have been the desire to make the rail head suit the prevailing wheel coning in an effort to secure more wheel contact. In the meantime nearly all plain girder (high-T) rails have retained the curved head feature.

Furthermore, the advantages to be gained from the curved head design were pointed out by C. B. Voynow of Philadelphia in the "Analysis of Rail Section," which was a part of the report of the committee on way matters of the American Electric Railway Engineering Association, printed in the 1911 Proceedings under the heading "Girder Rail Sections." It is quoted as follows:

"(b) *Outline of the Tread.* The tread is made a plane, inclined to the gage. The wear of all mechanical parts indicates that straight lines and plane surfaces should be avoided. Worn rails show rounded heads. A flat head would get less work or compression in rolling, and therefore would be of less dense texture on the wearing surface. Worn rails show also the tread inclined at some angle to the gage. From the above it seems desirable to make the tread of a curve of some radius, but the difficulty of grinding joints on a rounded head and also the added difficulty in rolling, pointed out by the manufacturers, determined the design of the tread, as shown."

It will be noted that difficulties due to accurate joint grinding and added difficulty in rolling were the reasons assigned for the adoption of an inclined plane head in-

CURVED RAIL HEADS—FIGS. 5 AND 6—EXTREME CORRUGATION ON PLANE HEAD RAILS, SHOWING CLEARLY THE ACCOMPANYING PEENING EFFECT

Fig. 18

CURVED RAIL HEADS—FIGS. 15 TO 18—CURVED-HEAD RAILS IN EXPERIMENTAL USE IN DUBLIN, IRELAND, AND CALCUTTA, INDIA; IN GLASGOW, SCOTLAND; IN THE CENTRAL WEST, U. S. A., AND IN LEEDS, ENGLAND, RESPECTIVELY

The second inference to be drawn is that some effort should be made to counteract such injurious effects by trying to increase the load concentration area and shifting its position with respect to the gage line. Evidently the simplest way to do this is to attempt to secure a greater range in the area of contact between the wheel and the rail head from the very beginning of rail service. It follows that with wheels worn to a curve of some form, it will only be possible to accomplish this by conforming the rail head to a similar or nearly similar curved shape. In support of this it may not be out of place to note that, as previously stated, worn rails all show curved heads, and after reaching a certain fixed form of curve we seldom find corrugation. Also, corrugations do not very often reappear after grinding provided the grinding has conformed the head to an angle approximating the angle of inclination downward toward the gage line which the worn curved head has assumed.

COLD ROLLING BY THE LOAD DOES NOT PREVENT CORRUGATION

Furthermore, the idea that cold rolling alone, when not accompanied by corrugation, hardens the rail head to such a degree that it is impossible to form corrugations does not appear to be substantiated by the fact that corrugations appear on new grooved girder rails of the hardest composition, which latter should approximate, if it does not exceed, the degree of hardness produced by cold rolling. Corrugation also appears rather suddenly on old girder rails after they have been in service a number of years without previous evidence of a tendency to corrugate, and the rails have certainly received the benefit of cold rolling as a hardening agent. For these reasons we are forced to consider the design of the rails as being the more responsible and, as has been shown, there is evidence in the early service of new rails which tends to place the responsibility upon design. There is also considerable reason for the belief that old rails corrugate, finally, because of the same action of the worn wheels. This can be accomplished by any change in rail position, either through regaging, which brings a small head area under wheel contact, or through changed position, gradually accomplished by failure of ties and fastenings which produces similar results. In each case the worn wheels take a new position with highly concentrated loading on the rail head, and this factor alone would seem to explain why the rails corrugate under such apparently opposing conditions.

It may be asked why T-rails do not act similarly under the same conditions, and the answer appears to lie in the difference in design. The load, even when so heavily concentrated, is better distributed to the web both vertically and laterally, and there is no stiffening tram or groove to offset more free and uniform head movement laterally under the sidewise movement of the wheels caused by the excessive coning. Hence the corrugations,

though tending to form to a somewhat lesser degree, are ground out by the wheels, which are more free to assume such varied positions on the head as to assist in the grinding. This point appears to be substantiated by the fact that we find the head metal of standard section (low T-rails) constantly peening or extruding on both sides upon examination of such rails in service on our elevated lines.

A STUDY OF WORN RAIL HEAD CONTOUR

Having studied the worn wheels and their possible effect on new rails, attention was then directed to worn rails. Advantage was taken of openings for joint repairs on three most important, heavy traffic lines, and a great many scribings were made from rail heads at points far enough away from joints to be free from excessive wear due to joint conditions. These scribings furnished a set of measurements from which it was possible to secure an average head contour of our standard 7-in. grooved girder rails worn in service for seven years on both steel and wood tie construction. This composite contour was found to have a curved head of a radius of about 12 in. with an angle of inclination toward the gage line of about 3 deg. below the horizontal.

It was decided that it would be worth while to experiment with the curved head rails and, therefore, a new head design was evolved, as shown in Fig. 13, which has been rolled by the Lorain Steel Company as section 105-481. It will be noted that there is no substantial change in weight. A comparison of the contours of the two rails 105-433 (plane head) and 105-481 (curved head) is shown in Fig. 14, while early wear is shown in Figs. 20 and 21.

RESULTS OBTAINED WITH CURVED HEAD RAILS

It was expected that new wheels might give some trouble on the new rail due to raising the flange slightly—and these were plotted as shown in Fig. 9. From this it was thought that the new wheels would work fairly well with little danger of derailment, which latter question was raised by the mechanical department. It appeared that comparatively few wheels in service are new, and derailments could be expected on worn rails for the same reasons if there were any particular danger from this point.

About 630 tons of this rail have been rolled and some 300 tons (approximately 9600 ft. of single track) have been installed this fall. In order to test the rail fully, about 700 ft. of single track has been laid on steel ties having 6 in. of concrete under them and a total of 10 1/4 in. of concrete under the base of the rail throughout. The new rails have also been laid in conjunction with our standard plane head rails in all cases, so as to secure a comparison under the same traffic.

It may be of interest to note by reference to Fig. 13 that a first contact width of about 1 1/8 in. was predetermined, and this width was found actually in the mark-

ings under the first car wheels to pass over the rails. The attempt is also being made to secure careful records of the wear as it progresses, by means of plaster of Paris casts made at definitely located points.

The accompanying Figs. 15-18 illustrate similar curved head rail designs now being experimented with in Dublin, Ireland, and Calcutta, India; in Glasgow, Scotland; in the Central West, U. S. A., and in Leeds, England, respectively.

In closing it may be stated, from the experience already gained during installation, that the two principal objections to the curved head feature, viz., rolling and joint grinding difficulties, are really of very little moment and may be disregarded. The rail mills have had no trouble in turning out a satisfactory product, close to templet, with a marked similarity of head contours which has tended to reduce the amount of grinding at joints necessary to secure good head surface. The work of grinding the joints is not difficult and very satisfactory results have been obtained. This is true also with respect to the compromise joints where the plane head rails are joined to the curved head rails.

The performance of the new rail section under traffic shows that the desired increase in first contact area, with the incidental location of the load center at a greater distance back from the gage line, have been secured and no peening of metal at the gage line has been found after a service of about eight weeks. This peening may be found in our new plane head rails within five days after being placed in operation.

CONCLUSIONS

An attempt has been made in the foregoing discussion to present a statement of the main features which were considered before reaching a decision to give a service trial to the curved head design, together with some information obtained from trial installations which seem to warrant the following conclusions:

1. Rail corrugation has become so general that it is

being accepted with more or less complacency, and the rapid improvement in rail-grinding apparatus has made the removal of corrugation quite an easy matter, which has tended to temporarily divert attention from the study of its causes.

2. The present general practice of eliminating corrugations by grinding, on new rails at least, is simply an expedient which is not only expensive but also wasteful—expensive in actual grinding cost and wasteful of otherwise useful rail head metal lost in the process.

3. A study of the now generally accepted theory of wheel and rail contact, and their resulting pressures, based on the experiments made by Professor Johnson and by G. L. Fowler, combined with a study of the actual conditions of rail head and wheel tread wears, lead to the belief that the inclined plane head design was based on a misconception of the theory of contact and was at variance with the requirements of correct design, as indicated by both wheel and rail wears.

4. The curved head design, on the other hand, by providing a range of contact over new heads about three times that presented by new plane heads and much further back from the unsupported metal near the gage line fillet, seems to satisfy the requirements of the theory of contacts as well as the conditions of wears found in service.

5. The curved head design practically eliminates the excessive amount of metal on inclined plane heads which must be removed in some manner before the heads can conform themselves to what may be called the accommodation wear curve found on all rails except those just installed. Such a curve of substantially uniform shape is found not only in the worn rails of any one system, but also in all groove and tram girder rails throughout the country.

6. The adoption of a curved head design involves a return to an early principle of grooved and tram girder rail design which has never been generally abandoned in T-rail designs. It presents no rolling mill or joint

Fig. 19

Fig. 20

Fig. 21

CURVED RAIL HEADS—FIG. 19—FIRST WEAR ON STANDARD B. R. T. RAIL. FIGS. 20 AND 21—FIRST WEAR ON CURVED-HEAD RAIL

grinding difficulties; there should be no increase in cost, and a curved head may be incorporated in practically all grooved or tram girder rails without altering any other features of the design.

7. In view of all these points in its favor it is thought that the curved head design merits the most careful investigation because of the potential value in tending to minimize the inherent tendency of all rails to cor- rugate.

8. An interesting point which arises is the question as to the desirability of providing wheels with curved treads also. It is not impractical from the manufacturing standpoint, as far as steel wheels are concerned, and a considerable saving in wheel wear could be anticipated. In any event, actual wheel wears show that the straight tread is very soon lost in service and that comparatively little attention is given to tread wear with respect to maintenance of straight contour because wheels are shopped only for turning required by flange wear. In view of the fact that the majority of wheels and rails which come in contact are worn to curved contours, it seems somewhat impractical to expect to get the best mechanical results by imposing curved wheel treads upon plane rail heads or vice versa, and it would appear to be more logical to have the two contours conform to nearly similar curvatures from the very beginning of their contact.

Electric Car Maintenance *

Appearance of Cars Reflects Grade of Service Rendered—
Value of Charting Defects and Scientific
Inspection of Equipment

BY J. F. LAYNG, GENERAL ELECTRIC COMPANY,
SCHENECTADY, N. Y.

In considering car maintenance it should be remembered that the general appearance and condition of the car is a direct indication of the grade of service that is being given. The underlying principle of keeping up the appearance and condition of the car is based upon inspection and overhauling. These are two distinct classes of work.

Inspection shows what work is necessary to do on a car to maintain it at the highest state of efficiency and at reasonable cost. There are two other very important indexes as to the states of efficiency, of workmanship and its direction. The first is the pull-in report, and the second is monthly segregated maintenance cost. These figures will be more readily appreciated provided they are charted. I have reviewed the pull-in report for the past year of a city system operating 800 cars, and by looking over this chart it can be seen in what months of the year the different classes of failures are experienced. These reports are divided under five different headings, which are: car bodies, trucks, electric equipments of cars, motors, air brakes.

Car bodies are further classified into car-body parts, sash or glass, ventilators, registers, gong signals, sand box, drawbars, fenders, trapdoors, seats, doors and operating mechanism, signs, heaters, headlights, light circuits, window shades.

Under trucks the following defects have been classified: wheels, axles, journal bearings, truck frame, brake heads and shoes, brake rods, brake levers, bolster springs, loose brakes, tight brakes,

Under electric equipment of cars the following defects have been classified: trolley base, trolley pole or wheel, wiring, fuse box, circuit breaker, controller, grid resistance.

Under motors the following defects have been classi-

fied: field coils, armatures, brush-holders, gears, pinions, gear case, motor frame, motor leads.

Under air brakes the following defects have been classified: compressor, motor, governor, air brake parts frozen, engineer's valve, reservoir, piping or brake cylinder.

The chart shows, for instance, a large number of failures of air brakes during the winter months. Many of these defects were due to frozen air parts, and after the chart had been made the company realized that it had to give a general overhauling to the air piping and place additional reservoirs on the cars. Unless the defects are definitely classified and charted it is practically impossible to secure the proper perspective of troubles experienced. When the defects on a particular classification amount to too high a figure it is advisable

SUMMARY OF PULL-IN REPORTS

to extend the charting of the individual items to determine what should be done on individual pieces of apparatus.

Scientific inspection will do more to promote efficient, dependable service than any other single thing. There are two general systems of inspection: the periodic basis and the mileage basis. Both can be worked out in many places to give equally dependable results, but there are some classes of work in which the mileage system is the only one which can logically be followed. For instance, on interurban lines, where there is relatively a small number of cars, with the rotational system of inspection, some cars would not receive attention in proportion to the work which they are performing. Cars of nearly every character should be inspected on a 1000-mile basis. Any rotational system based on approximately this mileage would be efficient.

At a typical carhouse with a force of fifteen men the day force would consist of a foreman, two controller men, two truck men, two truck men helpers, two air-equipment men, one car-body man and one terminal inspector, and the night force of three men, whose duties are to adjust brakes and look after small troubles reported by the motormen. From this it will be seen that all of the real work is done during the daytime. It has been found that night work is most inefficient. The best

*Abstract of paper presented at meeting of Pennsylvania Street Railway Association, Scranton, Pa., Dec. 14, 1915.

grade of men will refuse to work at night, as they can readily find more congenial employment. The car-cleaning force consists of six persons in the day and three at night. To inspect the 2000 cars on the line in question 150 employees are required. This is an average of 13.3 cars per inspector. The overhauling of these cars requires 250 employees, which is eight cars per employee. Where cars are inspected in rotation very little clerical work is involved and there will be a uniform amount in the shop at all times.

On motors the two principal things to consider are the condition of the bearings and the lubrication. Free oil around the motor is one of the most frequent sources of trouble that we have. Any point where the oil flows on the surface means that in a very short time there is an accumulation of dirt which will naturally cause insulation break-downs, and the oil will also cause the insulation to deteriorate rapidly. The other feature about motor inspection is the general condition of the commutation. If the brush-holders are well kept up and the insulating supports clean, there will be but few troubles from this source. By keeping up the brush-holders is meant uniform and proper tension on the brush springs, and that the shunts, hammers and brush-holder slots are kept up to practically the original standard. The motors should be blown out at regular intervals, depending, of course, upon the condition of the roadbed and general methods of operation.

The proper care of a controller consists of keeping the contact surfaces smooth and to replace tips when they are worn excessively. To secure the best operation, the adjustment of the fingers of platform controllers should be so made as to give a simultaneous break on all points that are in the same angle of contact. The next important feature in controller maintenance is proper lubrication and the keeping of all surfaces free of dirt. This especially includes the arc deflectors or, in the case of contactor control, the arc chute sides. It has been found that there is sometimes a tendency among the maintenance men to use insulating paints on controller surface parts that were insufficiently cleaned. The new paint makes the surface look clean, but the dirt is still suspended in the paint and is the cause of future troubles. The lubrication is very closely related to the work of keeping the controller clean. Excess oil means an accumulation of dirt, which causes insulation failures. Lubrication in controllers, as in motors, should be put only where it belongs.

Recently I visited a railway company that in the past had had a large amount of trolley troubles which were largely eliminated by the proper adjustment of the trolley spring tension. The height of the trolley wire was varied from 18 ft. to 20 ft. Standard gage ropes were used of such a length that when the end is placed on the rail head the trolley wheel would be at 18 ft. elevation. A spring balance constitutes a part of the gage rope, and the spring tension is then properly adjusted.

One of the most profitable methods of making savings on a good many systems is that of replacing old equipments. I know of one particular case where by an expenditure of approximately \$400 the maintenance of motors would be reduced from \$191 to \$7.50 per year. This is only one instance of many where large savings can be made, and it must be remembered that a motor that is costing a large amount of money to maintain is a motor which causes a proportionate number of detentions to service, and that all the expenses which are directly charged as maintenance represent but a small portion of the general cost of a defective motor to the company's business.

Another feature which should be mentioned in con-

nection with shop maintenance is that considerable benefit is derived from having monthly meetings of the maintenance men to review all of the troubles which have been experienced during the past month and see what can be done for their elimination. Successful maintenance means continually being on the job, and requires a large expenditure of careful thought and intelligence, not only on the part of the management but also of the men themselves.

Safety Appliances in Car Shops*

Suggestions for Stimulating Interest of Employees in Accident Prevention—Other Suggestions Covering Fire Hazard and Safety Devices on Equipment

BY H. P. MEGARGEE, ASSISTANT TO VICE-PRESIDENT
AMERICAN RAILWAYS, PHILADELPHIA, PA.

Most accidents are due to the human element, and their prevention is most difficult. Ignorance may be remedied to a degree by instruction, but carelessness, generally, is merely forgetfulness. The oldest and best workmen are often the ones injured. They become so familiar with danger that they forget its presence, with the inevitable result. At the congress of the National Safety Council last fall much of the discussion concerned this factor. It was the thought of that body that no pains should be spared in arousing the interest of the employees themselves in this matter of safety. The management should have permanent committees of the men appointed to meet and consider protection; suggestions for the elimination of risks by these committees and by individuals should be encouraged, passed upon and adopted if practicable; prizes should be offered for the best suggestion of the month or year, and safety-first literature distributed. In a word, every possible means should be employed to keep the safety-first idea always present in the minds of those exposed to danger.

The initial step in the production of a careful man is to provide him with a clean, healthful workplace and with safe tools and surroundings, and this brings us to the question of safety devices. The first principle to be observed is that every appliance should as nearly as possible automatically prevent accidents even though the workman is careless. To get a conception of the measures necessary to safeguard a representative railway shop, we shall examine one in detail.

First, we have the building itself, and here, probably, the most important consideration is the fire hazard, for a workman injured by fire while in the course of his employment is entitled to compensation to the same degree that he would be if injured in any other manner. We must see that proper fire fighting apparatus is installed and in place, that dangerous practices likely to cause fires are not indulged in, and that electrical and similar hazards are eliminated. Where doorways open upon tracks, they should have railings and warnings posted. Stairs should have slip-proof treads and proper spacing of steps. They, with hatchways, elevator shafts and other openings, should be inclosed or guarded with railings. Skylights should have wire mesh or insert wire glass in them. Ladders, when fixed, should be of steel with not less than 15 in. between stringers and 12 in. to 15 in. between rungs. Portable straight ladders should be supplied with adjustable non-slip shoes. Any stock and parts in process of construction should be placed upon racks or piled out of the way.

With regard to power transmission: Vertical belts

*Abstract of paper presented at meeting of Pennsylvania Street Railway Association at Scranton, Pa., Dec. 15, 1915.

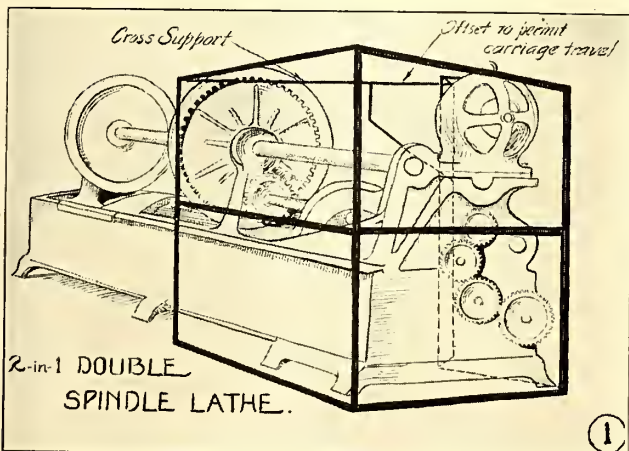

should be guarded to a height of 6 ft. from the floor. All gears when power driven should be completely incased, or at least beyond the root of the teeth. Pulley and clutches within 36 in. of a bearing should be entirely incased on the side nearest the bearing, and collars, couplings and set screws on revolving machinery should be of the safety type.

Slings should be tested and tagged with the date tested, and the foreman should make a daily examination for cuts or crushed fibers.

As to the machines themselves, I would refer you to the requirements of a safeguard, from the "Universal Safety Standards of the Workmen's Compensation Bureau," a book which should be contained in every street railway company's library. This book says of a safeguard: (1) that it should afford all possible safety to

the operator and surrounding workmen; (2) that it should be, if possible, automatic in its action, application or operation; (3) that it should be, if possible, an integral part of the machine itself, and (4) that it should not materially diminish the output or efficiency of the machine to which it is applied. If these principles are kept in mind and strictly adhered to, successful safeguarding is assured.

With regard to the type of guarding for individual machines, I have prepared drawings which show better than I can explain verbally how this is done. The sketches are taken directly from the machines in use in the Chicago & Joliet Electric Railway's plant and represent the best practice in safeguarding. I am of the opinion that, with this installation, a very successful attempt was made to use a single substantial screen

SKETCHES SHOWING MACHINE TOOL SAFETY GUARDS, CHICAGO & JOLIET ELECTRIC RAILWAY

or casing as far as it was possible and not to have a number of "gingerbread" guards stuck all over the machine. All parts to which access need not be had in the operation of the machine are grouped behind one guard.

A very interesting phase of the question is that of the expense involved, and in conclusion I give you the cost of protecting a typical plant. I have in mind one of our subsidiaries—a company operating about fifty cars and having shop facilities for that number. About fourteen machines were guarded in approved manner and several special safety devices were purchased, and the entire cost of labor and material was less than \$400.

If you consider that a single workman receiving \$12 a week in wages would have to be laid up only for a period of sixty-seven weeks to receive this amount—and should he be disabled by a permanent injury such as the loss of a hand he would be entitled to 50 per cent of his wages for 175 weeks, or \$1,050, it is apparent that the question of the cost of installing a reasonable number of safety appliances is so slight as to be absolutely negligible.

Skip Stops Held Up in St. Louis

Plans for Faster Schedules Have Been Approved by a Four-to-One Popular Vote—Adoption Now Awaiting Approval of Public Service Commission

A somewhat remarkable situation in connection with the recently-tested skip-stop plan has arisen in the city of St. Louis, as the order for its establishment, after a period of trial operation that proved satisfactory to the railway company's patrons, is apparently being held in abeyance by the local authorities. This failure to act is presumably based upon protests that have been made by a few property owners at the points where stops have been eliminated, although the patrons of the line have expressed themselves strongly in favor of the change.

The skip-stop plan for St. Louis was conceived about one year ago, when the local railway company decided to take up with the city authorities and with the State Public Service Commission the savings in time that could be effected for passengers by reducing the number of stops. The city of St. Louis is rather irregularly built, some of the blocks being short and some long. Under the old custom which grew up with the horse cars, the cars had been making stops at every street intersection. With electric operation, however, the different conditions made it evident that, if certain stops were eliminated in a manner which could not be objected to by the passengers, at least 10 per cent in running time could be saved. The railway company, therefore, called the attention of the municipal department of public utilities and also of the State Public Service Commission to these facts, and both organizations were so much interested in the matter that each delegated engineers to go over the scheme to determine what could be done. After an investigation, the commission's engineers reported that 28 per cent of the present stops could be eliminated without hardship

to any of the passengers and with great advantage to all of the riders, especially to those making the longer trips.

Although there seemed to be no question as to the advantage of the stop-elimination plan, both the municipal department of Public Utilities and the State Public Service Commission hesitated to issue an order in the matter. The railway company, therefore, made a formal petition to the State commission for the proposed elimination of stops, and a public hearing was held in St. Louis. At this hearing specific objection was made to the elimination of only twenty-eight stops out of a proposed total of 770. These objections came entirely from property owners and storekeepers at the proposed points where stops were to be cut out, these people fearing that their interests would be affected.

The State commission then took the matter under consideration and authorized a test to be made of the proposed plan on two of the railway company's lines, this test being of ninety days' duration. The commission, however, did not permit a test of the plan in the exact form which had been originally proposed, because in its order for the test certain stops were replaced in the schedule, and this reduced the possible saving in time. The selection of lines was also unfortunate because on some of the other lines of the system, where the blocks were shorter, a much better showing for the skip-stop scheme could have been made. In its order, also, the State commission incorporated a clause requiring the railway company to make application at the end of the test period to the municipal authorities for permission to eliminate the stops permanently, although the commission itself had several times held that the State public service law has removed from the municipal authorities all control over the service of public utilities.

The company proceeded, however, to make the test authorized by the State commission, and, near the end of the test, the passengers on the two lines concerned voted on the question as to whether or not the plan was acceptable to them. On one of the lines the vote showed approximately three to one in favor of the plan, and on the other line approximately four to one in favor of it, about half of the total number of riders on both lines having cast ballots. An attempt was made to have both the municipal department of Public Utilities and the State Public Service Commission assist in arranging this vote and supervise the counting, but neither body was willing to take any part in it. On Dec. 14, the company filed with the commission a report on the test and a petition for permission to install a modified alternate stop plan. This petition is now under consideration by the commission. An abstract of this document follows:

PETITION TO PUBLIC SERVICE COMMISSION FOR SKIP-STOP ORDER

The petition begins with a report outlining the conditions that led up to the test of the new plan, by stating that on Aug. 5, 1915, the Missouri Public Service Commission had issued an order authorizing the United Railways Company of St. Louis to make a test, beginning on Sept. 1. From this it was found that savings of 7 per cent on one line and 7½ per cent on the other were made in the running time without taking a single car out of service, although the commission did not allow the company to eliminate all the stops asked for in the original petition. However, the test was carried through with no more than the usual temporary confusion when any change in running conditions is made.

To determine the wishes of the passengers on the two lines in question, the railway company asked, on Nov.

This vote is taken to determine the preference of passengers on this line.

If you desire rapid transit, vote "YES."

If you do not wish rapid transit, vote "NO."

Tear off your ballot and deposit it in the box.

NO—Against Rapid Transit.

YES—For Rapid Transit.

ST. LOUIS SKIP-STOP—
SAMPLE BALLOT FOR
POPULAR VOTE

22, for a vote on the question of rapid transit as brought about by the elimination of stops, invitations having been extended to the commission and to the director of public utilities in St. Louis to supervise the voting, but not being accepted. In order to bring the matter prominently to the attention of the passengers bulletins were displayed in all of the cars on the lines in question on Nov. 19-22, and advertisements were carried in four Sunday newspapers on Nov. 21. On Monday, Nov. 22, advertisements were carried in five English daily newspapers and two German daily newspapers.

Ballots were distributed by the conductors to all the passengers, including those paying cash fares and those offering transfers, and a ballot box, on the front of which was painted "Vote Here for Rapid Transit," was placed in a prominent position at the front end of each car near the exit.

On Nov. 22 a large sign reading "Vote To-day For or Against Rapid Transit" was carried on the front dashboard of each car on the lines in question. There was some newspaper criticism as to the wording of the ballot which asked the passengers to vote for or against rapid transit. However, rapid transit was the result

attaining it by the complete elimination of certain stops is likely at first to meet pronounced though often selfish opposition from two classes of persons. These are, first, the property owners and storekeepers who fear the depreciation of property located at the affected corners for business purposes, and, second, those living in the neighborhood who have to walk further to reach the cars.

To meet such objections as have been made to the original plan and to treat all impartially, the company proposes a modified alternate stop plan which has been in use in the city of Cleveland for about two years and is so popular with the passengers that, according to the city street railway commissioner, they would not be willing to return to the old methods of operation. By this plan, the stops which are eliminated in one direction of travel are retained as stops in the other direction. It is proposed that the minimum distance between stops shall be 300 ft. and that the maximum distance between stops shall be 800 ft., so that the maximum additional distance which any passenger will be obliged to walk on account of the readjustment of stops shall be 400 ft. At the rate of 4 m.p.h. a passenger may walk 350 ft. in one minute; therefore, the loss of

NOTICE

The ninety day test period established by the Public Service Commission for a test of the elimination of stops expires November 30th.

By reason of this elimination six minutes have been cut from the schedule in each direction on the Broadway Line, making a saving of time for passengers of 7 1-2 per cent, and three minutes have been cut from the schedule in each direction on the Delmar and University Lines, making a saving in time for passengers of 7 per cent.

With a slight increase in the number of eliminated stops a saving of at least 10 per cent could be made without increase in maximum speed.

This has been accomplished without taking a single car out of service. The passengers and not the Railways Company have received the benefit of this saving in time.

It is the desire of the United Railways Company to please its patrons and give them the best practicable service within its means.

In order to determine the preference of our patrons we will, on Monday, November 22nd, ask passengers on the Olive and Broadway Lines to vote whether they wish to continue the present elimination of stops and rapid transit, or desire to return to the old method of more frequent stops and slower time.

On Monday, November 22nd, ballot boxes will be placed in each car on the Olive and Broadway Lines and the conductors will furnish each passenger as he enters the car with a ballot by means of which he may vote for or against rapid transit.

The Public Service Commission and the Department of Public Utilities have been requested to supervise the vote and see that it is properly conducted and fairly counted.

United Railways Company of St. Louis

ST. LOUIS SKIP-STOP—NOTICE POSTED IN CARS SEVERAL DAYS BEFORE VOTE

achieved by the elimination of stops and there was no misunderstanding as to what the ballot meant. The petition added that the company would have been glad to have submitted the wording either to the commission or to a municipal director of public utilities had either shown interest in the matter, but as the company did not have the benefit of their advice it was decided that many of the passengers might have been confused as to what was meant by "Elimination," whereas all would know what was meant by "Rapid Transit." Voting was continued on Nov. 22 from the time when the cars went out in the morning until they were turned in at night, at which time the ballot boxes were sealed and deposited in the vaults of the railway company. The counting of the ballots, in the presence of representatives from four newspapers, was completed the following afternoon. The result of the votes on the different lines was as follows:

Olive lines—For rapid transit, 38,910. Against rapid transit, 9,178.

Broadway lines—For rapid transit, 28,678. Against rapid transit, 12,217.

The petition continued by saying that ever since the tests had been in force the officers of the railway company had been studying the results and methods by which these results had been attained. There is no question but that the majority of passengers favor rapid transit obtained in any way, but any scheme of

THE WILL OF THE PEOPLE.

OLIVE LINES

FOR RAPID TRANSIT,— 38,910
AGAINST RAPID TRANSIT,— 9,178

BROADWAY LINE

FOR RAPID TRANSIT,— 28,678
AGAINST RAPID TRANSIT,— 12,217

This is the result of the vote on Monday, November 22nd, of the passengers on the Olive and Broadway Lines to indicate their preference as to rapid transit and fewer stops, or slower speed and more frequent stops.

ST. LOUIS SKIP-STOP—NOTICE POSTED IN CARS ON THE DAY AFTER VOTE

time in walking will probably be made up several fold by the saving in time on the car. However, at all transfer points and track intersections, and within the congested area of the business district of the city, no stops shall be eliminated.

The petition closed with a request to the commission for an order making the proposed rearrangement of stops permanent.

Service Conditions for Women Conductors in London

The Highways Committee of London, England, reports that the precise conditions under which the women will have to work on the London County Council Tramways can only be settled after some experience has been gained, and after it is seen how many men will be called up for service under the group system of Lord Derby's recruiting scheme. So far as possible, women will be engaged for full-time service and will then receive the same rate of pay as men. There might, however, be exceptional cases in which a long "spread over" occurs and one woman could hardly be expected to perform the full duty. It would probably be found convenient in these cases for one woman to take the early morning portion of the duties and another woman to take the late evening portion, and the full day's pay would be divided between the two women.

Massachusetts Northeastern Fare Hearing

Company Presents 6-Cent Fare Evidence Before Joint Session of Massachusetts and New Hampshire Commissions

The Massachusetts and New Hampshire Public Service Commissions at a joint session in Boston on Dec. 14 heard the contentions of the Massachusetts Northeastern Street Railway, Haverhill, Mass., for a general fare increase. John E. Benton, Keene, N. H., appeared as counsel for the company, and President David A. Belden filed a brief on behalf of the proposed changes. After the presentation of the company's evidence the hearing was adjourned to give the remonstrants an opportunity to prepare their case. Pending a finding the proposed changes have been suspended.

Mr. Benton urged that the road is entitled to a fair return upon the capital stock above fixed charges and operating expenses, pointing out that the Massachusetts commission has recently approved the outstanding capital stock. He said that every effort had been made to make the property yield some return to the stockholders, but that prior to the consolidation in 1913 under the present ownership, it was impossible to pay any dividend upon the stock of any of the ten companies then owning the properties. In 1915 the net operating revenue was about \$40,000 less than in 1914. The current year thus far shows a loss in gross revenue, which, even if not continued through the year, will, together with an unavoidable increase in labor charges, make the net showing for the year \$25,000 worse. The company desires to raise the cash fare from 5 to 6 cents, to increase the ticket-book rate 20 per cent, to introduce a new fare zone between Pelham Center and Hudson Center, to discontinue a lap-over privilege on the Merrimac Division and to make minor changes in fare limits. Mr. Benton said that these changes would yield less than a fair return.

POSITION OF THE COMPANY

The company is composed of seven Massachusetts and three New Hampshire street railways and the Canobie Lake Park Company, operating a pleasure resort in Salem, N. H. In general the lines connect Haverhill, Lowell, Lawrence and Newburyport, Mass., with the Hampton Beach district in southern New Hampshire while other lines connect Nashua and adjacent towns with the cities of the Merrimac Valley of Massachusetts and the seacoast. The system now comprises 126 miles of single track, 80 of which are in Massachusetts. Exclusive of the beach sections, where only summer service is offered, the average length of the fare sections is 4.04 miles, which on the basis of a 6-cent fare is 1.48 cents per passenger mile.

All but two lines were built for operation as a unit system, and the separate incorporation of the eight other companies was the result of the routes crossing the State boundary. Carhouses, repair shops and substations were located with reference to the combined mileage in both States, and with one exception no company could give practical service without the connections afforded by one or more of the companies in the adjoining State. Four of the Massachusetts companies owned no carhouses or shops, and only one in this group had a substation or power equipment of any kind.

Although the gross operating revenue of the system increased from \$646,009 in 1911 to \$674,818 in 1915, there was a loss of \$24,290 in the latter year compared with 1914, so that the net increase for the five years was only 4.46 per cent. Operating expenses increased \$50,346 or 10 per cent for the five years, and taxes increased 64.16 per cent. Prior to 1910 no depreciation

reserves were included in the accounts of the constituent companies, but in the five years ended June 30, 1914, the combined charge was \$561,500, as required by the equipment life conditions. While the profit and loss accounts were unable to meet these depreciation charges without creating large deficits, it seemed best at least to recognize the necessity of a reserve account.

Maintenance expenses for the five-year period ended in 1914 averaged 20.75 per cent of the gross operating revenue, and for 1915 the ratio was 23.93 per cent. Energy is supplied at 13,200 volts to six substations by the Rockingham County Light & Power Company, Portsmouth, N. H., at a rate of 1.4 cents per kilowatt-hour with a provision for slight increases following the price of coal. The cost of purchasing power for 1915 was \$144,288, and the cost of substation operation was \$14,317, of which maintenance required \$2,562 wages \$10,804, and supplies and expenses \$950. The total power cost was therefore \$158,605.

With the exception of the Citizen's Electric Street Railway, Newburyport, Mass., and the Haverhill & Amesbury Street Railway, none of the companies included in the Massachusetts Northeastern consolidation ever paid a dividend. In the eleven years ended June 30, 1911, the former company paid an average dividend of 5.6 per cent, accumulated a floating debt of \$45,000 and made no provision for depreciation. The physical condition of the property was such that dividends were suspended in 1911, since which time \$94,020 has been expended on repairs and replacements in addition to the regular maintenance outlays. The Haverhill & Amesbury Street Railway paid 4 per cent in three years and 3 per cent in 1897, no later dividends being declared. Since its purchase in 1909, \$223,351 has been expended in rehabilitation. The Massachusetts Northeastern has paid one dividend on its preferred stock amounting to \$16,825. Since 1914 earnings have not warranted the dividend, and it has been passed.

With the 1915 travel, the proposed rates, together with the additional fare section, would produce an increase of \$147,479 in passenger revenue if the traffic held up to normal. Omitting depreciation charges but including \$13,000 for wage increases effective on Oct. 1, 1915, and providing for additional taxes on the capital stock or franchise value which would result from a dividend return if one were earned, the company would have operating expenses and taxes of \$595,000 or \$17,811 more than for 1915. With 5 per cent interest on the funded and floating debt and 6 per cent dividends on the common and preferred stock, the total requirements would be:

Interest on \$1,000,000 bonds at 5 per cent.....	\$50,000
Interest on \$475,000 floating debt at 5 per cent.....	23,750
Dividends on \$665,000 preferred stock at 6 per cent.....	39,900
Dividends on \$1,500,000 common stock at 6 per cent.....	90,000
Operating expenses and taxes (est.).....	595,000
Total	\$798,650
Gross earnings, July 30, 1915, year.....	683,953
Theoretical increase due to new rates.....	147,479
Total	\$831,432
Excess	\$32,782

No allowance for depreciation is included in this tabulation, and the floating indebtedness in large part cannot be capitalized because it represents operating deficits and money borrowed to pay interest. To retire this in ten years an addition of \$47,500 per year is required out of earnings. Hence the proposed new schedule will fall far short of providing fully for the company's needs and paying a full fair return upon the investment, even as that investment is now represented by the outstanding securities. It is not expected that the new rates will enable the company to pay a 6 per cent dividend upon its common stock. While the stock-

holders are entitled to this moderate dividend, if it can be earned, it is believed that a higher fare than that proposed would tend to discourage travel to such an extent that the net increase in revenue would be less than under the proposed schedule. Jitney competition is another uncertain factor. Some of the increases proposed will yield no additional revenue unless corresponding increases are allowed upon competing lines of the Bay State Street Railway. If the rates upon competing street railway lines are not less than those fixed by the proposed schedule, it may be estimated that the revenues will be increased from 10 to 15 per cent the first year after the new rates are in effect, and that this percentage may thereafter be increased from year to year.

The National Safety Council and Its Electric Railway Section

BY H. A. BULLOCK, CHAIRMAN MEMBERSHIP COMMITTEE
ELECTRIC RAILWAY SECTION, SECRETARY NEW
YORK MUNICIPAL RAILWAY CORPORATION

The executive committee of the electric railway section of the National Safety Council met in New York City on Dec. 17 to receive reports from the sub-committees, and plans were put under way for important work along several lines.

THE NATIONAL SAFETY COUNCIL

Before taking up in some detail the work of the electric railway section it may be well to review briefly the remarkable history of the council itself. It was organized in a preliminary way four years ago and formally two years ago, principally at first by the steel and steam railroad industries. The president is Arthur T. Morey of the Commonwealth Steel Company, and W. H. Cameron, Chicago, Ill., is secretary and treasurer. A board of about fifty directors manages the work of the council through an executive committee of sixteen members. The rapidly growing membership now comprises 1450 firms and corporations, including forty-eight electric railways, and more than 5000 individual representatives of these interests.

The work of the council is organized in sections, of which two of immediate interest are those on electric railways and public safety. George O. Smith, Doherty Operating Company, is chairman of the former, and Edward C. Spring, Lehigh Valley Transit Company, of the latter. These two will work in close co-operation,

electric railways joining one being automatically enrolled in the other.

Among the important activities of the council are the following:

1. An annual congress with separate sessions devoted to the discussion of important safety problems peculiar to each section, and certain general sessions devoted to the safety problems common to all sections.

2. Local councils in industrial centers, automatically including in their membership the local members of the National Safety Council. These local councils provide facilities for the safety education of employees through public meetings and round-table discussions, and, in general, create facilities for the systematic handling of the public safety and other problems common to the various industries in their respective sections.

3. A weekly safety service, consisting of at least four bulletins distributed to all members every Monday. These bulletins represent the best information on safety topics and are directed to the stimulation of all those engaged in systematic safety work, and the education, particularly through pictures, posters, slogans, etc., of the rank and file of employees. The National Safety Council is, in large measure, the clearing house for the organized safety activities of the entire country.

4. Directive assistance in organizing and developing safety campaigns. The firms and corporations now belonging to the National Safety Council, particularly such companies in the transportation industry as the Boston Elevated Railway, the Brooklyn Rapid Transit Company, the New York Central lines, and the Delaware, Lackawanna & Western Railroad, have passed through the costly experimental stage in the safety education of their employees and the public. The National Safety Council is able to offer to others the results of the experience of these and hundreds of other concerns.

5. Information bureau service, involving answering, according to the most approved standards, the questions which are submitted by the members on safety problems in their respective fields.

6. The services of lecturers and safety experts, the council being able, through the co-operative activities of its members, to provide such services in connection with safety campaigns.

7. Motion picture and stereopticon slide service. The council maintains a collection of moving picture films and stereopticon slides which can be utilized by the members without charge.

National Safety Council Bulletins Are Read by 2,000,000 Workmen Every Week
MEMBER ORGANIZATION: NATIONAL SAFETY COUNCIL, CHICAGO, ILL. No. 30

SAFETY EVERYWHERE —ALL THE TIME

It is just as important to guard against accidents going to and from work as when in the shop.

This picture—which was specially posed for—is intended to show what might happen to a man who attempted to board a MOVING CAR on his way home. If he missed his hold, and was thrown under the wheels, he would lose a leg. But if he had observed the rule BE CAREFUL, he would not be a cripple for life.

An accident of this kind actually happened to one of the workmen of The Shaw Electric Crane Co.
ALWAYS "BE CAREFUL"—KEEP YOUR HEAD—AND YOU WON'T LOSE YOUR LIMBS.

(Courtesy of The Shaw Electric Crane Co., Muskegon, Mich.)

Distributed by NATIONAL COUNCIL FOR INDUSTRIAL SAFETY, Chicago, Ill.

Herein follows supplementary and eloquent evidence of results attained in Accident Prevention Work:

The Avery Company of Peoria, Ill.

For the period January 1, 1914, to July 1, 1914, paid only \$13.10 as compensation for injuries suffered by workmen and this Company is strictly complying with the Workmen's Compensation Law of Illinois.

This has been attained through their giving as much attention to Safety Work as to any other department of their operations. The results shown amply justify this.

The Oregon Short Line Railroad Company of Salt Lake City, Utah

Under date of July 1, 1914, present the following report of injuries on their system during the fiscal year just ended as compared with the one previous:

Second six months of 1912	-	1268 injuries
Second six months of 1913	-	1105 injuries
Reduction	-	163 or 12.9%
First six months of 1913	-	1561 injuries
First six months of 1914	-	606 injuries
Reduction	-	955 or 61.1%

Taking the whole year 1118 accidents have been saved—a reduction of 39.5%.

These results include every accident (slight or serious) and are based on an increasing business.

8. The services of the several technical committees which are at work standardizing and developing safety devices and practices.

9. Co-operation in sanitation, hygiene and general welfare matters. While the council is not primarily engaged in welfare work, nevertheless the subject of sanitation and hygiene is necessarily related to that of safety and it is able to give its members expert advice on plant hygiene, first aid instruction, the care of the injured, etc.

As the council is a co-operative organization, it is able to give the above service at a nominal membership payment, varying between \$10 and \$100 per year, the latter fee being that for employers of 10,000 or more persons.

THE ELECTRIC RAILWAY SECTION

Due to the size of the electric railway membership and to the satisfactory condition of the treasury special service to electric railway members will soon be inaugurated. Such members as the Boston Elevated Railway and the Brooklyn Rapid Transit Company have agreed to supply material for a weekly service.

NATIONAL SAFETY COUNCIL—AMERICAN CAR & FOUNDRY COMPANY'S POSTER

At the executive committee meeting already mentioned the committees reported in substance as follows:

The membership committee, of which the writer is chairman, stated that the enrollment has increased nearly 50 per cent since Oct. 1, and that printed matter will soon be sent out in an active campaign for new members.

The committee on standards, Henry B. Potter, Boston Elevated Railway, chairman, recommended that its work should be directed along these lines:

A standard code of principles underlying the forming of safety organizations in street railroad companies and methods of organization carrying out such principles should be prepared. While it was recognized that conditions in street railway organizations vary to such an extent that no single form of safety organization can be applied to all, the discussion developed the conviction that a clear statement of the principles underlying successful safety organizations already formed would be of great service.

Data on near-side stop practice should be compiled.

Uniform practices at grade crossings should be encouraged. In this particular the co-operation of the members of the steam railroad section will be solicited. Marcus A. Dow, New York Central lines, is chairman of the steam railroad section.

The committee on accident study and analysis, through Rex D. Billings, chairman, reported a plan for estab-

lishing for members of the electric railway section a special bulletin service of safety material. As already stated, the electric railway members have promised co-operation in this matter.

The details of the program for the sessions of the electric railway section at the next annual congress of the council, to be held in the fall of 1916, will be a special order of business at the February meeting of the sectional executive committee.

The executive committee of the electric railway section comprises the following: George O. Smith, Doherty Operating Company, chairman; Edward C. Spring, Lehigh Valley Transit Company, vice-chairman; C. B. Scott, Middle West Utilities Company, secretary; H. A. Bullock, Brooklyn Rapid Transit Company, chairman membership committee; Henry B. Potter, Boston Elevated Railway, chairman standardization committee; Rex D. Billings, Reading Transit & Light Company, chairman committee on accident study and analysis, and H. Irwin, Charlestown Consolidated Railway & Light Company, chairman program committee.

Trenton Fare Increase Denied

New Jersey Commission Refuses to Allow Trenton & Mercer County Traction Corporation to Withdraw Six-for-a-Quarter Tickets

The Board of Public Utility Commissioners of New Jersey in a recent decision disapproved the non-continuance of six-tickets-for-a-quarter by the Trenton & Mercer County Traction Corporation, Trenton, N. J., as announced in the ELECTRIC RAILWAY JOURNAL of Dec. 18. The following is an abstract of the salient points of the decision, which is now available in full.

DEVELOPMENT OF CASE

Under date of Aug. 13, 1915, the board received a communication from the Trenton & Mercer County Traction Corporation to the effect that the company and its lessors had many years past sold six tickets for 25 cents; that, owing to decreased revenue and increased cost of operation, the company intended to discontinue this practice and to withdraw the tickets from sale, and that it would charge a 5-cent fare for carrying each passenger over five years of age. The Trenton & Mercer County Traction Corporation operates as lessee the properties of the Trenton Street Railway and its subsidiaries, the Mercer County Traction Company, the Trenton, Pennington & Hopewell Street Railway and the Trenton, Hamilton & Ewing Traction Company. The tickets mentioned above were accepted as the equivalent of a 5-cent fare on all the leased lines.

On Aug. 17, 1915, the board suspended the increase as proposed by the company, and hearings were then held. The company contended that the board was without jurisdiction to inquire into the justice and reasonableness of the proposed change because the ordinances passed by the city of Trenton constituted inviolable contracts by which the rate of fare for each passenger over five years of age was fixed at 5 cents. In the board's opinion, however, neither the acts of incorporation nor the ordinances supported such a claim or prevented the exercise of the jurisdiction conferred by the regulatory act.

METHOD OF GETTING AT VALUATION

The question, in the board's opinion, therefore became one of the justice and reasonableness of the proposed change. In investigating along the primary subject of value, it was found that the books produced for the Trenton Street Railway and its subsidiaries were incomplete and did not disclose the actual cost of the

properties. They gave some information as to the amounts of stock and bonds issued by the subsidiary companies, but such data were held to bear no necessary relation to reasonable cost or value.

There was in evidence a valuation made by the board's engineer, Mr. Betts, in the spring of 1911 in connection with the lease of the properties to a new operating company. There was also a general valuation by Rankin Johnson, president of the company, based upon an investigation made by him in 1910. In addition, there was a valuation compiled for the purpose of this case by engineers representing the city, Messrs. Rand and Brackenridge, and a fourth valuation made up practically as of the present time by Mr. Johnson. The board decided that the best estimate of value could be made up by taking the Betts report of 1911, deducting from the inventory in that report the items which had since disappeared, adjusting the values where the present testimony showed substantial error, and adding amounts found by the board's examiners to be properly chargeable to road and equipment from February, 1911, to the present time. The value placed upon the property in 1911 was \$2,387,950, overhead charges being omitted, and after the deductions and additions mentioned were made, a reproduction value as of Sept. 30, 1915, was found to be \$2,905,500. From this sum the board deducted \$220,000 for accrued depreciation giving a present value of \$2,685,500 as of Sept. 30, 1915. The board stated that the deduction made for accrued depreciation was based upon actual depreciation ascertained by inspection, and not upon theoretical depreciation.

OVERHEAD CHARGES

In the matter of overhead charges the board considered that an allowance of 15 per cent was sufficient to cover engineering, errors and omissions, contingencies, and interest during construction, in view of the piecemeal manner in which a number of the lines and extensions were constructed. Calculated upon the items subject to such charges, an amount of \$324,000 was obtained. For organization expenses $2\frac{1}{2}$ per cent upon the bare structural cost was allowed. This cost was assumed to be \$2,500,000, giving an allowance of \$62,500. The board allowed for contractor's profit the sum of \$140,000, which it regarded as liberal in any circumstances.

Materials and supplies properly belong under working capital, but these items were included in the appraisal of the physical property, and in view of the facts testified the board did not deem proper any further allowances for working capital. The record contained no proof of development cost or of inadequacy of a fair return at any time upon fair value. No allowances for these items could therefore be made. Throughout the valuation, the board said, it gave full consideration to the fact that the property valued was a going concern in successful operation.

The board concluded that the value of the property, for the purpose of fixing rates, did not exceed \$3,212,000, as follows: Present value, Sept. 30, 1915, \$2,685,500; overhead charges, \$324,000; organization expenses, \$62,500; contractor's profit, \$140,000; total, \$3,212,000.

EARNINGS AND EXPENSES

The board found that the operating revenues had shown an increase each year from 1911 to 1914, the average for the four years being \$736,840. The operating expenses had also increased each year, but not in the same proportion, the average for the four years being \$389,923. Taxes had shown an increase each year, the average for the four years being \$45,062. The net

revenue had not shown the same increase as in the case of the gross revenue, the average net revenue being \$301,855.

The commissioners said that the financial statements submitted by the company appeared to show a deficit, but in arriving at this deficit there had been included among the deductions the rentals which the Trenton & Mercer County Traction Corporation agreed to pay to the owners of the Trenton Street Railway. The board refused, therefore, to look upon these statements as showing the actual relation between net revenue and the value of the property, when the earnings of the last four years and the value of the property used in the production of these earnings were being considered.

Based upon the property value of \$3,212,000, the average net revenue for the four years, \$301,855, showed a net return of 9.4 per cent. The board said that it was quite clear that the value in each of the previous three years was less, so that if the average net revenue for the four years were set off against the average valuation for the same period, the net return would be higher than 9.4 per cent. If the company were allowed to earn upon its claim of value, including \$1,139,952 of intangibles and making a total of \$5,900,703, the average return would be 5.11 per cent.

It was asserted, stated the board, that the properties had not been maintained in a first-class manner, and it might be that a larger amount should be set aside for depreciation and expended upon the property each year. The amount expended in 1914 was approximately \$70,000, and this included more than the average amount of replacement work. If, however, the allowance for depreciation were increased to \$135,000, the amount said to be required, thus decreasing the average net revenue from \$301,855 to \$236,855, a net return of approximately 7.37 per cent would still be shown on the value allowed. For these reasons, therefore, the board maintained that the proposed withdrawal of the six-for-a-quarter tickets was unwarranted.

New Haven Tie-Up Not Due to Electric Equipment

Further information regarding the recent suspension of service on the electric zone of the New York, New Haven & Hartford Railroad which is now available shows that the interruption was due primarily to a complete failure of all means of communication along the lines and not to a breakdown of the catenary or feeder systems, as was originally reported. The storm that caused the trouble was an unusually severe one, alternate falls of rain and snow accompanied by a freezing temperature producing a coating of ice of unprecedented thickness on all overhead wires. In several places actual measurements showed that the coating of ice was $3\frac{1}{4}$ in. in diameter, and this, it may be said, is more than three times the load for which overhead construction is normally designed in the vicinity of New York City. Nevertheless, all of the feeder wires and contact system withstood the strain. The only power wires that did not stand up were the No. 3 gage control wires which, it may be said, do not affect electric operation directly, and the No. 3 gage signal lines. However, the entire telephone and telegraph pole line along the route between Woodlawn and New Haven was broken down, and these wires and others that parallel the tracks caused a number of grounds when they fell across the contact wires for sidings which branched off from the main line. This difficulty was easily remedied by opening the knife switches that are installed to separate the sidings from the main line, but the complete absence of communication between the various sections

of the line prevented the prompt location and isolation of the grounded sections. At the same time the failure of both the signal wires and the means of communication with the dispatcher practically prevented the movement of trains even by steam locomotives.

COMMUNICATION

Accounting for Rents

CHICAGO ELEVATED RAILWAYS

CHICAGO, ILL., Dec. 6, 1915.

To the Editors:

In the *ELECTRIC RAILWAY JOURNAL* of Nov. 13 appears an editorial entitled "Accounting for Rents." Statement is made therein that "for steam railroads, only office and minor equipment rents are included in operating expenses." The I. C. C. classification for steam railroads provides joint facility accounts for each subdivision of operating expenses, except "traffic," and to these joint facility accounts the lessee company charges its proportion of operating expenses: maintenance of way and structures to "maintenance of way and structures," maintenance of equipment to "equipment," transportation to "transportation," and general to "general." The I. C. C. classification for electric lines, ignoring, in the opinion of the present writer, the foundations of an operating classification, charges every expense for joint facilities, irrespective of the nature of the expense, to the sub-accounts under "general and miscellaneous."

I agree that "the purpose to be attained by an accounting classification should be the controlling factor in its construction," and that "a classification should be so made as to indicate in the clearest and quickest way whether or not a utility is securing a reasonable return on the fair value of the property." I must take issue, however, with the statement that the "gross income" is "the actual return upon the fair value of property," "gross income" being "used in its official technical sense according to the I. C. C. classification." Gross income is the measure of the return upon the property only in a limited sense and under exceptional conditions. In determining such return, interest on unfunded debt and other analogous items are as proper a deduction from "net revenue" as taxes.

The assumption, moreover, is diametrically opposed to that of railway officials, who assert that a fair return in a valuation rate case or otherwise must be a fair return upon the capital stock. All valuation proceedings have this for their purpose. A utility may and often does have a large gross income and at the same time not have sufficient income to meet its interest and other fixed charges. For the purpose of clearly showing the return upon the investment, many income statements show "balance for funded debt and capital stock." The rates then should be sufficiently high to enable a railway to finance its capital expenditures upon a reasonable valuation and to pay dividends upon a reasonable investment. In railroad accounting this return is indicated by the "net income and corporate surplus." For the purpose of ascertaining whether or not a fair return upon the investment has been made, the distinction between "operating expenses" and "deductions from income" is purely artificial and may be disregarded altogether.

It further appears to me that the editorial fails to appreciate the accounting distinction between operating revenue and income. By operating earnings is to be understood income derived directly from the operation of the property, and by operating expenses, the cost of

maintaining and operating such property. By "income" is meant such income and deductions therefrom as represent a return upon the total capital invested in the property. If this distinction is kept in mind the accounting for rents becomes a simple proposition. That portion of the rental which represents maintenance or operation is a proper charge to operating expenses; that portion of the rental that represents a return upon the investment should be charged to income. The I. C. C. classification for steam roads follows this method entirely, but the electric classification only partially.

Leased property may be divided into two general classes: Property operated solely by the lessee and property operated jointly with another or others. In both cases the rental factors are the same—all operating expenses in the first case (usually), a proportion thereof in the second, and in both, an amount which represents a return to the lessor upon his investment. In both cases the lessee, instead of purchasing the property and paying interest thereon, elects, for purposes of economy, to pay the interest of the lessor. In the present writer's opinion that portion of the rental which represents a return to the lessor upon his investment should be charged where the interest on such property if owned would be charged, *viz.*: income.

The electric classification recognizes this distinction as to property operated solely by the lessee. All operating expenses assumed by the lessee are charged to the proper operating accounts, but that portion of the rental which represents a return upon the investment to Account No. 216, "rent for leased roads." As the official text states, "this account shall include amounts payable as rent for road, tracks or bridges (including equipment and other railway property covered by the contract) of other companies, held under lease or other agreement by the terms of which exclusive use and control for operating purposes are secured. The amount of rent payable by the lessee in accordance with the agreement shall be included in this account, whether paid to the lessor in cash, or disbursed by the lessee on behalf of the lessor, as interest on funded debt, guaranteed dividends on stocks, or otherwise." The charges are made upon the condition that the property leased shall be operated solely by the lessee, and no mention is made as to a long or short term lease.

It is for jointly operated property that electric lines differ from the steam. The steam roads charge all operating expenses to the proper joint facility accounts, and rent proper (return on the investment) to income. All rentals paid for such facilities by electric roads, whether they represent actual operating expenses or a return to the lessor upon his investment, are charged, not to the proper division of the operating accounts, but to "general and miscellaneous" account No. 97, "rent of track and facilities," or account No. 98, "rent of equipment." In the judgment of the present writer, this is an inconsistency that must, sooner or later, be corrected by conforming to the methods employed by steam railroads.

The main purpose of the present writer is not to indulge in "hair splitting," but to emphasize the principle, lost sight of by the electric classification, that "deductions from income" should include that portion of rents paid by the lessee which represent a return to the lessor on his investment, and the further principle that "income" is intended to reflect the return upon the property investment, and that "net income" is the true measure of such return.

T. B. MCRAE, Auditor.

[Mr. McRae's letter raises some interesting points which we shall discuss editorially in an early issue of this paper.—EDS.]

MID-YEAR MEETING
CHICAGO
FEBRUARY 4, 1916

American Association News

MID-YEAR MEETING
CHICAGO
FEBRUARY 4, 1916

Senator Oscar W. Underwood Will Speak at Mid-Winter Meeting—Details of Executive Committee Session,
Including Resolution Recommending Affiliation of Manufacturers' Association with Parent Body
—Meeting of Joint Committee on Block Signals—Company Section Activities

MID-YEAR MEETING PLANS

Rapid progress has been made this week on the program for the dinner to be held in Chicago on Feb. 4, 1916. Senator Oscar W. Underwood of Alabama has been secured as one of the two speakers from outside the association. He has chosen for his topic "Government Regulation and Our Transportation Systems." It is understood that Senator Underwood will go at some length into the subject, taken up in President Wilson's message, of the appointment of a federal commission to study the transportation industry. This is a matter to which the senator has devoted much attention and it is hoped that he will give the association the results of his study.

The program for the meeting aside from the dinner is being formulated by Chairman L. S. Storrs, who now plans to center the discussion around the subjects "Valuation" and "Rate of Return." Three papers will probably form the basis for the discussion, which will be participated in by leaders in the industry.

The meeting and the dinner will be held in the Congress Hotel and Annex.

AMERICAN ASSOCIATION EXECUTIVE COMMITTEE

The executive committee of the American Association was in session as last week's issue of the ELECTRIC RAILWAY JOURNAL went to press so that it was possible to mention only a few of the items of business which were considered. The full minutes are now available and a summary of the most important actions is given below.

A decision was reached to formally close the work of the bureau of fare research on Dec. 31.

A report was received from the committee on arrangements for the mid-year meeting dinner as to hotel accommodations, speakers, etc. It was decided to have but four addresses, one each by the presidents of the American and Manufacturers' Associations, and two by outside speakers. As announced above, Senator Oscar W. Underwood will be one of the latter.

A resolution was passed authorizing a special meeting on Feb. 4, 1916, to act upon amendments to the constitution and by-laws incorporating the suggestions of the special committee appointed to consider the recommendations contained in the presidential address delivered at San Francisco. For this committee Chairman Arthur W. Brady reported as follows:

"We have carefully considered the recommendations favoring an affiliation of the American Electric Railway Manufacturers' Association with the American Electric Railway Association, as are the Engineering and other affiliated associations, and in that connection have conferred with representatives of the Manufacturers' Association as well as with officers and others of the American Electric Railway Association.

"In our judgment, it is very desirable that there be a closer relationship than has heretofore existed between those who manufacture and sell the apparatus and material necessary to electric railway operation and the American Electric Railway Association, for the purpose of creating a clearer recognition of and of advancing the common interests of both. We do not believe that such closer relationship can be secured in the fullest degree

as long as the American Electric Railway Association and the American Electric Railway Manufacturers' Association continue to be as they now are, wholly separate and independent organizations, but we regard it as necessary that the two associations be brought together into a common organization.

"We therefore recommend that the constitution and by-laws of the American Electric Railway Association be so amended that the membership of the association be composed of companies, firms and individuals engaged in the manufacture or sale of electric railway material and apparatus, as well as of electric railway companies, the membership of both to be upon a basis of equality; that a scale of dues for manufacturers and dealers be established upon such an equitable basis as may be approved by the executive committee, and that there be formed an affiliated association consisting either of the present American Electric Railway Manufacturers' Association or of a new association, as may seem best, with which those connected with the manufacturing and selling interests of the industry may affiliate, if they so desire, without, however, diminishing the right of affiliation, if preferred, with any other of the affiliated associations as now."

W. J. Harvie, who represented the association in conferences with the National Bureau of Standards, reported regarding these conferences, which have been described in the ELECTRIC RAILWAY JOURNAL as they occurred.

The standards and recommendations approved at the 1915 convention together with the revisions were approved by the executive committee, which also approved changes in the interurban code of rules of the Transportation & Traffic Association.

The subject of safety organizations was then discussed and the president was directed to appoint a special committee on street traffic to make recommendations regarding the relation of the association to the several safety movements.

The board of accident prevention was abolished as being too cumbersome, as it was considered that the joint committee of the T. & T. and Claims Associations can now handle the work which the board was organized to accomplish.

The executive committee assigned for study to the committee on motor vehicles the topic "Handling Freight Business with Motor Trucks—the Proper Limits of Such Service."

The secretary was instructed to secure and compile for reference full information regarding costs, objects, methods of publication, etc., of company publications.

A special committee, consisting of H. A. Nicholl, president of the T. & T. Association, and John Lindall, president of the Engineering Association, was appointed to confer with the American Railway Association on the matter of block signal rules.

Appropriations were made to the affiliated associations as follows: Accountants', \$1,500; Engineering, \$4,000; Claims, \$1,200, and T. & T., \$2,750.

The special committee appointed to consider a recommendation originating with the T. & T. Association, to the effect that the number of vice-presidents in each association be reduced to one, reported adversely on the recommendation and the report was approved.

JOINT COMMITTEE ON BLOCK SIGNALS

A meeting of the joint Engineering and T. & T. Association committee on block signals was held on Dec. 17, 1915, at the offices of the Public Service Railway, Newark, N. J. The members present were as follows: J. M. Waldron, New York, N. Y., and J. W. Brown, Newark, N. J., co-chairmen; G. N. Brown, Syracuse, N. Y.; F. W. Coen, Sandusky, Ohio; J. J. Doyle, Baltimore, Md.; G. K. Jeffries, Indianapolis, Ind., and J. B. Stewart, Jr., Youngstown, Ohio. There were also present H. W. Griffin, Union Switch & Signal Company, S. M. Day, General Railway Signal Company, and H. H. Norris, *ELECTRIC RAILWAY JOURNAL*. Mr. Waldron presided over the meeting, and after discussion assigned the year's work to the following sub-committees:

Review of the Association's existing standards and recommendations, J. Leisenring, Springfield, Ill., and Mr. Coen. Consideration of A. I. E. E. standardization rules, G. N. Brown. Bibliography of block signal installations, Mr. Norris. Design of block signal apparatus, G. N. Brown and Messrs. Waldron, Griffin and Day. Clearance diagram for semaphore signals, Mr. Leisenring and G. N. Brown. Block signal rules, Messrs. Waldron, Jeffries, Coen, Doyle and Stewart. A special committee was also appointed on this subject, consisting of J. W. Brown and Mr. Coen, to confer with the president of the Transportation & Traffic Association on the matter of co-operation with the American Railway Association on the question of considering block signal rules jointly. Study of block signal operation, J. W. Brown, G. N. Brown and Mr. Jeffries. Highway crossing and drawbridge protection, Messrs. Leisenring, Jeffries, Coen, Day and Griffin. Light signals for interurban railways, Messrs. Leisenring, Jeffries, Stewart, Day and Griffin. Tests for contactor-type recording signals, Messrs. Stewart and Collins, and H. R. Stadelman, Electric Service Supplies Company; C. P. Nachod, Nachod Signal Company, and W. M. Chapman, Electric Railway Signal Company. Consideration of the tentative code of safety rules of the National Bureau of Standards, G. N. Brown. Co-ordination of past work of the committee, Mr. Norris. Form of contract for signal installation, J. W. Brown and Messrs. Coen, Doyle, Jeffries, Day and Griffin.

After the appointment of the sub-committees there was a general discussion of the work of each so that the members of these sub-committees might have the benefit of the advice of the main committee. The subject of clearance diagrams is to be considered in conjunction with the committees on heavy electric traction and power distribution. Nothing will be done with the block signal rules until information is received as to the results of a conference between the American Electric Railway Association and the American Railway Association. The sub-committee on block signal operation will send out forms to secure data, in an effort to segregate the several causes of failure. In connection with highway crossing protection, G. N. Brown reported on a recent conference of automobile and railway interests held in New York State under the auspices of the Public Service Commission. The automobile people favored light and semaphore indications but not bells. Mr. Brown will supply full information regarding this conference to his sub-committee. After discussion on the placing of warning signs, the committee was instructed to look over available data and to express an opinion as to the best apparatus for protecting grade crossings. Recommendations for possible adoption later as standards will be prepared. In a discussion on light signals it was pointed out that the size of the lens is important not in determining the distance at which the light can be seen, but in distinguishing from other lights.

It was recommended that the next joint meeting of the committee be held in Chicago about the middle of March at the time of the convention of the Railway Signal Association, and that meetings of the sub-committees on rules, signal operation, highway crossing protection, light signals and signal contracts be held in Cleveland about Feb. 1.

CAPITAL TRACTION SECTION COMING

On Jan. 13, 1916, a new section will be organized by the Capital Traction Company in Washington. There are good prospects of an initial membership of from seventy-five to 100. The association will be fully represented at the inauguration by officers and members of the committee on company sections and individual membership.

PUBLIC SERVICE SECTION

As was announced last week the annual smoker of the section was held on Dec. 16. Vice-President R. H. Harrison presided and the amusement features were in charge of T. J. Manning, chairman of the entertainment committee. The entertainment was provided by the Knickerbocker Theatrical Enterprises of New York, and was excellent. Two hundred or more members were in attendance.

Thirty-three new members were taken in and the membership committee under P. F. Maguire, last year's president, expects during 1916 to double last year's membership. The secretary announced that a suggestion contest, open to all employees, will be inaugurated on Jan. 1. Each month, excepting July and August, the company will award a prize of \$5 for the best suggestion received. At the end of the year \$25 will be given for the best suggestion of the year, whether it is used or not and \$50 will be awarded for the suggestion which, of those adopted, produces the best results. The committee in charge of the contest comprises J. J. Burleigh, vice-president; R. E. Danforth, general manager; Dudley Farrand, general manager Public Service Electric Company; H. C. Donecker, assistant general manager, and J. L. O'Toole, publicity agent.

DENVER TRAMWAY SECTION

The thirty-first regular monthly session of the section was held on Dec. 16 with an attendance of seventy-five.

R. W. Toll, chief engineer, spoke upon the subject, "Traction Travelogs, or Notes on the Street Railway Systems of San Francisco, Portland and Seattle." He had recently returned from an extended tour of inspection including these cities. A lively discussion on the future work of the section followed, some of the topics taken up being as follows: Verbatim printing of the monthly proceedings, open meetings, increase in attendance at meetings, nature of meeting programs, and general welfare of the section.

CHICAGO ELEVATED SECTION

There is space available here merely to state that the Christmas meeting of the Chicago Elevated section was held on Dec. 14 with a very large attendance. G. T. Seely, assistant general manager, was the principal speaker. The balance of the program consisted of entertainment features. A large Christmas tree furnished an appropriate decoration. Details of the meeting will be given in a later issue.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Anti-Friction Bearings on Main Car Journals

BY GAYLOR M. CAMERON, MASTER MECHANIC NEW YORK
STATE RAILWAYS, ROCHESTER, N. Y.

The use of ball and roller bearings on the main car journals of electrically propelled cars has been investigated and tried out experimentally, at least, by a number of railways during the last four or five years. Some tests have proved fairly satisfactory and have shown an economy in the use of such bearings; others have failed. However, it is only fair to state that, during the time of these tests, the manufacturers of bearings have made wonderful improvements in both design and materials, and the bearings which are obtainable to-day are much more reliable than were those used in the earlier tests. Likewise, there has been a reduction in the price of anti-friction bearings. In view of these facts it is not surprising that at the present time railway men are taking a greater interest in these bearings than ever before, and it is becoming quite common to see them specified in connection with the purchase of new equipment.

The economies to be obtained by the use of anti-friction bearings are dependent upon so many variables that a very careful analysis is necessary to determine the advisability of using them. Among the earlier tests widely divergent results were found. This was due, in part, to the difficulty of obtaining accurate power measurements on the car and the lack of sufficient data for making proper comparisons. By far the greater part of the difference was attributable to the varying service conditions under which the bearings were used. It is to be regretted that more accurate information is not obtainable regarding the different factors which make up the car resistance values which are so necessary in predetermining car performance. The ability to calculate accurately the total car resistance values for any particular set of conditions, and to separate therefrom that part which represents the friction on the main car journals, is necessary for making a proper investigation to predetermine whether or not sufficient economy can be obtained to justify the greater expenditure for anti-friction bearings.

On comparing the values of car resistance, for a given set of conditions, obtained by the use of several of the more common formulas, it is found that for the lower speeds, as in typical city runs, there is a considerable disagreement, but for the higher speeds, as in inter-urban runs, there is a very close agreement. We have, therefore, no reliable formula for use in making an investigation of the advisability of using anti-friction bearings on city cars. It would seem to be an opportune time for experimental work along this line, the experiments to be made in such a way that values can be obtained for the separate items such as journal friction, motor-bearing friction, windage, track resistance (based upon some standard condition), and especially flange friction, when running on grooved rail. With accurate data on these items one could predetermine, with a fair degree of accuracy, the results to be obtained from the use of anti-friction bearings.

The Rochester Lines of the New York State Railways have been experimenting with anti-friction bearings on car journals for the past four years. Early in the year 1911 city passenger car No. 721 was equipped with ball bearings. The following data were used for purchasing the bearings.

	Pounds
Weight of car complete without passengers.....	48,600
Weight of maximum passenger load (seating capacity, forty-two).....	11,250
Weight of car with maximum passenger load.....	59,850
One-half weight of four motors, with gear cases.....	5,310
Weight of eight cast-iron wheels.....	3,200
Weight of four axles.....	1,400
Weight of four gears.....	928
Total weight not on journals.....	10,838
Maximum weight on journals.....	49,012
Total weight per journal.....	6,126
Total weight per bearing (two to a journal).....	3,063

An attempt was made to predetermine the power saving to be obtained by using these bearings. The following data and graphs show the result.

ANTI-FRICTION BEARINGS—TIME-SPEED GRAPHS WITH
PLAIN AND ANTI-FRICTION BEARINGS RESPECTIVELY

The car was to be used on a line having no appreciable grades and no sharp curves except at the terminal loops. The service conditions were:

Average line voltage.....	525
Schedule speed, miles per hour.....	8.62
Stops per mile.....	8
Duration of average stop, seconds.....	7

From these figures a typical run graph was plotted, using 1.5 m.p.h.p.s. for accelerating and braking rates. This is shown in full lines in the diagram together with the corresponding power graph. It will be noted in the shape of the graph that the car is over-equipped. This car is now used to draw a trailer having a seated capacity of sixty, as well as to carry its own passenger load. The preliminary calculations here shown, however, were based on its operation without trailer and all tests were made with the single motor car. The car resistance values were obtained by use of the following formula:

$$R = 12.67 + 0.03M + 0.0052M^2$$

Where R is the resistance in pounds per ton, M is the speed in miles per hour. This formula is the same as

the one given in the "Standard Handbook for Electrical Engineers" with the exception that the constant term of the second member is larger. This larger figure is believed by the writer to give more accurate results for the lower city speeds. Table I shows the calculated values of R .

In making up the typical run curve, the average car and passenger weight was obtained by adding to the car weight 75 per cent of 140 times the seating capacity. This made a total of 53,010 lb. or 6.63 tons per motor. Table II shows the figures from which the run and power graphs were plotted.

After these graphs had been plotted, an effort was made to determine the exact values of journal bearing friction. These values were expressed in terms of the tractive effort required to overcome them, that is, in pounds per ton. The car resistance was taken as uniform during the straight-line acceleration. The value obtained from the use of a formula for 12.75 m.p.h. was used. At this speed the acceleration rate begins to grow smaller. For a speed of 12.75 m.p.h. the corresponding journal speed was calculated and a coefficient of friction of 0.033 determined. The average weight per journal was taken as 5272 lb. As there are two journals per motor this would be twice 5272 or 10,544 lb. per motor. Applying the coefficient 0.033 to this figure, it is found that to overcome this journal friction requires a force of 348 lb., applied at the surface of the journal. As the journal is $3\frac{3}{4}$ in. in diameter and the car is equipped with 33-in. wheels, the force reduced to tractive effort is $3.75/33 \times 348$ or 39.6 lb., and dividing this by 6.63, the weight per motor (expressed in tons), we obtain 5.97 as the equivalent number of pounds per ton tractive effort to overcome journal friction. The coefficient of friction for the ball bearings was taken as 0.0012. The corresponding tractive effort value is $(0.0012/0.033) \times 5.97$ or 0.21 lb. per ton. Substituting

this for the 5.97 value in the total car resistance of 13.89 lb. per ton, we obtain 8.13 as the value of car resistance for a speed of 12.75 m.p.h. with ball journal bearings. This brings the total car resistance up to 54 lb. per motor. In order to give every advantage possible to the showing to be made by anti-friction bearings in power saving, it was assumed that the entire reduction in car resistance was utilized in increasing the rate of acceleration. This rate was determined as follows: Tractive effort, 1087 lb.; car resistance, 54 lb.; net tractive effort, 1087 — 54 = 1033 lb.; 6.63 tons require 663 lb. to accelerate at the rate of 1 m.p.h.p.s. in addition to car resistance, $1033 \div 663 = 1.56$ m.p.h.p.s. = new rate of acceleration. With this figure a new run graph was plotted, together with its corresponding power graph. These are shown as broken lines in the figure. The area of the power graph for plain bearings is 2.142 sq. in. and that for anti-friction bearings is 1.822 sq. in. This indicates a power saving of 14.9 per cent.

Before the ball bearings were installed, a watt-hour meter was placed in the car and a series of readings taken with the car in regular service. Table III shows the readings taken and results calculated therefrom for a typical day's run. A corresponding set of readings was taken with the car equipped with ball bearings. Table IV shows a recapitulation of both sets of readings and a comparison of the average results. It will be noted that the power saving as shown by the tests was 14.1 per cent while the predetermined figure was 14.9 per cent. This is an agreement much closer than could ordinarily be expected, considering the lack of exact knowledge of car resistance values. The method outlined will, undoubtedly, prove sufficiently accurate for any preliminary investigation.

It will be evident by studying the curves that the power saving to be obtained will vary with the service conditions and motor characteristics. For this reason, the results shown in this investigation are not general

and each case should be investigated separately before any conclusions are drawn. After the probable power saving has been determined, calculations should be made to determine the economy, if any, which will result from the use of anti-friction bearings.

One very important item, as yet rather indeterminate, is the average life of the ball bearings. The following calculations were made to cover the previously described conditions.

ECONOMY CALCULATION, CAR 721

The average yearly mileage for cars of this type was checked and found to be 33,000 per car. The power consumption with plain bearings was 3.33 kw.-hr. per car-mile. Using the 14.1 per cent saving, determined by the tests, the saving per car-mile amounts to 0.47 kw.-hr. The yearly saving is 15,510 kw.-hr.

15,510 kw.-hr. at 1 cent = \$155.10 annual power cost saving per car.	
Total cost of ball bearing equipment.....	\$606.00
Annual Expense—Ball Bearings	
Based on an estimated life of five years	
Interest at 5 per cent.....	\$30.30
Amortization at 5 per cent compounded.....	108.22
Lubrication (special lubricant used).....	4.20
Maintenance.....	4.00
Total.....	\$146.72
Total cost of plain bearing equipment.....	\$42.24
Annual Expense—Plain Bearings	
Based on an estimated life of box of five years	
Interest at 5 per cent.....	\$2.11
Amortization at 5 per cent compounded.....	7.54
Lubrication.....	6.00
Maintenance, including brass renewals.....	9.36
Total.....	\$25.01

The total annual expense of ball-bearing equipment exceeds that for plain bearings by (\$146.72 — \$25.01) \$121.71. As the annual power cost saving obtained from the use of ball bearings is \$155.10, the net annual saving resulting from the use of ball bearings is \$155.10 — \$121.71 or \$33.39.

The preceding figures were based upon the cost of a ball-bearing equipment nearly five years ago. Recent quotations received show that a similar and perhaps better equipment could be purchased and installed at the present time in a car of this type for \$482. Substituting this for the \$606 in the calculation for ball bearings, the result is as follows:

Interest at 5 per cent.....	\$24.10
Amortization at 5 per cent compounded.....	\$6.07
Lubrication.....	4.20
Maintenance.....	4.00
Total.....	\$118.37

Excess over corresponding plain bearing costs, \$118.37 — \$25.01 or \$93.36. Net annual saving per car in favor of ball bearings is \$155.10 — \$93.36 or \$61.74.

It is evident from the test that the serviceable life of the bearings, without heavy maintenance, will exceed five years. As the bearings now manufactured are improved over those used in the test, it is a safe estimate that with equipment properly adapted to the service, an average life of seven years can be obtained (33,000 miles per year). Allowing a seven-year life for the plain bearing journal boxes, the following calculations were made up:

Cost of ball bearing equipment.....	\$482.00
Annual Expense—Ball Bearings	
Based on an estimated life of seven years	
Interest at 5 per cent.....	\$24.10
Amortization at 5 per cent compounded.....	58.78
Lubrication.....	4.20
Maintenance.....	4.00
Total.....	\$91.08
Cost of plain bearing equipment.....	\$42.24
Annual Expense—Plain Bearings	
Based on an estimated life of seven years	
Interest at 5 per cent.....	\$2.11
Amortization at 5 per cent compounded.....	5.14
Lubrication.....	6.00
Maintenance, including brass renewals.....	9.36
Total.....	\$22.61

Excess annual expense of ball over plain bearing equipment = \$91.08 — \$22.61 or \$68.47.

Annual power cost saving (as before) = \$155.10.

Net annual saving, under these conditions, in favor of ball bearings is \$155.10 — \$68.47 or \$86.63.

The tests described were made upon a comparatively heavy car for city service. It has been found, in the past, that the cost of anti-friction bearings does not vary directly with the weight of car. In fact, quotations on bearing equipment for a car nearly 6 tons lighter were found to be little lower than those for this car. The present trend toward lighter and more efficient cars makes it evident that with the same percentage of power saving the value of the annual saving would become less, and for the same net saving a lower initial investment will have to obtain. It is reasonable to believe that with proper standardization, so as to limit the number of sizes of bearings used, and with a more general application so as to increase the demand, the price would drop so that an annual saving on the lighter car can be obtained which will be equal to or even greater than the figures shown.

The general adoption of ball journal bearings will entail a greater investment where extra axles are kept for making necessary wheel and axle changes at operating carhouses. This is due to the fact that all such axles must be equipped with anti-friction bearings and boxes on account of the non-interchangeable feature of such bearings. Where standardization exists and a considerable number of similar cars are equipped with anti-friction bearings, the additional investment required for such extra parts can be kept very small.

Steel Tie Spacing Can Be Too Great

BY L. A. MITCHELL, SUPERINTENDENT OF ROADWAY UNION TRACTION COMPANY OF INDIANA, ANDERSON, IND.

The description of steel tie track construction at Circleville, Ohio, in the issue of Oct. 30, 1915, is of a type which for certain tonnage may prove satisfactory. It would seem, however, that the rail is expected to do more work as a beam than it has been the custom to require of it in other types of concrete track foundations, or in open track construction where a certain amount of flexibility is expected to exist. Some engineers have assumed that where steel ties were used on a concrete foundation the spacing could be increased because the concrete would carry a portion of the load and thus prevent deflection of the rail between ties. This probably is the reasoning which leads to the conclusion that greater space between ties warrants the use of the more expensive ties because the cost per foot of track is not increased proportionately.

Prior to the advent of the steel tie, so-called solid concrete construction was used quite extensively, but the spacing of the wooden ties was maintained the same as that adopted for ordinary ballasted track construction, or the ties were eliminated altogether. The latter is the concrete beam construction which is still being used in some localities. In the beam construction, anchor bolts were used to fasten down the rail, and tie rods, placed three or four to the rail length, were employed to hold the rail to gage. In making repairs to this type of construction, it was often found that the rail had loosened from the concrete beam and that the concrete beneath the rail was worn away by abrasion. This indicated that the bond between the concrete and the rail could not be maintained where the rail was supported directly on the concrete. Moreover, the area of distribution for track loads afforded by the rail base was insufficient to prevent the ultimate wearing away of the concrete under

the vibration of passing car wheels. Concrete failures of this kind decrease with the number of rail supports, and particularly when these supports present a comparatively large area to transmit the vibration from the rail to the concrete and thence to the subgrade.

If the distance between supports is such that the rail deflection is appreciable, the concrete is certain to wear away where it comes in contact with the rail. This deflection in rail sections generally used in paved streets can only be obviated by making the steel tie spacing the same as that adopted for wooden ties. The experience of the last few years has shown, however, that the heavier rail sections will permit a greater distance between tie supports. This interval can also be increased when wood ties are used, but the limit of spacing would be somewhat less than that for steel ties due to the difference in the crushing strengths of the wood and steel. Where 7-in. rail is used the probable maximum clear span between ties is 3 ft. Many of the failures of steel-tie, solid-concrete construction can be attributed to a spacing greater than this. Engineers have tried to make the cost of steel-tie construction as near that of wooden ties as possible. This has been accomplished by increasing the tie spacing and thereby decreasing the number of ties necessary. In doing this they have neglected the consideration of other factors which may ultimately prove to be more costly than an additional number of ties.

Mandrel for Babbitting Motor Axle Bearings

BY F. G. LISTER, MECHANICAL ENGINEER SPOKANE, PORTLAND & SEATTLE RAILWAY, PORTLAND, ORE.

A mandrel for use in babbitting motor axle bearings which has saved a great amount of labor and material is being used by the Oregon Electric Railway in its Portland shops.

MANDREL FOR USE IN BABBITTING AXLE BEARINGS

It has always been the practice to babbitt the bearings a little below size and then to bore them out in a lathe or boring mill to the exact size of the bearing. This process took a great deal of time and additional material, and when the bearings were bored to the exact size the toughened surface or skin was necessarily re-

moved. The bearings thus lost much of their wearing qualities. By the use of the mandrel of the type shown in the illustration, which gives details of one made for the GE-205 motor, it is possible to get along without doing any work on the bearing after taking it from the mandrel. It has a clean, smooth surface and is ready for service immediately. Similar mandrels are also used for the other types of motors on this system. Bearings babbitted in these mandrels have been in use for more than a year with very little wear. A hot axle bearing is unknown on the Oregon Electric Railway.

Economies with New Bedford & Onset Signals

The New Bedford & Onset Street Railway, New Bedford, Mass., has lately installed automatic block signals on 10 miles of its single-track line between Fairhaven and Wareham, and one set of signals between Onset and Ramsdell's, to facilitate handling traffic under the diversified conditions associated with the system. The signals are of the United States Electric Signal Company's K-2 type, and through their use not only has traffic been accelerated but the expense of dispatching has been reduced.

On the line between the Fairhaven - Mattapoisett boundary and Wareham there are ten sidings, including a spur for express cars at Marion; from Wareham to Onset Wharf 4 miles of double track are in service, and from Onset Wharf to Monument Beach the line is single track with three turnouts, including that at Ramsdell's. Through service is operated over this route between New Bedford and Monument

FIG. 1—INITIAL SIGNAL INSTALLATION

Beach, the summer headway being thirty minutes. A single-track branch, not signaled, extends from Wareham to Middleboro, the headway being sixty minutes on weekdays and thirty minutes on Sundays for service between Middleboro and Ramsdell's. Between Wareham and Onset Wharf a short spur track branches from the main line to the Onset Junction station of the New York, New Haven & Hartford Railroad, and between this station and Ramsdell's a shuttle service varying in volume and headway is operated, the length of the one-way route being 3 miles. Wareham is 16 miles from New Bedford, Onset Wharf being 21 miles and Monument Beach 27 miles distant from this point.

The restrictions of topography between Onset and Ramsdell's, making the cost of double-tracking prohibitive and the location of the Onset Junction station out of sight of the main line, as well as the varying demands of local and through service, regular and extra cars, passenger and freight traffic, render the rapid movement of cars a problem of some complexity. Under the original method of operation, crews were required to report by telephone at each siding to receive orders from the dispatcher located at Wareham. This made it necessary to maintain an extra dispatcher to handle car movements on the section between Onset Junction and Ramsdell's during five hours every summer afternoon. The fluctua-

tions of traffic are considerable, and the necessity for making connections with the New Haven trains at all times at Onset Junction resulted in a puzzling operating problem, there being no check on the car movements except by memory and telephone. Four or five cars were frequently run in a group under ten-minute headway in either direction, the running time being about four minutes for the block between Onset Wharf and Ramsdell's. However, the installation of one pair of signals at this point, as shown in Fig. 1, dispensed with the need of the extra dispatcher, and this led to the equipment of the Fairhaven-Wareham line with seven two-point blocks and one three-point block.

The turnouts on the main line average about a quarter of a mile in length, the total length of the seven sidings between Fairhaven and Wareham being about 2 miles. Instead of placing the setting and restoring trolley contact switches as shown in Fig. 2, which is a common practice, the contacts are located in the main line, as shown in Fig. 3. In the New Bedford & Onset arrangement, the first or setting contactor is located 100 ft. from the switch, the restoring contactor being 100 ft. beyond the setting contactor and the signal 100 ft.

FIGS. 2 TO 4—DIAGRAM SHOWING SIGNAL ARRANGEMENT AND THAT USED ON NEW BEDFORD & ONSET RAILWAY, AND ARRANGEMENT OF THREE-POINT BLOCK

from the latter, making the signal 300 ft. from the switch at either end of the block. All signals carry a red semaphore in addition to the lamp indication, and are of the counting-in type. The three-point block on the road is installed in connection with an express car spur at Marion, as shown in Fig. 4, and protects car movements through the main line, also controlling the movement of cars on the spur upon the main line. The block is 1.5 miles long. A car clearing the main line also clears the signal at the spur, and an express car entering the main line from the spur sets the signals at the ends of the block; and conversely, when entering the spur from the main line, an express car clears the main line signals, provided no car is behind it on the main line. The signal at the spur is visible only from cars on the spur.

The local advantages of the contact arrangement employed, according to J. E. Marvelle, assistant superintendent New Bedford & Onset Street Railway, are that this plan provides for the operation of cars within the siding and for 100 ft. at either end with no relation to the signals, making this trackage in effect a railway yard. It allows operation in winter, when an hourly schedule instead of a thirty-minute schedule is maintained, without reference to sidings except those necessary for the cars to pass, which may be cleared of snow while the rest of the turnouts are left until convenient.

The saving in snowplow work and in shoveling is thus a considerable item. With the line contacts placed outside the turnout, either track may be utilized, as convenient. Regular cars may pass extras on either side, without reference to right-handed operation, which is a marked advantage when cars on sidings are being loaded with logs or other heavy materials.

Only about half the snow-fighting equipment is needed, compared with the plan of using all the sidings. If a trip is terminated at a certain siding short of the usual destination, the location of the overhead trolley contact 100 ft. beyond the switch enables the trolley to be changed and the direction of travel reversed without interfering in any way with traffic or setting signals not intended. The usual arrangement of contacts in the trolley wire on the siding and in the main line is satisfactory if every car passes through every turnout at all times, without turning back at intermediate points, but the New Bedford & Onset arrangement, according to Mr. Marvelle, is more flexible. It saves slowing down and passing through all sidings; enables portions of sidings to be used, as in snowy weather; does away with the probability of setting signals unintentionally against opposing cars in turning back, and permits setting off crippled cars, construction trains, and cars to be loaded or unloaded without interfering with through traffic.

Severe tests have been given the signal system since its installation, but no failures that could conflict "rights of track" have resulted. On rare occasions a car has to go back upon the line a short distance after passing the siding switch because of receiving a stop signal at the entrance of the block, due to the opposing car's reaching the line contact first; but this is seldom experienced and simply requires that the car back a few feet to the siding, on account of the clearance between the switch points and the setting contact.

Sponge Impurities

Some railway companies have found that sponges bought by the bale sometimes contain as much as 50 per cent of impurities. Those familiar with the natural impurity-retaining qualities of the sponge state that this should not be more than 25 per cent. Tests for impurities are made by first weighing, then thoroughly washing the sponges, and after they are perfectly dry the weight is again determined. If the shrinkage is as much as 50 per cent it represents quite an item, especially when the average price for good sponges is about \$3.50 per pound. One railway company, in order to obtain the maximum results with the sponges employed in washing cars, has prepared a specification under which the cost per pound is reduced in proportion to the increase in impurities over 25 per cent. The manner of testing the amount of impurities is also specified, and only sponges procured from certain waters are acceptable.

In the annual report of W. W. Hoy, general manager of the South African Railways & Harbors, it is stated that the administration had in contemplation the electrification of certain sections of the railway, and a decision had been arrived at to obtain the services of an eminent consulting engineer to study the local problems and conditions on the spot, and thereafter submit a comprehensive report. Unfortunately, the condition of affairs in Europe and in South Africa necessitated a postponement of the proposals, but the matter is one which should receive early attention after the cessation of hostilities.

MANGANESE CROSSING REPAIRED WITH GAGE LINE SIDE LEFT UNGROUND

Electric Welded Special Work and Joints at Portland, Ore.

Through the courtesy of Thomas Pumfrey, engineer maintenance of way the Portland Railway, Light & Power Company, Portland, Ore., the accompanying interesting photographs of work done with an Indianapolis portable electric welder have been made available. Two pairs of the illustrations show the conditions before and after at a steam crossing of solid manganese steel. Here a point on the running rail had broken down. The pictures of the completed work do not show a very even finish on the gage line, but this is due to the fact that the Portland company does not consider it necessary to grind the gage line side of the rail. This practice, of course, does not diminish the usefulness of the crossing, while helping to produce an effective repair at very low cost.

Another pair of illustrations shows the ability of the portable electric welder to build up a battered joint.

It is apparent from the work done at Portland that the success of the weld is not only a matter of careful workmanship, but also of employing the proper fluxated metal. Thus for welding manganese crossings, the company uses one kind of special fluxated steel, while for the building up of cups in joints, it employs a second grade of steel whose chemical properties resemble as closely as possible the chemical content of the rails. The steel used for manganese work must differ in melting point and other qualities because the greater

THE WELDING OF A BATTERED JOINT—BEFORE AND AFTER

resistance offered by manganese diminishes the effectiveness of the electric arc as compared with welding on steels of higher conductivity.

Finally, all welding must be made on solid metal. Hence if the top of a broken piece of special work is to be welded, the structure should be carefully examined for traces of honeycombing.

MANGANESE CROSSINGS WITH BROKEN RAIL BEFORE ELECTRIC WELDING AT PORTLAND, ORE.

All-Steel Cars for Binghamton Railway

The Binghamton (N. Y.) Railway Company has recently placed in operation thirteen new all-steel cars for use in city service on the Binghamton lines. The general dimensions of the cars, which were built by the Cincinnati Car Company, are given in the following table:

Length over all.....	37 ft.
Length of car body.....	25 ft.
Extreme width.....	8 ft. 6 in.
Rail to first step.....	15 in.
First step to platform floor.....	13 in.
Platform to car floor.....	11 in.
Post centers.....	30 in.
Width of aisle.....	24 in.
Truck centers.....	12 ft. 6 in.
Size of wheels.....	34 in.
Seating capacity.....	42

The entire bottom framing, the body and the roof are of steel construction, the body bolsters being of the steel-plate type with cast-iron spacing members. The underframing is covered with sheet steel, upon which are laid 13/16-in. yellow pine boards, forming the floor, and this is finished with tapered floor-mat strips screwed to the floor with bronze screws, which reach the entire length of the car floor except a space of 2 in. at each end to allow for sweeping. The floor strips are jointed 2 ft. from the end of the car so that they are easily renewable, and the side floors are raised flush with strips in the aisle.

The bumpers are formed of 5-in. steel channels, which are protected with No. 16 gage sheet steel to prevent anyone from riding on them. The vestibules are arranged for pay-within operation, and are provided with double folding doors operated in conjunction with the folding steps. The outside of the vestibule below the sash rest is sheathed with 1/8-in. steel, and there are three drop sash above this, the center sash having stops so that it can be lowered part way to give the motorman clear vision during stormy weather. The front sash is fitted with a sleet cleaner manufactured by the Standard Accessories Company, 505 Fifth Avenue, New York City.

The vestibule steps are of the folding type, the edges of which are covered with a 3-in. strip of safety tread, which is also provided on the platform edge over the steps. The roof is plain arch pattern. It is covered with No. 18 gage sheet steel and is insulated on the outside with 1-in. compressed cork, this being covered with No. 8 canvas.

The interior trim, including sash, moldings, etc., with the exception of the folding doors, is finished with Sherwin-Williams green. The wainscoting below the windows is formed of 1-in. compressed cork covered with No. 18 gage sheet steel. The side-post cappings

INTERIOR VIEW, BINGHAMTON CAR

are made of pressed steel and are readily removable. The ceiling is carline finish, except for that portion on either side which is provided with moldings to receive 11-in. advertising cards, and it is finished with Sherwin-Williams flat white enamel.

There are nine windows on each side of the car which have double AA quality glass set in rubber and held in place by moldings screwed in position. The lower sash raise, and are fitted with flush barrel sash locks engaging with holes in T-bar posts to hold the sash at various heights. The upper sash are stationary with arched heads. The side windows are provided with Fabrikoid curtains, Curtain Supply Company's ring-type fixtures and Rex rollers. Curtains are also provided back of the motorman for his protection. Consolidated Car Company's heaters with deflectors are used, ten coils being connected in series with the switch on the trolley side. The heater manufacturer's thermostatic control has been installed. There are also ten Hale & Kilburn 37-in. cross-type seats having 19-in. backs and bronze grab handles on the aisle side. Longitudinal seats are provided in each corner of the car, these occupying the space of two windows. All seats are upholstered with canvas-backed rattan.

Each end of the car is equipped with a Peacock staffless brake manufactured by the National Brake Company. Consolidated buzzers connected with push buttons in each side post are provided, these being operated

VIEWS OF VESTIBULE DOORS AND SIDE, BINGHAMTON CAR

from the trolley circuit, and the Ohio Brass Company's Style D signal system is installed. A 14-in. gong is provided under each platform.

The steel window guards are of the five-bar, $\frac{1}{4}$ -in. hard-drawn removable type, spaced $2\frac{1}{2}$ -in. centers. One sand box operated by a Westinghouse air sander is located under the longitudinal seat at each end of the car, this being provided with Johns-Manville sand hose and Ohio Brass Company's air traps. The trolley boards are formed of two 6-in. x $1\frac{1}{4}$ -in. oak planks extending the full length of the car, and arranged to receive two Nuttall No. 14 trolley bases. Earll trolley catchers are provided. Each end of the car is equipped with one cast-steel drawhead, and in addition a pull bar 4 ft. long is hung on hooks under the side of the car. Each end of the car also has one Golden Glow headlight with a 23-watt lamp, one Dayton Model DB fare box and one Sterling single register, arranged so that it can be operated from either end and from any part of the car, are also provided, as well as a sheet-steel transfer box, having a glass face and door with staple and padlock. A hand-strap pole is installed over each corner longitudinal seat, this being fitted with five Rico sanitary straps, 5 ft. 10 in. from the floor.

Each end of the car is equipped with a Berg fender and Root air-operated track scrapers, and a Hunter route and destination sign is provided in each right-hand vestibule wing sash. Ventilation and illumination are provided by four Utility, honeycomb, combination ventilators and registers, and light fixtures of the Dayton Manufacturing Company's type, complete with Alba shades and 94-watt lamps. The light circuit is supplied with one extra lamp fixture, controlled by a Nichols-Lintern selector switch. The sign lights, headlights, platform lights and extra light are wired for 23-watt lamps.

The mechanism to operate the folding doors and steps is of the car builder's standard design, and the doors are connected to the main switch through the contactor line relay so that the car cannot start when the doors are open. To protect the car against side-swiping by vehicles an angle iron fastened to the side sill on each side projects $1\frac{1}{2}$ -in. from the side sheathing.

The car is equipped with a Westinghouse A-3 compressor, having a displacement of $1\frac{1}{2}$ cu. ft. of air at 90 lb. pressure, a Westinghouse S-6-A governor, $\frac{1}{2}$ -in. PV motorman's valve, Type C sander valves and Type S brake cylinders. Type E American Automatic slack adjusters are provided. There is a 25-ft. cooling coil between the compressor and the main reservoir, and the necessary splash guards are provided to protect the slack adjuster, compressor and resistance from wheel wash.

Two Westinghouse 323 V motors, rated at 33 hp. at 500 volts and 40 hp. at 600 volts, are installed, together with double-end K-36-K control. The car is mounted on one pair of Baldwin maximum traction trucks with 21-in. steel trail wheels and 34-in. steel drive wheels, 54-in. centers. American Brake Shoe & Foundry brakeshoes and brakeshoe heads are installed, and S. K. F. ball bearings are used on both driver and trailer axles.

All wiring is installed in conduit, and special junction boxes and condulets at motor leads and resistance leads are provided. Light, heat and air brake compressor switches are placed on an enamel slate base, installed in a cabinet that has a swing door and is lined with asbestos lumber or transite. This switch cabinet is located on the inside of the car body at the corner post.

One of the especially interesting features is found in the novel form of motorman's steps which are installed. Heretofore the steps used by the motorman to reach the roof have projected beyond the side of the car, and if the car was side-swiped by a wagon or otherwise these

steps were broken off and were a continual source of annoyance. The form of depressed step shown in the accompanying illustration was therefore devised by C. S. Banghart, vice-president Binghamton Railway, as an improvement over the old method.

Convenient Portable Grinder

The Stow Manufacturing Company, inventor and builder of the well-known Stow flexible shaft, has placed on the market an application of the device that is especially advantageous for use in connection with the grinding of cumbersome, inaccessible or irregularly shaped pieces which cannot conveniently be brought to an emery wheel or set in a machine tool in the customary manner. The apparatus consists of an emery wheel mounted on a length of flexible shafting, which in turn is supported by an arm attached to a small motor. The motor is mounted upon a truck, thus making it easily transportable to any part of the shop and eliminating the necessity for taking work to the tool, with a resultant saving in time and cost of cutting.

PORTABLE GRINDING MACHINE

The motor is ruggedly built, being totally inclosed and having the starting equipment incorporated within the motor frame, to give a compact construction. Variation in motor speed is secured by means of a plunger in the pole piece which changes the reluctance of the magnetic circuit. No power is lost through this operation, as is the case in most variable speed motors, and the full-load efficiency remains practically the same at all speeds. The speed variation is provided so that worn emery wheels may be consumed down to the minimum size, a proper cutting speed being insured regardless of size, and the maximum grinding efficiency being obtained in all cases. A motor for alternating current is also furnished if required, but this does not have a variable speed, although it may be used with power of any frequency, single or polyphase.

The tool is built in several sizes, according to the capacity of the emery wheel desired. The motor is so balanced on the truck that it may be adjusted to the proper angle for all purposes and to meet all grinding conditions, the extended arm taking the weight of the flexible shaft from the operator. If desired, the emery wheel at the driven end of the shaft may be interchanged with a scratch brush in case the work demands this.

News of Electric Railways

CINCINNATI RAPID TRANSIT ROUTE ADOPTED

Rapid Transit Commission Decides on Construction of Line to Cost \$6,000,000.

What is known as modified plan No. 4 for a rapid transit loop about Cincinnati, Ohio, has been adopted by the rapid transit commission recently appointed by Mayor Spiegel. The commission, however, has reserved the right to make such further modifications as may be found advisable before the question of issuing \$6,000,000 of bonds for the construction of the road is submitted to a vote of the electors at the presidential primaries in April. This is the plan favored by the former commission, after an examination of several others submitted by different engineers.

The route as proposed begins as an elevated structure at Third and Walnut Streets in the business section of the city. It enters a subway between Fourth and Fifth Streets and continues as such until it reaches the canal, in the bed of which it runs as a subway to Brighton, stations being located at convenient intervals along the subway route. With the exception of occasional short distances the route is located in an open cut from Brighton to Carthage Pike in St. Bernard. From Carthage Pike to Smith Road and Duck Creek, in Oakley, the route lies along the surface. In the original plan this section was to be in an open cut, but because of excessive cost the plan was modified. Until the road is on a paying basis this section will be operated as a fast surface line. At Duck Creek the route becomes a subway and, after passing under Walnut Hills and Owl's Nest Park, it comes to the surface at Columbia Avenue and runs on an elevated structure to the point of starting at Third and Walnut Streets.

The proposed West End Rapid Transit Company, which will build an extension to the Cincinnati, Lawrenceburg & Aurora Electric Street Railway, has planned to connect with the municipal route at its terminal at Third and Walnut Streets. The Indianapolis & Cincinnati Traction Company, if built to the city, will connect with the rapid transit line at Brighton station.

The Ohio Electric Railway line between Cincinnati and Dayton will enter the subway at Crawford station and the Millcreek Valley line will form a connection at Carthage Pike in St. Bernard. All the lines of the Interurban Railway & Terminal Company except the Georgetown division will intersect the rapid transit line at Smith Road and Montgomery Pike. This latter division and the Cincinnati, Georgetown & Portsmouth Railroad will connect at Elmhurst viaduct and Madison Road.

E. W. Edwards, president of the rapid transit commission, insists that the cost of the road must be kept within \$6,000,000. He said, however, that this amount of money will not provide for a generating plant and rolling stock nor pay for interurban connections. The leasing company will have to furnish its own plant or purchase power from the proposed new station of the Union Gas & Electric Company. Mr. Edwards regards it as out of the question to attempt to advance money to the interurban companies with which to build connections with the amount at the committee's disposal. He believes that with the advantages the rapid transit entrance to the city will offer to the interurban roads, the banks will furnish funds for making these connections.

The regular sessions of the commission will be held on the afternoons of the first and third Fridays of each month. Frank Krug, city engineer, has been authorized to confer with the interurban railways with a view to estimating the cost and planning connections with the rapid transit line.

Delegations from Price Hill and Hyde Park appeared before the rapid transit commission at Cincinnati at its first regular meeting on Dec. 17 and urged that the route accepted by the commission be so modified as to bring the line closer to these two suburbs or that route No. 5, as suggested by Engineer Bion J. Arnold, be substituted. Mr. Edwards, chairman, explained that either suggestion would mean the expenditure of more money than is allowed the commission under the law for the purpose of constructing

the loop. He said the first thing to be considered is a line that will bring the interurban roads to the heart of the city.

DES MOINES REHABILITATION PLANS UNDER WAY

Plans for forty new street cars, to cost approximately \$240,000, have been submitted to the City Council by the Des Moines (Ia.) City Railway. The Council has approved the plans and the company is asking for bids. The cars will be all steel, center entrance, with a seating capacity of fifty-four, and there will be no smoking compartment or platform on which smoking will be permitted. Emil G. Schmidt, president of the company, told the Council that he expects the new cars will begin to arrive within four months. More new cars will be added later. The new equipment is a part of the general scheme of rehabilitation which will be carried out in accordance with the conditions of the new franchise to the company. Mr. Schmidt has also announced that the building of a network of interurban lines will follow the rehabilitation of the city lines. The Des Moines City Railway controls and operates interurban lines to Perry and Colfax. The Colfax line is to be extended 11 miles to Newton, and new interurban lines are planned to Indianola, Winterest, Red Oak, and eventually to Omaha through a territory not now served by any railroad.

PLANS PRESENTED FOR SUBWAY APPROACHES TO NEW CLEVELAND BRIDGE

Engineer Frederick Law Olmsted on Dec. 9 presented to Director of Public Service Sidlo of Cleveland, Ohio, two plans for subway approaches to the new bridge across the Cuyahoga River at Superior Avenue. For the east side he suggested that the subway extend under Superior Avenue to West Sixth Street where the cars could be brought to the surface, with subway wells at some point between the bridge and West Sixth Street. He said that the tube could be extended from West Sixth Street to the Public Square. An easy grade connection between the bridge and the old viaduct is also provided in his plan, although Mr. Olmstead suggested that the approach to the viaduct be moved to St. Clair Avenue.

On the west side of the river he suggested that the West Twenty-fifth Street cars be brought to the surface at a point between Church Avenue and Franklin Avenue and that the Detroit Avenue cars be brought to the surface at West Twenty-eighth Street. His second plan for this side would place the subways under West Twenty-fifth Street, and the Detroit Avenue cars would reach the surface at the junction of this street and Detroit Avenue. The Twenty-fifth Street cars would emerge from the surface at the same point as suggested in the first plan. Mr. Olmsted believes these plans would obviate congestion at the approaches. Under his second plan an extension of the Detroit Avenue subway beyond Twenty-fifth Street could be built if it becomes necessary. County Engineer Stinchcomb feels that the plan of having cars on the Detroit Avenue line come to the surface at West Twenty-fifth Street will result in congestion.

The city plan commission at Cleveland, on Dec. 15, approved the plans of County Engineer Stinchcomb for subway approaches to the high-level bridge across the Cuyahoga River in preference to those of Frederick Law Olmsted. The vote was informal.

Peter Witt, street railway commissioner of Cleveland, did not make a report on the status of the various funds of the Cleveland Railway at the meeting of the City Council on the evening of Dec. 13, as directed by the Woods resolution adopted a week previously. Councilman Wood made no comment on Mr. Witt's failure to comply with Council's orders.

Under a resolution introduced by Councilman E. A. Meyers, a committee of five members was appointed to study traffic conditions in the congested business district of the city and at other points where trouble is frequent.

Councilman J. J. McGinty has introduced an amendment to the franchise of the Cleveland & Youngstown Railway. Under the amendment the electrification clause agreed upon some time ago will be inserted in the franchise.

W. F. M. GOSS DISCUSSES CHICAGO ELECTRIFICATION REPORT

That phase of the smoke abatement and electrification of railway terminals report dealing with the problem of electrifying Chicago's terminals was discussed at a meeting of the Western Society of Engineers Dec. 20, by W. F. M. Goss, chief engineer of the committee of the Association of Commerce which made this investigation. His address consisted largely of an abstract of the report which he divided into six subjects, namely, existing installations of electrified steam railroads, the Chicago problem, the electric load requirements, the cost, the operating results and the benefits to be derived. Dean Goss made the interesting statement in connection with the question of utilizing the electrified railroad right-of-way for building purposes, that property obtained by the right of eminent domain could not legally be used for commercial purposes. He also said that it was conceivable that the Chicago terminal situation could be unscrambled and the problem of electrification greatly simplified, but that was not within the province of the committee. Dean Goss illustrated his talk with lantern slides, and in the brief discussion which followed, it was suggested that the benefits to be derived from electrification would principally accrue to the city, therefore, it should contribute to the cost of electrification. In response to this question, Dean Goss stated that electrification undertaken as a public improvement could not be financed under the present State constitution, which specifically prohibits city aid in this respect.

MOTION TO DISMISS SEATTLE CASE DENIED

Outline of Contention of Counsel in Case in Which Company Seeks Relief from Franchise Burdens

The Public Service Commission of the State of Washington has denied the motion to dismiss the case of the Public Service Commission on the relation of the Puget Sound Traction, Light & Power Company against the city of Seattle. The action is the one in which the company asks that the city of Seattle be restrained from enforcing certain franchise provisions.

Ralph Pierce, assistant corporation counsel for the city of Seattle, appeared for the city. He contended that the commission must necessarily dismiss the case on the grounds, first, that the law gives no authority for filing such complaint, and, second, that the commission is without power to grant the relief sought. He said that the company seeks relief from all of the terms and conditions the city imposes, but offers to give up none of the rights. Mr. Pierce insisted that the franchise is a contract, and that the only way to break it or to get relief from any of its provisions, is for the court to grant a writ of mandate, stating that when the city seeks to make the company live up to any part of the franchise, the matter goes into the courts. He contended that so far as paving is concerned, the only jurisdiction the commission has is to say that the pavement between the tracks shall be safe, but that it cannot specify the kind of paving under the franchise agreement. He referred to the fact that acting upon the advice of Attorney General Von Tanner, the commission had ruled it had no jurisdiction over streets, having announced in a previous case that it could not force the company to make certain extensions.

Mr. Pierce, in his argument before the commission, stated that instead of trying to avoid the requirements imposed in the franchise, the company should seek relief by raising its passenger rates. He contended that the city, by 1934, the date of expiration of company's franchises, would lose \$1,500,000 if the 2 per cent gross earnings tax provision of the franchise should be eliminated.

J. B. Howe, attorney for the company, contended that the commission has jurisdiction to supersede franchise provisions laid down by a city if the commission finds the provisions are unjust. Mr. Howe cited as evidence that certain provisions of the franchise of the company are unjust, the requirement to pave between the tracks and to a width 18 in. beyond the tracks, to pay part of the maintenance of the paving, and the clause under which the City Council can arbitrarily map out an extensive improvement district.

He said further that the franchise provision which stipulates that 2 per cent of the gross earnings be paid to the city is unjust. He also cited several court rulings which he contended gave the State authorities power to abrogate or supersede franchise provisions originally laid down by a city.

Charles C. Reynolds, chairman of the commission, following the conclusion of the arguments, announced that the commission would deny the motion of the city with the proviso, however, that the motion may be renewed when the case comes up for a hearing on its merits. The city of Seattle has five days to file an answer to the complaint. The date of hearing on this petition has been set by the commission for Feb. 16, 1916. James E. Bradford, corporation counsel of the city, recently asked the Council for an appropriation of \$10,000 in order to prepare for the hearing before the commission.

MR. HARRIS EXPLAINS TORONTO TRANSIT PLANS

R. C. Harris, Works Commission of Toronto, Ont., who, with E. L. Cousins, engineer of the Toronto Harbor Board, and F. A. Gaby, chief engineer of the Hydro-Electric Power Commission of Ontario, prepared for the city the comprehensive report recommending a system of semi-rapid transit with radial entrances, explained the plans to the Board of Trade at a meeting on Dec. 18.

Mr. Harris said that rapid transit in the strict sense of the word had never been adopted in cities of less than 1,000,000 people, except, perhaps, in the case of Boston, where conditions were peculiar. The city of Toronto was not ripe for rapid transit, but semi-rapid transit could be attained by the construction of radial lines, east, west and northeast, provided they were controlled by the city within the city limits.

The commissioner said further that in so far as the city itself as at present constituted was concerned, when the city in 1921 acquired the Toronto Railway franchise, with its consequent rehabilitation and the building of new civic lines, the proper placing of new surface lines in the interim would bring about a passage from the remotest limit to King and Queen Streets in thirty-five minutes. The commissioner then dealt with the radial entrances. He dwelt on the recommendation for a transportation commission that would control all the electric transportation within the city, assume control of the civic car lines, lay out and build new lines and arrange for the acquisition of the Toronto Railway in 1921, the city to control the railways within the city limits.

The City Council will at its next meeting declare its policy in reference to taking over the Toronto Railway at the expiration of its franchise. The Mayor said: "The present Board of Control has tacitly declared in favor of the policy, but at the next meeting we will send on a resolution in favor of taking it over."

EFFORTS TO SETTLE WILKES-BARRE STRIKE FAIL

Efforts of Federal and State mediators and the pleas of the united business men have gone for naught in the attempt to settle the strike of the carmen on the system of the Wilkes-Barre (Pa.) Railway. The merchants of the city have made the most substantial and practical endeavor to end the strike by appealing to the striking employees in a declaration that business is paralyzed and that unless the strike is ended at once several hundred clerks and other store employees will be thrown out of work. All admitted that business is the poorest ever known for the Christmas season and that to save themselves it will be necessary to cut down expenses by discharging clerks and other help. The carmen rejected the offer of a peace proposal made by the merchants of the city, declaring that it contained nothing new.

It has been announced by the company that night service will be started in a few days. Since the strike started cars have only been run until dusk on account of the possibility of riots, but an adequate police force has now been provided and the militant temper of the mobs has materially subsided. Considerably more traveling is being done by the general public, especially since the recent inclement weather, and it is expected conditions will be restored to normal in a short time.

MANY WITNESSES EXAMINED IN NEW YORK INQUIRY

The inquiry by the legislative committee into the workings of the Public Service Commission for the First District of New York was continued during the week. Four witnesses were before the Grand Jury on Dec. 17. They were Sidney G. Johnson of the General Railway Signal Company; Walter D. Uptegraff, president of the Union Switch & Signal Company; S. O. Levinson, general counsel of the Union Switch & Signal Company, and John R. McCune, a director of that company. On Dec. 21 the Grand Jury had before it Col. H. G. Prout, formerly president of the Union Switch & Signal Company. The proceedings before this body are secret, but the opinion seems to prevail that no action will be taken by the jury until the committee from the Legislature has exhausted its inquiry.

Col. Prout was the principal witness before the committee on Dec. 17. Col. Prout said that he could not tell of any specific occasion when he talked with Mr. Johnson, who was formerly vice-president in charge of sales of the Union Switch & Signal Company, with respect to the Center Street loop signal contract. He did say, however, that Mr. Johnson had come to him more than once with the subject of his (Mr. Johnson) being approached by Commissioner Wood. Col. Prout said that he advised Mr. Johnson that it was the duty of the company to keep a watch on the commissioner, to "tow" him along, but to make no promises. He had then spoken about the matter to various members of his board of directors and it was formally put before the board. They rejected the idea of making any propositions of payment to Mr. Wood.

On Dec. 18 Alfred Renshaw, president of the Federal Signal Company, Albany, N. Y., said that Vice-President Cade of that company had told him that Commissioner Wood had invited him (Cade) to his (Wood's) office and Mr. Renshaw got the impression that Mr. Cade said that Mr. Wood gave Mr. Cade an opportunity to make a proposition in connection with the signal contract for the Fourth Avenue line. Mr. Renshaw also testified on Dec. 21. Another witness was Clifton W. Wilder, electrical engineer for the commission.

William G. Banks, a former associate of Commissioner Wood, was examined on Dec. 21. He went over meetings which he said he had with both Mr. Cade and Mr. Wood. The only influence he brought to bear on Mr. Wood was to try to get some of the signal equipment business. The witness was excused by Senator Thompson, chairman of the legislative committee, with the advice that he "come back here in the morning and tell us everything you have forgotten to tell us."

OSCAR S. STRAUS ON HIS IDEALS

Oscar S. Straus, who was appointed on Dec. 9 by Governor Whitman of New York to succeed Edward E. McCall, removed by the Governor as chairman and member of the Public Service Commission for the First District, said in an interview prior to his being sworn in as a member of the commission:

"I have not given any attention to transportation problems or the regulation of corporations. I make no claim to be an expert. But I was head of the Department of Commerce and Labor, a great department which has since been divided into two, and I shall use the advice of experts with common sense and a fearless determination to serve the public interest. I may go in as a student at first, but I am determined to give the city a square deal. I shall not be afraid to do the unpopular thing if I believe it to be right.

"The decisions of the commission in the railroad arbitration of 1912, of which I was chairman, did not quite satisfy either side, but worked out well. I suppose the same may be the result of my work in the Public Service Commission. Then there was another reason why I hesitated to accept: the hostile criticism I must expect. That is one of the most difficult things in public affairs, especially municipal affairs, even if one be as pure as ice and chaste as snow. So, for a man of my time of life, with a fair record behind him, it is taking quite a chance to accept office with no object but to serve the public. Only recently I have become a member of a committee in that great beneficent neutral

work of feeding and clothing the Belgians and the French within the German lines. I must stay on that, and if the commission work conflicted with it, I should have to drop the commission. So the public must not be surprised to see me get out. My controlling idea is that I believe in the efficacy of commissions as a development of the highest value to municipal government. I believe that value would be lost and the commission system discredited unless public-spirited men were willing to devote themselves to the work. As the Governor put it to me, I regard this as a call for public service. I regret that I have been selected. It takes from me the leisure that I have earned in twenty-eight years of public service, off and on, but I could not refuse the summons when it came to me."

CHICAGO TRACTION COMMISSION ORDINANCE PASSED

The employment of three engineers to study the entire local transportation problem of Chicago, Ill., was authorized by the passage of an ordinance at the meeting of the Chicago City Council on Dec. 20. A number of amendments were submitted, but after two hours' debate the ordinance was approved essentially as it was recommended by the local transportation committee. The ordinance authorizes the employment of three engineers, one from Chicago and two who have had experience in connection with the efforts to solve the transportation problems of New York, Philadelphia or Boston. The local transportation committee now has full authority to negotiate for the employment of the engineers, but their appointment must be confirmed by the City Council. Henry B. Capitain, the chairman of the committee, has been asked by the committee, to submit the names of qualified engineers with their records and his recommendations.

New Rules of Procedure for District Commission.—The Public Utilities Commission of the District of Columbia has adopted new rules of procedure to facilitate the transaction of matters coming before the commission. The new rules went into effect on Dec. 1.

Cincinnati Officials Appointed.—Mayor-Elect George Puchta of Cincinnati, Ohio, announced on Dec. 16 that he had selected Charles F. Hornberger as director of public service and Walter J. Friedlander as director of public safety. Charles Groom will succeed Walter M. Schoenle as city solicitor and Harry Barnes will be his first assistant.

Plea to Dismiss New Haven Case.—Judge Hunt listened all of Dec. 20 in the Federal District Court at New York while counsel for the eleven ex-directors of the New York, New Haven & Hartford Railroad tried to show that he should dismiss the complaint of the government against them for alleged conspiracy to monopolize trade in New England.

Acquisition of Part of Toronto Line Recommended.—The City Council of Toronto, Ont., at a special meeting on Dec. 17 unanimously adopted the recommendation of the Board of Control that the Hydro-Electric Power Commission of Ontario be requested to enter into negotiations with the Toronto & York Radial Railway for the acquisition of the Metropolitan line on Yonge Street. The question of taking over that portion of the line within the city limits to make it part of the civic system will be arranged with the Hydro-Electric Commission after it has secured possession of the line.

Interborough Men as Entertainers.—At the annual smoker and entertainment of the New York Railroad Club, held at the Waldorf-Astoria on Dec. 17, all of the entertainment was provided by talent from the force of the Interborough Rapid Transit Company, New York. The features on the program included instrumental music from the Subway Orchestra, songs from the Interborough Quartette, a ventriloquist, monologues, etc. The entertainment was fully up to those given by professionals in past years, and the members of the club present were greatly appreciative of the opportunity of learning what the Interborough force could do.

Plea for Retention of Transit Experts in Philadelphia.—A. Merritt Taylor, director of the department of city transit of Philadelphia, Pa., appeared before the Council-

manic finance committee recently and urged that an appropriation of \$60,000 for consulting engineers be included in the amount made available for 1916. Director Taylor, in urging that Councils make the same provision regarding consulting engineers for 1916 as was made in 1914 and the present year, declared that it would be a great misfortune to do away with the services of valuable experts who have been stationed almost constantly in his office since the development of the transit plan was begun.

Resolution for Congressional Inquiry Into Railroads.—Senator Newlands has introduced a resolution for a Congressional investigation of the railroad situation along the lines advocated by President Wilson in his message. The Senator is chairman of the committee on interstate commerce, and his resolution has been referred to that committee. He has expressed the view that the Interstate Commerce Commission should be enlarged, that there should be a section for the Eastern roads, another for the Middle Western roads, and a third for the Far Western roads. He has also raised the question of incorporating the railroads under a federal charter.

Action on Philadelphia Transit Loan Put Over.—Action on the \$95,000,000 loan for Philadelphia, which is to include \$45,000,000 for rapid transit work, has been halted at the request of Mayor-elect Thomas B. Smith. The Mayor-elect says that no steps on the project will be taken until after the first of the year. He was quoted recently in part as follows: "The loan was held up at my request. I want it to come up under the new Councils. The city solicitor called my attention to several legal points that are involved, and I asked Mr. Connelly to sidetrack the loan until these matters are straightened out. I went to be sure of my ground. The loan will go through, however, and all of the improvements planned will be amply provided for." It was expected that on Dec. 16 the loan bill would pass both chambers of Councils, that Mayor Blankenburg would sign it promptly and that the thirty-day period for advertising would be ended in time to hold a special election on Feb. 8.

Lehigh Valley Transit Company Increases Wages.—Announcement has been made that the board of directors of the Lehigh Valley Transit Company, Allentown, Pa., has granted an increase of wages to the trainmen in the employ of the company, effective on Jan. 1, 1916. The new schedule rate of wages will be as follows: Twenty-four cents an hour for first year men, 25 cents an hour for second year men, 26 cents an hour for third year men, 27 cents an hour for fourth year men, 28 cents an hour for the fifth year and thereafter to the fifteenth year and 29 cents an hour for the fifteenth year and thereafter. The old rate of pay ranged from 23 cents to 27 cents an hour, so that under the new schedule the men receive an increase of 1 cent an hour up to the fifteen year men, who are advanced 2 cents an hour. The increase also applies to the men on the Easton, Pa., and Phillipsburg, N. J., branches of the company, as well as on the Philadelphia division and the lines directly connecting these points. More than 300 men will share in the advance.

Charleston Arbitration Findings.—The board of arbitration selected to settle differences existing between the Charleston Consolidated Railway & Lighting Company, Charleston, S. C., and its trainmen relative to a new contract and increased wages has reached a decision. The old contract expired on Nov. 16. Representatives of the company and men were unable to agree on the terms of a new contract and the matter was submitted to a board of arbitrators consisting of B. F. McLeod, representing the company, and Frank Simmons, representing the carmen. R. G. Rhett was chosen as the third arbiter. By the terms of the new contract, some forty men in the employ of the company four or more years receive an increase of 3 cents an hour, getting 24 cents. Another forty men, who have been employed more than two years and less than four years, get an increase of 2 cents an hour, their pay being 22 cents. The men who have been with the company less than two years, are granted an increase of 1 cent an hour, their pay being 20 cents an hour. They number about sixty. Some thirty extra men employed as motormen and conductors also get an increase of 1 cent an hour, or 18 cents an hour. All are employed on a contract based on a nine-hour day. The decision of the board was unanimous.

PROGRAMS OF ASSOCIATION MEETINGS

Railway Business Association

The annual meeting of the Railway Business Association will be held at the Waldorf-Astoria Hotel, New York, N. Y., on Jan. 27, 1916. The sessions will be a business meeting at 11 a. m., election of officers 1.30 p. m. and dinner at 7 p. m. The program of speakers will be announced later.

American Economic Association

The twenty-eighth annual meeting of the American Economic Association to be held at Washington, D. C., Dec. 27-30. Among the many papers to be presented, the following are perhaps of greatest interest to readers of the *ELECTRIC RAILWAY JOURNAL*:

"Probable Changes in Foreign Trade of the United States Resulting from the European War," by Emory R. Johnson of the University of Pennsylvania.

"The Requisites for the Encouragement of the Investment of Foreign Capital," by William Straight, New York.

At the session on the afternoon of Dec. 29, Balthasar H. Mayer of the Interstate Commerce Commission will preside. The subject will be "Some Recent Tendencies in Economic Theory."

National Civic Federation

The annual meeting of the National Civic Federation will be held in Washington, D. C., on Jan. 17, 18 and 19, 1916. The annual dinner will take place at Hotel New Willard on Jan. 18. The general topics for discussion will be:

"The legal and moral obligations resting upon foreign-born citizens of the United States—those who have become naturalized citizens, and those who have taken steps to become citizens, as well as those engaged in labor or business here, but not intending to take out citizen's papers."

"The present and prospective effects of the war upon immigration to the United States, as it relates (1) to the wage-earner, (2) to industry, and (3) to the body politic; and what, if any, new legislation is required to deal with this problem."

Among the reports which will be made by special committees will be one giving an analysis of more than 100 profit-sharing plans now in operation in this country, as well as a description of many abandoned ones and the causes of their failure. A plan will be presented for the organization of a commission to study the question, "How far shall government in this country enter into private industry?" The industrial economics department will make a preliminary report on its survey of the social and industrial changes that have taken place in the United States during the last generation.

Pan-American Scientific Congress

The program of Section V, or that on engineering, of the Second Pan-American Scientific Congress, has just been published by the government. This congress will begin on Monday, Dec. 27, 1915, and will continue until Saturday, Jan. 8, 1916, and will be held in Washington, D. C. The engineering section is divided into six subsections, namely: civil engineering; marine engineering; electrical engineering; reclamation, sewage, and municipal water supply; mechanical engineering; standard surveys, parks, building, nomenclature. Among the papers of electric railway interest already announced are the following, all of which will be presented on Jan. 3:

"Electric Power Transmission and Distribution Systems," by Percy H. Thomas.

"Aluminum Conductors for Electric Transmission Lines," by Theodore Varney.

"Underground Cables," by H. W. Fisher.

"Electrification of Transportation Lines," by N. W. Storer.

On Jan. 4, Dr. E. B. Rosa, of the National Bureau of Standards, will present a paper on "Electrical Codes and Standards." On the evening of Jan. 6 it is expected that the president of the United States will address the members of the congress, and on the following evening there will be a reception to the members at the White House. On the evening of Jan. 8 a banquet will be extended to the members of the congress by the Secretary of State and by the United States delegates.

Financial and Corporate

ANNUAL REPORT

New York, New Haven & Hartford Railroad

The annual report of the New York, New Haven & Hartford Railroad for the year ended June 30, 1915, contains comparative statements of income, profit and loss for the various affiliated electric railways, as shown in the accompanying table. In the New York, Westchester & Boston Railway, which is held directly through the ownership of 98.4 per cent of the capital stock, the New York, New Haven & Hartford Railroad has an investment of \$13,910,703, book value. The operating expenses and taxes of this electric line for the year ended June 30, 1915, were 109.93 per cent of the total operating revenues, a decrease of 29.80 per cent. The deficit in the profit and loss account as of June 30, 1915, was \$4,257,874. The volume of business handled by this company is said to be increasing steadily, and it is expected that the earnings for the current fiscal year will be sufficient to pay operating expenses and taxes.

Other electric lines which are held directly through ownership of the entire capital stock by the railroad, but which under decree of the federal court must be disposed

CONNECTICUT COMMISSION REPORT

\$416,418 Decrease in Electric Railway Operating Revenues for Year Ended June 30—Only One Operating Company Paid Dividend

According to the report of the Connecticut Public Utilities Commission for the year ended June 30, 1915, the total operating revenue of all street railways was \$15,240,174, a decrease of \$416,418. Every source of revenue showed a decrease for the year. Passenger revenue decreased \$33,166, owing, it is thought, largely to the introduction of the jitney. While operating expenses increased \$60,618, there was a decrease in expenses of conducting transportation of \$111,113. The results of operation showed a decrease of \$477,037 in operating income. These figures cover all companies reporting to the commission, including the Rhode Island Company, which operates largely outside the State. Of the total decrease in passenger revenue of \$333,166 the decrease of the Rhode Island Company was \$266,793, and of the total decrease of \$416,418 in all operating revenue, that of the Rhode Island Company was \$295,011.

By eliminating from the calculations the operating expense and revenue of the Rhode Island Company, there was a decrease in operating revenue of \$121,407, an increase in

*1915 deductions from gross income include \$1,368,065 and the 1914 figures include \$1,298,396 for interest accruing to the New York, New Haven & Hartford Railroad, which was not included in the income account of that company. Similar items included for the other companies are as follows: Berkshire Street Railway, \$118,000; Rhode Island Company, \$199,617; New York & Stamford Railway, \$22,000; and Westchester Street Railroad, \$14,855.

†Deficit.

*The Connecticut Company paid dividends of \$400,000, a decrease of \$1,100,000, and had a surplus of \$923,457 for the year, an increase of \$922,384.

of on or before July 1, 1919, include the following: The Berkshire Street Railway, with a New Haven investment of \$9,936,156; the Rhode Island Company, with a New Haven investment of \$27,582,337; the New York & Stamford Railway, with a New Haven investment of \$1,420,395, and the Westchester Street Railroad, with a New Haven investment of \$1,237,426. The operating expenses and taxes of the Berkshire Street Railway for the last fiscal year were 90.88 per cent of the total operating revenues, an increase of 3.94 per cent. The deficit in the profit and loss account as of June 30, 1915, was \$364,050. In the case of the Rhode Island company the operating expenses and taxes were 76.93 per cent of the total operating revenues, an increase of 4.49 per cent, and the credit to the profit and loss account was \$1,360,932. For the New York & Stamford Railway the operating expenses and taxes were 80.71 per cent of the total operating revenues, an increase of 4.12 per cent, and the deficit in the profit and loss account amounted to \$67,839. The operating expenses and taxes of the remaining company directly held, the Westchester Street Railroad, were 102.86 per cent of the total operating revenues, an increase of 10.07 per cent. The deficit in the profit and loss account totaled \$56,798.

The New York, New Haven & Hartford Railroad also controls, though indirectly, the Connecticut Company, the entire capital stock being held by the New England Navigation Company. The entire investment of the railroad in this property amounts to \$42,025,000. The company is likewise to be disposed of before July 1, 1919. The operating expenses and taxes of this railway during the year were 71.94 per cent of the total operating revenues, an increase of 0.61 per cent, and the credit to the profit and loss account as of June 30, 1915, was \$1,016,886.

The report states that it will be necessary for the railroad to spend in the next few years \$1,500,000 for electric equipment and facilities to get full benefit of the electrification between New York and New Haven.

operating expense of \$59,632 and a net decrease in operating income of \$181,039, applicable to the companies in Connecticut. There were 7,788,863 fewer fare passengers carried during the year than the previous year. Of these 5,222,029 passengers represent the decrease in those carried by the Rhode Island Company.

The total amount paid in dividends was \$740,804, a decrease from the amount paid the year previous of \$1,507,500. With the exception of the Bristol & Plainville Tramway the only companies that paid dividends were the ones that leased their lines and did not engage in street railway operation. Without the addition to its net earnings of \$50,486 operating profit from its electric light and gas departments, this company would not have been able to pay a dividend from the result of its railway operation.

There was during the year a net addition to the investment in road and equipment, by all street railways, of \$805,526, and a total addition on leased properties of \$813,841. Of this latter amount \$296,328 was expended by the Connecticut Company and the Shore Line Electric Railway, the balance being expended by the Rhode Island Company on its properties outside of Connecticut. At June 30, 1915, the total amount of capital stock issued and outstanding was \$73,270,985, an increase of \$137,600 for the year. The funded debt was \$22,033,113, an increase of \$980,034 for the year.

On June 30, 1915, the total mileage of single track operated in Connecticut was 828.18, and outside of Connecticut, 341.6. The total amount paid in salaries and wages to employees of street railways for the year was \$6,403,696, and of this amount \$4,099,463 was paid to employees of companies in Connecticut. For the same period the total number of employees was 5,390.

There are twenty-two street railways in Connecticut, nine of which are non-operating companies. During the year the Lordship Park Association, which operates a short line in Bridgeport, began service operation. On Nov. 11, 1914,

The Danbury & Bethel Street Railway voted to acquire all the property, rights and contracts of the Bridgeport & Danbury Electric Railway, which was operating 5 miles of single track. Since that date this line has been operated by the former company.

UNITED RAILROADS NEW FINANCING

Commission Authorizes New Secured Notes to Redeem Bonds, but Company Must Produce Missing Books or Satisfy the Commission With Its Efforts

The California Railroad Commission has issued an order authorizing the United Railroads of San Francisco to issue \$1,800,000 of 6 per cent promissory notes, and the subsidiary Market Street Railway to issue \$1,800,000 of 5 per cent first mortgage bonds as security for the notes. The notes mature two years from date and may be sold any time before Oct. 15, 1916. The bonds are secured by a deed of trust, dated July 12, 1894, from the Market Street Railway to the Union Trust Company of San Francisco. The application to the commission was noted in the *ELECTRIC RAILWAY JOURNAL* of Dec. 18.

The proceeds from the notes may be used only to buy and cancel not more than \$1,800,000 of the remaining outstanding bonds of the Market Street Cable Railway. The original issue of the first mortgage 6 per cent gold bonds of this company in 1882 was \$3,000,000, maturing in 1913. All but \$1,800,000 of the issue has been paid, and the owners of the bonds to the latter amount have been demanding payment. The United Railroads of San Francisco said that it could postpone this payment until Oct. 15, 1916, by the promissory notes asked for, secured as above.

Neither bonds nor notes now authorized, however, may be issued until the United Railroads of San Francisco has produced the missing books of that company for 1907, 1908, 1909, 1910 and 1911, or has taken the necessary legal and other steps to secure the books to the satisfaction of the commission. Moreover, a stipulation must be filed with the commission that the net income of the company shall be applied or held to pay off the notes, as directed by the commission, and the commission will fix the selling price of the notes before the bonds are issued.

Authority was asked to issue bonds for \$2,250,000, but the commission said that in view of the financial condition of the company insofar as it could be determined in the absence of the original books of account, it could not authorize an issue of bonds of the Market Street Railway in excess of the face of the notes. The commission drew attention to the fact that a number of additional obligations will shortly be payable. On Feb. 1, 1916, ten-year gold notes of the United Railroads of San Francisco of the face value of \$1,000,000 will become due. On Dec. 31, 1916, \$400,000 of bonds of the Ferries & Cliff House Railway are payable. The United Railroads of San Francisco owes the United Railway Investment Company \$740,000, of which \$555,000 was due in 1913. It was stated at the hearing before the commission that no arrangement had been made to pay these obligations or to pay the notes now authorized by the commission. B. S. Guinness, a New York banker representing the controlling interest in the properties, stated that he assumed a reorganization would be necessary to take care of the maturing obligations.

Referring to the absence of the books of the United Railroads of San Francisco, Mr. Guinness said that he had been for years a director of the United Railroads of San Francisco and allied companies and a partner of Ladenberg, Thalmann & Company, New York. He testified that he and those interested with him were unable to get the books from Patrick Calhoun. The commission stated, however, that these books were the property of the United Railroads of San Francisco and not Mr. Calhoun, and that it was not satisfied that the eastern owners of the company had made reasonable efforts to secure them. While it was not the function of the commission to indicate the precise means to secure these books, it expected the stockholders to use every effort in their power, both legal and otherwise, to procure the books and return them to California.

It is reported that as a result of later action the commission changed the order that the United Railroads of San Francisco take "necessary" steps to secure the missing

books to an order that it make a "reasonable" effort to produce these books. Thereupon a syndicate composed of E. H. Rollins & Sons, Boston, the Anglo & London Paris National Bank, San Francisco, and Ladenberg, Thalmann & Company, New York, gave out that a satisfactory arrangement had been made with the company for the payment of \$1,800,000 of bonds due on Dec. 15 or for a ten months' extension of the bonds, optional with the bondholder. The changed wording, it is reported, will make possible the issuance of notes totaling \$1,800,000 at any time within the next ten months. Within that time, it is presumed, the company will make a "reasonable" effort to produce the missing books. In view of the short time intervening between the issuance of the commission's order and the maturity of the bonds now due, it was decided by the syndicate to extend the time for payment to Oct. 15, 1916, semi-annual interest at the coupon rate to be paid meanwhile.

POLICY OF EMPIRE UNITED RECEIVERS

Will Run Line at Lowest Cost Consistent with Safety—Announcements by Bondholders' Committee Regarding Deposits and Reorganization Plan

H. S. Holden and C. Loomis Allen, receivers of the Empire United Railways, Inc., Syracuse, N. Y., have issued a formal statement in response to requests concerning their policy and the future of the property after receivership. This follows in part:

"With reference to the operation we desire to say that it will be the policy of the receivers to operate the property for the lowest cost possible, consistent with safe and convenient service to the people who are dependent upon the company for transportation.

"It is not possible to answer the second query at this time. Information has been asked and is being prepared in reference to the last five years' history of operation. This includes a statement of earnings and payments from earnings for salaries, labor and materials used in operating the railways, taxes and interest upon bonds, notes and other obligations. As soon as we have received this information, a careful study of this history will be made, and with this history in mind, as a guide, a conservative estimate of the earnings as well as the cost of operating the property in the future will be formed.

"Until this study has been made the receivers ask the traveling public and the owners of all securities to suspend their judgment and withhold action, with the assurance on the part of the receivers that there is but one motive actuating them in the management of the property, namely, to render the necessary service as economically as possible and to conserve to the utmost degree the interests of all parties who put cash into the enterprise and make the enterprise possible."

The committee for first mortgage 5 per cent. bonds of the Rochester, Syracuse & Eastern Railroad has announced that more than a majority of the outstanding bonds have been deposited, and that after Dec. 31 bonds will be received only upon compliance with such additional conditions as may be imposed by the committee. Arthur W. Loasby, president Trust & Deposit Company of Onondaga, Syracuse, a depository, is chairman of the committee.

It has also been announced that the committee is not inclined to favor any plan of reorganization or of readjustment which contemplates, as the proposed plan does, not only a sacrifice of the interests of the first mortgage bondholders, but a continuance of the present management of the property. It is said that the committee has been and is of the opinion that no plan which would in any way change the status or obligation of the Rochester, Syracuse & Eastern Railroad bonds can be intelligently considered until definite information as to the receipts and disbursements of the property covered by the mortgage has been secured. The committee says that it has requested C. Loomis Allen as co-receiver to institute a system of bookkeeping which will show exactly the earning capacity of the Rochester, Syracuse & Eastern property, and that he has agreed. When this information is furnished, the preparation of plans of readjustment may be considered, if readjustment is shown to be necessary. The proposed plan above referred to was published in the *ELECTRIC RAILWAY JOURNAL* of Dec. 11.

American Cities Company, New York, N. Y.—Francis T. Homer and T. H. Tutwiler have been elected directors of the American Cities Company.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—George D. Crofts, Buffalo, N. Y., has been appointed referee in the foreclosure action brought by the New York Trust Company, New York, against the Buffalo & Lake Erie Traction Company and its leased lines. The appointment of a receiver for the company was noted in the *ELECTRIC RAILWAY JOURNAL* of July 17. Referee Crofts has been directed to compute the amount due on the mortgage sought to be foreclosed, together with the amount of interest unpaid; to take proof of all property covered by the mortgage and subject to its lien and to take proof whether the property should be sold in one parcel or in separate parcels. The company defaulted the Nov. 1, 1912, interest payment on the \$7,066,000 of first and refunding mortgage twenty-year 5 per cent bonds outstanding under its \$12,000,000 mortgage to the New York Trust Company, dated Nov. 1, 1906, and it has continued to default up to and including Nov. 1, 1915. The present proceedings and the appointment of the referee to take testimony are said to mark the beginning of the end of the foreclosure action.

Choctaw Railway & Lighting Company, McAlester, Okla.—C. N. Mason, chairman of the bondholders' committee of the Choctaw Railway & Lighting Company, has announced that 90 per cent of the bondholders are prepared to begin foreclosure of the mortgage securing the first mortgage bonds and that the same percentage of bonds has been deposited with the Guaranty Trust Company, New York. The appointment of receivers for this company was mentioned in the *ELECTRIC RAILWAY JOURNAL* of Oct. 30.

Detroit (Mich.) United Railway.—William A. Read & Company, New York, has sold at 100 and accrued interest the \$3,500,000 of collateral trust 5 per cent gold notes of the Detroit United Railway recently authorized by the Michigan Railroad Commission, as noted in the *ELECTRIC RAILWAY JOURNAL* of Dec. 18.

Northampton Traction Company, Easton, Pa.—The Pennsylvania Public Service Commission has approved the merger of the Northampton Traction Company and the Bangor & Portland Traction Company, Bangor, Pa., under the name of the former. The Northampton Traction Company operates 25 miles of single track between Easton and Bangor, with direct connection for the Delaware Water Gap and Stroudsburg, while the Bangor & Portland Traction Company has 8.75 miles of single track between Bangor and Portland. As a result of the present merger a new line will be run from Wind Gap to the Delaware Water Gap, and Saylor's Lake will be purchased and turned into a summer resort, the sum of \$500,000 being involved. The new line will connect at Stroudsburg with the Stroudsburg Passenger Railway, which, it is said, will be absorbed, and will be built through Kellersville to Saylor's Lake, thence to Saylor'sburg and over to Wind Gap. It is hoped to begin work by June 1.

Portland & Oregon City Railway, Portland, Ore.—The Portland & Oregon City Railway recently received permission from the City Council to give a mortgage to the Security Savings & Trust Company for \$350,000 to cover the 16-mile line being built between Oregon City and Portland. This permission was required by the terms of the company's franchise. As noted in the *ELECTRIC RAILWAY JOURNAL* of Dec. 18, this company has begun operations between Milwaukee and Carver, and it is expected that the line will be completed to Portland by Jan. 10.

Public Service Corporation of New Jersey, Newark, N. J.—The directors of the Public Service Corporation of New Jersey have voted to put the stock of the corporation on a 7 per cent basis instead of 6 per cent as it has been for several years. A dividend of 1¼ per cent for the quarter ending Dec. 31 was declared, this action having been taken after it was shown that the amounts set aside for amortization were very liberal, and the surplus account was in a very satisfactory condition.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The California Railroad Commission has authorized the San Francisco-Oakland Terminal Railways to issue one-day six per cent promissory notes for not more than \$218,459,

and general lien bonds of a face value of \$337,000 as collateral security therefor.

Second Avenue Railroad, New York, N. Y.—Justice Whitaker of the Supreme Court on Dec. 21 signed an order permitting settlement of the claims of the Second Avenue Railroad against the old Metropolitan Street Railway on the basis of an agreement reached between the late George W. Lynch, receiver of the former company, and the New York Railways, successor to the latter company. The agreement has been concurred in by John Beaver, the new receiver, and the New York Railways. The agreement provides for the payment of \$548,352 to the Second Avenue Railroad, the money to be turned over to the court and used in paying off the company's indebtedness. The payments cover three claims: damages of \$111,737 for a breach of lease, the amount being fixed by the federal courts; a similar claim for \$594,727, which was compromised for \$267,627 or 45 per cent of the claim, and a claim of \$168,988, based on an inter-receivership accounting. It was said that the money to be paid would enable the Second Avenue Railroad to clear off all indebtedness and assist it in developing the property. Individual damage claims against the corporation have been settled for a total of \$66,000.

Springfield & Xenia Railway, Springfield, Ohio.—The Springfield & Xenia Railway has declared a dividend of 3 per cent on common stock, payable on Dec. 20 to holders of record on Dec. 15. This payment is the same as that made in 1914, but is an increase of 1 per cent over the 1913 payment.

Toronto (Ont.) Railway.—William A. Read & Company, New York, recently purchased and sold on a 4.875 basis \$500,000 of 6 per cent gold notes of 1914 of the Toronto Railway, due on Dec. 1, 1916, and on a 5.5 basis \$250,000 of the notes due on Dec. 1, 1917. These \$750,000 of notes are redeemable at 102½ and interest on any interest date on thirty days' notice. They are part of an authorized issue limited to \$2,000,000, and are issued for refunding a like amount due on Dec. 1, 1915, which, together with \$750,000 due in 1916, were originally issued in 1914 for financing extensions and improvements of the business and properties of the Toronto Power Company, Ltd., which indorses them. The Toronto Railway covenants not to issue any bonds or other funded debt while any of these notes remain unpaid, without applying the proceeds to their redemption.

York (Pa.) Railways.—The Philadelphia Stock Exchange has listed \$546,000 of additional first mortgage thirty-year 5 per cent gold bonds, due in 1937, of the York Railways, making the total \$4,271,000. The added bonds cover the following: \$94,000 for railway extensions, improvements and equipment; \$137,000 for acquiring or building a power plant, and \$315,000 for purchasing \$124,500 out of \$150,000 bonds and the entire 100 shares of stock of the Merchants' Electric Light, Heat & Power Company. This company last July was consolidated with the Edison Light & Power Company, which had previously been formed to take over the lighting and power subsidiaries of the York Railways and several other similar properties. Of the \$1,301,000 of capital stock of the Edison Light & Power Company, \$1,300,950 is owned by the York Railways and deposited as collateral under its mortgage.

DIVIDENDS DECLARED

Asheville Power & Light Company, Asheville, N. C., quarterly, 1¼ per cent, preferred.

Bangor Railway & Electric Company, Bangor, Me., quarterly, 1¼ per cent, preferred.

California Railway & Power Company, San Francisco, Cal., quarterly, 1¼ per cent, prior preferred.

Carolina Power & Light Company, Raleigh, N. C., quarterly, 1¼ per cent, preferred.

Charlottesville & Albermarle Railway, Charlottesville, Va., semi-annual, 3½ per cent, preferred.

Cincinnati & Hamilton Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Cincinnati (Ohio) Street Railway, quarterly, 1½ per cent.

Traffic and Transportation

MR. BRUSH ON BOSTON TRANSFER ABUSES

He Discusses the Transfer Problem in Its More Important Phases for the Massachusetts Commission

Matthew C. Brush, second vice-president of the Boston (Mass.) Elevated Railway, addressed the Massachusetts Public Service Commission at a hearing on Dec. 20, upon transfer abuses in Boston. Mr. Brush was before the board relative to the petition of the Roxbury Board of Trade for the institution of transfer checks at Dudley Street station. The company opposed the extension of the paper transfer system now in use on the ground that it is subject to enormous abuses, and pointed out that contemplated changes at Egleston Square station should be given a trial before changing the practice at Dudley Street.

Mr. Brush's discussion of the general transfer situation at Boston resulted from a request by Commissioner Meany that the larger phases of the question be set forth. Mr. Brush said that the company had 109 free transfer points where checks were used; that about 100,000,000 free transfers were issued annually, and that the number issued was growing at the rate of 10 per cent a year. Many transfers were issued improperly and used fraudulently daily. The company held that it had no more right to accept these transfers as fares than it had to honor lead nickels, but that it is absolutely helpless before the mass of transfers received. Mr. Brush considered it impossible to design a satisfactory transfer check for a large city system. An immense additional staff of employees would be required merely to examine the checks issued daily to see if they were correctly used. All the company could do was to take the checks and pocket the loss.

Describing the prevailing transfer abuses, Mr. Brush said that in one recent case it was found that a transfer was issued in a saloon with every drink, and in another case a passenger on the station platform at Northampton Street mingled with the crowd and secured five checks which he sold to confederates on the street below at 1 cent apiece. Faults in issuing and punching checks and many other evils in their train were outlined. One hundred and thirty boys have been arrested recently at the Dover Street elevated station for the fraudulent use of transfers. It had been impossible to tabulate the losses, but in a recent study of transfers issued and received in one day 64 per cent were found to be incorrect as to destination. On Nov. 29 the company received 340,000 checks. At Central Square, Cambridge, 4808 outward checks were received from surface cars to subway trains. Only 36 per cent of these were correctly punched as to destination. There were 11,554 free transfers accepted that day at the same station for transportation in the opposite direction, and of these only 9564 would legally entitle the holders to ride on toward Boston, had they been carefully inspected. On this date 5049 of the Central Square transfers were not properly acceptable as fare on account of the destination punched, and how many were fraudulent or otherwise inaccurate the company had not determined. How many were improper as to hour of usage, with the possibility of being accepted on the homeward trip at night though issued in the morning could never be determined. Some conductors were issuing transfers to persons not entitled to receive them; some issued for illegal trips, but whether they were issuing them in ignorance, carelessness or with intent the company could not attempt to prove in all cases. Conductors who accepted the slips did not have sufficient time to determine their legality.

At Central Square, in Cambridge, 14,000,000 transfers were made yearly; at Northampton Street station, 7,400,000; at Dover Street, 7,000,000; at Brookline Village, 5,082,000; at Massachusetts Avenue, Boston, 4,800,000; at Kendall Square, 4,800,000; at Dorchester Avenue, 4,703,000, and at Dudley Street, 57,000,000. To get away from the transfer difficulty the company has established a considerable number of prepayment areas where checks were not required, and where transfers could be effected with far greater safety than in congested streets. In conclusion, Mr. Brush said that if twenty such areas could be established the company could do away with about 70,000,000 of

the checks at present annually used, and the remaining 30,000,000 could be handled with fair accuracy. Larger checks could be issued, with less reading matter, thus facilitating checking.

Chairman McLeod closed the hearing with the statement that while the commission in general favored the system of transferring without checks, each case must be considered on its merits.

MASSACHUSETTS COMMISSION DECLARES ITS JURISDICTION IN BAY STATE FARE CASE

The full board of the Massachusetts Public Service Commission has ruled that it has jurisdiction in the Bay State Street Railway fare case and has decided to admit the testimony of the company's witness, Robert M. Feustel, of Sloan, Huddle, Feustel & Freeman, Madison, Wis., relative to the valuation of the company's property, presented at recent hearings. Mayor William M. Blakeley, of Walden, Mass., president of the Massachusetts Municipal Officers' Association, had asked the commission to dismiss the Feustel testimony. He raised the point that the board had no jurisdiction in view of the interstate service performed on certain of the company's lines. The commission points out that it would not be in the public interest at this time to restrict the scope of the inquiry by prescribing narrow and arbitrary rules regulating the methods of valuation, as a basis for the presentation of evidence. It states that the proposed changes in passenger fares and fare limits are intended, with certain possible and unimportant exceptions, to apply to transportation services to be performed by the carrier exclusively within the State, and that the board therefore considers it has jurisdiction in the case.

REMOVAL OF STANDING VEHICLES URGED

In an advertisement appearing in all the local newspapers on Dec. 9, 1915, the Chicago (Ill.) Surface Lines urged the discontinuance of the storage of vehicles along the streets in the loop district. The advertisement was published under the title, "For Storage or for Service?" The text of the advertisement was as follows:

"A large part of the area of the loop streets is now used for the storage of automobiles. This practice is a survival of the old 'hitching post' days. It forces heavy trucks and other vehicles to use the car tracks, and causes congestion and confusion. The entire width of narrow streets should be used for traffic purposes. This would be of special benefit to the hundreds of thousands who use the street cars every day. These hundreds of thousands are delayed and often seriously inconvenienced by the congestion caused by the storing of vehicles in narrow streets. Present conditions are out of date and should be corrected. This problem can best be solved by those who drive automobiles. Their slight personal convenience causes the serious inconvenience of the great majority who do not drive automobiles. The narrow loop streets should be reserved for service, not for storage."

DECISION IN COVINGTON OVERCROWDING CASE

Judge Harbeson in the Kenton Circuit Court at Covington has upheld the ordinance authorizing the chief of police of the city to "arrest" street cars which are overcrowded. The ordinance was enacted in 1910 and has been in litigation since. The course of the case has taken the measure through the Kentucky courts and on to the Supreme Court and back again to the Kenton Court for final judgment. The ordinance provides that each overcrowded car constitutes an offense, punishable by a fine of not less than \$50 nor more than \$100, each day's overcrowding to constitute a separate offense. The entrance and exit platforms must be kept free and open so that passengers can pass in or out without crowding, while persons refusing to vacate these spaces may be found guilty of misdemeanors and fined from \$5 to \$50.

The City Commission has instructed the safety commissioner to enforce all the valid provisions of the ordinance and calls on citizens to assist in assembling data for use in prosecutions. It is provided that any police officer guilty of ignoring violations of the ordinance, or who is reported to the safety commissioner for having done so, shall be sus-

pending for thirty days on the first offense and dismissed from the service for the second. Four plain clothes men were immediately detailed by Chief of Police Schuler and the result of the first day's observations was eight cases of alleged overcrowding of cars of the South Covington & Cincinnati Traction Company.

These eight cases, however, were continued when the company stated that it would immediately comply with the terms of the ordinance and that it had not been advised of the final step in the case in time to get ready before proceedings were begun. Extra cars will be put on during rush hours and other provisions made to live up to the letter of the ordinance.

One-Man Cars and Near Side Stops in Pine Bluff.—The Pine Bluff (Ark.) Company has increased the number of cars in operation and has gone over to the one-man system. Stops are now made on the near side.

Passaic Fare Hearing on Jan. 19.—The Board of Public Utility Commissioners of New Jersey had set Jan. 19, at Newark, as the time for hearing the appeal of the city of Passaic against the Public Service Railway. The city wants a 5-cent fare from the Garfield bridge to the Essex County line.

Crusade Against Spitters.—An extra force of inspectors of the Louisville health office, armed with pink cards which contain statements as to the penalty for spitting in public places, has been assigned to duty and is paying special attention to the evil on the street cars. Volunteer inspectors have been supplied with the cards. The pink cards are in the way of warning. It is believed that they are accomplishing results.

Supreme Court Upholds Wichita Jitney Ordinance.—The Supreme Court of Kansas has upheld the ordinance of Wichita taxing jitneys. This measure contains a section which assesses an excess license of \$300 to \$400 a year on motor buses that operate on designated streets. The streets designated were those on which there are street railway lines. The court said that the requirement of an additional license from motor buses using specified streets was a valid exercise of municipal control, and that conferring a benefit on the street railway by such regulations did not constitute a reason against such right.

Trial Before County Court for Failure to Meet Commission Requirement.—John J. Dempsey, superintendent of transportation of the elevated lines of the Brooklyn (N. Y.) Rapid Transit Company, will be tried in the County Court on the charge of failing to obey an order issued by the Public Service Commission. Justice Aspinall denied his motion to have the case removed to the Supreme Court for trial. The court said: "The offense charged is a simple misdemeanor, and while the questions of law which will undoubtedly be raised at the trial by counsel for the defendant may be new and novel, I have been unable to find any sufficient reason to magnify the importance of this case so as to justify its removal."

Increase in Fare Denied in New Jersey.—The Board of Public Utility Commissioners of New Jersey has refused the request of the New Jersey & Pennsylvania Traction Company for permission to substitute a 25-cent fare for the present rate of 15 cents between Trenton and Princeton. About two years ago the board permitted the company to increase the fare from 10 to 15 cents between the terminals with corresponding increases for travel between intervening points. About a year ago the company inaugurated an improved service which, while increasing platform expense, has resulted in an increase of revenue. The board said it had not yet been demonstrated whether this added revenue will not afford the company the additional returns to which it is reasonably entitled.

Municipal Railway Exposition Service Withdrawn.—Fifty crews have been taken from service on the San Francisco (Cal.) Municipal Railway as a result of the closing of the exposition, and the running schedules of six of the eight lines have been cut down to comply with reduced traffic demands. The only line actually discontinued is the "D" blue line route, turning from Van Ness Avenue west in Chestnut Street. The "D" red line cars will continue to run from Van Ness Avenue in Vallejo, Franklin, Union, Steiner, Green-

wich and Scott Streets, returning over the same route. A. J. Cashin, superintendent of the railway, has announced that the "J" line, running from the Ferry out Columbus Avenue to Van Ness Avenue and thence along Chestnut Street to Scott Street, will be continued so long as it will pay operating expenses.

Decrease in Fatal Accidents in New York.—The Public Service Commission for the First District of New York has prepared a summary of the reports of accidents on railroads and street railroads for the month of November, 1915. It shows a total of 5046 accidents against 4726 in November, 1914. The number of serious accidents, however, decreased from 184 in November, 1914, to 134. The fatalities were twenty-two in November of this year against eighteen in November of last year. The total number of passengers injured was 2087 against 1954 in November last year; employees, 896 against 757; all other persons, 374 against 442—a total of persons injured of 3357 against 3153 in the same month last year. Of the total number of accidents, namely, 5046, 3430 took place on surface lines; 1011 on subway and elevated lines; 582 on railroad trunk lines; eighteen on railroad terminal lines, and five on omnibus lines.

Illinois Traction Makes New Agreement.—Negotiations leading to a new two-year contract with its trainmen have been consummated by the Illinois Traction System, Peoria, Ill. Effective on Dec. 1, 1915, a nine-hour minimum day, or 200 miles was fixed for passenger crews. Runs in excess of 200 miles are to be figured at the rate of 22.2 miles per hour, for which 1¼ cents per mile of excess will be paid the first year of the contract and 1½ cents per mile of excess will be paid the second year of the contract. Trainmen in order to obtain any excess pay or be paid on a mileage basis, must run at a speed to exceed 22.2 miles per hour while on duty. In other words, a train crew running 250 miles in ten hours will be paid for ten hours at 33 cents, or 222 miles, and in addition will receive 1¼ cents per mile for the additional 28 miles. In reality, under the new agreement, this gives an increase in the rates paid.

Near-Side Stops in Atlanta.—The traffic ordinance recently passed by the City Council of Atlanta, Ga., prohibits street cars from stopping on the far side of street crossings. This means that in the downtown section, where cars heretofore have been stopping on both the near and far sides of the street, they will hereafter stop only on the near side. The only exception which the ordinance makes to this general rule is that north-bound cars on Peachtree Street shall stop at the northeast corner of Peachtree Street and Edgewood Avenue, and shall not stop on Peachtree Street between Decatur Street and Edgewood Avenue. The ordinance further provides that the north-bound cars on Peachtree Street shall not stop at Walton Street. Where cars turn from one street into another, they will stop at the beginning of the curve, but not at the end of the curve, as they have been accustomed to do in some instances heretofore. The changes are being explained to its patrons by the Georgia Railway & Power Company in advertisements displayed prominently in the local papers in Atlanta.

Report to Commission on Storm Service.—The Public Service Commission for the Second District of New York on Dec. 16 made public the report of Charles R. Barnes, its electric railway inspector, on the manner in which some of the electric railways in Albany and vicinity met the storm of Dec. 13 and 14. The report is complimentary to most of the companies, especially to the United Traction Company, Albany, where the heavier plows and sweepers, ordered by the commission last year, kept the lines open throughout the storm with one or two slight exceptions. Mr. Barnes said that the Schenectady Railway lines, both urban and interurban, were all open to traffic by 9 a. m. on Dec. 14, though some of the service was very irregular. Some of the lines were closed from 4 a. m. to 9 by the drifts. The Albany Southern Railway got its last car through on the night of Dec. 13, but the first car from Hudson on the morning of Dec. 14 did not arrive at Albany until 10 a. m. Mr. Barnes says the Albany Southern Railway used modern and efficient snow-fighting apparatus in reasonable amount. The Hudson Valley Railway kept all its lines open. All of the lines of the Syracuse-Utica division of the New York State Railways were kept open.

Personal Mention

Mr. Bion J. Arnold, Chicago, has been decided upon by the Syracuse Grade Crossing Commission as an expert to examine, criticize and report on the plans adopted by the commission for the elimination of grade crossings in Syracuse, N. Y.

Mr. Clinton L. Rossiter, formerly president of the Brooklyn (N. Y.) Rapid Transit Company, has been elected a director and vice-president of the Underwood Typewriter Company to succeed the late Charles W. Hand. Mr. Rossiter, who has been vice-president of the Brooklyn Trust Company, has resigned as an official of that company, but will continue to serve as a trustee.

Mr. Oliver H. Hughes has resigned as a member of the Public Utilities Commission of Ohio. Mr. Hughes has been a member of the Utilities Commission, or the Railroad Commission, its predecessor, for ten years. He was appointed on the Railroad Commission by Governor Harris in 1905, after he had served about six months as adjutant general as an appointee of Governor Pattison.

Mr. G. B. Powell, superintendent of the employment department of the Louisville (Ky.) Railway, who attended the Panama-Pacific Exposition at San Francisco and visited other cities of the West, is relating his experiences in a continued story in *Trolley Topics*, which is published by the company. Of special interest is his reference frequently to electric railway conditions in the cities he visited and his presentation of the handicaps under which trainmen in these cities work.

Mr. A. W. Brohman has been appointed division superintendent to handle both the Kentucky and the Twenty-fourth and Utah divisions of the United Railroads, San Francisco, Cal., succeeding the late A. J. Reglin on the Twenty-fourth and Utah Division. Mr. Brohman entered street railway work in 1891. His first service was with the North Jersey Street Railway, now included in the system of the Public Service Railway, Newark, N. J., but his main activity has been in San Francisco, where he has risen from the platform to the position that he now holds.

Mr. Thomas Allen Wright, who was elected president of the Pennsylvania Street Railway Association at the recent meeting in Scranton, has been general manager of the

T. A. WRIGHT

Wilkes-Barre & Wyoming Valley Traction Company since 1899 and of the Wilkes-Barre Railway since its lease of the former. Mr. Wright was born in 1863 in Quakertown, Pa., of Quaker parentage. His mother died when Mr. Wright was three years of age. In 1869 he went to Wilkes-Barre with his father. Later he returned to Quakertown and lived on a farm. In 1880 he entered Wyoming Seminary and Business College to study engineering. After he completed his schooling Mr. Wright turned his attention to railroad work and assisted in the survey of the Harvey's Lake Branch Railway at Wilkes-Barre. In 1892 he entered upon the survey of the present street railway system of Wilkes-Barre. In 1897 he was made manager of the maintenance of way department, and two years later was appointed general manager of the entire street railway system at Wilkes-Barre, consisting of nearly 100 miles of track, all of which was surveyed, constructed and brought to its present high standard of excellence under his immediate direction. When local interests in Wilkes-Barre took over the Wilkes-Barre & Wyoming Valley Traction Company in 1910 under the name of the Wilkes-Barre Railway, Mr. Wright was elected vice-president in addition to general manager. In all he has been identified with the upbuilding and development of the Wyoming Valley for more than thirty years.

Mr. O. H. Simonds, the new president of the Mississippi Electric Association, is the manager of the Vicksburg Light & Traction Company. Mr. Simonds was graduated from Cornell University in 1908, and was connected with the Duluth office of the General Electric Company on construction work, and later with the Great Northern Power Company, Duluth. He then went to the Chicago office of the General Electric Company and made a special study of central station design and operation, and later entered the engineering department of Elston, Clifford & Company, Chicago. In April of this year he was appointed general manager of the Vicksburg Light & Traction Company. While in Vicksburg he has devoted considerable interest to work along local civic lines, and last summer he was elected president of the Young Men's Business Club of Vicksburg.

OBITUARY

Jacob Mandelbaum, of the firm of Mandelbaum, Wolf & Lang, Cleveland, Ohio, died in Cleveland on Dec. 16. Through this firm Mr. Mandelbaum was interested in the Western Ohio Railway and a number of other electric railways. He was well known in Cleveland for his philanthropic work. Mr. Mandelbaum was born in Bavaria more than eighty years ago. He had been a resident of Cleveland more than sixty-two years. His family consists of one son, M. J. Mandelbaum, and two daughters.

William C. Andrews, advertising manager of the Edison Storage Battery Company, Orange, N. J., died suddenly in New York on Dec. 21 from an overdose of strychnine taken by mistake. Mr. Andrews was forty-two years old. He was graduated from Columbia University and was an instructor there for a time. He was subsequently connected with the editorial staff of the *ELECTRIC RAILWAY JOURNAL* and later was with the Stanley Electrical Instrument Company, first at Schenectady, N. Y., and then at Harrison, N. J. He is survived by his widow and two children.

Charles D. McKelvey, chief inspector of the railroad division of the Board of Public Utilities Commissioners of New Jersey and for many years superintendent of the New York, Susquehanna & Western Railroad, is dead. Mr. McKelvey was born in Orange County, N. Y., seventy years ago. He entered railroad service as a brakeman. After his retirement from the New York, Susquehanna & Western Railroad he became a member of the finance committee of Paterson, N. J., and still later a member of the Board of Public Works for that city. In 1910 he became connected with the Public Utilities Commission.

Robert Coddington Brewster, connected for many years with the street railways of Philadelphia, Pa., died on Nov. 13, 1915, in his eighty-first year. Mr. Brewster was born in Rahway, N. J., and was prominent in banking and other business circles there for many years. In 1885 he became connected with the banking firm of L. H. Taylor & Company, Philadelphia, Pa., and soon after that was made secretary and treasurer of the Frankford & Southwark Passenger Railway, known as the Fifth and Sixth Streets line. As the Fifth and Sixth Streets line and the other lines with which he was associated were absorbed by the Philadelphia Electric Traction Company, the Union Traction Company and the Philadelphia Rapid Transit Company, Mr. Brewster's services and intimate knowledge of the early history of railroading in Philadelphia continued to be in demand until his voluntary withdrawal from the companies three years ago on account of advancing age.

Calvin G. Goodrich, president of the Twin City Rapid Transit Company, Minneapolis, Minn., and the Duluth-Superior Traction Company and the Duluth (Minn.) Street Railway, died on Dec. 21. He had been connected with the Minneapolis system for thirty-eight years. Mr. Goodrich was born in Oxford, Ohio, on March 12, 1856. When twenty-one years of age, on the invitation of the late Thomas Lowry, long president of the Twin City Rapid Transit Company, Mr. Goodrich entered the service of the Minneapolis Street Railway as auditor, and for a long time he was the only man in the accounting offices. On July 2, 1878, he was elected secretary of the company, and on July 10, 1880, a director. On Aug. 14, 1883, Mr. Goodrich was appointed superintendent of the company, and shortly afterward, general manager. On June 12, 1886, he was elected vice-

president and general manager of the company, resigning the office of secretary. Later, with Mr. Lowry and Mr. Clinton Morrison, he secured control of the St. Paul City Railway, and assumed the management of the property. When the Minneapolis and the St. Paul systems were merged as the Twin City Rapid Transit Company, on June 5, 1891, Mr. Goodrich retained the title of vice-president and general manager of the consolidated company. Later he was elected vice-president and managing director of the company. In March, 1909, after the death of Mr. Lowry he was elected president of the company to succeed Mr. Lowry. Mr. Goodrich was elected president of the American Street & Interurban Railway Association, now the American Electric Railway Association, in 1908, and previously had served as first and second vice-president.

John Graham, formerly connected with the electric railways in Wilkes-Barre, Pa., Bloomington, Ill., and Huntington, W. Va., died at the Johns Hopkins Hospital in Baltimore, Md., on Dec. 15. Mr. Graham was born near Newville, Pa., on Aug. 4, 1843. He was educated in the country schools and at the Eastman Business College at Poughkeepsie, N. Y. He served as a bookkeeper in the First National Bank, Newville, from 1870 to 1876, when he resigned to engage in the tanning business in Newville. In 1882 he was elected to the Pennsylvania Legislature by the Democrats and was re-elected in 1884. Later he became interested in the street railways at Bloomington, Ill. In the fall of 1890 Mr. Graham organized a syndicate which consolidated the electric railways in Wilkes-Barre as the Wilkes-Barre & Wyoming Valley Traction Company. He was manager of this company until the sale of the property in 1899 to the United Power & Transportation Company. He again became interested in the properties at Bloomington, but disposed of his interests there in 1902 and secured control of the Camden Interstate Railway at Huntington, W. Va. He disposed of this road to the Ohio Valley Electric Railway in 1906. In 1908 and 1909 Mr. Graham assisted in organizing the Cumberland Railway, Carlisle, Pa. He was the first president of this company and at the time of his death was a director of the company.

W. W. Cole, of Cole, Ives & Davison, New York, died suddenly on Dec. 20 at Poughkeepsie, N. Y., after conferring with Mr. H. M. Beugler, operating manager of the Central Hudson Gas & Electric Company. Mr. Cole was widely known in electric railway and electric lighting circles as an engineer and operator. He was born in Medford, Mass., and was graduated from the Worcester Polytechnic Institute in 1887. He began his career as construction engineer for George H. Norman, Boston, and the New England Construction Company. Subsequently Mr. Cole became connected with the Toledo, St. Louis & Kansas City Railroad as construction engineer. Mr. Cole next entered the expert course of the Thomson-Houston Company at Lynn, Mass., and was superintendent of electrical installation of the Allston division of the West End Street Railway, Boston, Mass. After completing this work Mr. Cole became manager of the Utica (N. Y.) Belt Line. From Utica he went to Elmira in 1893 and constructed the West Side Railroad there. He was personally interested in the consolidation of all the utilities in Elmira and became vice-president and general manager of the Elmira Water, Light & Railroad Company. On account of the increase in his consulting practice Mr. Cole resigned from the company at Elmira in 1908 to become general manager of the public utilities department of Dodge & Day, Philadelphia. For a long while Mr. Cole was located at Oil City, Pa., for Dodge & Day, with the Oil City Traction Company. In March, 1914, he resigned from Dodge & Day to open an office for himself in New York as an independent consulting engineer. In February of this year the firm of Cole, Ives & Davidson was formed to give special attention to public utility problems of all kinds. Mr. Cole was the first president of the Empire State Gas & Electric Association, being elected in 1905. He was also second vice-president of the New York Street Railway Association in 1894 and was first vice-president of the association in 1895 and 1896. He was treasurer of the association for three years from 1903 and was secretary and treasurer of the association for two years from 1903. Mr. Cole was forty-eight years old. He is survived by his widow and two sons.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

FRANCHISES

Mattoon, Ill.—The Decatur, Sullivan & Mattoon Traction Company has asked the Council for a new franchise to extend from Dec. 3, 1915, to Dec. 3, 1920, the old one having expired. This is a proposed line to connect Sullivan, Decatur and Mattoon. The project has been suspended until the close of the European war. [Nov. 28, '14.]

Peoria, Ill.—The Peoria & Chillicothe Electric Railway has asked the Council for a franchise in Peoria.

Chicopee Falls, Mass.—The Springfield Street Railway has received a franchise from the Council to construct tracks on Church Street and Broadway.

Tonawanda, N. Y.—The Council of Tonawanda has granted the Frontier Electric Railway a number of amendments to its franchise. Under the changes the company will not have to pay 2½ per cent on the revenue derived from switching charges in Tonawanda, nor will it have to maintain more than one station should it have a passenger service through Tonawanda. The Aldermen granted the company an extension of time in which to begin the construction of the new road to Dec. 31, 1916, and for the completion of the line until Dec. 31, 1919.

Cincinnati, Ohio.—The Cincinnati, Newport & Covington Street Railway will again ask the Council for a franchise for its loop in Cincinnati some time next spring, according to an announcement recently made. It has been operating for some time without a franchise.

Pittsburgh, Pa.—Twenty-one ordinances granting new franchises to the Pittsburgh Railways and looking to the establishment of a system of transfers from all lines to a loop between North Avenue and the Court House have been introduced in City Council.

Dallas, Tex.—The Dallas Standard Traction Company has asked the Council for a franchise to construct a line through Mount Auburn to Parkview Place, both additions recently opened to Dallas.

San Angelo, Tex.—The City Commissioners of San Angelo have declared the franchise of the San Angelo Power & Street Railway void because of the company's failure to construct extensions as called for.

TRACK AND ROADWAY

Edmonton (Alta.) Power Company, Ltd.—This company is planning to build a solid concrete dam, 1500 ft. long and 100 ft. high, on the Saskatchewan River, above Rocky Rapids, making an artificial lake about 60 square miles in area. This development will cost approximately \$6,000,000, not including an electric railway, which, as a separate scheme, will be built from Edmonton to the proposed power site.

Municipal Railways of San Francisco, San Francisco, Cal.—The contract for the construction of a section of the Church Street municipal railway between Eighteenth and Twenty-second Streets has been awarded by the Board of Public Works to the Contra Costa Construction Company for \$120,500. Bids are being received for the construction of two more units of the Church Street line, one extending from Sixteenth to Eighteenth Street and one from Twenty-second to Thirtieth Street.

Connecticut Company, New Haven, Conn.—Plans are being made by the North End Improvement Association of Waterbury to petition the Connecticut Company to extend its line to Pearsallville.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—Many changes in the track of the Wilmington & Philadelphia Traction Company in various parts of Wilmington are now being made by the company, either to connect the tracks of the old Peoples Railway with the Wilmington & Philadelphia Traction Company system or to provide a means of maintaining the schedule in a more effective manner.

Clearwater, Fla.—Surveys have been made for an electric railway from Tampa to Clearwater on the west coast, about 30 miles. A bridge consisting of 160-ft. steel draw span and about 2 miles of wood approaches will be built in connection with the line. E. W. Parker, Curry Building, Clearwater, is interested. [July 31, '15.]

Fairburn & Atlanta Railway & Electric Company, Fairburn, Ga.—At a recent meeting of the stockholders of this company it was decided that electric cars be substituted for the present motor cars, the change to be made at the earliest possible moment.

Hawkinsville & Florida Southern Railway, Macon, Ga.—Operation has been begun with a gasoline-electric car on this company's line between Hawkinsville and Camilla. The steam train will continue for the present without change.

Illinois Traction System, Peoria, Ill.—This company has recently placed in service four small cabin type mechanical interlocking plants on the division between Springfield, Ill., and St. Louis, Mo. These plants vary in size from eight to twelve levers and are for the control of traffic at crossings of the main line of the Illinois Traction System, with switch tracks leading from the Wabash and Chicago & Northwestern Railroads to coal mines. The contract for the material and installation was let to the Union Switch & Signal Company.

Springfield (Ill.) Consolidated Railway.—It is reported that this company is considering the extension of its line east to Bergen Park.

Kankakee & Urbana Traction Company, Urbana, Ill.—The contract for the construction of a 90-ft. span north of Ludlow on this company's line has been awarded to the Central State Bridge Company of Indianapolis.

Des Moines (Iowa) City Railway.—In connection with the rehabilitation of its city lines, this company has announced that it will construct an 11-mile extension of its Colfax line to Newton. New interurban lines are also planned to Indianola, Winterest, Red Oak and eventually to Omaha through a territory not now served by any railroad.

Cumberland & Manchester Railroad, Barbourville, Ky.—It is reported that A. B. Furnish, Mount Vernon, has received a contract to complete the grading on a section of this company's line which is being built between Barbourville and Manchester. The Read Construction Company, Philadelphia and Hazelton, has the general contract. [Dec. 11, '15.]

Rockland, South Thomaston & St. George Railway, St. George, Me.—This company states that it will build 1 mile of new track during 1916.

Springfield (Mass.) Street Railway.—Operation has been begun by this company on its new East Street line into Chicopee Falls.

Albion-Charlotte Northern Railway, Lansing, Mich.—Construction will be begun in the spring on this company's line from Albion to Lansing. The company will use a roadbed made twenty years ago for a railroad between Albion and Charlotte. The proposed route will pass through some of the richest farming country in Michigan, most of which is not served by any railway. Among the places through which it will pass are Brookfield, Charlotte, Potterville and Grand Ledge. It will also be tributary to the region around Duck Lake, a summer resort 10 miles north of Albion. Arthur B. Wood, Coruna, president. [Dec. 12, '14.]

Duluth (Minn.) Street Railway.—This company reports that during 1916 it expects to build 4 miles of new track.

Meridian Light & Railway Company, Meridian, Miss.—This company expects to build about 1¼ miles of new track during 1916.

Kansas City & Tiffany Springs Railway, Kansas City, Mo.—A report from this company, which was incorporated in November, states that surveys are being made and rights-of-way being secured for its proposed line between Kansas City and Tiffany Springs. Construction will be begun early in the spring of 1916 and it is expected that about 2½ miles will be in operation by summer. An amusement park will be established by the company at Tiffany Springs. The company may build a power plant at Tiffany Springs later, and the repair shops will be located at North Kansas City,

Mo. Willard E. Winner, Kansas City, will receive the contract for constructing the line. The officers are as follows: H. G. Pert, president; J. N. Baird, secretary; Charles J. Smith, treasurer, and W. M. Spratt, chief engineer. The offices of the company are located at 310 Dwight Building, Kansas City, Mo. [Nov. 13, '15.]

Municipal Railway, Brooklyn, N. Y.—Information has been received by the Queens Chamber of Commerce from the Public Service Commission for the First District of New York that the engineering plans for the construction of the subway under the East River at Sixtieth Street are practically completed, and it is expected that the advertising for bids will be started shortly after Jan. 1.

Buffalo & Depew Railway, Buffalo, N. Y.—This company reports that during 1916 it expects to build 2 miles or 2½ miles of new line.

International Railway, Buffalo, N. Y.—New double tracks have been laid on Bailey Avenue between Winspear and Kensington Avenues, Buffalo, by this company, and the Kensington car line is now routed through this street. A one-car stub line was formerly operated in this section to handle the traffic during the morning and late afternoon. A new steel bridge has been placed over Ellicott Creek in Tonawanda, by the company, replacing the wooden structure that has been used for years. During the few days the bridge was being moved into place, passengers on the Buffalo & Niagara Falls and Buffalo, Tonawanda and Gratiwick interurban lines were transferred from car to car over the waterway by automobiles over the regular vehicle bridge. The bridge connects Tonawanda and North Tonawanda.

Interborough Rapid Transit Company, New York, N. Y.—The Public Service Commission for the First District of New York has approved this company's plans for the construction of an extension of its Third Avenue elevated line from near its terminus to Gun Hill Road. The extension will leave the existing line a little south of its present terminus at Bronx Park, and will turn up Webster Avenue to Gun Hill Road, about 1½ miles south of Yonkers, where it will effect a junction with the new White Plains Road elevated line which extends almost to Mount Vernon. It is expected that the line will be in operation by the end of 1917.

Goldsboro (N. C.) Street Railway.—This company expects to build 1 mile of new track during 1916.

***Kansas-Oklahoma Electric Company, Caney, Okla.**—Plans are being considered by this company to build a line between Caney and Dewey, where connection would be made with the Bartlesville Interurban Railway. Col. S. M. Porter, Caney, is interested.

Sarnia (Ont.) Street Railway.—This company expects to build ½ mile of new line during 1916.

Northampton Traction Company, Easton, Pa.—This company, which has been merged with the Bangor & Portland Traction Company, as noted elsewhere in this issue, plans to construct a new line from Wind Gap to the Delaware Water Gap. The new line will connect at Stroudsburg with the Stroudsburg Passenger Railway, which it is said will be absorbed, and will be built through Kellersville to Saylor's Lake, thence to Saylor's Lake and Wind Gap. Saylor's Lake will be purchased and turned into a summer resort. It is expected that construction of the line will be begun by June 1.

Philadelphia, Pa.—The contract for the structural steel to be used in the extension of the elevated railway on Frankford Avenue between Unity and Dyre Streets, will be awarded to the American Bridge Company, the lowest bidder, for \$249,000.

West Penn Traction Company, Pittsburgh, Pa.—Surveys are being made by this company for the extension of its lines in the Butler district. It is expected that the lines will be extended to the McFetridge coal mines, 7 miles north of Butler.

Scranton & Binghamton Railroad, Scranton, Pa.—This company reports that its 10-mile extension to Montrose will be completed and placed in operation about July 1, 1916. During the next year the company expects to build about 20 miles of track between Heart Lake, New Milford and Hallstead.

Montreal (Que.) Tramways.—This company will begin work at once on the construction of an extension of its line on Park Avenue from Van Horne Avenue to Atlantic Avenue.

Three Rivers (Que.) Traction Company.—Operation has been begun by the Three Rivers Traction Company, a subsidiary of the Shawinigan Water & Power Company, on its new 3-mile line in Three Rivers. Plans are being made to construct a 5-mile extension to Cap de la Madeleine in the spring. Thomas McDougall, president. [Oct. 9, '15.]

Dallas (Tex.) Consolidated Electric Street Railway.—Paving and reconstruction of tracks and roadbed on Commerce Street from Houston & Texas Railroad to Exposition Avenue, will be begun by Jan. 1, involving an outlay of \$70,000.

Northern Texas Traction Company, Fort Worth, Tex.—In accordance with requirements made by the city of Polytechnic, the Northern Texas Traction Company is moving its tracks on Nashville Street from Vickery Boulevard to Avenue E and on Avenue E to Annis Street from the side to the middle of the street. Much double track also will be installed on Nashville Street. The line already has been double-tracked on Vickery Boulevard.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—A report from this company states that during 1916 it expects to build 10 miles of line between Provo, Springville and Spanish Fork.

***Leavenworth, Wash.**—It is reported that preliminary surveys have been made and a part of the right-of-way secured for a railway from Leavenworth to Icle, 25 miles. A. Van Eppes, Leavenworth, is interested.

Grafton Light & Power Company, Grafton, W. Va.—This company reports that during 1916 it will construct 1 mile of new line.

Charleston-Dunbar Traction Company, Charleston, W. Va.—During 1916 this company expects to build 20 miles of new line.

Morgantown & Wheeling Railway, Morgantown, W. Va.—This company reports that it expects to build 7.45 miles of new interurban line from Price to Blacksville during 1916.

Green Bay & Eastern Railway, Manitowoc, Wis.—This company reports that the engineering work for the construction of its line from Green Bay to Sheboygan via Manitowoc is now being arranged and it is expected that work will be begun early in the spring. The following officers have been elected: William M. Willinger, Manitowoc, president; George Frosch, Wayside, vice-president; Rude Stockinger, Manitowoc, secretary, and Charles Frazier, Manitowoc, treasurer. [Dec. 11, '15.]

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—This company's station on Santa Monica Boulevard, near Sixth Street, Sawtelle, is being moved to make way for the new McClellan brick business block upon which construction has begun. The old station will occupy a site at the northwest corner of the grounds. The railway offices will have space in a building just east of the postoffice until the new business block is completed, when new quarters will be found for it in the McClellan structure.

Boston, Mass.—The contract for laying 1760 sq. yd. of terrazzo finish on walls of South Station of the Dorchester Tunnel has been awarded by the Boston Transit Commission to Galassi Mosaic & Tile Company, Boston, at \$8,160.

Metropolitan Street Railway, Kansas City, Mo.—Bids will be received by this company until Jan. 1 for the construction of a shelter station at Twenty-third and Main Streets. The structure will be 12 ft. x 44 ft., of Bedford limestone and tile roof.

Lincoln (Neb.) Traction Company.—The contract for the construction of this company's ten-story terminal building at Lincoln has been awarded to the Selden Breck Construction Company, St. Louis, at \$500,000.

Brantford & Hamilton Electric Railway, Hamilton, Ont.—Arrangements are practically completed for the erection of a union radial station in Brantford, to be used jointly by the Brantford & Hamilton Electric Railway and the Lake Erie & Northern Railway. It will be a brick structure, costing approximately \$30,000.

Manufactures and Supplies

ROLLING STOCK

Central Railroad of Oregon, Union, Ore., expects to purchase during 1916 one closed motor car.

Chattanooga (Tenn.) Traction Company expects to purchase during 1916 two double end combination express and passenger cars, also one work car.

London & Port Stanley Railway, London, Ont., expects to purchase during 1916 three trail cars and one motor car, equipped with four 125-hp., 1500-volt motors, for its new electrified line.

Des Moines (Iowa) City Railway, which was mentioned last week as being in the market for forty cars, has not yet placed its order for these cars, but will probably do so in the near future.

Pittsburgh (Pa.) Railways, noted in the ELECTRIC RAILWAY JOURNAL of Nov. 21 as having ordered seventy-five steel city cars from the Cincinnati Car Company, has increased this order to 100 cars.

Inter-Urban Railway, Des Moines, Iowa, has purchased a 60-ton electric locomotive, the mechanical equipment and construction of which will be done by the McGuire-Cummings Manufacturing Company. The electrical equipment, which includes 165-hp., 600-1200-volt motors and control, will be furnished by the Westinghouse Electric & Manufacturing Company.

Louisville (Ky.) Railway is rebuilding one of its old open cars in its shops into a closed car, with exit door at the front and entrance and exit doors at the rear, the bulkheads at the ends being removed altogether. There will be no platforms front or back and the conductor will stand in the car at the rear and the motorman in a railed-off portion at the front. It is stated that if the experiment proves a success, probably the remainder of these old cars will be similarly remodeled.

TRADE NOTES

Hensley Trolley & Manufacturing Company, Detroit, Mich., has recently doubled the capacity of its factory and office accommodations. This company reports that several large companies have recently adopted as standard the Hensley hollow-hub type of wheel.

Root Spring Scraper Company, Kalamazoo, Mich., has just finished delivering to the Michigan Railways its No. 3 air-operated snow scraper equipment for eighteen large high-speed cars. These are being mounted directly on the trucks. When this installation is completed every car on the Michigan United Railway and the Michigan Railway will be equipped with Root snow scrapers.

Barney & Smith Car Company, Dayton, Ohio, on December 15 lifted its receivership. Through the issuance of debenture notes to the amount of \$600,000 the company was able to straighten out its affairs in a manner satisfactory to the court. In his application for discharge Receiver H. M. Estabrook stated that 67½ per cent of the claims of unsecured creditors had been paid. It is stated that there are sufficient orders on hand and work under way to meet all debts and obligations. The organization will remain as it was before the receiver took charge in June, 1913. The plan of reorganization announced some months ago has been abandoned.

St. Louis Railway Supply Company, St. Louis, Mo., will be reorganized at once into a new company under Joseph C. Reed as president. Mr. Reed was formerly a director of the Shapleigh Hardware Company. W. D. Achuff, vice-president, and Ephron Catlin, Jr., secretary and treasurer of the Southern Company, will have similar positions with the new company. The new company, the name of which has not yet been determined, in addition to carrying in stock a full line of miscellaneous supplies for railroads, mines, mills and industrial corporations, will specialize and represent exclusively in the Southwestern territory such well-known firms as the Buda Company, the E. F. Houghton Company, and the Verona Tool Works. It also has the exclusive sales agency in the United States for the Saunders corrugated car stopper.

ADVERTISING LITERATURE

Salomon Brothers & Hutzler, New York, N. Y., have issued a 64-page pamphlet showing a number of short term securities, of various classes, arranged according to maturities and indexed alphabetically. A detailed description is published for each issue.

Lisbon Falls Manufacturing Company, Boston, Mass., has issued a folder illustrating the "Economy" snow remover, a horse-driven device said to be used by some of the largest street railways in the New England States, for removing snow from city or town streets.

George H. Davis of Ford, Bacon & Davis, engineers, New York, N. Y., has issued a reprint of an address entitled "Economic Advantages Resulting from Port Development," delivered before the League of American Municipalities on Sept. 28, 1915, and an address entitled "Business Opportunities of Louisiana and Adjacent States" delivered before the College of Commerce and Business Administration of the Tulane University of Louisiana on Oct. 29, 1915.

Ohmer Fare Register Company, Dayton, Ohio, has issued a bulletin entitled "An Element of Success," describing its fare register system, which quotes statements of commendation from the Inter-Urban Railway, Des Moines, Iowa, and the Southern Public Utilities Company, Charlotte, N. C., in regard to its system. The bulletin also reproduces some figures taken from the merit record grades of conductors on the Denver Tramways and the Chicago & West Towns Railway, illustrating the consistent improvement in efficiency shown.

NEW PUBLICATIONS

Thirty-Third Annual Report of the New York Electric Railway Association.—Published by the Association from the Office of the Secretary, Schenectady, N. Y.; 246 pages.

The thirty-third annual report of the New York Electric Railway Association, or that for the fiscal year ending June 30, 1915, is issued in the same attractive form and regard for typographical appearance which have characterized previous reports of the association during recent years. The association meets twice during the year, one its annual convention, which was held this year at Manhattan Beach, on June 29-30, and the "quarterly" meeting which was held this year at Lake George on March 3. The reports of both meetings are published, and both will warrant reading, even by those who were in attendance at the convention, because the questions considered were all live topics of the day, and the New York association has the ability to attract to its meetings men who have something worth while to say.

Railway Maintenance Engineering. By William H. Sellew, A.S.M.E. D. Van Nostrand Company, New York. 360 pages. \$2.50.

This book presents the subject from the viewpoint of the student, but is of a sufficiently advanced character to be of reference value to steam and, to some extent, to electric interurban railway engineers. The contents were prepared from notes used by the author in his classroom lectures at the University of Michigan. Information concerning major bridges, yards and terminals is not included because the author believed these subjects were so important as to require special treatment. As indicated by the title, the subject matter is treated largely from a maintenance standpoint with a view to studying improvement of existing lines of railways. The scope of the work is shown by the following chapter headings: Engineering; land; grading; bridges, trestles and culverts; ties; rails; other track material; ballast; maintaining track and right-of-way; station and roadway buildings; water stations; fuel stations; shops and engine houses; icing stations; signals and interlockers. Each chapter is followed by a bibliography of the author's references.

The traffic department records of the Puget Sound Traction, Light & Power Company, Seattle, Wash., show that at the present time there are 130 traimen on the payrolls of the company who have been in this company's service for ten years or longer. This is exclusive of the employees in other lines of work who have been ten years or more with the company.

An Excellent Motor

Box frame type. For medium city or light, moderate speed interurban service.

Embodies all of the desirable features known to the art—pressed steel gear case, effective ventilation, “through bolts”, axle dust guards, minimum weight, combined with maximum capacity and great mechanical durability. Built to stand the severity of service where frequent starts and stops are made.

Rail Bonds

Electric Weld and Copper Weld

Portable Combination Plant
For Electric and Copper Welding

Electric Weld

THE well known Welded Rail Bonds as manufactured by The Electric Railway Improvement Company have been on the market for the last ten years.

After a careful investigation of the service this type of bond has given, the Westinghouse Company came to the conclusion that they should be added to their list of railway supplies.

Our salesmen in your locality will be pleased to discuss this method of bonding with you.

FRICTION

(Its relation to efficient brake control
of moving trains)

FRICTION IS A RETARDING FORCE IN SOCIETY, POLITICS, BUSINESS AND RELIGION.

BUT FRICTION REPRESENTS A CURIOUS PARADOX IN THE VARIOUS FIELDS OF ENGINEERING AND MECHANICS. IT IS AT ONCE ESSENTIAL TO EFFICIENCY AND OPPOSED TO IT. PRACTICALLY ALL APPLICATIONS OF POWER DEPEND FINALLY UPON FRICTION; ALSO ALL POWER APPLICATIONS ARE SUBJECT TO SERIOUS LOSSES DUE TO FRICTION.

A RAILROAD TRAIN IS PECULIAR IN THAT WHILE ACCELERATION—THE HAULING CAPACITY OR TRACTIVE EFFORT OF THE LOCOMOTIVE—DEPENDS FUNDAMENTALLY UPON FRICTION—(WHEEL—RAIL); DECELERATION—BRAKE CONTROL OF ALL TRAIN MOVEMENT—ALSO DEPENDS FUNDAMENTALLY UPON FRICTION (WHEEL—SHOE).

ON THE ONE HAND WE HAVE HEAVY TRAINS AT HIGH SPEEDS REPRESENTING UNBELIEVABLE TOTALS OF FOOT TONS OF ENERGY; ON THE OTHER HAND WE HAVE, TO CONTROL THIS MOVING MASS, THE FRICTION OF A FEW SQUARE INCHES OF BRAKE SHOE IN CONTACT WITH A ROTATING WHEEL.

BRAKE SHOE FRICTION AND TRAIN RETARDATION RESULTING THEREFROM VARY WITH LEVERAGE, PRESSURE, TEMPERATURE, DURATION OF CONTACT, LOCATION OF BRAKE SHOE ON WHEEL, BRAKE MECHANISM DESIGN INVOLVING ABILITY TO ALTERNATE AND GRADUATE BRAKING POWER ON THE TRAIN, AND A HUNDRED OTHER FACTORS WHICH ENTER INTO THIS MOST COMPLEX AND INVOLVED BRANCH OF AIR BRAKE ENGINEERING.

AIR BRAKE ENGINEERING IS MAINLY CONCERNED WITH THE FLEXIBLE, RELIABLE AND EFFECTIVE APPLICATION OF FRICTION TO PROPERLY CONTROL ALL TRAFFIC MOVEMENT BY RAIL.

PUBLISHER'S PAGE

Buy, Boom and Use Advertised Products Because :

[1]

Advertising is a sign of good faith whereby the promise is irrevocably set before the eyes of the buying world.

[2]

Advertising is a symbol of progressive methods that recognize the sound business sense of "satisfaction first."

[3]

Advertising conserves the buyer's time by acquainting him with a product at his leisure, long before the buying need arises.

[4]

Advertising is useful only to those who have a message of genuine service to tell.

[5]

Advertising is a bond of fair dealing, for only a promise performed can justify the cost of a promise published.

[6]

Advertised statements bear the stamp of authority from those responsible for the conduct of the organization whose signature is published.

[7]

Advertising is an economy and cuts the cost of selling, making lower prices or better goods possible without sacrifice of the producer's profits.

[8]

Advertisers are almost invariably the most successful business men in their industry, and success in business is inseparable from service rendered.

[9]

Advertising in a given field is evidence of a well-founded belief in ability to serve it.

[10]

Advertising can long prove profitable only to producers of meritorious products.

In succeeding issues, we plan briefly to discuss the buyers' interests in connection with advertised products under each of the headings outlined above.

O-B Lock Hangers and Extruded Ears In Cuba

A particularly fine piece of construction in the Island Republic makes use of these two O-B Specialties that are giving universal satisfaction.

O-B Lock Hanger eliminates the loose joint between Hanger and Ear at "A". Gives a better job than the old style Hanger and requires no more of the lineman's time.

O-B Extruded Ears are easy to install and have long life. The method of manufacture of Extruded Metal imparts to it those physical properties long desired for trolley ears—ductility and toughness.

O-B Catalog No. 14 gives full details.

Patch Bituminous Asphalt with a KOEHRING HOT MIXER

Cuts patching costs

Write for *authoritative* figures to prove the economy

—cuts your costs way below your best possible figures in remelting and remixing by stationary plant, or having the work done under contract—and this means a cut, *not* in remelting and remixing costs *alone*, but in the *total cost of ripping up, remixing and relaying old material.*

Besides think of the flexibility of this smaller unit. Haul it from job to job behind a car, use trolley power.

Give this cost-saving hot mixer a *hearing*, especially on its cost-cutting claims for patch work.

800 square yards per day, new 2 inch material.

That's what this mixer can do per day with new 2 inch bituminous material.

Also mixes concrete,—disconnection of asphalt tank and blower and connection of water tank turns it into concrete mixer with capacity of 180 square street yards *per hour.*

Write for cost figures of electric railways which are using this mixer—and remember, its costs-saving justifies its use even if you have a stationary plant.

KOEHRING MACHINE CO.
MILWAUKEE, WIS.

Re-melting and Re-mixing Old Asphalt

Here's What "Electric Service" Signals Are Doing

Direct View of "Electric Service" Signal on the Terre Haute, Indianapolis & Eastern Traction Co. Lines

The Terre Haute, Indianapolis and Eastern Traction Company on December 14th, 1914, placed in service one block of "Electric Service" Automatic Block Signals. To and including April 30th, 1915, they recorded 16078 car movements with but 13 failures—an efficiency of 99.919 per cent, counting all failures.

Of these 13 failures, 3 were traceable to the Signal Department, 3 were traceable to blown fuses, 6 were traceable to defective apparatus, 1 traceable to miscellaneous trouble.

Omitting the 3 failures each traceable to Signal Department and blown fuses, counting only the remaining 7, gives these "Electric Service" Signals an efficiency of 99.956 per cent—a truly remarkable showing.

A letter under date of May 26th from the company reads as follows:

"I am enclosing herewith a report of the operation of the Reliable Signals installed on our Crawfordsville Division, between Junction and Crawfordsville.

"This report is for a period of five months. The signals were put in service December 14, 1914, and taking everything into consid-

eration, I believe that this is a pretty good showing. Judging from the performance in March and April, I believe that the longer the signals are in use the more familiar our men will be with them, and no doubt prevent, so far as practicable, avoidable failures.

"It is my opinion that the failures charged to signals not clearing when trains left block may in some cases have been due to train switching in Crawfordsville while regular train was in the block."

Complete copy of this report will gladly be sent to interested parties on request.

Why not take up your signalling problems with us now and let us prove just what the use of "Electric Service" Signals will mean to you?

Building up a guard rail with the Prest-O-Lite welding outfit. This simple operation obviates expensive disorganization of traffic and loss of time that replacing by any other method would require.

This motor frame was made good as new with the same welding outfit that was used for line work in the picture to the left. The arm was welded on, at trifling expense compared to any other method of repairing.

PREST-O-LITE

Dissolved Acetylene makes the Oxy-Acetylene Process of greater utility in railway work

It enables every electric railway, large or small, to enjoy *every* economy of time, labor and materials that only this process of joining or cutting metals gives. Prest-O-Lite makes good welding or cutting equipment a general purpose outfit, instead of a single purpose machine, with added capabilities, added efficiency and increase in quality of work done.

Enables you to use the same outfit for Rail Bonding and for Shop Repairs

The applications of oxy-acetylene welding are almost unlimited. New uses and added savings are being found daily. You can make immediate savings on damaged or worn equipment, avoid costly breakdowns, expensive delays and replacements by "on the spot" welding repairs. The apparatus being portable, can be taken to the job—dismantling of heavy equipment is unnecessary. Welding equipment pays for itself many times over when used for repair work alone. It is a good investment as "stand by" equipment. But the same outfit can be used to equal advantage in the yard and on the line.

No other method of rail bonding approaches the oxy-acetylene process for ensuring a contact which will not be reduced in efficiency by time and service. Thousands have been applied to new and existing track at a minimum expense and with no disorganization of traffic. The outfit stands at the side of the track.

Then, too, there are times when twenty minutes' use of an oxy-acetylene cutting blowpipe will prevent tie-ups which would be unavoidable by any other method of clearing the track.

Back Your Acetylene Supply by Permanent Service

Prest-O-Lite Acetylene Service furnishes the highest grade of Dissolved Acetylene in portable cylinders, used as conveniently as you use cylinders of oxygen. Saves the large initial outlay and heavy depreciation, trouble and inconvenience of making crude Acetylene in carbide generators. Besides, Prest-O-Lite Dissolved Acetylene is perfectly dried, cleaned and purified—makes better welds and is cheaper to use.

Ask us for information on Oxy-Acetylene Welding and Cutting in the electric railway field, and full details of Prest-O-Lite Acetylene service. Your name on the margin of this page will do.

 Construction

It's Tough Trolley Wire

When you specify trolley wire—be sure you ask for “Phono-Electric”.

“Phono-Electric” is the best wire for keeping down maintenance costs and—that’s just what you want in an over-head wire.

The increased demand for better rolling stock and better roadbeds as well as faster schedules makes it imperative that a saving in over-head costs be maintained.

“Phono-Electric” is tough and will save you money—it will give more car mileage and longer service life.

E. R. J.

The Hundred Eyes of Fabled Argus

and the fifty heads of Briareus are literally at your command when you engage our staff of specialists to concentrate their experience on one or more of your engineering or chemical difficulties. We have already set forth in separate advertisements the various fields in which we can help you to operate your properties with greater safety at less expense, but

Our Diverse Activities in Power and Railway Consultation

may be summarized by outlining our services for each department. To co-operate with your power engineer we have specialists in fuel, water, and general equipment. For your distribution and line engineer, we have specialists in bonding, electrolysis, choice of wires and cables, insulators and insulation, etc. For your way engineer we have specialists in rails, structural material, timber and timber preservation. For your car equipment engineer, we have specialists in everything from castings and bearing composition to motors, conduit, paint and varnish. But despite this high degree of specialization, our individual chemists and engineers are checked from making decisions which might unduly favor their specialty by a system of teamwork and records that brings to bear on any single problem the broad, united experiences of all. When to this practice is added the condition that we have absolutely no commercial interest at stake other than to please you, the utility of our service calls for no further argument.

Rollway Bearings in Interurban Service

They Conserve
Energy

They Save
Lubrication

They prolong equipment life

- ☐ Above is shown a car equipped with Rollway Bearings in daily service between Syracuse and Rochester, N. Y.
- ☐ Tests show that Rollway Bearings effect a current saving over plain journals ranging from 15% to 20%. Lubrication costs are reduced because of minimized friction and the oil-tight, dust-proof design of the bearings. The wear on wheels, track and car is minimized.
- ☐ Rollway Bearings can be applied to any type of car. Write for all the facts. Better still, write and arrange to test a set in service.

The Railway Roller Bearing Co.

SYRACUSE, N. Y.

Rollway Bearings for Journals and Motors

Automatic Recording of Car Movements

THE instant a car enters the block, it automatically records on this sheet its entry to that block, and the exact time at which it entered. The sheet then records automatically the length of time the car remains in the block and records the time of its entry to the next block.

With this continuous graphic train sheet, as utilized in

The Simmen System

the dispatcher has before him, every instant, the location of every car on the division, and that location is visualized to him. He has literally a moving picture of the movements of every car on the road all the time, a permanent record of the time of entry to every block, and a permanent record of the length of time each block is occupied.

By means of interlocked control levers on his table, the dispatcher controls continuous cab signals in every car on the division. These signals positively indicate the dispatcher's orders to each motorman, and are so placed in the cab that the motorman MUST see them. By consulting his record sheet, the dispatcher can see the location of every car, and if he desires to change the signals given to any of them, he can do so by simply turning one of his control levers. This combination provides

SAFE OPERATION and greatly increases FACILITY OF OPERATION.

The value of this permanent record sheet does not by any means end with its value to the dispatcher in moving cars safely and expeditiously. It forms a permanent document of the highest value for improving schedules, and for fixing individual responsibility under all circumstances.

The indication of the records cannot be questioned, as they are automatically made by the movement of the cars themselves.

Automatic recording of car movements is only one of the interesting features of the Simmen System. This system presents a flexibility which enables it to meet varying conditions of traffic from those encountered on the light traffic interurban road to those found in the heavy traffic subways.

*May we tell you how we can meet **your** conditions?*

Simmen Automatic Railway Signal Co.

1575 Niagara Street, Buffalo, N. Y.

The Old Way

The New Way

Finigan Says:

I submit views of our old and new style of protecting single-track lines; view 1 is of the old type of hand-throw signal used, having to entirely depend upon crew to operate Signal, which caused a certain amount of delay and a chance of running past signal.

On our new installation of the United States Automatic Electric Signals we have done away with that certain amount of delay and the chances.

These signals are used to protect about a mile of single track, with a turn-out about half way, over which two different railways operate a line of cars, each road using the turn-out as a meeting-point.

Under old conditions when one line would run late it would naturally delay the other line, but under the present conditions these delays have been done away with.

In December, 1914, 2 sets of the United States Automatic Electric Signals were installed on this line and have been operating successfully up to the present.

Yours respectfully,

Chas. Finigan, Line Foreman

Westchester Electric
Railroad Company

Let us **SERVE** you first—afterward we hope to sell you, because if we can gain your confidence you will **WANT** to buy from us.

Every engineer has individual problems—problems of gaining power, of cutting down waste—problems that need all his experience and knowledge in the solving. The H. W. Johns-Manville Company, through its organization of experts and its vast army of representatives, is constantly in touch with thousands of such individual problems and is constantly helping electrical engineers and central station managers by suggestions and recommendations leading to greater efficiency in their work.

When a J-M salesman calls on you, give him a chance. Perhaps there is a question in the back of your mind that you have not quite found the answer for. Perhaps Johns-Manville Service answered that question for an engineer a thousand miles away from you. If so, the answer is for you, too. Put it up to the J-M salesman, and if he has not got the answer at the time, he'll get it. For that is J-M Service—to serve first, sell afterward.

Your installation crew will move along three times as fast when they work with J-M Fibre Conduit

Every time they nipple up a length—five feet of duct is finished, with an airtight joint made in a trice.

They will work quicker and easier too, because of the lightness of this conduit; nor can they break it easily when it gets thrown around, as it often does.

J-M Fibre Conduit answers every underground conduit requirement, electrical or mechanical. It can be used generally all over the underground system in Generating Stations, Sub-Stations, back of Switchboards, on Feeders and on Signal Systems.

Why not use it on your system?

Pacific Light & Power Co., Los Angeles, Cal., installing J-M Fibre Conduit

Every "Noark" Subway Box you order is subjected to an internal hydraulic test of 15 lbs. per sq. inch

This is the severest ordeal to which a cast iron box can be subjected.

You will note that not only is the box water-tight from the outside, but is also air-tight from the inside.

Doesn't this argue well for its manhole efficiency; for protection of your feeders, subfeeders and other cables—against seepage and subterranean gases?

When you install "Noark" Subway Boxes you are using a box with a big factor of safety—a box that is electrically and mechanically perfect, from the nuts that hold down the cover to the slate base on which the copper is mounted.

The copper in "Noark" Subway Boxes is ample and well assembled. All contacts are carefully ground. The line is complete, embracing every network and distribution condition.

Write for literature on both these products.

Your Own

ELECTRIC RAILWAY JOURNAL

The advantages of being a personal subscriber for the Journal are these:

You receive your own copy of the paper each week.

You have it to read when you want it and as long as you want it.

You can keep your own file of the paper for reference.

If you are **not** a regular subscriber, you probably see the Journal from time to time.

But there are times—and many of them—when you want to read the latest issue, and some one else has it.

There are many other times when you want to refer to an article in a back number, but cannot find that number.

For less than six cents a week

you can be a personal subscriber—you can get all the news of the field while it is still fresh and valuable—you can have copies when you want them.

You will never miss the subscription price, but you miss a lot of things when you do not have **your own** copy of the Journal every week.

**Better send
your order

City Officials Approve T-Rail

When the Paving is Protected by

NELSONVILLE Filler and Stretcher Brick

T-Rail construction in cities was given a bad name by the failures of paving due to the use of "nose-brick." The economical T-Rail was barred out of many municipalities on this account.

Now the T-Rail is **welcomed**—when paving is protected by Nelsonville Filler and Stretcher Brick.

Over a thousand miles of our brick are in use in American and Canadian cities. Officials of one hundred and twenty-five cities are prepared to show you how Nelsonville Filler and Stretcher Brick has given them better paving and fewer repairs.

The old-fashioned method of using "nose-brick" with T-Rail resulted in breaking up the paving slab between the rails. The "nose-brick" projected beneath the ball of the rail and were literally "pried-up" by rail vibration.

Compare the diagram above with such construction.

The economies of "Nelsonville" T-Rail construction—both in **lower first cost** and **decreased maintenance** are considerable.

Write for the **data**.

Stop Building Perishable Track

Make your road a highway of steel in every sense of the word. The steel rails should rest on a foundation of steel. They should not go down on ties that begin to rot soon after they are buried. Put them on

International Steel Twin Ties

They are a permanent addition to your road values. They do not have to be pulled up every little while for replacement, interfering with schedules, increasing maintenance cost, "de-stabilizing" your whole system.

All that is necessary to see why roads throughout the country are making International Steel Twin Ties part of their standard equipment is to try the ties on a section of your track, or ask your neighbor for results obtained with the International Steel Twin Ties.

Creeping and spreading of the rails are virtually unknown with these steel Ties.

Tie rods are dispensed with. Gauge spacers are unnecessary. Unskilled labor can take care of the installation.

And the first cost in paved street construction is less than wooden tie construction.

We will be pleased to furnish an estimate of cost, together with working plans of different types of construction now in use.

Write us for the facts.

The Ohmer System

Let us analyze your troubles and we will show you a way out. If you even suspect that your local conditions are capable of improvement let us give you our expert opinion. You will be under absolutely no obligation to us. We are anxious to meet new problems for our own good as well as yours. We have met and overcome so many for our clients and others that we are confident of our ability to solve yours. Will you let us try?

Ohmer Fare Register Company
Dayton, Ohio

HARD TIMES, JITNEYS, WARS—don't let these things get on your nerves. Tighten up the leaks and stick to methods which are *absolutely safe* in matters of finance.

THE OHMER SYSTEM for making fare collections safe is a fare protection certainty. It has made good under the most adverse conditions. New applications are being made of it continually.

It is a *standard* method. It is a *successful* method.

It is a *safe* method.

The benefits to be derived from it are the result of our years of experience. We are specialists in such matters and stand ready to serve you.

For better accounting and greater economy

the Lincoln (Neb.) Traction Company changed from paper to metal tickets. The register illustrated and described below was especially designed by us for them to meet the new conditions and all their cars are thus equipped.

INTERNATIONAL COMBINED COIN, METAL TICKET AND TRANSFER REGISTER, TYPE C24

THE Type C24 register is adapted for use on single end and center entrance prepayment cars. Cash Fares and Tickets are received in the one hopper of the machine and are automatically registered on separate dials. But one crank is used for operation. Transfers are received by the conductor and registered by him on a separate dial of the same machine. Bells of three differing tones also give audible indication of the class of fare registered. The three trips reset to zero by the one operation of the resetting knob.

THIS machine gives the decided advantages of one compact, simple device combining all three functions, performing them easily, quickly and economically, at the same time, giving the conductor greater freedom for attention to other duties.

Consistent with their cost, the price has been kept at the lowest possible figure. The savings attained will cover their cost in a very short time. We can demonstrate that your revenue can be increased by the use of some of the various types of our Coin counting registers. We seek an opportunity to prove our claims. If, from the many types we now manufacture, we fail to meet your requirements, we shall be glad to investigate conditions and design a machine that will.

ECONOMY METERS

BUILT LIKE A WATCH

Type of Sangamo Economy Meter producing net saving of more than \$12,000 per year for one interurban road.

There is every reason to expect, however, that maintenance charges for the present year will show a substantial decrease over those of 1914, and this can largely be attributed to the use of meters.

EFFECT ON VOLTAGE REGULATION

One other interesting fact was brought out, and that was that the voltage at the car was far better as a result of using power only when necessary. Obviously, this is equivalent to increased trolley-wire cross-section, especially where full voltage is necessary to make the scheduled time. In 1914 the limited trains could not maintain schedule time just south of Milwaukee, due both to an exceedingly severe schedule and to the fact that they had a number of meeting points where the power distribution also was not very good. This year, with the same schedule and all other conditions the same, there has been a marked absence of delays. This is attributed principally to the fact that while the motormen are still unable to coast to any great extent, the heavy drafts of current are less continuous which results in more voltage at the car.

From Electric Railway Journal, May 22, 1915.

Better Voltage

One prominent high-speed road installed Sangamo Economy Car Meters primarily to reduce energy consumption—and gained a net annual return of more than \$12,000 on an investment of one-fifth of this amount.

Lower energy consumption per car mile was but one of the several benefits.

In addition, many other maintenance economies and schedule improvements were accomplished by means of the Economy meters.

Another improvement, that of *higher average voltage*, is described above. Note that this was accomplished with the same power equipment and the same schedule, but because *Economy Meter Service* had smoothed out the demand peaks, it was easier for the motormen to meet the schedule requirements.

Let us supply you with interesting data and a copy of Bulletin 416, giving complete details.

You—Who Specify

It's a hard road you've got to travel these days—that of holding down expenses when nearly every cost item keeps climbing steadily upwards.

You're trying earnestly to select equipment and material for your road that will prove really economical—work long and work well. We realize how many problems of this kind come up to you and how difficult some of them are to solve the right way.

We've studied one of them thoroughly—that of trolley equipment. We've worked on it for years. The outcome is the development and perfection of a new type of trolley wheel and harp that we know will simplify your trouble along this line. The

V-K OILLESS TROLLEY WHEEL and NON-ARCING HARP

is not only more economical in operation—saving power, material, labor and renewals—but it is more efficient as well. You are spared worry and assured of the most improved trolley service possible to obtain.

In the V-K OILLESS TROLLEY WHEEL you have a practical, reliable, efficient self-lubricating wheel. Once installed you've no further expense for attention or lubrication. And it lasts longer, provides greater conductivity, saves the wire, eliminates the harm that dripping oil or grease from the bearings of other wheels causes to the car roof, besides keeping shopmen off it.

With the V-K NON-ARCING HARP you get a harp in which all wear on the pin-hole is impossible. You know that such wear is the commonest of all reasons for having to replace harps. Its patented gripping device locks the pin firmly and solidly in its socket—preventing looseness and arcing. It furnishes the best form of contact yet devised.

Just compare these points about the V-K equipment with any other type. We believe you'll see where and how it can help you.

Send for our new illustrated catalog. It contains full information on sizes, styles, etc., covering our whole line of wheels and harps.

The Wonderful Single Service Chilled Iron Car Wheel

THE economy in the use of the Chilled Iron Car Wheel for street railway service is recognized. In 90 out of 100 cities in the United States and Canada operating 100 cars or over the chilled iron wheel is the standard.

The reasons are:

- 1st. Chilled iron wheels will give a larger mileage per unit of wheel cost.
- 2nd. Chilled iron wheels have the advantage in interest charges, both in wheel and shop investment.
- 3rd. Chilled iron wheels are much more economical in brake shoe consumption,—in wear and tear on the track and power requirements.

The Wonderful Single Service Chilled Iron Car Wheel

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS
1214 McCormick Building, Chicago

Representing forty-eight wheel foundries throughout the United States and Canada.
Capacity 20,000 Chilled Iron Wheels per day.

The STANDARD for RUBBER INSULATION

Railway Feed Wires insulated with OKONITE are unequalled for flexibility, durability, and efficiency, and are in use by the leading Electric Street Railway Companies. OKONITE is preferred above any other insulation for Car Wiring, Telegraph and Telephone Purposes.

OKONITE WIRES—OKONITE TAPE—

Dossert & Company

H. B. LOGAN, President, 242 West 41st Street, N. Y.

Little things these—but vital to your line

A weak strain insulator—a faulty hanger—a defective splicing ear—may cause a lot of trouble at a most inconvenient moment. Big responsibilities rest on these “little” details of overhead construction. The selection of materials—the painstaking care and skill devoted to design and construction—the scrupulous inspection—that goes into the production of Macallen overhead specialties is in every way commensurate with the importance of the work these “little things” must do.

***The least detail of the
Macallen Line is of the
First Importance***

The Macallen Company
Macallen and Foundry Sts., Boston

This Crossing Is Safe

It is Positively Guarded

by a barrier that cannot be ignored and a warning bell which clangs out the coming of the car.

Prevention of accidents is here practically assured by the

Cook Automatic Signal Gate

At night there are the flashing red light and the illuminated semaphore.

Claims for damages weaken, when the "Cook" looms as a convincing witness.

Don't you think you ought to investigate? Do it at once—before the heavy traffic (both car and highway) of the summer season sets in.

You cannot afford to let those crossings go unprotected during this season of straw rides, joy rides, etc.

The Cook Railway Signal Co.
1793 South Broadway, Denver, Colo.

The "teeth of friction" can't bite if you lubricate with—

There's only one way to get perfect lubrication, and that way is to eliminate the "teeth of friction" the minute imperfections which, in even the most highly finished bearing surfaces show, under microscope, like hills and dales. Oils or plain grease are only transitory lubricants, subject to the whims of load, pressure, climatic and other conditions. Flake graphite, unlike oil or plain grease, is not squeezed out by pressure, and unlike other forms of graphite, does not remain suspended in oil, and is therefore not floated away. Pressure forces flake graphite upon the tiny projections—"the teeth of friction"—the flakes become pinned and form over the surface a most marvelous veneer-like coating, unctuous and wonderfully smooth. Dixon's Flake Graphite will improve the efficiency of the oil or grease that you are using. Thousands of expert engineers all over the world have proven this to *their* satisfaction. Why not write for sample No. 108-C and prove it to *your own*?

Made in Jersey City, N. J., by the

Modern Practice

EMPLOYED by many progressive railway companies regardless of mileage.

The Reciprocating Track Grinder is used by more than fifty roads—from the largest to some of the very small properties. This shows one of many in use in Greater New York.

Write us for opinions of users.

Railway Track-work Co., Philadelphia

The Thew Gasoline Shovel—

Ideal for Excavating New Lines or Grading Interurban Roadbeds

Type O Thew Gasoline Shovel— $\frac{3}{4}$ -yard Dipper.

IN instances such as these, when power cables are not already strung or the source of fuel is far removed, the Thew Gasoline Shovel is ideal.

It has all the advantages of standard Thew Shovels; is strictly a one man machine; consumes only 20 to 30 cents worth of gasoline per hour; requires no licensed operator; avoids expense of hauling coal and inconvenience of this kind of firing; is economical in use of water; can later be changed to an electric shovel if desired, by substituting an electric motor and equipment instead of the gasoline engine, and has many other advantages.

These are explained in a special gasoline shovel circular which will be sent upon request.

Sign and Mail or Use for Memorandum

The THEW Automatic Shovel Co., Lorain, O.

Send me special gasoline shovel circular with any other interesting data about gasoline shovel as advertised in Electric Railway Journal.

PATENTS PENDING

IT WILL KEEP THE VOLTAGE IN THE LIGHTING CIRCUITS WITHIN 7% VARIATION EVEN WHEN LINE VOLTAGE FLUCTUATES FROM 650 TO 300 VOLTS.

You do not have to make any important car wiring changes.

The Regulator itself is simple in character and requires

no attention after installation, except a yearly change of small contacts.

Acquaint yourself at once with the Watson. Full information will be sent you at your request.

If desirous of knowing cost of installing the Regulator on your cars, send us wiring diagrams and voltage and amperage of headlight.

Thos. S. Watson Company, Milwaukee, Wis.

*It happened on
a Curve!*

But the

PARMENTER WHEEL GUARD Saved Him

Make your cars ready for any emergency. When rounding curves fenders project out on a tangent leaving the front wheels exposed—careless pedestrians often stumble on curves. Be ready for the emergency.

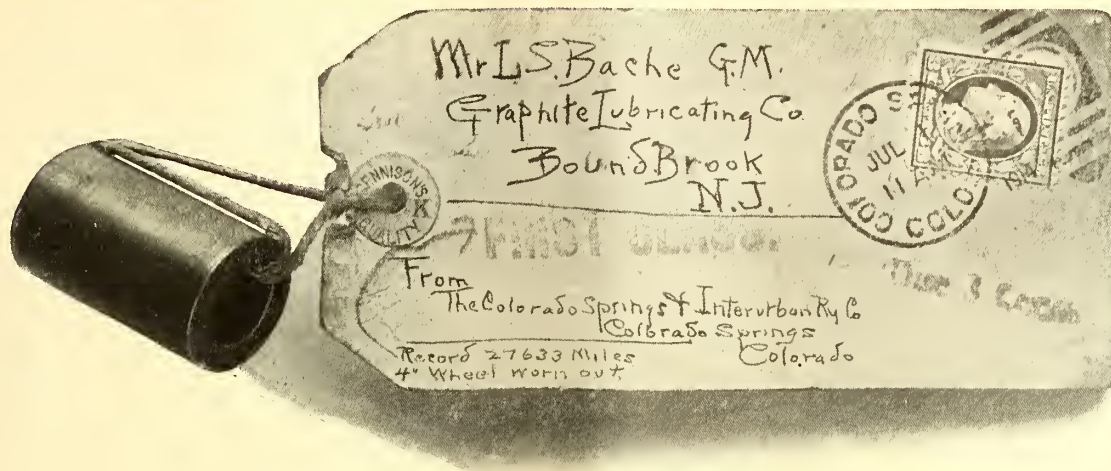

Parmenter Fenders and Wheel Guards do great "team-work." On curves and at all times the wheel guard furnishes that final perfection in safety which

every street railway needs. Anybody who gets by the fender is protected *positively* from the wheels. Your claim agent will welcome the advent of this combination.

Parmenter Fenders are called the "four-way" safeguard. The latest model is locked against the dangerous rebound action. *Write for the interesting details of this new model Parmenter.*

Parmenter Fender & Wheel Guard Co.

Commutator Wear Reduced 90%

Undue friction between brushes and commutator means wear, cutting, heating, sparking. The result is big maintenance expense and loss of power.

"No Spark" Carbon Brushes

make brush contacts practically frictionless. They reduce commutator repairs enough to pay for brushes several times over. They run the machine noiselessly and at highest efficiency without sparking. "No Spark" brushes carry more load than any other brush on the market, are permanently self-lubricating, are moisture proof and will not chip, split or break.

Write our engineering department and let them show you the way to permanent brush-satisfaction and brush economy. Ask for a sample of the kind you can use.

Calebaugh Self-Lubricating Carbon Co.

1502 Columbia Ave., Phila., Pa.

This method of suspension

is used on Chillingworth cases wherever motor requirements permit.

Experience has proved that this type of suspension is immune to vibration and its consequent evils.

Chillingworth cases are Seamless and Rivetless.

"VD & D" GEARS AND PINIONS

Strength That Wears Well

Men and gears are alike in this, that some can lift a tremendous weight, but cannot carry any load very far—that's strength minus; while some can carry a load indefinitely, but cannot lift much of a weight—that's endurance minus.

A few men can do both; they are all-round men. A few gears have both strength and endurance; they are Van Dorn & Dutton Gears.

Traction service demands all-round gears, gears that stand up both under sudden strain and under long steady grind.

Here are two "V D & D" grades that are meeting these conditions today wherever operating efficiency is found.

Grade HARDENED—with the emphasis on wear.

Grade TREATED—with the emphasis on strength.

Write for our treatise on "A Feature of Lowest Operating and Maintenance Cost."

This Problem Solved Like a Thousand Others

Owing to changes in the plant, it was necessary to shorten this 7600-lb. cast-iron steam-turbine connection, or to replace it by a new casting costing about \$300, and requiring about 25 days to make and deliver.

There was only one way to shorten the casting.

An 18-in. section was cut from the connection and the flange welded into place so exactly that the three flange surfaces fitted perfectly when the casting was replaced in the line.

Oxwelding solved this problem at a fraction of the time and expense required to obtain a new casting of the correct size. This job represents but one of the unlimited applications of

The OXWELD PROCESS

to repair problems of every description in the electric railway field.

Oxweld equipment can be used to reclaim broken castings and forgings from the scrap pile—to repair track work or apply bonds out on the line—to a thousand and one money and time-saving uses in shop work and maintenance.

Flange Welded on Shortened Connection and the 18-in. Section That Was Removed

We have prepared a series of bulletins giving valuable information on the Oxweld Process. They will be sent free on request. Send for them today—Bulletins Series 700.

The "K-I" Splicing Sleeve

This well known device is now manufactured in improved design, in various sizes for all types of trolley wire. An effective and permanent splice is easily and quickly made, requiring only the insertion of two small tempered steel wedges into the sleeve. No soldering.

Making Compromise Joints Over Night

3 men can make 6 joints in 10 hours

We have an inexpensive outfit that will enable you to make your own compromise joints at a great deal lower cost than the mechanical or cast joint, and make them in a jiffy.

The Thermit fully welded compromise joint will give perfect electrical conductivity and stand up under the most severe traffic.

You can end your compromise joint troubles by installing a Thermit Outfit for this work.

In the event of your ordering an outfit, we will be pleased to have one of our representatives call and give the necessary instructions.

Full information is given in our pamphlet No. 3932

Wherever There Are Steam Plants

you'll find that Dearborn Feed Water Treat-
ment is saving money and trouble for the
steam plant operators—year after year.

Our customers are numbered by thousands
—we analyze over 8000 samples of feed water
annually—and prepare treatment for the spe-
cial conditions at each plant, that prevents the
trouble caused by the boiler water, whether it
be scale, corrosion, pitting or foaming.

No matter in what section you may be lo-
cated, we have a satisfied user in your vicinity
—we know we can prepare treatment that
will end your boiler troubles.

Send us a gallon of your feed water—we
will analyze and let you know the cost of
proper effective treatment.

You'll save enough in repairs to more than
pay for the treatment.

Manufacturing Sites for Lease with Building and Electric Power

At Boonton, New Jersey, 30 miles from Hoboken.

Twenty acres of ideal factory sites for lease in lots as desired on attractive terms. Several buildings ready for occupancy. Served by the main line of the D. L. & W. Railroad, with sidings on the property. The Rockaway River and the Morris & Essex Canal bound the property on two sides.

Electrical power available at low rates from Jersey Corporation, whose power station is located on the site. This Company already supplies power to many plants in vicinity. Labor conditions ideal. The Boonton Board of Trade will co-operate with owners to provide attractive houses for workmen and their families.

For particulars regarding these ideal manufacturing conditions, inquire of W. S. Barstow & Company, Inc., Engineers and Managers, 50 Pine Street, New York, N. Y.

Marketing Scrap

In an issue of this paper an official of a large light and railway company said:

"Some means of interchanging information about materials on hand would be desirable. One company might use a certain type of car or line equipment and have on hand a large supply of extra parts, which while perfectly good, would become useless, and if it were possible to interchange information with another company using the parts in question, many dollars which are now lost would be saved. Nearly everyone familiar with storeroom accounting can recall thousands of dollars which might have been saved if proper means had been adopted."

THE Searchlight Section of the ELECTRIC RAILWAY JOURNAL offers a market place for just such an interchange of information as mentioned above. Machinery or supplies that have outlived their usefulness, or are no longer standard with one company are often just what another company requires, and if advertised in the Searchlight Section of the JOURNAL the exchange could be made at very slight cost.

Better look over your stock and send us a list of what you have on hand but for which you have no immediate use. The Searchlight Section can help you whether you are looking for a market, a man or a job.

Get your wants into the Searchlight

READY-REFERENCE INDEX

to products manufactured by advertisers in this issue of Electric Railway Journal

Over 300 different products are here listed.
The Alphabetical Index (see eighth page following) gives the page number of each advertisement.

As far as possible advertisements are so arranged that those relating to the same kind of equipment or apparatus will be found together.

This ready-reference index is up to date, changes being made each week.

If you don't find listed in these pages any product of which you desire the name of the maker, write or wire Electric Railway Journal, and we will promptly furnish the information.

Weston

Model 45 D. C. Portable Ammeters and Voltmeters

Designed to meet the demand for a medium-priced Ammeter and Voltmeter. They are guaranteed to be of sufficient accuracy (one per cent) for general testing in electric power plants, or for outdoor work.

They are shielded from the influence of external magnetic fields, the movement and magnetic system being enclosed in an iron case permanently mounted in a handsome wooden carrying-box with hinged cover.

The scale has a mirror over which the knife-edge pointer travels. Readings can be made within 1/10 of a division at any part of the scale.

In mechanical and electrical workmanship the Weston Model 45 Portable Ammeters and Voltmeters practically attain perfection.

A full description will be found in Bulletin 501, which will be mailed to you on request.

See That Winding?

Well, it's about the most rugged combination of insulation and wire ever created for standing up against motor temperature conditions. It's

Deltabeston Magnet Wire

Just a word will do about the wire itself. It's a pure lake copper, drawn accurately to gauge.

But it's the insulation we want to call your attention to. It's made of pure asbestos and a high temperature filler. The asbestos meets the demands of all over-load temperatures. The filler is a special impregnating compound which gives it the electrical insulating "back-bone."

Your motor can't burn out with Deltabeston. Up-hill or sudden starts don't make any difference.

Suppose you get the facts—today. It definitely means dollars and cents to you.

Overloads are Sure to Come but
Some Burnouts can be Prevented
by the Use of

ARMALAC

Overloads are sure to come to your car motors—and to your power station generators and rotaries, too. Doubtless you have had some expensive burnouts in the past. Why not take a tip from the experience of many other big central stations and treat all your armatures, large and small, with *Armamac*. A thorough armalacking, properly done, will make a big difference in a year's upkeep costs. Write for data and learn why.

Showing destruction of Levee Road caused by flood.

Upper illustration shows another section of same road after the flood.

Levee Road at Middletown, O. Brick pavement filled with Barrett's Paving Pitch in 1892.

An Extraordinary Test

Twenty-three years ago this road at Middletown, O., was paved with brick and filled with Barrett's Paving Pitch.

Recently a section of the road was damaged by flood and this gave an opportunity to observe carefully the condition of the Paving Pitch.

It still clung tightly to the bricks that were washed away. Samples of it were taken and found to be in exactly as good condition chemically as when new. In fact, if it were practicable to scrape or melt it off the bricks it could be used over again today in a new

pavement and would undoubtedly give perfect satisfaction for another twenty-three years.

Pitch is wonderful in its absolute immunity to the action of water. It ranks with gold and copper in its resisting power against the elements.

Service considered, it is the least expensive filler known and the easiest to apply. It maintains a perfect seal against the intrusion of water and frost. It eliminates the ancient expansion problem, for it makes every joint an expansion joint.

Booklets free on request. Address our nearest office.

Niles Car & Mfg. Co.

NILES, OHIO

This is a "single end" interurban car with exceptionally light and strong steel underframe, steel and Flexolith floor, steel plate side girders below windows, but with oak posts bolted between angles riveted to the side girders.

Passenger doors and steps are at right side of rear vestibule only. Opposite side of vestibule is fitted with a seat.

Front vestibule has a folding door on left side for receiving a limited amount of baggage and folding sashes for motorman on right side.

Heater is enclosed in a cabinet next to the toilet room.

If interested, let us tell you more about this car.

THE CINCINNATI CAR COMPANY

WORKS:

WINTON PLACE
CINCINNATI, OHIO

Sure-Built Cars

There is no guesswork to a "Jones-built" electric railway car.

The workmanship, practice and material are those which have been found best by experience.

—The experience of seventy-six years.

The founder of our company began to build cars with a single business principle—to build only cars which represented good value at a prudent purchase price.

"JONES-BUILT" CARS

are just the same today as they were in the olden days. They're all quality. Good materials. Good workmanship. Convenience. Durability. Smooth running. Minimum maintenance.

We invite inquiries.

The Method of Packing a Journal

leaves an impress on the lubrication cost sheet. If it's improperly packed the best of lubricants can never right the wrong.

By working with the car house men Galena experts get them into the habit of properly packing journals.

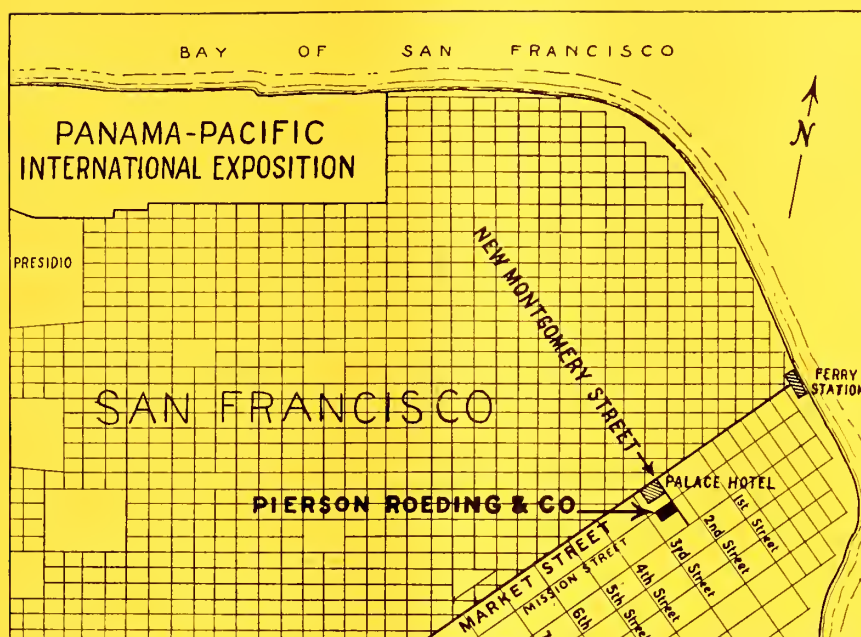

Then by using Galena oils the cost goes down to bed-rock.

We guarantee the saving.

GALENA SIGNAL OIL COMPANY

Franklin, Pa.

INVITATION

THIS map of the northeastern section of San Francisco shows the location of the Exposition Grounds in relation to the business district along Market Street. The well-known and conspicuous Market Street landmark, the Palace Hotel, is in the heart of the busiest part of the city and is at the corner of New Montgomery Street, where but a block east will be found the main offices of our Pacific Coast Agents, Messrs. Pierson, Roeding & Company. The offices are on the ground floor of the Rialto Building, 118-130 New Montgomery Street—corner of Mission Street. All Railway Officials from abroad and from all parts of this country who will attend the Exposition during the year, are cordially invited to visit the offices and are requested to ask for Mr. H. R. Noack, President, Mr. Thomas Finigan, Vice-President, and Mr. F. A. Richards, Manager Car Dept.

63 G-E Locomotives on the New York Central

Eight years ago thirty-five 115-ton G-E Locomotives, designed to haul 535-ton trains at 60 miles per hour, were placed in service.

Today, 63 G-E Locomotives are used in this electrification. The illustration shows the latest type placed in passenger service. The total weight of 125 tons is on the driving-wheels and the locomotive can haul 1200-ton trains at 60 miles an hour.

One phase of G-E electrification progress is indicated in the above figures—an increase of 124 per cent in train weight successfully operated by locomotives weighing only 9 per cent more than the original type.

desire.

Joe's Christmas Gift to the General Manager

"Certainly an impressive sight, Joe," said the General Manager early Christmas Eve, as he gazed spellbound upon the seething mass of holiday shoppers crowding the streets below, and the endless chain of traffic threading its way through the merry throngs. "A marked contrast to the service we could extend to the public before we equipped all our cars with Westinghouse modern motors and good old 'HL' Control, and used 'train operation' for these heavy traffic swings."

"Looks good to me, too, Boss," replied Joe, grinning happily. "I sure am proud of those equipments. Everything on the Main Street and Grand Ave. Lines is a two-car 'HL' train, and the Traffic Manager just told me over the 'phone that they can easily handle the bunch—that every car is out, and that everything is moving as smooth as silk."

"A splendid report for Christmas Eve, my boy," said the General Manager. "You couldn't have presented me with a more welcome Christmas gift, and I'm sure that happy crowd down there would like to tell you the same thing."

"Featherweight"

Straight Air Brake with Emergency Feature

Economical Features

- 1—Low First Cost
- 2—Light Weight
- 3—Small Current Consumption
- 4—Low Maintenance
- 5—Long Life

Meets all requirements of city and suburban service where moderate speeds prevail. Possesses the flexibility of the simple, straight air brake in service application and release.

Carries the automatic, instant-acting, full-pressure features of the standard automatic air brake in emergencies.

Whether used normally on a single motor car, or on a two-car motor and trailer train during rush hours, it is equally effective and reliable, and retains at all times the integrity of its various characteristic features.

When each car is fitted with a conductor's application valve, the emergency brake may be applied by the conductor from any point in either car or on the car platforms.

Likewise, pressure escaping from the emergency pipe line, due to pipe breakage, hose rupture, or hose separation, will automatically cause an emergency application of the brake.

High speed suburban and interurban trains of three cars or more, whose more intensive service requires higher power and control, should be fitted with the corresponding type of Westinghouse standard automatic air brakes.

The specially exacting service of elevated, subway and electrified steam road divisions is admirably met by the Westinghouse electro-pneumatic brake.

Our engineering and inspection force of practical, "firing line" men is maintained at considerable expense to assist our patrons in working out all air brake problems of operation and maintenance.

These experts are yours. Use them.

The first of three 30,000 KW. Cross-Compound Turbo-Generator Units
for the Interboro Rapid Transit Co., New York City

The Most Economical Turbine

Since placed in operation the 18th of December, 1914, this turbine has been carrying loads up to 32,000 KW., and has established a record for ruggedness and reliability. As determined by accurate tests made by the purchaser, the economy of this turbine has never been equaled. Two duplicate units have since been placed in service, and their operation has borne out the record made by the first.

Some Misconceptions Regarding Advertising in the Electric Railway Field

IT is one of the fundamental laws of the action of the human mind that when a subject is suggested to us we think of it first and most clearly in that particular aspect of the subject which is most familiar to us.

For instance when we speak of war, the average mind thinks of great masses of men in uniform, marching regiments, military bands, and waving flags, the outward and familiar display of military preparation.

Comparatively few think of the questions of transportation, commissary, ammunition, communication, and the many other vital things which are of such supreme importance in warfare.

In the same way, when we speak of advertising, the average man thinks of the great dominating advertising campaigns, of which he sees the evidence every day, which are directed to the general public and which stare at him from the pages of his magazine, or daily newspaper, spring at him from every corner billboard, or command his attention as he rides on the street car.

From such a conception the average man gains the idea that this kind of activity, and this only, is advertising.

A Much Abused Phrase

IT is from such misconception of advertising that we get the timeworn and much overworked phrase which attempts an all-inclusive definition of advertising by saying that it is the art of "keeping your name before the public"—a phrase frequently used even by sellers of commodities in which there is no appeal to the general public whatsoever.

There is no sense in this epigrammatical definition as it stands, anyhow, because a name by itself alone means nothing. It is only as it identifies the thing for which it stands that a name means anything or has any use.

What sense would there be in John Smith & Company "keeping their name before the public," if they did not connect with that action a clear understanding of the commodity they have for sale, and its value to the buyer?

What this much overworked and much misunderstood phrase really means, then, is to keep your name before the public in connection with information as to the commodities or products for which that name stands.

In the second place, the public is an all-inclusive term, unless you qualify it. It means the *whole* public, which, of course, includes men, women and children, lawyers, doctors, clerks, farmers, teamsters, and persons in any and every other line of occupation, who make up the public.

What sense would there be in keeping before "the public" the name of the manufacturer of a Concrete Mixer, or a Hoisting Engine, or an Electric Railway Controller, or a specially designed machine for the reducing and refining processes used in manufacturing plants?

And yet manufacturers of these very commodities do, apparently without much thought, consider advertising purely from the standpoint of "keeping their name before the public."

The Dominant Minority

OF course, what they mean when they say this, is keeping their name, in connection with the *merits* of their commodities, before *their* public, that is, before the comparatively small number of persons in the *whole* public who might be interested in their products, or have a controlling or contributing influence in the purchase of such products.

This distinction, of course, is one of fundamental importance, and yet it is a question whether such a manufacturer as we have cited, in using the term, is generally conscious that he is making this distinction.

To many persons this discussion may seem theoretical and far-fetched, but, from such misconceptions and misunderstandings of the purposes and functions of advertising, spring many of the abuses of advertising, and many of the disappointments and failures in the use of advertising.

The seller who, consciously or unconsciously, thinks of advertising only in the form and expression in which he is most familiar with it in campaigns to the general public, is very likely to think that all there is to advertising is the use of "clever catch phrases and pretty pictures."

That these have their place for certain kinds of advertising is unquestionably true. The trouble is that they are often *misplaced*.

And the root of the trouble is that it is not understood generally that every advertising campaign, no matter how small or large, is an *individual* and distinctive problem, and to be most profitable and successful must be handled on individual and distinctive lines.

Every Problem Is Different

THE kind of advertising which will induce a housewife to demand a cake of soap by name is not always, or even rarely the kind of advertising which will lead an engineer to determine whether a certain machine is the one he wants to specify for a special purpose.

Again, from this misconception of the application and use of advertising (particularly in the fields of sale of special commodities, appealing only to special classes of buyers), there arises the obsession, which possesses the minds of so many manufacturers, that if they put their name in connection with their commodity in some place or position where it may be constantly seen by the possible buyers in their field, that they are using advertising in an efficient way. In other words, that keeping their name and their commodity before the public is the aim and end of all advertising.

Many a manufacturer is obsessed with the idea that if he places his *business card* in some reference book, or directory, or periodical, where it may be *looked for* by the prospective purchaser who is looking for his kind of commodities, that he is thus doing for himself all that can be done in the way of advertising.

He may have a product, the advantages of which would require hours of personal argument on the part of an expert salesman to demonstrate to the buyer, yet he fails to see the opportunities which exist for him in the *proper use of advertising* for doing this demonstration work.

Successful advertisers almost universally utilize advertising for its *educational* value. They use it in *advance* of actual demand.

They utilize advertising not merely to let a man already in the market know where he may obtain a given product, but to *convince him beforehand*, that when he is in the market, they have the product which will give him the service for which he is seeking.

They use it not merely to let the buyer know where he may get a thing that he *knows he wants*, but to convince him, *before* he arrives at that stage, that they have the thing which he needs and should use.

Creative Advertising

SUCH advertising is educational. It is suggestive. It is creative. It supplies information. It purchases confidence in advance. It induces the buyer in advance to favor the product advertised. It directs and largely influences demand.

It does not wait, nor depend, upon an *inquiry* from the man in the market, but it *creates* a market by convincing the buyer in advance that he needs the commodity offered.

Such advertisers "tell their story" from every possible angle of appeal and interest. They *put themselves in the place of their possible buyer*. They point out to that possible buyer the special conditions which he may have to meet, which will make their product particularly valuable for *his* service.

They do not *await* demand, they *create* it.

They do not merely *supply* the market, they *make* a market.

This is the kind of advertising which is of service and profit, not only to the advertiser, but also to the purchaser.

It is the kind of advertising for which Electric Railway Journal Service stands.

For any seller of products or service which have or may create a market in the Electric Railway field, this kind of advertising, through Electric Railway Journal Service, offers one of the most efficient, powerful and certain methods for the profitable development of business.

O-B Catcher (Pat. App'd For)

O-B Retriever (Patented)

O-B Trolley Catchers and Retrievers are Trouble Eliminators

You can put either of these devices on your cars and then forget about it; there will be no further cause for worry. Special attention to the details of design and manufacture guarantee successful operation under the most severe conditions. The mechanism is simple and efficient.

Try at Our Expense

We will gladly send a Catcher or Retriever for service trial on your road.

Put it on a car, give it some rough treatment and see how it does its work.

If you are not satisfied, return it at our expense.

It costs you nothing to investigate.

THE OHIO BRASS CO.
Mansfield, Ohio

Get the Outside Viewpoint on the Inside of Your Power House

Consider lubrication. It's a far-reaching subject. Under your present system, its cost-reduction may be impossible because the men are **too close to the proposition** to see any weak points. The application of the **outside viewpoint** is why

Galena Oils and Galena Service

combined, reduce lubricating costs. We come to you with a contract—it **guarantees** to reduce your lubrication cost 10%

below what you are now paying for other oils.

We don't work against your men. We work **with them**.

Why not get the details of our cost-cutting co-operation?

Galena-Signal Oil Co.

Franklin, Pa.

Do You PERMIT this?

The conductor has thrown the signal and he is looking to make sure that he has **correctly** thrown it.

He is probably a careful conductor.

But **all** conductors aren't so careful.

Looking-again-to-make-sure takes time—causes delays whether the conductor is careful or not.

Why should he be forced to leave his car anyway?

United States Electric Signals take the responsibility of **making sure** out of human hands.

Safety is automatic.

Do you **PERMIT** the safety of cars and passengers to rest entirely on the good (or poor) judgment of the conductor?

It costs **LESS** to let U. S. Electric Signals take care of safety

—and schedules.

United States Electric Signal Company

West Newton, Massachusetts

Foreign Representatives:

Forest City Electric Services Supply Co., Salford, England

As specialists in door and step control, we use special tools to attain the highest degree of accuracy and reliability.

Here are a few examples:

The faces of NATIONAL pneumatic engine castings are ground off perfectly on a horizontal carborundum grinder.

The castings of NATIONAL pneumatic engines are broached by a tool which gives the accurate bore of a rifle barrel.

Broaching a National Pneumatic Engine

Our Automatic Oscillating Valve Grinder does perfect work

The valves of NATIONAL pneumatic equipments are placed on an oscillating grinder which grinds every valve with an unvarying exactness impossible in hand operation.

These are but a few reasons why you should correspond with us for either manual or pneumatic door and step control.

A clean-cut product pre-supposes a clean-cut maker. You will find that our manufacturing and business standards go hand in hand.

The Railway Field Book of Today

The fifth edition of Allen's Railroad Curves and Earthwork, with Field and Office Tables (published in 1914) is now in wide use among electric railway men. Its growth has not come by luck, but through a careful, systematic study of the needs of the engineer and prompt adaptation to his changing requirements.

For example, Prof. Allen was the first to produce his book in two parts for convenience in field use. He has also been early to recognize the value of the Standard Spiral of the American Railway Engineering Association, and has added special tables to facilitate its field use.

In the same manner the typography, illustrations, arrangement of the text and tables, treatment of the various problems—briefly, every detail has been studied carefully and improved whenever improvement seemed possible.

You have the privilege of free examination of this book. Merely return the attached coupon. You can return the book without obligation if it does not seem of value to you.

Allen Railroad Curves and Earthwork Field and Office Tables

By C. FRANK ALLEN

Prof. of Railroad Engineering, Mass. Inst. of Tech.

PUBLISHED IN TWO FORMS

A—Two Parts in One Volume.

516 pages, flexible leather, pocket size, gilt edges, \$3.00 (12/6) net, postpaid.

B—In Two Parts, as follows:

RAILROAD CURVES AND EARTHWORK.

234 pages, \$2.00 (8/4) net, postpaid.

FIELD AND OFFICE TABLES.

282 pages, \$2.00 (8/4) net, postpaid.

Sent for Free Examination

We will send this book or any book published by the McGRAW-HILL BOOK COMPANY, Inc., to any subscriber to the Electric Railway Journal or any member of the American Institute of Electrical Engineers or American Electric Railway Association for ten days' free examination.

If you are not a subscriber to Electric Railway Journal or a member of the American Institute of Electrical Engineers or American Electric Railway Association a reference will give you the same privilege.

Reapplying Old Bonds

PREST-O-LITE

Gas-Weld Rail Bonding

(Oxy-Acetylene Process)

Reapplying certain types of bonds that have become defective is one of the simplest and most effective means of proving quickly the efficiency and savings to be made by the Prest-O-Lite Process—provided you prefer to experiment in your own way before adopting this method for *all* of your future bonding work.

Cost of necessary equipment is only a fraction of what you would have to pay in the purchase or lease of bonding apparatus—thoroughly high-grade apparatus only \$60 (Canada \$75)—acetylene and oxygen in portable cylinders on an extremely liberal basis—prompt service everywhere.

This is a time for enforcing methods of strictest economy—in rail bonding as well as in all other departments of maintenance work. Consider the leakage of profits owing to defective bonds. This loss can be immediately checked by employing the Prest-O-Lite Process. One tester and one welder can pick out and repair defective bonds without interfering with traffic in any way.

The savings that the Prest-O-Lite Process will show you in rail bonding alone will surprise you. The same portable welding outfit has enormous possibilities of savings in shop and yard repairs.

Let us send you some interesting data on oxy-acetylene welding—how you can save your road a lot of time and money with this low-cost process. Your request for information will not obligate you in any way. Write—

Do Your Next Bonding by the Prest-O-Lite Process

A Tale of Two Crossings

They are side by side, only 30 ft. apart on the Union Traction Co. line at Muncie, Ind.

Here's what C. A. Prentice, Division Engineer of the U. T. Co., writes about them in the Electric Railway Journal of Nov. 20.

Both crossings went in within 5 days of each other in December, 1912. One is as GOOD AS NEW. It is on an INTERNATIONAL STEEL CROSSING FOUNDATION.

The other is "nearly worn out"—to quote Mr. Prentice. It rests upon timber ties.

An International Steel Crossing Foundation relieves your crossing frogs of bending stress, because of its uniform, full length support of the whole frog. It conserves the life of the crossing and minimizes the work of keeping it in line and surface. The Big Four Railway crossing first mentioned has only cost \$56.81 in three years for tamping.

Look into the economy of International Steel Foundations and Steel Ties. They mean lower costs and BETTER TRACK.

Write for all the facts.

Type F C Bond

Type P 4 P Bond

Every "Protected" Rail Bond You Install Saves Money—Here's Why

Because its terminals are made of soft, dense copper, forged to shape in dies. They are very soft and ductile and will not crack under compression.

Because the body of the bond is made of pure lake copper, in both cable and flat wire types. This gives you a flexible bond, one that absorbs vibration perfectly and one in which the strands won't break or crack.

Because body is forged and welded to the terminals by a special process; and on every "Protected" Rail Bond, whether compressed terminal type, pin driven type or duplex stud type, this provides a mechanically protecting sleeve—a "shot-over" sleeve—around the strands at their point of emergence from the terminal. It allows the cables or wires to emerge from the terminals in their original form, neither flattened, distorted, reduced in area nor burnt.

In every "Protected" Rail Bond, where vibration is most severe—at the junction of terminal and strand, you get new, live, unburnt, mechanically protected copper to absorb it. This is why "Protected" Rail Bonds don't crack at this point.

In considering your bonding, remember that "Protected" Rail Bonds are furnished in both compressed terminal and pin driven types; remember that every one has the valuable "shot-over" sleeve features; and remember that the proof of their service lies IN THE EIGHTEEN YEARS' EXPERIENCE BEHIND THEM AND IN THE OVER EIGHT MILLIONS THAT ARE NOW IN USE.

Wouldn't our broad experience in connection with every class and kind of rail bonding problem be of great value to you right now?

It is yours for the asking, without the slightest obligation on your part.

ELECTRIC SERVICE SUPPLIES Co.

Manufacturer of Railway Material and Electrical Supplies

PHILADELPHIA
17th and Cambria Sts.

NEW YORK
50 Church St.

CHICAGO
417 So. Dearborn St.

JOHNS-MANVILLE SERVICE

EVERY product sold under this emblem is backed by J-M Responsibility—a new order of Service pledged by a nation-wide organization that has had over half a century of experience in solving YOUR problems.

J-M Products are made not merely to sell but to give satisfaction in use. Hundreds of J-M Service Representatives everywhere give this assurance. That's J-M Responsibility.

More rugged than slate—more serviceable than marble— J-M EBONY ASBESTOS WOOD

This should suggest many uses around the station to the electric railway engineer.

The fact that this material is tough, highly dielectric and at the same time resistant to the heat of the arc makes it admirable for any electrical mounting that is needed in service.

You can machine and tool this material in your own shop without loss due to breakage, and you won't be worried with metallic veins or flaws. Write our nearest branch for "Switchboard Materials" booklet to-day.

Central Switchboard Cordelia Street Station, Pacific Gas & Elec. Co., Oakland, Cal.—Made of J-M Transite Ebony Asbestos Wood

A "Short" in a Cable may mean a Fire in a Manhole—unless the Cable is wrapped with J-M Niagrite

A fire in a manhole is a nasty thing to fight. And it can do a lot of damage in a few minutes—unless the cables are protected with J-M Niagrite.

J-M Niagrite is a tough, heavy woven asbestos tape about three inches wide. Wrapped tightly about a cable and covered with the special J-M cement used with it, it hardens into a fireproof armor. Even a "short" in that cable can't spread fire to other cables similarly protected.

To wrap your cables with J-M Niagrite is to insure them against fire. It's a big factor in minimizing service interruptions. J-M Niagrite is a cable protection that every Central Station needs.

Write for complete data on J-M Niagrite service.

about the

V-K

OILLESS TROLLEY WHEEL and NON-ARCING HARP

You can obtain more mileage from the wheel with least wear on the expensive overhead construction. You can be sure of a greater and more even flow of current and stop that destructive arcing due to wear and looseness of the axle pin. You can save the expense entailed in lubricating wheel bearings and damage to car roofing by dripping oil and shopmen's feet.

The V-K Equipment will do it because of—

- the high conductivity of the wheel metal.
- the perfect finish and uniform balance of the wheel.
- the patented (V-K) self-lubricating, non-insulating graphite and bronze gauze bearing.
- the most efficient form of contacts.
- the patented (V-K) pin-locking device which prevents arcing, and the building up of heat so destructive to the wheel.

On the basis of service rendered, there is no other form of Trolley Equipment that will give you the economies obtainable with the V-K.

Brooklyn Rapid Transit Orders Grade M Gearing

One of the largest supply gear orders ever placed has just been awarded by the Brooklyn Rapid Transit Company for G-E Grade M Gearing.

This Company operates over 4500 cars in Greater New York and has been using a number of Grade M gears on its lines for several years. As a result of their satisfactory operation this new order for 2800 gears and an equal number of pinions was placed.

Grade M Gearing owes its unprecedented success, not to its excellence in laboratory tests, but to its unfailing efficiency and economy in actual service.

A Prehistoric Brake

It was a big idea for one of our ancestors to discover that he could stop a moving vehicle by getting leverage on a stick and pressing it into the earth.

The stick was good enough at first only, for bye and bye it had to make room for something more reliable.

So, too, the old-fashioned trolley car hand brake has had to give way to the Improved Peacock Brake. Instead of overworking the motorman and jarring the car, the Improved Peacock Brake provides the ease, the elasticity and the sure control of the air brake, including instant application of power to the brake shoe and positive prevention of skidding wheels.

In the crisis of an emergency application the Peacock does not lose an instant in getting a good hold on the wheels. The motorman does not have to scratch gravel to take up slack chain—the Peacock leaves none to take up.

It gets through the preliminaries and down to real business *quick*.

That's what you want in a brake!

Read the Searchlight Section Every Week

The For Sale pages are a weekly "Bargain Sale"—the biggest to be found anywhere, because the JOURNAL publishes more ads of this kind than can be found in any other paper in its field.

Every issue contains offers of equipment and machinery that are real bargains. It is a habit counting for economy to look over the For Sale pages every week whether or not you intend to buy anything at the moment. This keeps you in touch with what is available—and where—when you must buy.

Keep an eye on the Want columns at the same time. They afford an easy means of marketing equipment for which one concern may have no further use, but which may be just what another concern wants.

Altogether the Want and For Sale pages of the ELECTRIC RAILWAY JOURNAL form an "Opportunity Department" that hardly anybody in the electric railway field can pass by without losing money.

Tell us Your Wants and let us help you

ELECTRIC RAILWAY JOURNAL
239 West 39th Street, New York

There's One Thing About
These
Western Electric
SELECTORS

that makes a great "big hit with us," said the maintenance man on one of the big railroad systems; "it's the fact that we can take any one and put it in at any way-station—without having to send it back to the factory for readjustment."

This interchangeability is but one of many of the good points to be found in these selectors—of which there are now over 17,000 in use on large and small railroad systems all over the world.

Write to us for further details and let us help you in solving your dispatching problems.

EQUIPMENT FOR EVERY ELECTRICAL NEED
Member Society for Electrical Development. "Do it Electrically"

The On-Time Advertiser

who gets his copy and cuts to us well before the day his advertisement should go to press, gets better type composition, better location and a better opportunity to make necessary corrections on the proofs which can then be submitted before publication.

The Last-Hour Advertiser

whose copy and cuts come in at the last minute or even later, gets the best attention we can possibly give him. We work overtime to do what we can for him. But the lack of sufficient time makes it physically impossible to do as well for him as for the advertiser whose instructions come in well before the last hour.

Get Your Copy and Cuts in Early

Do this, not on our account, but for the sake of your own advertising. We want to serve all advertisers equally well—but we can't put more hours into a day, and the advertiser who gives us the most time gets the best results.

Copy and cuts should be in our hands by Thursday of the week preceding the date of issue. This means that Thursday is the last day on which copy can be handled normally.

After that we cannot promise proofs, and we cannot insure classification.

For good advertising, get your cuts and copy in every week *before* Thursday.

Electric Railway Journal
239 West 39th Street, New York

A Factor in Successful Line Material —AETNA Insulation

Its durability survives seasons of changing temperature, changing atmospheric conditions and the blows and jars consequent to service. It is a maintenance reducer as well as a protection against costly breakdowns.

Twenty years' manufacture of Aetna insures an

"experience plus" product where it is used in line material.

If you haven't studied Anderson economies from the standpoint of your work, get the Anderson Complete Catalog. It is *more* than a Catalog. Find out why. Write.

Pow aur Harth

Some natives of Egypt stain their hands and feet with Henna. They say it prevents the skin from becoming too tender and sensitive.

So you see them trudging along with pow and harth looking like the artistic color scheme of a Sunday comic section.

But it's only imaginary protection—nature would have provided it if it had been essential.

Just as Morganite brushes provide necessary lubrication in themselves which obviates the foolish expedient of slopping lubrication on the commutator.

"Then it's cheaper to use Morganite brushes alone than cheap brushes plus *lubricant*"—you say. *Sure* it is! and, what is more, with Morganite brushes you get *engineering service* to prescribe the exact type of Morganite your service calls for.

Save your money by getting your prescription now.

Safety and Economy in Electric Railway Wheels

Electric railways strive to maintain their rolling stock with the least possible expense; that is, they must keep their cars out of the repair shops. To do this necessarily means they must use wheels that will not require frequent renewals.

F. C. S. Wheels

are one-wear wheels that do not have to be shopped for frequent turning—all that is necessary to remove flat spots is to run the car onto a pit grinder for twenty to forty minutes at night when in the barn and the wheels are ground truly cylindrical and are as good as new, saving the expense of removal from truck.

The composition of the flange and tread insure a hard wearing surface indicative of long service.

Tests that have been made prove that brake shoe wear on chilled iron wheels is twenty to twenty-five per cent. less than on any other type of wheel.

F. C. S. wheels are designed to meet the demands to be imposed upon them by the weight of car, speed, brake pressure, condition of track, etc., on each individual system, therefore insuring safety to a maximum degree.

Micrometer Unable to Detect any Wear After Two Years' Service

A western road after operating for two years a car equipped with "Rollway" Bearings, decided to examine the bearings to determine how they had stood up in service. It was found that the wear of these

"ROLLWAY" BEARINGS

was so slight it could not be detected by the use of a micrometer; in fact there seemed to be no wear whatever.

You examine the bearings of your cars occasionally, don't you? What do you find? Do you find wear that means excessive loss of energy—that means constant attention is necessary—that means repairs are essential, either at once or at an early period? Are you bothered with oil leakage, with heavy maintenance costs? If so,

you need "Rollway" Bearings NOW. At any rate, it will do no harm to learn more about them. Complete information sent on request. Write for it.

Salt Water Test
of

"ACME"
(NESTABLE)

NO-CO-RO METAL Culvert

Diameter—12", length 4 ft. Galvanized Anti - Corrosive NO-CO-RO METAL (99.90% pure). Suspended so that when tide was "out" the culvert was entirely exposed to sunlight; when tide "in" entirely submerged. Original weight 46.40 lbs. Installed October 20, 1912. When inspected and tested 3 years later (October 20, 1915) found by the chemist of our laboratories to have lost only 1.70 lb. or 3.66% total weight in the 3 years—a splendid condition considering severity of test. Galvanizing is partly off of base metal, which base metal shows a covering of fine oxide.

This is real Corrosion-resistance. Read all about "ACME" (Nestable) NO-CO-RO METAL Culverts in Catalog G-3.

Does Your Plant Measure Up to Its Load?

If you are forced to keep two or three extra boilers under steam, ready to help carry your peaks, there is probably scale in your boilers, and they are not steaming freely.

DEARBORN TREATMENT

will remove this and likely enable you to get enough steam from your regular boilers to meet and carry your peaks, and at the same time greatly reduce your fuel consumption.

Dearborn Treatment is made to suit water conditions at each plant. Send gallon of water for analysis.

ECONOMY METERS

BUILT LIKE A WATCH

— the only means at your disposal to accurately measure the power consumption of cars. You can well afford to investigate. Bulletin 416.

Sangamo Electric Company
Springfield, Illinois

New York Rochester Minneapolis Los Angeles
50 Church St. Mercantile Bldg. Met'p'tan Life Bldg. San Fernando Bldg.

The Kalamazoo Trolley Wheels

have always been made of entirely new metal, which accounts for their long life WITHOUT INJURY TO THE WIRE. Do not be misled by statements of large mileage, because a wheel that will run too long will damage the wire. If our catalogue does not show the style you need, write us—the LARGEST EXCLUSIVE TROLLEY WHEEL MAKERS IN THE WORLD.

THE STAR BRASS WORKS
KALAMAZOO, MICH., U. S. A.

The New Weston

Single-Phase and Direct Current Portable Electrodynamometer Wattmeter, Model 310

An Instrument of Precision guaranteed to an accuracy of $\frac{1}{4}$ of 1% of full scale value on the working part of the scale, whether used on D.C. circuits or A.C. circuits of any frequency up to 133 cycles per second and on circuits of any wave form.

Double ranges are provided for both current and voltage circuits. All current ranges can be used for 100% overload indefinitely without introducing error.

The movable system has an extremely low moment of inertia and is very effectively damped. Indications are independent of room temperature and the instrument is shielded from external magnetic influences. The scale, $5\frac{1}{4}$ inches long, is uniform throughout the entire length, a characteristic of great value. It is hand-calibrated and provided with a mirror, over which the knife-edge pointer travels, and the pointer may easily be adjusted to zero by means of a zero-correcting device.

For complete information regarding Model 310 Wattmeters (illustrated) and Model 329 Portable Polyphase Wattmeters write for Bulletin No. 2002. Other Models in this group are Model 341 A.C. and D.C. Portable Voltmeter, described in Bulletin No. 2004; and Model 370 A.C. and D.C. Portable Ammeter, described in Bulletin No. 2003.

A REMARKABLE SAVING

If you pay \$12.50 for an untreated gear which lasts 150,000 miles and is worn out, your cost per thousand miles is 8.33c

If you pay \$18.75 for a BP gear guaranteed to last three and one-half times as long, or 525,000 miles, your cost per thousand miles is 3.57c

Saving 4.76 or 57%

The greater mileage 525,000 would require three and one-half untreated gears at \$12.50 \$43.75

or one BP gear at 18.75

Saving \$25.00 or 57%

400° Fahrenheit

You'd say Goodbye to a great many insulating tapes long before that temperature was reached. But until you reach that figure you can't put a kink into the insulating qualities of

"Deltatape"

It is just the right "blend" of asbestos fibre and a special insulating compound.

Its particular value lies in the fact that while it is a good electrical insulator, it is also a *splendid conductor of heat*. Your coils can't stay blanketed when the temperature comes up.

Deltatape can be supplied in any width, and in thicknesses between 10 and 25 mils. The 10 mil tape requires 2500 volts to puncture it, while 5000 volts is required to break down the 25 mil tape.

You ought to get all the facts. It will pay you. For your car operation will always be at the mercy of motor conditions.

So we say—WRITE

D & W FUSE CO.

Providence, R. I.

2

The Need of the Hour is Efficiency

This is the cry of every industry.
In yours it is attained by using

Sherwin-Williams Paints and Varnishes

used according to our new Modern Method Car Painting System. Send for our new booklet, "Efficiency the Need of the Hour." It will tell you how to attain it in your Paint Shop.

THE SHERWIN-WILLIAMS CO.

RAILWAY SALES DEPARTMENT

601 CANAL ROAD, CLEVELAND, OHIO

FORD TRIBLOC

A Chain Hoist that excels in every feature. It has Planetary Gears, Steel Parts, $3\frac{1}{2}$ to 1 factor of Safety. It's the only Block that carries a five-year guarantee.

BRAKE SHOES

A Road May be Proud of Its Braking Efficiency

Yet it may be wrong to conclude that the type they use should be on *your* cars. Your operating conditions are probably different. What is profitable for one line may be unsuited to many others. The easiest way to make *sure* of getting maximum braking economy and efficiency for *your* road is to consult specialists. That is our business. Consult us.

Titanium Treated

—the
BEST
Insurance
against
rail wear.

COMPARATIVE service tests have proved repeatedly that Titanium-treated rails outwear untreated rails.

The average increase is about 40%.

The increase in rail cost to produce this saving is under 5%.

Not only is this good economy but the Titanium rail is more ductile, freer from slag inclusions and segregation. It is therefore a **safer** rail, and safety is good economy.

Rail Reports 1 to 8 give conclusive evidence of the superior quality of the treated rail. Write for them.

What's Your Car Costs?

If you have measured your energy consumption per car mile—it will prove interesting to compare it with the results obtained by The Railway Storage Battery Car Co. by using S K F Ball Bearings.

Then when you are called upon to cut operating costs you will have the way mapped out to effect telling economies.

EDISON STORAGE BATTERY CARS

ENGINEERING DEPARTMENT

THE RAILWAY STORAGE BATTERY CAR CO.

30 BROAD STREET
NEW YORK.

ADDRESS ALL COMMUNICATIONS
TO THE COMPANY

SUBJECT: Ball Bearing car of the
Cambria & Indiana Rd. Co. August 10th, 1915.

Messrs. S.K.F. Ball-Bearing Co..
50 Church Street, New York City.

Gentlemen:

It is with pleasure we write you this letter in regards to the serviceability derived from the use of your ball bearings. From our numerous operations and from tests made we are able to say that a saving of at least 20% may be had over friction bearings.

For any of your possible customers who would like to compare figures, the following will be interesting:

We can operate a 30 ton car at a maximum speed of about 40 miles per hour on grades such as would be encountered on the Pennsylvania Rd. Co. operating between New York and Baltimore at 1.4 K.W.Hr.
p.c.m.

On grades such as encountered in the operation of the Cambria & Indiana Rd. Co. operating between Rexis and Colver Heights (profile which you may get by communicating with Mr. W. E. Dobson, Land Title Bldg., Philadelphia,) at 2.19 K.W.Hr.

Yours very truly,

FNK/MH

BRILL SINGLE-TRUCK CARS

There is surely something wrong about the system of running half-loaded big cars most of the time—cars that most of the day are eating up the revenue of the short, rush-hour periods. It's like the man who has a big, heavy touring car to run around town alone in all day so that he may have room to take all the family out on Sunday. Of course, it doesn't apply everywhere, but there are many places in this fair land where the public is being served with too many seats and not enough cars. And, like the man with the auto, who finally added a little runabout and saved money, so many a road could put light-weight, single-truck cars in service and make money.

THE J. G. BRILL COMPANY, PHILADELPHIA, PA.
AMERICAN CAR COMPANY, ST. LOUIS, MISSOURI
G. C. KUHLMAN CAR COMPANY, CLEVELAND, OHIO
WASON MANUFACTURING CO., SPRINGFIELD, MASS.
COMPAGNIE J. G. BRILL, PARIS, FRANCE

Rapid Transit in Philadelphia

The service in Philadelphia is particularly severe owing to the high speeds, heavy curves and abrupt grades due to the subway, under river, street and bridge levels.

The trains are equipped with G-E 222 Ventilated Railway motors and Sprague G-E Type MK Control.

Over three million car miles have been operated without a single motor or control detention during the past two years.

ONE HUNDRED of these G-E 222 Ventilated Railway motors are giving highly satisfactory service on the 50 new cars of the Philadelphia Rapid Transit Company which were placed in operation two years ago.
